TRAVIS COUNTY HEALTHCARE DISTRICT

1111 E. Cesar Chavez Street, Suite B

Austin, Texas 78702

September 17, 2021 2:00PM CST

CSP 2108-002 General Contractor for Del Valle Health & Wellness Center

The Travis County Healthcare District (“TCHD” or “District”) invites qualified entities to submit proposals to provide *CSP 2108-002 General Contractor for Del Valle Health & Wellness Center*. Sealed Proposals will be received until 2:00 p.m. Central Time, on *September 17, 2021* by the Travis County Healthcare District, 1111 East Cesar Chavez, Suite B, Austin, TX 78702.

TCHD reserves the right to reject any and /or all proposals, to award contracts for individual products or services as may appear advantageous and to negotiate separately in any manner necessary to serve its best interests.

If not submitted electronically via www.bidsync.com, proposals delivered to TCHD locations other than Suite B will not be considered “received” until they arrive in Suite B. TCHD will not be responsible for delays in delivery resulting from need to transport a bid from another location or error or delay on the part of any carrier. **Proposals received at the designated location after the published time and date cannot be considered.**

No proposals may be withdrawn for a period of sixty (60) days subsequent to the deadline for receipt of proposals without the prior written consent of the Travis County Healthcare District.

There is no express or implied obligation for the District to reimburse entities or individuals for any expense incurred in preparing proposals in response to this request, and the District will not reimburse anyone for these expenses. The District will consider proposals from all responsible entities and/or individuals.

Unless accepted through Bidsync, proposals submitted by electronic transmission will not be considered; however, proposals may be modified by electronic transmission if the notice is received prior to the time and date set for the proposal opening and specific information is not exposed by the amendment.

Travis County Healthcare District d/b/a Central Health

Competitive Sealed Proposal

CSP 2108-002 General Contractor for Del Valle Health & Wellness Center

PROPOSAL INSTRUCTIONS

Proposers should note that this Competitive Sealed Proposal (CSP) is published and accessible through electronic means. Proposers who received notification of this solicitation by means other than through any of the three websites listed below should register with BidSync in order to receive timely notification of any addenda, amendment, and/or other forms of information that may be issued prior to the solicitation submittal date:

<http://www.centralhealth.net/finance/purchasing>

<http://www.txsmartbuy.com/sp>

<https://prod.bidsync.com/central-health>

Registration is **free**.

Proposers are being given the option to submit an electronic proposal via BidSync or deliver a printed Proposal. In the event a proposer provides an electronic and a printed proposal, the electronic BidSync Proposal will be the proposal of record and will be used for the purposes of the CSP. **Proposals submitted in a format other than 1) online via BidSync or 2) delivery of a sealed printed proposal to the address below, will not be considered.**

Proposers who choose to deliver one (1) printed and sealed Proposal are asked to deliver via USPS mail, FedEx, DHL, etc.

DUE TO COVID-19 AND CURRENT BUILDING ACCESS RESTRICTIONS, YOU MUST CONTACT THE PROCUREMENT AUTHORITY PRIOR TO DELIVERY OF A PRINTED COPY TO THE PURCHASING OFFICE. The printed Proposal, with any supporting and/or sample documentation, must be delivered in a sealed container that is labeled and addressed as follows:

Attn: CSP 2108-002 General Contractor Del Valle Health & Wellness Center
Central Health - Purchasing Office
Attn: Christina Irvin, Senior Purchasing Analyst
1111 East Cesar Chavez Street
Austin, TX 78702

It is the Proposer's sole responsibility to ensure that it obtains any and all addenda and/or amendments to this CSP; addenda and amendments will be posted on the Bidsync website the day they are released. In the event of a conflict between a version of the CSP in the Proposer's possession and the version maintained by Central Health, the version maintained by Central Health will control.

All Proposals will be submitted and/or delivered on or before the closing date and time for receipt of Proposals. **Proposals received at the designated location after the published time and date will not be considered.**

I. INTRODUCTION

A. Entity Background

The Travis County Healthcare District d/b/a Central Health (“Central Health”) is a special purpose district created under Chapter 281 of the Texas Health and Safety Code that is responsible for providing hospital and medical care to the indigent and needy residents of Travis County. Together with its affiliates, the Community Care Collaborative, Sendero Health Plans, Inc., and Central Texas Community Health Centers d/b/a CommUnityCare (all four entities collectively, “TCHD Entities”), Central Health ensures low-income and uninsured residents receive timely access to quality health care services.

B. Purpose of Request for Proposals/Project Scope

Central Health seeks to obtain Proposals from qualified General Contractors. The project scope includes the new construction of a building and related site work for the Del Valle Health & Wellness Center. The project consists of a community health center on a 2.5-acre site in Southeast Travis County, 7050 Elroy Rd, Del Valle, TX 78617.

The new facility is a one-story building with 18,904 GSF. The facility will house a comprehensive primary care and dental care clinic and include a Class A Pharmacy with drive thru. A portion of the facility, roughly 1,700 sf, will remain shell space for future fit out. The project includes additional site amenities like a community gathering space and community garden.

The owner will supply all furniture, fixtures, and equipment through other vendors.

C. Procurement Authority

Central Health has designated a Procurement Authority who is responsible for the conduct of this procurement on behalf of Central Health; therefore, all deliveries (including Proposal delivery) shall be addressed as follows:

CSP 2108-002 General Contractor for Del Valle Health & Wellness Center

Central Health – Purchasing Office

Attn: Christina Irvin, Senior Purchasing Analyst

1111 East Cesar Chavez Street Austin, TX 78702

purchasing@centralhealth.net

Any inquiries or requests regarding this procurement should be submitted to the Procurement Authority as identified on BidSync and Central Health’s Website:

<http://www.centralhealth.net/finance/purchasing>. Proposers shall ONLY contact the Procurement Authority regarding this procurement. Proposers shall NOT contact individual Central Health Board Members, Central Health executive team leaders or staff regarding this solicitation. Such contact shall result in disqualification of the Proposer initiating the contact.

D. Definition of Terminology

This section contains definitions and abbreviations that are used throughout this procurement document.

"BAFO" request for a Best and Final Offer.

"BidSync Website" is the following link:

<https://prod.bidsync.com/central-health>

"Central Health Website" is the following link:

<http://www.centralhealth.net/finance/purchasing>.

"Close of Business (COB)" means 5:00 PM Prevailing Central Time.

"Competitive Sealed Proposal" or "CSP" means this request for submission of competitive sealed proposals, including all associated documents, Attachments, and Exhibits, which are hereby incorporated by reference and considered a part of the Proposals. The term may also refer to the competitive sealed proposals (see "Proposal" below) submitted by proposers in response to this request.

"Contract" means a written agreement for the procurement of items of tangible personal property or services, or both.

"Determination" means the written documentation of a decision by the Procurement Authority, including findings of fact supporting a decision. A Determination becomes part of the procurement file.

"Desirable" means that the terms "may", "can", "preferably", or "prefers" identify a Desirable or discretionary item or factor (as opposed to "Mandatory").

"Duly Authorized Representative" means the individual who is authorized to submit a Proposal to this CSP on behalf of Proposer and to bind the Proposer to any Contract that may result from the Submission of Proposal.

"ESBD" is the following link: <http://www.txsmartbuy.com/sp>

"Evaluation Committee" means a body appointed by Central Health management to perform the evaluation of Proposals.

"Evaluation Committee Report" means a document prepared by the Procurement Authority and the Evaluation Committee for Contract/s award. It contains all written Determinations resulting from the CSP.

"Finalist" is defined as a Proposer who meets all the Mandatory specifications of this Request for Proposals and whose score on evaluation factors is sufficiently high to merit further consideration by the Evaluation Committee.

"Mandatory" means that the terms "must", "shall", "will", "is required", or "are required" identify a Mandatory item or factor (as opposed to "Desirable"). Failure to meet a Mandatory item or factor may result in the rejection of the Proposer's Proposal.

"Principal" is a person in charge of an organization who takes leadership.

"Proposer" is any person, entity, corporation, or partnership that submits a Proposal.

"Proposal" means a competitive sealed proposal submitted in response to this CSP.

"Procurement Authority" means a person or designee authorized by Central Health to manage or administer a procurement requiring the evaluation of the CSP Proposal.

"Responsible Proposer" means a Proposer who submits a Proposal and who has furnished, when required, information and data to prove that on the basis of demonstrated competence and qualifications, its financial resources, production and service facilities, personnel, service reputation and experience are adequate to satisfactorily perform the Services or provide items of tangible personal property described in the Proposal.

"Responsive Proposal" means a Proposal that includes all required documentation and conforms in all material respects to the requirements set forth in the Request for Proposals. The Proposal to this Request for Proposals must include responsive information, which support the Proposer's competence, qualifications, and ability to perform the Services, including, but not limited to, quality, quantity, and delivery requirements.

II. PROCUREMENT SCHEDULE

This section of the CSP describes all major events listed in the CSP Schedule. The Procurement Authority will make every effort to adhere to the Procurement Schedule set forth in this CSP.

A. Pre-proposal Conference

If a pre-proposal conference, the date and time of that event, will be noted in the Procurement Schedule on page 2 of this CSP and on the BidSync Website. Attendees' names and email contact information will be shared and posted on BidSync and the Central Health Website to facilitate possible subcontracting opportunities. In addition, any questions received and answered at this event will be posted on BidSync and the Central Health Website.

B. Deadline to Submit Questions

All Proposers are expected to carefully examine this CSP. Any ambiguities or inconsistencies therein should be brought to the attention of the Procurement Authority as described in this CSP. Additionally, it is the responsibility of the Proposer to obtain clarification of any information contained herein that is not fully understood. Proposers may submit written questions via BidSync.

C. Response to Written Questions

Written responses to all questions submitted by potential Proposers will be addressed in either a CSP addendum or question and answer document that will be posted on BidSync by Close of

Business per the Question Response Date as indicated in the Procurement Schedule on page 2 of this CSP.

Any verbal statement made by Central Health regarding the CSP prior to the award will be considered non-binding. The only formal interpretation of the CSP will be made by addendum or a question-and-answer document issued by the Procurement Authority.

D. Submission of Proposal

The Procurement Authority or designee must receive all proposals for review and evaluation no later than 2:00 PM Central Time per the Proposal Submission Date as indicated in the Procurement Schedule on page 2 of this CSP. Proposals received after this deadline will not be accepted. **Refer to Proposal Instructions on page 3 of this CSP for Proposal Submission instructions.**

Proposals submitted via Bidsync (preferred method), BidSync.com will automatically record the date and time of receipt of each correctly submitted Proposal.

The date and time of receipt will be recorded on each printed Proposal. The Proposal **must be addressed and delivered to the Procurement Authority in a sealed container at the address listed in 1.C above**. Proposals submitted by facsimile or other electronic means will not be accepted.

A public log will be kept of the names of all organizations that submit a Proposal. Unless required by law, the contents of any Proposal will not be disclosed to competing Proposers prior to Contract award.

E. Opening of Proposals

The Procurement Authority will publicly open all sealed proposals received by the submission deadline, as outlined in the Procurement Schedule, virtually, on the Date and Time indicated in the Procurement Schedule on page 2 of this CSP. For all proposals received by the deadline, the Procurement Authority will read aloud the names of the offerors and any monetary proposal made by the offerors. For Proposals submitted electronically, the names of the proposers will be available on the solicitation opening date immediately after the opening time at BidSync.com. Please note for hard copy responses the names of the proposers will be uploaded into BidSync.com and available to the public within four business hours of the opening date and time.

The Purchasing Offices strongly encourages proposers to download the names of the proposers from Bidsync.com or use the virtual dial-in information (supplied within the solicitation) where the names of the proposers will be listed for your information. We are strongly discouraging proposers from going to our office for the solicitation openings. At the opening, the proposals are opened in a manner that avoids disclosure of the contents to other proposers. They are kept secret until the contract is awarded. After the contract award, unless a proposer has identified parts of the proposal as trade secrets and confidential information in compliance with the Public Information Act, the contents of all proposals will be available and open for public inspection.

F. Proposal Evaluation

Bids shall be evaluated without discussions. The Evaluation Committee will evaluate, score, and rank written Proposals using the evaluation criteria identified in section XIV. A. EVALUATION CRITERIA.

G. Negotiations with Selected Offeror

Based on the scoring, the Purchasing Manager will attempt to negotiate a contract with the highest scoring offeror who the Evaluation Committee determines offers the best value. Central Health, and its architect or engineer may discuss with the selected offeror options for a scope or time modification and any price change associated with the modification. If Central Health is unable to negotiate a satisfactory contract with the selected offeror, the governmental entity shall, formally and in writing, end negotiations with that offeror and proceed to the next offeror in the order of the selection ranking until a contract is reached or all proposals are rejected.

H. Contract Award

Central Health may but is not obligated to award a Contract to the Proposer that best satisfies Central Health's requirements and provides the best overall value to Central Health for the Project.

As of the date of issuance, a single award is contemplated.

III. PROPOSER RIGHTS AND OBLIGATIONS

A. Rights

1. Amending Proposals

Any Proposer may submit an amended Proposal before the deadline for receipt of Proposals. Such amended Proposals must be complete replacements for a previously submitted Proposal and must be clearly identified as such in the transmittal letter. Central Health will not merge, collate, or assemble Proposal materials.

2. Withdrawing Proposals

Proposers will be allowed to withdraw their Proposals at any time prior to the deadline for receipt of Proposals. To withdraw a Proposal, the Proposer must submit a written withdrawal request signed by the Proposer's Duly Authorized Representative and addressed to the Procurement Authority.

3. Designating Proposal Contents as Confidential or Proprietary

Proposers may mark, stamp, or imprint the words "proprietary" or "confidential" on any pages of the Proposal that include information of this type. However, Proprietary or confidential information should be readily separable from the Proposal in order to facilitate eventual public inspection of the other portions of the Proposal. Central Health will not sort, otherwise isolate, or redact proprietary or confidential information embedded within the body of a Proposal.

B. Obligations

1. Conditions and Contract Terms Associated with CSP

Proposers must indicate their acceptance of all conditions governing the CSP in their letter of

transmittal. However, a Proposer's failure to do so will not operate to exempt Proposer from these conditions, as the act of submission itself constitutes acceptance of the conditions, including the evaluation criteria contained in section VI. B. EVALUATION CRITERIA of this CSP.

Additionally, Proposers must agree to include the terms contained within Exhibit G – Sample Contract with Required Contract Terms and Conditions, which is incorporated in this CSP, and in any Contract that results from this CSP.

2. Costs Associated with Procurement

Any and all costs incurred by the Proposer in preparation, transmittal, and presentation of any Proposal or material submitted in response to this CSP will be borne solely by the Proposer.

3. Electronic Mail Address

A large part of the communication regarding this procurement will be conducted by electronic mail (e-mail). Therefore, all Proposers must have a valid e-mail address to receive correspondence.

4. Identification and Selection of Subcontractors

The term "subcontractor" includes sub-consultants. Proposer's intended use of subcontractors must be clearly explained in its Proposals, and major subcontractors must be identified by name. The awarded Proposer will be wholly responsible for the entire performance of the Contract, whether or not subcontractors are used, and Proposer expressly acknowledges that in entering into such subcontract(s), Central Health is in no manner liable to any subcontractor(s). Awarded Proposer further acknowledges that Central Health will make Contract payments only to the awarded Proposer.

5. Historically Underutilized Business (HUB) Program and Good Faith Effort

Proposers will be required to make a "good faith effort" to take all necessary and reasonable steps to ensure that certified HUBs (see next paragraph) have the maximum opportunity to participate in the performance of any Contract that results from this CSP as subcontractors. An awarded Proposer's failure to carry out this "good faith effort" will constitute a breach of Contract and may result in termination of the Contract.

HUB contractors and subcontractors must be certified as a HUB, Minority/Women-Owned Business Enterprises, or Disadvantaged Business Enterprise source by a recognized governmental program, such as:

- City of Austin Municipal Government;
- Texas Unified Certification Program; or
- State of Texas; or
- Other certification entity recognized by Travis County, Texas

Any subcontractor who Proposer intends to subcontract with at the time of Proposal submission and that is identified as a HUB, will be required to submit a copy of its certification with this Proposal. Central Health reserves the right to verify any entity's HUB status prior to

Contract award.

6. Suspension and Debarment Certification

The Proposer will certify, by signing the Acknowledgement of Receipt Form, attached hereto as Exhibit C, that to the best of its knowledge and belief that the Proposer and/or its Principals or subcontractors are not and have not been debarred, suspended, proposed for debarment, or declared ineligible for the award of Contracts by any federal department or district.

7. Conflict-of-Interest Questionnaire (CIQ Form)

Pursuant to Chapter 176 of the Texas Local Government Code, the awarded Proposer, if any, will be required to complete the Conflict-of-Interest Questionnaire ("CIQ"), which is attached to this CSP as Exhibit E, and submit it together with the Contract, if the Proposer has: (i) an employment or other business relationship with a local government officer of Central Health or a family member of same; (ii) given a local government officer of Central Health or a family member of same one or more gifts having an aggregate value as specified in Exhibit E or (iii) has a family relationship with a local government officer of Central Health. For additional information concerning filling out the CIQ, see with <https://www.ethics.state.tx.us/forms/conflict/>

8. Certificate of Interested Parties (Form 1295)

Section 2252.908 of the Texas Government Code prohibits a governmental entity, like Central Health, from entering into certain Contracts, unless the business entity submits a Certificate of Interested Parties form, attached to this CSP as EXHIBIT I, to the governmental entity at the time the business entity executes a Contract. Form 1295 is applicable to any of awarded Proposer's directors, officers, or employees who hold a controlling interest (10% or more ownership) in the business entity and who actively participated in facilitating the Contract or negotiating the terms of same (broker, intermediary, advisor, and/or attorney), if any.

Selected Offeror will be required to electronically file a Form 1295 with the Texas Ethics Commission upon notification of selection from Central Health. The online filing process will generate a Certificate Number and Date Filed. Selected Offeror will submit that information Central Health as part of its contract.

For more information, visit:

<https://www.ethics.state.tx.us/filinginfo/1295/>

9. Good-Faith Negotiations

The Procurement Authority or designee will participate in all discussions with Selected Offeror. Discussions will only be conducted with responsible Selected Offeror who submit Responsive Proposals to the CSP, which are determined to be reasonably acceptable of being selected for award. The Selected Offeror will be accorded fair and equal treatment with respect to any opportunity for discussion and revision of Proposals. The Selected Offeror may be required to submit additional information and/or clarify previously submitted information before negotiations commence. Revisions and supplements to Proposals may also be permitted after submission and before Contract award for the purpose of obtaining BAFOs in Central

Health's sole discretion. Any BAFO, as well as the entire Proposal, will become part of Central Health's awarded Contract.

Central Health reserves the right to negotiate the price and any other term with the Selected Offeror. Any oral negotiations must be confirmed in writing prior to an award.

10. Texas Workers' Compensation Coverage (TWCC)

The Texas Department of Insurance, Division of Workers' Compensation ("TDIDWC") has adopted Rule 110.110. Rule 110.110 applies to all building and construction contracts advertised for bid by a governmental entity on or after September 1, 1994. Rule 110.100, and any amendments thereto, affects your bid on this project.

- Rule 110.110 is designed to achieve compliance from contractors, subcontractors, and governmental entities regarding workers' compensation insurance coverage. This affects contractors, subcontractors, and the Central Health on this project.
- Providing false or misleading certificates of coverage, failing to provide or maintain required coverage, or failing to report any change that materially affects the coverage may subject the contractor(s) or other persons providing services on this project to administrative penalties, criminal penalties, civil penalties, or other civil actions. This affects contractors and subcontractors.
- Therefore, the following TDIDWC RULE 110.110 is provided in accordance with the requirements on governmental entities as set forth in Title 28, Part 2, Section 110.110(c) of the Texas Administrative Code. Please read this carefully and prepare your bid in full compliance with TDIDWC Rule 110.110. Failure to provide the required certificates upon submission of a bid could result in your bid being declared non-responsive.
- We do not believe that Rule 110.110 creates any additional duties or burdens on anyone which Texas workers' compensation laws, rules, and regulations have not already established. Therefore, the County should not experience any increase in cost because of the need to comply with all Texas workers' compensation laws, rules, and regulations.

Additional questions may be addressed to the Texas Department of Insurance, Division of Workers' Compensation Central Office, 7551 Metro Center Drive, Suite 100, Austin, Texas 78744, (512) 804-4000 or toll free at (800) 372-7713.

TDIDWC Rule 110.110 Workers' Compensation Insurance Coverage

A. Definitions:

Certificate of Coverage ("certificate") - A copy of a certificate of insurance, a certificate of authority to self-insure issued by the commission, or a coverage agreement (TWCC-81, TWCC-82, TWCC-83, or TWCC-84), showing statutory workers' compensation insurance coverage for the person's or entity's employees providing services on a project, for the duration of the project.

Duration of the project - includes the time from the beginning of the work on the project until the contractor's/person's work on the project has been completed and accepted by the

governmental entity.

Persons providing services on the project (“subcontractor” in §406.096) - includes all persons or entities performing all or part of the services the contractor has undertaken to perform on the project, regardless of whether that person contracted directly with the contractor and regardless of whether that person has employees. This includes, without limitation, independent contractors, subcontractors, leasing companies, motor carriers, owner-operators, employees of any such entity, or employees of any entity which furnishes persons to provide services on the project. “Services” include, without limitation, providing, hauling, or delivering equipment or materials, or providing labor, transportation, or other service related to a project. “Services” does not include activities unrelated to the project, such as food/beverage vendors, office supply deliveries, and delivery of portable toilets.

B. The contractor shall provide coverage, based on proper reporting of classification codes and payroll amounts and filing of any coverage agreements, which meets the statutory requirements of Texas Labor Code, Section 401.011(44) for all employees of the contractor providing services on the project, for the duration of the project.

C. The Contractor must provide a certificate of coverage to the governmental entity prior to being awarded the contract.

D. If the coverage period shown on the contractor’s current certificate of coverage ends during the duration of the project, the contractor must, prior to the end of the coverage period, file a new certificate of coverage with the governmental entity showing that coverage has been extended.

E. The contractor shall obtain from each person providing services on a project, and provide to the governmental entity:

1. A certificate of coverage, prior to that person beginning work on the project, so the governmental entity will have on file certificates of coverage showing coverage for all persons providing services on the project; and
2. No later than seven days after receipt by the contractor, a new certificate of coverage showing extension of coverage, if the coverage period shown on the current certificate of coverage ends during the duration of the project.

F. The contractor shall retain all required certificates of coverage for the duration of the project and for one year thereafter.

G. The contractor shall notify the governmental entity in writing by certified mail or personal delivery, within 10 days after the contractor knew or should have known, of any change that materially affects the provision of coverage of any person providing services on the project.

H. The contractor shall post on each project site a notice, in the text, form and manner prescribed by the Texas Workers’ Compensation Commission, informing all persons providing services on the project that they are required to be covered, and stating how a person may

verify coverage and report lack of coverage.

- I.** The contractor shall contractually require each person with whom it contracts to provide services on a project, to:
1. Provide coverage, based on proper reporting of classification codes and payroll amounts and filing of any coverage agreements, which meets the statutory requirements of Texas Labor Code, Section 401.011(44) for all of its employees providing services on the project, for the duration of the project;
 2. Provide to the contractor, prior to that person beginning work on the project, a certificate of coverage showing that coverage is being provided for all employees of the person providing services on the project, for the duration of the project;
 3. Provide the contractor, prior to the end of the coverage period, a new certificate of coverage showing extension of coverage, if the coverage period shown on the current certificate of coverage ends during the duration of the project;
 4. Obtain from each other person with whom it contracts, and provide to the contractor:
 - A certificate of coverage, prior to the other person beginning work on the project; and
 - A new certificate of coverage showing extension of coverage, prior to the end of the coverage period, if the coverage period shown on the current certificate of coverage ends during the duration of the project;
 5. Retain all required certificates of coverage on file for the duration of the project and for one year thereafter;
 6. Notify the governmental entity in writing by certified mail or personal delivery, within 10 days after the person knew or should have known, of any change that materially affects the provision of coverage of any person providing services on the project; and
 7. Contractually require each person with whom it contracts, to perform as required by paragraphs (1) - (7), with the certificates of coverage to be provided to the person for whom they are providing services.
- J.** By signing this contract or providing or causing to be provided a certificate of coverage, the contractor is representing to the governmental entity that all employees of the contractor who will provide services on the project will be covered by workers' compensation coverage for the duration of the project, that the coverage will be based on proper reporting of classification codes and payroll amounts, and that all coverage agreements will be filed with the appropriate insurance carrier or, in the case of a self-insured, with the commission's Division of Self-Insurance Regulation. Providing false or misleading information may subject the contractor to administrative penalties, criminal penalties, civil penalties, or other civil actions.
- K.** The contractor's failure to comply with any of these provisions is a breach of contract by the contractor which entitles the governmental entity to declare the contract void if the contractor does not remedy the breach within ten days after receipt of notice of breach from the governmental entity.

11. Prevailing Wage Rate Determination - Site Construction & Building Construction Crafts

NOTICE

The Central Health has adopted the prevailing wage rates for its Travis County projects as determined by the United States Department of Labor in accordance with the Davis –Bacon Act and its subsequent amendments. The prevailing wage rates for this project are those rates set forth for Travis County in the U.S. Department of Labor General Decisions for (1) Building Construction Projects or (2) Highway Construction Projects.

Copies of the appropriate U.S. Department of Labor General Decisions referenced above are included in this CSP.

This determination of prevailing wages will not be construed to prohibit the payment of more than the rate named. Under no condition will any laborer, workman, or mechanic employed on this job be paid less than the minimum wage scale.

The Contractor must comply with all applicable state and federal laws, including, but not limited to, laws concerned with labor, equal employment opportunity, safety, and minimum wage. The Contractor must post the applicable Prevailing Wage Rate Determination in a prominent, easily accessible place at the work site. To ensure that the Contractor, and/or subcontractors are paying the posted specified rates (including fringe benefits when applicable) to all classifications of workmen, mechanics, and laborers, the Central Health reserves the right to perform “spot labor interviews” and examine Contractor payroll information.

Pursuant to Chapter 2258 of the Texas Government Code:

- A worker employed on a public work by or on behalf of Central Health must be paid:
 - Not less than the general prevailing rate of per diem wages for work of a similar character in the locality in which the work is performed; and
 - Not less than the general prevailing rate of per diem wages for legal holiday and overtime work. NOTE: This Paragraph Number 1 does not apply to maintenance work.
- A worker is employed on a public work for the purposes of Paragraph Number 1 if the worker is employed by a contractor or subcontractor in the execution of a contract for the public work with Central Health or any officer or department of Central Health.
- The contractor who is awarded a contract by the Central Health, or a subcontractor of the contractor, must pay not less than the rates (plus fringe benefits when applicable) as listed in the U.S. Department of Labor General Decisions referenced above to a worker employed by the contractor to work on the project.
- A contractor or subcontractor who violates this section must pay to the Central Health \$60 for each worker employed for each calendar day or part of the day that the worker is paid less than the wage rates set forth in the U.S. Department of Labor General Decisions referenced above. Subject to a final determination of the matter, Central Health may use any money collected pursuant to this section to offset the cost incurred in the administration of the requirements of Chapter 2258.
- Central Health will take notice of complaints of all violations of this chapter committed in the execution of the contract and withhold money or required to be withheld under

Chapter 2258 from the payments to the contractor under the contract, except that the Central Health may not withhold money from other than the final payment without a determination by the Central Health that there is good cause to believe that the contractor has violated this chapter.

- The contractor will post the following notices and the wage rates prominently at the Project.

WAGE SCHEDULE

"General Decision Number: TX20210271 07/09/2021

Superseded General Decision Number: TX20200271

State: Texas

Construction Type: Building

County: Travis County in Texas.

BUILDING CONSTRUCTION PROJECTS (does not include single family homes or apartments up to and including 4 stories).

Note: Under Executive Order (EO) 13658, an hourly minimum wage of \$10.95 for calendar year 2021 applies to all contracts subject to the Davis-Bacon Act for which the contract is awarded (and any solicitation was issued) on or after January 1, 2015. If this contract is covered by the EO, the contractor must pay all workers in any classification listed on this wage determination at least \$10.95 per hour (or the applicable wage rate listed on this wage determination, if it is higher) for all hours spent performing on the contract in calendar year 2021. If this contract is covered by the EO and a classification considered necessary for performance of work on the contract does not appear on this wage determination, the contractor must pay workers in that classification at least the wage rate determined through the conformance process set forth in 29 CFR 5.5(a)(1)(ii) (or the EO minimum wage rate, if it is higher than the conformed wage rate). The EO minimum wage rate will be adjusted annually. Please note that this EO applies to the above-mentioned types of contracts entered into by the federal government that are subject to the Davis-Bacon Act itself, but it does not apply to contracts subject only to the Davis-Bacon Related Acts, including those set forth at 29 CFR 5.1(a)(2)-(60). Additional information on contractor requirements and worker protections under the EO is available

at <https://protect-us.mimecast.com/s/-O2FC820wAcNNE2szJeIs?domain=dol.gov>.

WELDERS - Receive rate prescribed for craft performing operation to which welding is incidental.

=====

Note: Executive Order (EO) 13706, Establishing Paid Sick Leave for Federal Contractors applies to all contracts subject to the Davis-Bacon Act for which the contract is awarded (and any solicitation was issued) on or after January 1, 2017. If this contract is covered by the EO, the contractor must provide employees with 1 hour of paid sick leave for every 30 hours they work, up to 56 hours of paid sick leave each year. Employees must be permitted to use paid sick leave for their own illness, injury or other health-related needs, including preventive care; to assist a family member (or person who is like family to the employee) who is ill, injured, or has other health-related needs, including preventive care; or for reasons resulting from, or to assist a family member (or person who is like family to the employee) who is a victim of, domestic violence, sexual assault, or stalking. Additional information on contractor requirements and worker protections under the EO is available at <https://protect-us.mimecast.com/s/-O2FC820wAcNNE2szJeIs?domain=dol.gov>.

Unlisted classifications needed for work not included within the scope of the classifications listed may be added after award only as provided in the labor standards contract clauses (29CFR 5.5 (a) (1) (ii)).

The body of each wage determination lists the classification and wage rates that have been found to be prevailing for the cited type(s) of construction in the area covered by the wage determination. The classifications are listed in alphabetical order of ""identifiers"" that indicate whether the particular rate is a union rate (current union negotiated rate for local), a survey rate (weighted average rate) or a union average rate (weighted union average rate).

Union Rate Identifiers

A four letter classification abbreviation identifier enclosed in dotted lines beginning with characters other than ""SU"" or ""UAVG"" denotes that the union classification and rate were prevailing for that classification in the survey. Example: PLUM0198-005 07/01/2014. PLUM is an abbreviation identifier of the union which prevailed in the survey for this classification, which in this example would be Plumbers. 0198 indicates the local union number or district council number where applicable, i.e., Plumbers Local 0198. The next number, 005 in the example, is an internal number used in processing the wage determination. 07/01/2014 is the effective date of the most current negotiated rate, which in this example is July 1, 2014.

Union prevailing wage rates are updated to reflect all rate changes in the collective bargaining agreement (CBA) governing this classification and rate.

Survey Rate Identifiers

Classifications listed under the ""SU"" identifier indicate that no one rate prevailed for this classification in the survey and the published rate is derived by computing a weighted average rate based on all the rates reported in the survey for that classification. As this weighted average rate includes all rates reported in the survey, it may include both union and non-union rates. Example: SULA2012-007 5/13/2014. SU indicates the rates are survey rates based on a weighted average calculation of rates and are not majority rates. LA indicates the State of Louisiana. 2012 is the year of survey on which these classifications and rates are based. The next number, 007 in the example, is an internal number used in producing the wage determination. 5/13/2014 indicates the survey completion date for the classifications and rates under that identifier.

Survey wage rates are not updated and remain in effect until a new survey is conducted.

Union Average Rate Identifiers

Classification(s) listed under the UAVG identifier indicate that no single majority rate prevailed for those classifications; however, 100% of the data reported for the classifications was union data. EXAMPLE: UAVG-OH-0010

08/29/2014. UAVG indicates that the rate is a weighted union average rate. OH indicates the state. The next number, 0010 in the example, is an internal number used in producing the wage determination. 08/29/2014 indicates the survey completion date for the classifications and rates under that identifier.

A UAVG rate will be updated once a year, usually in January of each year, to reflect a weighted average of the current negotiated/CBA rate of the union locals from which the rate is based.

WAGE DETERMINATION APPEALS PROCESS

1.) Has there been an initial decision in the matter? This can be:

- * an existing published wage determination
- * a survey underlying a wage determination
- * a Wage and Hour Division letter setting forth a position on a wage determination matter
- * a conformance (additional classification and rate) ruling

On survey related matters, initial contact, including requests for summaries of surveys, should be with the Wage and Hour Regional Office for the area in which the survey was conducted because those Regional Offices have responsibility for the Davis-Bacon survey program. If the response from this initial contact is not satisfactory, then the process described in 2.) and 3.) should be followed.

With regard to any other matter not yet ripe for the formal process described here, initial contact should be with the Branch of Construction Wage Determinations. Write to:

Branch of Construction Wage Determinations
Wage and Hour Division
U.S. Department of Labor
200 Constitution Avenue, N.W.
Washington, DC 20210

2.) If the answer to the question in 1.) is yes, then an

interested party (those affected by the action) can request review and reconsideration from the Wage and Hour Administrator (See 29 CFR Part 1.8 and 29 CFR Part 7). Write to:

Wage and Hour Administrator
U.S. Department of Labor
200 Constitution Avenue, N.W.
Washington, DC 20210

The request should be accompanied by a full statement of the interested party's position and by any information (wage payment data, project description, area practice material, etc.) that the requestor considers relevant to the issue.

3.) If the decision of the Administrator is not favorable, an interested party may appeal directly to the Administrative Review Board (formerly the Wage Appeals Board). Write to:

Administrative Review Board
U.S. Department of Labor
200 Constitution Avenue, N.W.
Washington, DC 20210

4.) All decisions by the Administrative Review Board are final.

END OF GENERAL DECISION"

IMPORTANT INFORMATION

YOU CAN DIRECT ANY WAGE DISPUTES OR QUESTIONS TO:

**Central Health Purchasing Office
1111 E. Cesar Chavez Street
Austin, TX 78702
512-580-8003**

Pursuant to Section 2258.023(a) of the Government Code, "The contractor who is awarded a contract by a public body or a subcontractor of the contractor must pay not less than the rates determined under Section 2258.022 to a worker employed by it in the execution of the contract."

INFORMACION IMPORTANTE

TU PUEDES DISCUTIR O PREGUNTAR DE TU SALARIO DIRECTAMENTE CON:

**OFICINA DE COMPRAS DE CENTRAL HEALTH
1111 E. Cesar Chavez Street
Austin, TX 78702
512-580-8003**

De acuerdo con la seccion 2258.023(a) delCodigo del Gobierno, "El contratista al que le fue adjudicado un contrato por el Gobierno, o su subcontratista, debaran pagar a un trabajador contratado, no menos que las tarifas determinadas bajo la seccion 2258.022, para la ejecucion del contrato."

IV. CENTRAL HEALTH RIGHTS

A. Summary of Rights

Central Health may:

1. Reject any or all Proposals without obligation or liability to any Proposer;
2. Accept a Proposal other than the lowest-price Proposal (as applicable);
3. Award a Contract on the basis of an initial Proposal received without discussions or requests for Best and Final Offers;
4. Request Best and Final Offers from Selected Offeror;
5. Procure the Services in whole or in part by other means;
6. Award a Contract; and/or
7. Not award any Contract.

V. Termination of CSP

This CSP may be canceled at any time and any and all Proposals may be rejected in whole or in part if Central Health determines such action to be in Central Health's best interest.

VI. Waive Minor Irregularities

The Evaluation Committee reserves the right to waive minor irregularities (e.g. Proposer submits the incorrect number of Proposal copies or does not sign all Proposal copies) in the Proposals. The Evaluation Committee also reserves the right to waive certain, non-mandatory requirements contained herein if the Proposal otherwise meets the mandatory requirements and/or waiving the minor irregularity does not otherwise materially affect the procurement. This right may be exercised at the Evaluation Committee's sole discretion.

VII. CSP Amendments

Central Health reserves the right to issue amendments to this CSP before the date on which Proposals are due. Amendments will be posted on the Bidsync website.

VIII. Negotiate Additional Contract Terms

Central Health reserves the right to modify and negotiate with a successful Proposer provisions in addition to those attached to this CSP. The contents of this CSP, as revised and/or supplemented, and any portions of the successful Proposer's Proposal acceptable to Central Health, will be incorporated into and become part of the Contract.

IX. Accept Contract Deviations

Any additional terms and conditions, which may be the subject of negotiation, will be discussed only between Central Health and the selected Proposer and will not be deemed an opportunity to amend the Proposer's Proposal. If a Proposer requests significant changes to either the required Contract terms or the terms of the Business Associate Agreement, Proposer's Proposal may be considered non-Responsive and result in Proposers' disqualification or, if such changes are requested post-Proposal submission in violation of this CSP, will result in termination of negotiations and Contract award.

X. Investigate Proposers

The Evaluation Committee may make such investigations as necessary to determine the qualifications and ability of the Proposer to adhere to the requirements specified within this CSP. The Evaluation Committee will reject any Proposal that is submitted by a Proposer who it deems unqualified or who otherwise fails to submit a responsive Proposal.

XI. Request Change in Proposer Representatives

Central Health reserves the right to require a change in the representatives that Proposer submits with the Proposal, if the assigned representatives are not, in the opinion of Central Health, able to adequately meet Central Health's needs.

XII. Assert Ownership of Proposals

All documents submitted in response to this Request for Competitive Sealed Proposals will become the property of Central Health.

XIII. PROPOSAL FORMAT AND ORGANIZATION

This section of the CSP describes the format and organization of the Proposer's Proposal. **Failure to conform to the requirements contained herein may result in disqualification of the Proposal.**

A. Proposal Format

All Proposals, electronic and printed, must delineate each section. The page limit should be **no more than forty (40) pages (20 front/back if printed) not including tabs and requested forms (see item B. below), or as further instructed in this CSP.** If submitting a printed Proposal, the Proposal must be in a binder with tabs delineating each section.

B. Proposal Organization

The Proposal must be organized and indexed in the following format and must contain, as a minimum, all items that are listed as required in the sequence indicated.

1. Letter of Transmittal – Required

- Identify the submitting organization;
- Identify the name, title, e-mail address and telephone number of the person authorized to contractually obligate the organization or individual proposing;
- Identify the name, title, e-mail address, and telephone number of the person authorized to negotiate a Contract on behalf of the organization;
- Identify the names, titles, e-mail addresses, and telephone numbers of persons to be contacted for Proposal clarification;
- Proposed Price including base bid and alternates;
- **Explicitly indicate acceptance of Sections II through IV of this CSP;**
- Be signed by the person authorized to contractually obligate the organization; and
- Acknowledge receipt of all, if any, addenda to this CSP.
 - Table of Contents - Optional
 - Proposal Summary - Optional

- Response to Prompts - **Required**
- Completed and Signed Acknowledgement of Receipt Form - **Required**
- Completed Historically Underutilized Business (HUB) Form - **Required**
- Completed and Signed Conflict of Interest Questionnaire (CIQ) – **Required upon selection**
- Completed and Signed Certificate of Secretary – **Required if Proposer is a corporation**
- Completed Insurance Coverage Form - **Required**
- Other (optional) supporting material (may be included on the electronic device)

The forms listed behind the numbers 5, 6, 8 and 9 must be thoroughly completed, executed and witnessed, if and as required, and included in the appropriate section of the Proposal. Proposals must include all Attachments and Exhibits in order to be considered Responsive.

Any Proposal that does not adhere to these requirements may be deemed non-responsive and rejected on that basis.

XIV. PROPOSAL CONTENT REQUIREMENTS

Proposers shall respond in the form of a detailed narrative to each of the narrative prompts contained in Item A below. The narratives, along with supporting materials, will be evaluated and awarded points accordingly.

Failure to respond to the following mandatory narrative prompts will result in disqualification of the Proposal as non-responsive.

A. Evaluation Criteria

Relevant Experience	10%
Project Management Ability & Key Staff Experience	15%
Current & Past Performance	10%
Subcontractors & Suppliers	5%
Proposal Price	50%
Schedule	10%
Financial Stability	Pass/Fail
Litigation History	Pass/Fail

B. Narrative Prompts

1. Relevant Experience: Based on information provided by Contractor

- Experience- Points awarded based on number of years established as a commercial firm capable of bonding an individual \$9,000,000.00 project.
- Representative Projects- Completed clinic projects.

2. Project Management Ability & Key Staff Experience: Based on information provided and references

- Organizational Structure- based on completed information submitted
 - Provide a complete organizational chart indicating key team members proposed to work full time on the project for the entire length of the project. Organize this

chart to show field personnel and those who will support the project from elsewhere. Identify the location of main office.

- Provide the resumes of the Project Superintendent, Assistant Superintendent(s), and Project Manager. Include information on projects completed together, if any.
- For each key team members, list all of the projects that they have worked on during the past five (5) years, their roles on these projects, and whether or not they were employed by your firm. Provide complete information regarding their project experience including, but not limited to, information requested in 3.1 below.
- Provide a current company safety policy and a safety plan that is specific to the project and proposed construction site.
- Project Superintendent and Project Manager Evaluations- Based on references
 - Questions to Owners- Points awarded for each “yes” response Was the project(s) completed on schedule?
 - Was the project(s) completed within the budget?
- Questions to Architects/Engineers
 - Does the Superintendent/Project Manager have the construction knowledge necessary to successfully carry out his/duties?
 - Is the Superintendent/Project Manager organized in all aspects of their duties?
 - Does the Superintendent/Project Manager stay within standard construction communication practice guidelines?
 - Does the Superintendent/Project Manager complete and process construction related paperwork in a timely manner?
 - Does the Superintendent/Project Manager work to ensure that subcontractors are held accountable for the quality and quantity of their work?
 - Does the Superintendent/Project Manager behave in a professional manner at all times?
 - Is the Superintendent/Project Manager proactive in identifying and dealing with construction related problems and issues?

3. Current and Past Performance- Based on Owner and Architect/Engineer References.

Points awarded based on evaluation team’s knowledge of the contractor’s past experience with the district or other owners. Up to three (3) past healthcare projects will be evaluated based on the following information.

- Contractor to provide a chronological list of all clinic projects completed in the past three (3) years and currently in progress. Include the following information for each project:
 - Project name
 - Project Type
 - Date Project Complete
 - Name of Project Superintendent
 - Name of Project Manager
 - Owner Contact (name, phone & address)
 - Architect/Engineer Contact (name, phone & address)
 - Project Location (city and county)
- Questions to Owner/Architect/Engineer:
 - Were the projects completed on schedule and within budget?

- Were closeout processes organized and completed in a timely fashion?
 - Did the contractor cooperate and work well with the owner's staff?
 - Did the general contractor lead the effort of coordinating subcontractor work?
 - Was the quality of work performed well?
 - Were warranty calls kept to a minimum number?
- 4. Subcontractors and Suppliers- Based on information provided**
- Provide the name of the proposed subcontractor for each of the following trades. Provide each subcontractor's safety policy and the name and resume of the field superintendent.
 - Rubber/Tile/LVT/Carpet Subcontractor
 - Electrical Subcontractor
 - Steel Fabricator & Erector
 - Mechanical Subcontractor
- 5. Proposal Price- Based on proposal form submitted**
- The lowest proposal is based on Base Bid plus accepted Alternates.
 - Fifty (50) points will be awarded for the lowest proposal
 - Points are deducted from proposal greater than the lowest proposal based on 1/3% point variation from the lowest proposal up to 5% difference. Points range from 44 (for 0.33% difference) to 30 (for 5% difference).
 - Proposals with greater than 5% difference will be awarded points based on one (1) point being deducted for each additional 1%. (i.e. 6% difference equals 29 points, 7% difference equals 28 points, etc.)
- 6. Schedule**
- Provide a proposed baseline schedule in Microsoft Projects or comparable Gantt chart format for this work defining a critical path.
 - Schedule Strategies- Provide strategies which are included in the proposal to minimize delays and identify areas for possible time savings.
- 7. Litigation History- Based on information provided by contractor**
Pass/Fail
- Provide a list of all Texas litigation your firm has been involved with for the last five years. If none, provide a signed notarized affidavit stating that the offeror has not been involved in any litigation in Texas from December 1, 2015 to present.
 - List all current and ongoing disputes (those that your firm has had to employ an attorney to act on your behalf) your firm has ongoing with any owner or subcontractor that is related to a construction project. Briefly describe the situation and how you see it being resolved.
- 8. Financial Stability- Based on information provided by contractor**
Pass/Fail
- Provide a current certified audited financial statement
 - Indicate the total number of staff your firm has employed for the past three years.
 - Separate each year's total employees into totals for office and/or field staff categories.

C. Evaluation Process

1. All Proposals will be reviewed for compliance with above and above of this CSP. Proposals deemed non-responsive may be eliminated from further consideration.

2. The Procurement Authority may contact the Proposer for clarification of the Proposal as specified in above.
3. The Evaluation Committee may use other sources of information to perform the evaluation as specified in Proposal Evaluation.
4. Responsive Proposals will be evaluated using the criteria set forth in the table above.

The Proposer whose Proposal is most advantageous to Central Health, taking into consideration the stated EVALUATION CRITERIA, may be recommended for Contract award as specified in above. Proposers who are asked or chosen to submit a revised Proposal for the purpose of obtaining Best and Final Offers may have their points recalculated accordingly. Please note however, that a serious deficiency in the initial Proposal may be grounds for rejection regardless of overall score.

Exhibit C
Acknowledgment of Receipt Form

In acknowledgment of receipt of this Request for Qualifications, the undersigned agrees that he/she has received a complete copy, beginning with the title page and Table of Contents and Exhibits.

The acknowledgment of receipt should be signed, returned, and included with the Respondent's submittal. Complete (Legal) Name of Proposer: _____

Proposer Tax Identification Number: _____

Business Address: _____

Telephone Number: _____

Type of Organization: Individual Partnership Corporation Association

Other (please describe) _____

If incorporated, state of incorporation: _____

Date organization was formed (month/year): _____

The number of years providing services/systems similar to those requested in this Solicitation: _____

Description of Proposer's organization, locations, and number of staff (including subcontractors as applicable) that will provide services/support outlined in this Solicitation):

Please certify the following by placing an "X" in the appropriate column:

Certification	Yes	No
Is Proposer/Respondent currently in the process of filing for bankruptcy?		
Has Proposer/Respondent filed for bankruptcy within the past five (5) years?		
Is the Proposer/Responder delinquent on any taxes owed to Travis County?		
Is the Proposer/Responder currently under suspension or debarment by any governmental entity (City of Austin/state/federal government)?		

Proposer/Responder may be not be considered if currently under suspension or debarment.

Acknowledged Addenda _____ of _____

**Exhibit C
Acknowledgment of Receipt Form**

III. Individual authorized to bind Proposer/Respondent to contract:

Name/Title: _____

Telephone: _____ E-mail: _____

Point of contact information for this Solicitation (if different from authorized individual):

Name/Title: _____

Telephone: _____ E-mail: _____

IV. Terms and Conditions

The required contract terms and conditions identified in the Exhibit G, of this Solicitation, will be incorporated into the contract resulting from this Solicitation, and the Proposer /Respondent's submission will be incorporated into the contract. Please identify whether there are any requested exceptions or deviations.

- I do not request any exceptions or deviations to the stated contract terms.
- I request the following exceptions or deviations to the stated contract terms.

V. Litigation History:

Description of litigation to which the firm has been a party in the most recent five-year period. Please include the following details:

- 1) Name of case
- 2) Date filed
- 3) Court in which filed
- 4) Judgment or result

(Continued on Next page)

Exhibit C
Acknowledgment of Receipt Form

Important: The Proposer/Respondent must respond to all questions. The Proposer/Respondent may attach additional documents to the questionnaire to provide additional details.

**EXHIBIT D
HISTORICALLY UNDERUTILIZED BUSINESS (HUB) FORM**

The Travis County Healthcare District’s policy is to include Historically Underutilized Businesses (HUBs) in its procurement process and to provide equal opportunities for HUB participation in the provision of supplies, services, equipment and construction projects required by the District. As such, the District seeks to ensure that a “good faith effort” is made to assist certified HUB vendors and contractors in its award of contracts and subcontracts.

To be considered as a “Certified HUB Contractor/Vendor”, the contractor/vendor must have been certified by and hold a current and valid certification from any of the following certifying agencies recognized by the District: the Texas Building and Procurement Commission (State of Texas); City of Austin; and the Texas Unified Certification Program (TUCP), which includes six (6) certifying agencies.

Suggested directories to assist proposers in identifying potential HUBs to meet the District’s “good faith effort” requirement include: **State:** <https://comptroller.texas.gov/purchasing/vendor/hub/>;

City: <http://www.austintexas.gov/department/purchasing> ; and

TUCP: <https://www.txdot.gov/business/partnerships/tucp.html>

Proposer HUB Declaration

Is your company certified as a HUB or an MBE/WBE/DBE source? Yes No. If yes,

1. **Attach your certification to this form and return it in the proposal;**

2. Identify the certification agency by checking all that apply;

State of Texas Comptroller HUB Program

City of Austin; Texas Unified Certification Program; and

3. Identify HUB Status (Gender & Ethnicity): _____

****Please complete page 2 - Disclosure of HUB Subcontractors****

Estimated percentage of the bid (proposal) that is to be subcontracted with Certified HUB sources: ___%

EXHIBIT E
Conflict of Interest Questionnaire

CONFLICT OF INTEREST QUESTIONNAIRE
For vendor doing business with local governmental entity

FORM CIQ

This questionnaire reflects changes made to the law by H.B. 23, 84th Leg., Regular Session.

This questionnaire is being filed in accordance with Chapter 176, Local Government Code, by a vendor who has a business relationship as defined by Section 176.001(1-a) with a local governmental entity and the vendor meets requirements under Section 176.006(a).

By law this questionnaire must be filed with the records administrator of the local governmental entity not later than the 7th business day after the date the vendor becomes aware of facts that require the statement to be filed. See Section 176.006(a-1), Local Government Code.

A vendor commits an offense if the vendor knowingly violates Section 176.006, Local Government Code. An offense under this section is a misdemeanor.

OFFICE USE ONLY

Date Received

1 Name of vendor who has a business relationship with local governmental entity.

2 Check this box if you are filing an update to a previously filed questionnaire. (The law requires that you file an updated completed questionnaire with the appropriate filing authority not later than the 7th business day after the date on which you became aware that the originally filed questionnaire was incomplete or inaccurate.)

3 Name of local government officer about whom the information is being disclosed.

Name of Officer

4 Describe each employment or other business relationship with the local government officer, or a family member of the officer, as described by Section 176.003(a)(2)(A). Also describe any family relationship with the local government officer. Complete subparts A and B for each employment or business relationship described. Attach additional pages to this Form CIQ as necessary.

A. Is the local government officer or a family member of the officer receiving or likely to receive taxable income, other than investment income, from the vendor?

Yes No

B. Is the vendor receiving or likely to receive taxable income, other than investment income, from or at the direction of the local government officer or a family member of the officer AND the taxable income is not received from the local governmental entity?

Yes No

5 Describe each employment or business relationship that the vendor named in Section 1 maintains with a corporation or other business entity with respect to which the local government officer serves as an officer or director, or holds an ownership interest of one percent or more.

6 Check this box if the vendor has given the local government officer or a family member of the officer one or more gifts as described in Section 176.003(a)(2)(B), excluding gifts described in Section 176.003(a-1).

EXHIBIT G
CONSTRUCTION AGREEMENT

This Construction Contract is made as of _____, 20____ (the “Effective Date”), by and between

The Owner: Travis County Healthcare District d/b/a Central Health
1111 East Cesar Chavez Street
Austin, Texas 78702
512 / 978-8000

And Contractor:

For the Project known as: General Contractor for Del Valle Health & Wellness Center

Contract Sum: \$

Project Architect/Engineer: O’Connell Robertson

The Contractor is the person or entity identified as such in the Construction Contract and will be referred to as if singular in number and masculine in gender. The term Contractor means the Contractor or his authorized representative.

The Contractor agrees that:

The Contractor will, coordinate and cooperate with the Owner and the Owner’s Architect/Engineer and other consultants, and proactively work to eliminate conflicts within the Work. He will provide without limit, all labor, materials, equipment, and similar resources to ensure the most expedient and safe performance of the Work. He will attentively manage the construction and protect the Owner against cost increases, Project delay, and deficient work.

The Owner and Contractor agree as follows:

ARTICLE 1 - SCOPE OF WORK

- 1.1 The Contractor has overall responsibility for and will furnish all materials, equipment, tools, labor and similar items as necessary or reasonably inferable to complete the Work, or any phase of the Work, in accordance with the Owner's requirements and the terms of the Contract Documents.
- 1.2 The Contractor will fully execute the Work described in the Contract Documents, except work specifically indicated in the Contract Documents to be others' responsibility.
- 1.3 The Construction Contract will not be construed to create any contractual relationship of any kind between the Owner and any Subcontractor or Sub-subcontractor, as those terms are defined herein.
- 1.4 Construction will commence upon the date specified in a written Notice to Proceed, which will be issued by Owner after approval of the Contract Sum, and will continue until Final Completion of all Work. Construction may provide for Work phasing to provide cost or time advantage to the Owner and Project. Unless otherwise agreed, Contractor will not incur any Subcontractor costs for construction of the Work prior to Owner's issuing the Notice to Proceed.

ARTICLE 2 - CONTRACT DOCUMENTS

- 2.1 The Contract Documents consist of:
 - 2.1.1 This Agreement and all exhibits and attachments listed, contained or referenced in this Agreement, Owner's supplemental scope of work requirements, definitions or clarifications, and Contractor's Proposal;
 - 2.1.2 The Drawings, Specifications, scope definition, and clarifications, details and other Construction Documents that have been accepted by Owner and developed by Architect/Engineer or Owner's other consultants to describe the Project;
 - 2.1.3 All Construction Documents' Addenda issued prior to the Effective Date of this Agreement;
 - 2.1.4 All Change Orders issued after the Effective Date of this Agreement;
 - 2.1.5 The CSP 2108 General Contractor for Del Valle Health Wellness Center and all its attachments and exhibits;
 - 2.1.6 Contractor's material quality and conformance certifications executed during the Work construction;
 - 2.1.7 Construction Schedule and other documents identified per Contract; and
 - 2.1.8 Other documents and/or attachments included or made part of this Agreement.
- 2.2 The Contract Documents form the entire and integrated Contract between Owner and Contractor and supersede all prior proposals, negotiations, representations or agreements, written or oral.
- 2.3 The term "Contractor" will be interchangeable with the terms "General Contractor" or other similar terms as appropriate in the Contract Documents.
- 2.4 Documents Use and Ownership.
 - 2.4.1 Drawings, specifications, and other documents prepared by the Architect/Engineer, its consultants, or other consultants retained by the Owner for the Project that describe the Work to be executed by the Contractor (the "Construction Documents") are instruments of service and will remain the property of the Owner whether the Project for which they are made is executed or not. The Contractor will be permitted to retain one record set of the Construction Documents. All other copies of the Construction Documents will be returned to the Owner as required, or will otherwise be suitably accounted for or destroyed. The Contractor and its Subcontractors are authorized to reproduce and use portions of the Construction Documents as necessary and appropriate for the execution of the Work. The Contractor and its Subcontractors will not use the Construction Documents on any other projects.

- 2.4.2 Submission or distribution of the Construction Documents to meet official regulatory requirements or for other purposes in connection with the Project will not diminish the Owner's rights.

ARTICLE 3 – COMMENCEMENT AND SUBSTANTIAL COMPLETION DATES

- 3.1 TIME LIMITS STATED IN THE CONTRACT DOCUMENTS ARE OF THE ESSENCE.
- 3.2 Unless otherwise approved, the Contractor will perform its obligations under the Contract Documents as expeditiously as is consistent with reasonable skill and care and the orderly progress of the Work.
- 3.3 The Commencement Date of the Work will be established per Owner's Notice to Proceed issued to Contractor. The Contractor will achieve Substantial Completion no later than _____, subject to adjustments and extension of time, if any, approved by the Owner or change order.
- 3.4 Contract Time will be measured from the Commencement Date. The Project Work will be performed as directed by the Contractor to complete the Work within the specified Contract Time unless otherwise provided by Contract Documents.
- 3.5 Substantial Completion.
- 3.5.1 The date of "Substantial Completion" of the Work or designated portion thereof is the date accepted by the Owner as the date when construction is sufficiently complete, in accordance with the Contract Documents, so the Owner can occupy the building or utilize the Work or designated portion thereof for the use for which it is intended. A Certificate of Occupancy or Temporary Certificate of Occupancy, issued by the governing authority, is required for Substantial Completion unless waived by the Owner.
- 3.5.2 The Contractor will achieve Substantial Completion of the entire Work not later than the date stated in Section 3.3, subject to the timely receipt of a general building permit and subject to adjustments of the Contract Time as provided in the Contract Documents.
- 3.5.3 Substantial Completion will require without limitation, that: i) all systems and parts required for occupancy are functional; ii) all utilities necessary for occupancy are connected and operating in accordance with Contract Documents; iii) all permits required for occupancy have been issued including, but not limited to a Temporary or final Certificate of Occupancy or jurisdictional equivalent as applicable; iv) normal vehicular and pedestrian traffic routes to the Project are not obstructed by Contractor's operations; and v) Architect has performed its inspection of the Work or designated portion thereof and determines the Work to be complete, which determination will not be unreasonably withheld. Upon the occurrence of the above, the Project or designated portion thereof will be deemed Substantially Complete and, the Architect will issue a Certificate of Substantial Completion for the designated portion or whole of the Work. Warranties called for by the Contract Documents will commence on Final Completion of all the Work. Within two (2) weeks of Substantial Completion, a "punch list" will be established by the Owner, Architect, and Contractor that lists all items of the Work or designated portion thereof to be completed or corrected. Contractor will complete all items listed on the "punch list" within thirty (30) days of the date of Substantial Completion provided such items are reasonably capable of being completed within this time frame.
- 3.5.4 Liquidated Damages. Should the Contractor fail to meet the date for Substantial Completion as set forth in Attachment B, subject only to adjustments of the Contract Time as provided in the Contract Documents, the parties agree that the Owner will suffer financial damages which are at present difficult or impossible to estimate, and that it is the intent of the parties to provide for compensatory damages and a degree of certainty in this contract, therefore the Contractor will, as Liquidated Damages and not as a penalty, be liable to Owner for the Liquidated Damages established in Attachment E. Owner will be able to deduct the amounts due under this Section from any payment that may become due to the Contractor. Should the Liquidated Damages amount due from Contractor to Owner exceed the

amount otherwise due or payable to Contractor by Owner, Contractor will promptly pay to Owner, the balance of Liquidated Damages. In the event that Contractor fails to achieve Substantial Completion of the Work, then, if Owner has previously accepted designated portion(s) of the Work, any Liquidated Damages payable by Contractor to Owner will be reduced by the following ratio: value of accepted Work relative to the total Contract Sum. Contractor agrees that, in addition to liquidated damages, Owner may exercise against Contractor any other right or remedy available under this Contract.

ARTICLE 4 – CONTRACT SUM & COST DETAIL

- 4.1 The Contract Sum is defined and described in the Agreement and, including authorized adjustments thereto, is the total amount payable by the Owner to the Contractor for performance of the Work. The Contract Sum is as defined in Attachment C – Contract Sum and Cost Conditions.
- 4.2 Allowances, and alternates, if any, are listed in Attachment C.
- 4.3 The Contract Sum is based upon laws, codes, and regulations enacted and effective as of the date of this Agreement.
- 4.4 The Contract Sum allows for and includes all services, items, and work required for the complete and correct performance of the Work in conformance with the requirements of the Contract Documents.
- 4.5 Change Orders
- 4.5.1 A “Change Order” is a written modification to the Contract signed by the Owner, the Architect/Engineer, and the Contractor issued after award of the Construction Contract authorizing a change in the Work and an adjustment, if any, in the Contract Sum or the Contract Time. The Contract Sum and the Contract Time may be changed only by Change Order. A Change Order signed by the Contractor indicates his agreement therewith, including the adjustment in the Contract Sum or the Contract Time.
- 4.5.2 Routine changes in the Construction Contract shall be formally initiated by the Architect/Engineer by means of a “Change Proposal Request (“CPR”)” form detailing requirements of the proposed change. The Contractor shall prepare a Change Proposal (“CP”) based on the CPR form. This action may be preceded by communications between the Contractor, Architect/Engineer, and Owner concerning the need for and nature of the change, but such communications shall not constitute a basis for beginning the proposed Work by the Contractor. Except for emergency conditions defined in subparagraph 4.5.10 or for conditions described in subparagraph 4.6.3, the Owner must approve the Contractor’s Change Proposal by the Architect/Engineer and Owner and authorize the Contractor to proceed with the Change Order Work. Without prior approval the Contractor may be required to remove Work so installed.
- 4.5.3 The cost or credit to the Owner resulting from Change Order Work shall be determined in one or more of the following ways:
- 4.5.3.1 by mutual acceptance of a lump sum properly itemized and supported by sufficient substantiating data to permit evaluation;
- 4.5.3.2 by unit prices stated in the Construction Documents, if any, or subsequently agreed upon; or
- 4.5.3.3 by a cost to be determined in a manner agreed upon by the parties and a mutually acceptable fixed or percentage fee. (The Contractor shall keep and present, in such form as the Architect/Engineer or the Owner may prescribe, an itemized accounting together with appropriate supporting data for inclusion in a Change Order.)
- 4.5.4 All proposed costs for Change Order Work must be supported by an itemized accounting of material, equipment, and associated itemized installation costs in sufficient detail to permit analysis by the Architect/Engineer and Owner using current estimating guides and/or prices. Photocopies of Subcontractor and significant vendor proposals supporting the Contractor’s Change Proposal shall be furnished unless specifically waived by the Owner. The Contractor shall provide written response to a Change Proposal Request within ten (10) working days of receipt, unless otherwise specified in the

Supplementary Conditions, if applicable.

- 4.5.5 Unless otherwise provided in the Contract Documents, the “Change Order Base Cost” shall be limited to the following:
 - 4.5.5.1 The total cost of materials and supplies, reflecting all available discounts, itemized by cost and quantity;
 - 4.5.5.2 The total cost of all labor, including the cost of additional supervision, itemized to show man-hours by trade and classification and burdened hourly rates (which include social security tax, unemployment insurance, fringe benefits required by agreement or custom, and workers' compensation insurance)
 - 4.5.5.3 The rental value of equipment and machinery calculated for each type of equipment used in performing the changed Work, based on hours of use. Unless otherwise specified, prices for use of machinery and equipment shall be determined by using 80 percent of the latest schedule of “Equipment Ownership Expense” adopted by Associated General Contractors of America. Mobilization costs will not be allowed except when the Contractor demonstrates that the need to mobilize a piece of equipment arose solely because of the changed Work;
 - 4.5.5.4 All transportation costs for delivery and handling of materials, equipment, and supplies, and the removal of waste or debris;
 - 4.5.5.5 All storage costs in excess of thirty (30) days for materials and supplies, if necessitated solely by the changed Work;
 - 4.5.5.6 Sales taxes are not to be included in charges for materials that are tangible personal property incorporated into the Project or completely consumed at the job site and services required by or integral to the performance of the Construction Contract, as provided in Texas Tax Code Section 151.311.
- 4.5.6 The amounts that the Contractor or a Subcontractor adds to the Change Order Base Cost for overhead and profit will also be considered by the Owner before approval is given. The amounts established hereinafter are the maximums that are acceptable to the Owner without a full and complete justification acceptable to the Owner.
 - 4.5.6.1 To the total of the Change Order Base Cost, the Contractor will be allowed to add a percentage as noted below to cover overhead and profit combined. Overhead shall be considered to include insurance other than mentioned above, office supervisors and assistants, use of small tools, incidental job burdens and general home office expense, and no separate allowance will be made therefor. Allowable percentages for overhead and profit on changes will not exceed 15% on the first \$10,000.00, 10% on the next \$10,000.00 and 7 1/2% on the balance over \$20,000.00.
 - 4.5.6.2 The allowance to the Contractor for profit and overhead for work done by his own forces or by Subcontractors will be a minimum of \$50.00.
 - 4.5.6.3 On changes involving both additions and deletions, percentages for overhead and profit will be allowed only on the net addition.
 - 4.5.6.4 The amount of credit to be allowed by the Contractor to the Owner for any deletion or change which results in a net decrease in the Contract Sum will be the amount of the actual net cost.
- 4.5.7 No payments can be made on such work until the final amount is agreed and the Change Order approved.
- 4.5.8 The execution of a Change Order by the Owner and the Contractor constitutes the full, final and complete settlement of all claims with regard to the modifications contained in the Change Order for foreseeable impacts on the Contract Sum or the Contract Time.
- 4.5.9 Emergency changes to save life or property may be initiated by the Contractor alone with the claimed cost of such Work to be fully documented as to necessity and detail of the reported costs in accordance with subparagraph 4.6.5.

4.5.10 The cumulative total of all Change Orders may not increase the Contract Sum by more than twenty-five percent (25%). The Contract Sum may be decreased by more than eighteen percent (18%) only with the consent of the Contractor.

4.6 Construction Change Directive

4.6.1 A Construction Change Directive, (a “CCD”), is a written order prepared by the Architect/Engineer and signed by the Owner and Architect/Engineer, directing a change in the Work and stating a proposed basis for adjustment, if any, in the Contract Sum or Contract Time, or both. The Owner may by Construction Change Directive, without invalidating the Construction Contract, order changes in the Work within the general scope of the Construction Documents consisting of additions, deletions or other revisions, the Contract Sum, and the Contract Time being adjusted accordingly. All such changes in the Work shall be performed under the applicable conditions of the Contract Documents.

4.6.2 A Construction Change Directive shall be used if one of the following circumstances applies:

4.6.2.1 If the Contractor fails to provide a written Change Proposal within 10 days of receiving a Change Proposal Request or fails or refuses to execute an agreed Change Order within the time required to prevent a delay to the Construction Schedule;

4.6.2.2 If negotiations fail to achieve an agreed price; or

4.6.2.3 If, in the Owner’s judgement based on the Construction Schedule, a failure to authorize the Contractor to proceed with a Change Order under the normal process may adversely affect the timely completion of the Work.

4.6.3 Any unexpected circumstances which necessitates an immediate change in order to prevent damage to the Work in place, to avoid a delay in the Construction Schedule, or to maintain safety shall be expedited by verbal communication and authorization between the Contractor, Architect/Engineer and Owner with written Construction Change Directive following as soon as may be practical. Should consultation with all other interested parties be precluded by events, the Owner may act alone. A limiting not-to-exceed estimate of cost will be requested prior to authorizing Work to proceed. Should a cost estimate be impractical for any reason, the Owner may authorize the use of detailed cost records of such Work to establish and confirm the actual costs for documentation in a formal Change Order.

4.6.4 If the Construction Change Directive provides for an adjustment to the Contract Sum, the basis and method for determining the cost or credit to the Owner shall be in accordance with either 4.5.3 or as described below.

4.6.5. If the Contractor does not respond promptly or disagrees with the method for adjustment of the Contract Sum, the Contractor shall be paid “Actual Field Cost” plus overhead and profit. “Actual Field Cost” is calculated to include the same costs as outlined in 4.5.5, also known as the Change Order Base Cost. Overhead and profit is determined in accordance with subparagraph 4.5.6. The Owner may direct the form in which accounts of Actual Field Cost shall be kept and records of those accounts shall be made available to the Owner. When Contractor’s field office must be maintained solely on account of such extra work; then the cost to maintain and operate the same shall be included in Actual Field Cost.

4.6.6 When Actual Field Cost is used to determine the cost of the Construction Change Directive, the Contractor shall provide the Owner records of Work done for the CCD at the end of each day. Copies of these records will be made upon suitable forms approved for this purpose by the Owner and signed by Contractor. All claims for work performed for the CCD shall be submitted to the Architect/Engineer by the Contractor upon certified statements to which shall be attached certified copies of invoices covering the cost of, and the freight charges on, all materials used in such Work. Such statements shall be filed not later than the tenth day of the month following that in which the work was actually performed. The statements shall separate charges in accordance with subparagraph 4.5.5.

4.6.7 When the estimated cost of work related to the CCD is less than \$500.00, payment of same may be

made on the basis of an invoice submitted to the Architect/Engineer by the Contractor. The invoice shall include the Contractor's actual cost for materials, labor, equipment and incidentals necessary to complete the extra work.

- 4.6.8 When the Owner and Contractor agree on the adjustments to the Contract Sum and Contract Time, such agreement shall be recorded by preparation and execution of an appropriate Change Order in accordance with 4.5.1.

ARTICLE 5 – PERFORMANCE & PAYMENT BONDS AND INSURANCE

- 5.1 Upon acceptance by Owner of Contractor's Contract Sum, Contractor will provide performance and payment bonds on forms prescribed by Owner and in accordance with Contract Documents. The penal sum of the payment and performance bonds will be equal to the Contract Sum.
- 5.2 The Contractor must obtain and maintain insurance policies and provide certificates evidencing such coverage in strict compliance with terms, conditions, and provisions set forth on Attachment D.

ARTICLE 6 – CONTRACT PAYMENTS

6.1 Contract Sum

- 6.1.1 The Contract Sum is defined and described in the Agreement for Construction Services and, including authorized adjustments thereto, is the total amount payable by Owner to the Contractor for the performance of the Work under the Construction Documents.

6.2 Schedule of Values

Before the first Application for Payment, as defined herein, the Contractor shall submit to the Architect/Engineer a schedule of values allocated to the various portions of the Work, prepared in such form and supported by such data to substantiate its accuracy as the Owner or the Architect/Engineer may require. This schedule, unless objected to by the Owner or the Architect/Engineer, shall be used only as a basis for the Contractor's Applications for Payment.

6.3 Applications for Payment.

- 6.3.1 Contractor will submit monthly Applications for Payment by the tenth (10th) day of the month for Work completed in the prior month. The period covered for each Application for Payment will be from the 1st to the last day of the month, inclusive. Contractor's Applications for Payment will be submitted in triplicate on properly completed AIA Forms G702 and G703 or an equivalent form acceptable to Owner and in executable electronic format (MS Excel). The Application will be based on the approved schedule of values for each Bid or Trade Package, the Contractor's Fee, General Conditions, Contractor's Contingency, Allowances, and any Change Orders. All columns on the AIA G702 and G703 Forms will be properly completed and reflect all corrections, if any, from the previous month's Application for Payment. Supporting documentation, to include Subcontractor invoices, purchase orders, approved change orders, timecards with weather day reporting, lien waivers, Contractor's construction schedule, and photos of completed work, will be submitted with each Application for Payment. In each Application for Payment, Contractor will clearly identify and list all adjustments to the approved schedule of values to include without limit, changes in and between Allowances.

- 6.3.2 Payments may be made on account of materials or equipment not incorporated in the Work but delivered and suitably stored at the site. If approved in advance by the Owner, payments may similarly be made for materials or equipment suitably stored at some other location agreed upon in writing. Payments for materials or equipment stored on or off the site shall be conditioned upon submission by the Contractor of bills of sale or such other procedures satisfactory to the Owner to establish the Owner's title to such materials or equipment or otherwise protect the Owner's interest, including applicable insurance and transportation to the site for those materials and equipment stored off the site.

- 6.3.3 The Contractor warrants that title to all Work, materials, and equipment covered by an Application for Payment will pass to the Owner either by incorporation in the construction or upon the receipt of payment by the Contractor, whichever occurs first, free and clear of all liens, claims, security interests, or encumbrances, hereinafter referred to in this Article 9 as "liens"; and that no Work, materials, or equipment covered by an Application for Payment will have been acquired in the Contractor's behalf, or by any other person performing Work at the site or furnishing materials and equipment for the Project. Rather, the purchase shall be in the Owner's behalf.
- 6.3.4 First payment will be made without Lien Waivers. Lien Waivers must accompany all subsequent Applications for Payment from the Contractor, its Subcontractors and their subcontractors, and suppliers for the principal portions of the Work covering one hundred percent (100%) of the amounts paid for the previous calendar months. All Lien Waivers must show the amounts paid and be in a format and include content acceptable to Owner. All Lien Waivers must be originals and signed in order to be valid. Owner may withhold payment of amounts associated with incomplete or incorrect Lien Waivers.
- 6.3.5 Each Schedule of Values submitted with an Application for Payment will include the originally established value for each work classification line item or subcontract and will identify any Owner approved revisions to the costs for each work classification or subcontract. Work classifications/divisions will follow and be based on CSI work divisions. Schedule of Values will not be adjusted without Owner approval, such approval not unreasonably withheld. The format and tracking method of the original schedule of values and of all updates will be subject to approval by the Owner. At all times, the estimated cost of performing the uncompleted and unpaid portion of the Work, including Contractor's Fee, will not exceed the unpaid balance of the Contract Sum less retainage on Work previously completed.
- 6.3.6 No partial payment made by the Owner will constitute, or be construed to constitute, final acceptance or approval of the work to which the partial payment relates or of the documentation provided in support of the partial payment. No partial payment made by the Owner will constitute, or be construed to constitute, a release of Contractor from any of its obligations or liabilities with respect to the Work.
- 6.3.7 Owner will have the right to verify and audit the details of Contractor's billings, certificates, accountings, cost data, and statements, either before or after payment, by (1) inspecting the books and records of Contractor during normal business hours; (2) examining any reports with respect to this Project; (3) interviewing Contractor's employees; (4) visiting the Project site; and (5) any other reasonable action. Contractor's records will be kept on the basis of generally accepted accounting principles (GAAP) in accordance with cost accounting standards issued by the Financial Accounting Standards Board and organized by each Application for Payment period.

6.4 Certificates for Payment

- 6.4.1 The Owner will, within twenty-one (21) days after the receipt of the Contractor's Application for Payment, either approve and process Application for Payment, with a copy to the Contractor, for such amount as the Owner determines is properly due or notify the Contractor in writing his reasons for not approving the Application for Payment as provided in subparagraph 6.6.1.
- 6.4.2 The issuance of an Application for Payment will constitute a representation by the Owner, based on his observations at the site and the data comprising the Application for Payment, that the Work has progressed to the point indicated, that the quality of the Work is in accordance with the Construction Documents, and that the Contractor is entitled to payment in the amount certified. This certification is subject to an evaluation of the Work for conformance with the Construction Documents upon Substantial Completion, to the results of any subsequent tests required by or performed under the Construction Documents, to minor deviations from the Construction Documents correctable prior to completion of the Work, and to any specific qualifications stated in the Application for Payment. However, by issuing an Application for Payment, the Owner shall not thereby be deemed to represent

that he had made continuous on-site inspections to check the quality or quantity of the Work or that he has made any examination to ascertain how or for what purpose the Contractor has used the monies previously paid on account of the Contract Sum.

6.5 Progress Payments

- 6.5.1 After Owner has received the Application for Payment, the Owner shall make payment within thirty (30) days, however if the Owner notified the Contractor in writing of any objections to payment within twenty-one (21) days, only the undisputed portion will be paid. Objections to payment shall be for any incurred breach of the Contract Documents by the Contractor, including, but not limited to, the specific grounds for withholding payment set forth in subparagraph 6.6.1. The Owner shall retain not less than five percent (5%) of each payment until final completion and acceptance of all Work covered by the Construction Contract.
- 6.5.2 The Contractor shall promptly pay each Subcontractor upon receipt of payment from the Owner, out of the amount paid to the Contractor on account of such Subcontractor's Work, the amount of which said Subcontractor is entitled, reflecting the percentage actually retained, from payments to the Contractor on account of such Subcontractor's work. The Contractor shall, by an appropriate agreement with each Subcontractor, require each Subcontractor to make payments to his Sub-subcontractors in similar manner. All payments to Subcontractors and Sub-subcontractors shall be made within ten (10) days of receipt of payment for Work claimed in an Application for Payment that Subcontractor or Sub-subcontractor performed. Such Application for Payments shall designate the dollar amount of Work which Subcontractor or Sub-subcontractor provided to allow for the Owner's tracking of Historically Underutilized Business ("HUB") Program requirements.
- 6.5.3 The Owner may, on request and at his discretion, furnish to any Subcontractor, if practicable, information regarding the percentage of completion or the amounts applied for by the Contractor and the action taken thereon by the Architect/Engineer and the Owner on account of work done by such Subcontractor.
- 6.5.4 Neither the Owner nor the Architect/Engineer shall have any obligations to pay or to see to the payment of any monies to any Subcontractor except as may otherwise be required by law.
- 6.5.5 No approval of Application for Payment, nor any Progress Payment, nor any partial or entire use or occupancy of the Project by the Owner, shall constitute an acceptance of any Work not in accordance with the Contract Documents.
- 6.5.6 Payments will be made by check or electronic transfer of funds by Owner upon satisfactory delivery and acceptance of the goods or services required under this Contract. Electronic applications for payment and invoices in accordance with the Contract Documents, shall be sent to: Finance@centralhealth.net with copy to Central Health's Project Manager
- 6.5.7 Taxpayer ID Number Required. Before Owner can process an Application for Payment, the Contractor must provide Owner with an Internal Revenue Form W-9, Request for Taxpayer Identification Number and Certification that is completed in compliance with the Internal Revenue Code, its rule and regulations.

6.6 Payments Withheld

- 6.6.1 The Owner may decline to approve the Application for Payment in whole or in part, to the extent reasonably necessary, if in his opinion he is unable to confirm, based on his observations at the site and the data compromising the Application for Payment, that the Work has progressed to the point indicated, that the quality of the Work is in accordance with the Contract Documents and the Contractor is entitled to payment in the amount approved. In such situations, Owner will notify the

Contractor as provided in subparagraph 6.4.1. If the Contractor and the Owner cannot agree on a revised amount, the Owner will promptly revise and approve the Application for Payment for the amount for which he is able to confirm. The Owner may also decline to approve payment or, because of subsequently discovered evidence or subsequent observations, he may nullify the whole or any part of any Application for Payment previously issued, to such extent as may be necessary in his opinion to protect the Owner from loss because of:

- 6.6.1.1 defective Work not remedied;
 - 6.6.1.2 third party claims filed or reasonable evidence indicating probable filing of such claims;
 - 6.6.1.3 failure of the Contractor to make payments properly to Subcontractors or for labor, materials, or equipment;
 - 6.6.1.4 reasonable evidence that the Work cannot be completed for the unpaid balance of the Contract Sum;
 - 6.6.1.5 damage to the Owner or another contractor;
 - 6.6.1.6 reasonable evidence that the Work will not be completed within the Contract Time;
 - 6.6.1.7 failure to carry out the Work in accordance with the Construction Documents; or
 - 6.6.1.8 Contractor's failure to correct any serious violation of OSHA standards or non-compliance with Construction Documents related to Protection of Persons and Property.
- 6.6.2 When the above grounds in subparagraph 6.6.1 are removed, payment shall be made for amounts withheld because of them.
- 6.6.3 Owner will have the right to withhold from payments due Contractor such sums as are necessary to protect Owner against any loss or damage which may result from negligence by Contractor or any Subcontractor or failure of Contractor or any Subcontractor to perform their obligations under this Agreement.
- 6.6.4 Notwithstanding any other contractual provision to the contrary, Owner may reduce the Contractor's payment application amount as necessary to protect the Owner's interest under any of the following circumstances:
- 6.6.4.1 Contractor persistently fails to perform the Work in accordance with the Contract Documents, including the Schedule Requirements attached thereto, or is otherwise in material breach or default under this Agreement;
 - 6.6.4.2 The payment request has insufficient documentation to support the amount of payment requested for Project costs; provided, however, Owner will pay for allowable Project costs for which there is sufficient documentation;
 - 6.6.4.3 Contractor is in violation of the Prevailing Wage requirements or has failed to make payments promptly to Subcontractors or other third parties used in connection with any services or materials for which Owner has made payment to Contractor;
 - 6.6.4.4 Contractor is insolvent, makes a general assignment for the benefit of its creditors or otherwise seeks protection under the laws and regulations of the bankruptcy courts; or
 - 6.6.4.5 Contractor fails to obtain, maintain or renew insurance coverage as required by the Agreement.

6.7 Failure of Payment

- 6.7.1 If the Owner does not approve an Application for Payment, through no fault of the Contractor, within twenty-one (21) days after receipt of the Contractor's Application for Payment, or if the Owner does not pay the Contractor within thirty (30) days of receipt of the Application for Payment,

then the Contractor may, upon ten (10) additional days' written notice to the Owner, commencing upon Owner's receipt of such notice, stop the Work until payment of the amount owing has been received. The Contract Sum shall be increased by the amount of the Contractor's reasonable costs of shut-down, delay, and start-up, which shall all be affected by appropriate Change Order.

6.8 Final Payment

- 6.8.1 The Contractor's Request for Final Payment will not be made until all Work is completed and all requirements of the Construction Documents are satisfied including, without limitation: delivery to Owner of a complete release of all liens and claims arising out of the Work; written consent of surety to release of final payment; delivery of complete As-Built drawings, delivery of all manufacturer and product warranties; delivery to the Owner of a written and executed waiver of claims against the Owner as described in Section 6.8.4 below; and an affidavit that, to the best of the Contractor's information, knowledge and belief, all known debts and claims arising from the Project have been satisfied.
- 6.8.2 Owner will have no obligation to make Final Payment until the Punch List has been completed in its entirety.
- 6.8.3 Nothing contained herein will require Owner to pay the Contractor an aggregate amount for the Work that exceeds the Contract Sum or to make any payment if, the Owner believes, the cost to complete the Work would exceed the Contract Sum less previous payments to Contractor.
- 6.8.4 Acceptance by the Contractor or the Contractor's successors of Final Payment will constitute a full and complete release of Owner from any and all claims, demands, and causes of action whatsoever that Contractor, its Subcontractors, suppliers and consultants or any of their successors or assigns have or may have against Owner arising from the Project or any provision(s) of this Agreement except for those previously made in writing and identified by Contractor as unsettled at the time of the Request for Final Payment.

ARTICLE 7 – GENERAL PROVISIONS

- 7.1 Definitions. The terms, words and phrases used in the Contract Documents will have the meanings given in the General Conditions and as follows:
 - 7.1.1 **Architect/Engineer** means the professional architect and/or engineer employed by the Owner as architect or engineer of record for the Project and its consultants.
 - 7.1.2 **Construction Documents** means, collectively, the Drawings, Specifications, details, Change Orders and other documents prepared by the Architect/Engineer, its consultants and by the Owner's other consultants that describe the scope and quality of the Project and the materials, supplies, equipment, systems and other elements that are required for construction of the Project that are accepted by the Owner, and the General and Supplemental Conditions of the Contract, if any.
 - 7.1.3 **Contract Sum** means the total amount of all compensation payable to the Contractor for the Project subject to adjustment for Additional Services or Change Orders. Any costs that exceed the Contract Sum will be borne solely by Contractor without reimbursement by Owner.
 - 7.1.4 **General Conditions Cost** means costs incurred by the Contractor without the need for competitive bids/proposals. The allowable General Conditions Cost items are further described and limited as part of Attachment C.
 - 7.1.5 **Owner** means the Owner of the Project and will be referred to as if singular in number and masculine in gender. The term Owner means Central Health, or its designated and authorized representative (Project Manager).

- 7.1.6 **Project** means the entire construction job, of which the Work performed under the Contract Documents may be the whole or a part.
- 7.1.7 **Project Team** means the Owner, Contractor, Architect/Engineer and its consultants, any separate contractors employed by Owner, and other consultants employed for the purpose of programming, design, and construction of the Project. The members of the Project Team will be designated by Owner and may be modified from time to time by Owner.
- 7.1.8 **Subcontractor** means a person or entity who has an agreement with the Contractor to perform any portion of the Work. The term Subcontractor does not include the Architect/Engineer, or any person or entity hired directly by the Owner.
- 7.1.9 **Work** means the provision of all services, labor, materials, supplies, and equipment that are required of the Contractor to complete the Project in strict accordance with the requirements of the Contract and the Contract Documents. Work includes, but is not limited to, the Construction, additional work required by Change Orders, and any other work reasonably inferable from the Contract Documents. The term “reasonably inferable” takes into consideration the understanding of the parties that some details necessary for completion of the Work may not be shown on the Drawings or included in the Specifications, but they are a requirement of the Work if they are a usual and customary component of the Work or otherwise necessary for complete installation and operation of the Work.
- 7.1.10 **Worker Wage Rate** means the actual hourly wage of non-salaried persons performing work on the Project plus allowable employer contributions as established on the Worker Wage Rate Form required by the Construction Documents. Any payments made for Contractor’s and/or subcontractors’ personnel are subject to audit to determine the actual cost of the wages and allowable employer contributions incurred by the Contractor for services performed for the Project.

ARTICLE 8 - OWNER’S RESPONSIBILITIES

- 8.1 Owner will designate an Architect/Engineer or other consultant for the Project.
- 8.2 Owner will identify a person who is authorized to act on Owner's behalf with respect to the Project. This person is referred to herein as the “Project Manager”. The Owner's Project Manager will examine the documents submitted by the Contractor and will render decisions on behalf of Owner. The Project Manager will administer this Agreement on behalf of Owner, including final determination of fees and costs earned by the Contractor and equitable back charges against the Contractor.
- 8.3 Owner, at Owner’s cost, will secure the services of surveyors, geotechnical engineers, existing facility surveys, testing and balancing, environmental surveys and/or other special consultants to develop such additional information as may be necessary for the design or construction of the Project.
- 8.4 **The Contractor's attention is directed to the fact that piping, pipelines, conduit, duct banks and other underground and under-slab utilities and/or installations as may be shown on the plans have been taken from the best available information. Owner makes no representations that information provided on underground and under-slab installations is complete or accurate. There may be other subsurface and under-slab pipelines, conduit, devices or installations. The Contractor will save and hold harmless Owner from any and all suits or claims resulting from damage by his operations to any pipeline, electric or communications conduits or similar underground installation.**
- 8.5 Unless otherwise provided in the Contract Documents, Owner will secure and pay for necessary rights of way and easements required for the construction, use, or occupancy of permanent structures or for permanent changes in existing facilities.
- 8.6 Owner will arrange and pay for materials, structural, mechanical, chemical and other laboratory tests as required by the Construction Documents.

- 8.7 Owner will furnish all legal, accounting, auditing and insurance counseling services for itself as may be necessary for the Project.
- 8.8 Owner or its Architect/Engineer will furnish required information and services and will render approvals and decisions as expeditiously as is consistent with reasonable skill and care and the orderly progress of the Contractor's services and of the Work. Contractor will advise Owner of key or critical information in a timely manner in order to avoid Project delay. Owner will not be held accountable to Contractor for any delay if the Contractor failed to provide sufficient notice to Owner of key or critical information needed for approval.
- 8.9 Owner may designate one or more construction inspectors who will be given access to the Work as requested or needed. The provision of inspection services by Owner will not reduce or lessen Contractor's responsibility for quality assurance and inspection of the Work. Contractor is fully and solely responsible for constructing the Project in strict accordance with the Construction Documents.
- 8.10 Owner will have the right to reject any defective Work on the Project. Should the Contractor refuse or neglect to correct any such Work within a reasonable time after notice, Owner may have the Work corrected and recover all expenses incurred from the Contractor on demand.
- 8.11 Owner will forward all instructions to the Contractor in writing. Any verbal directions given by Owner will be confirmed in writing. No communication or direction from Owner will be interpreted as a change to the Agreement unless provided in writing and processed as a Change Order.
- 8.12 Owner will not be responsible for and will not have control or charge of construction means, methods, techniques, sequences or procedures, or for safety precautions and programs in connection with the Work. Owner will not be responsible for or have control or charge over the acts or omissions of the Contractor, Subcontractors, or any of their agents or employees, or any other person performing any of the Work. Owner will not be responsible for failure of any of the aforementioned persons to carry out the Construction Work in accordance with the Contract Documents.
- 8.13 Owner will observe the Work to evaluate the Contractor's Applications for Payment.
- 8.14 Owner's Right to Stop the Work.
- 8.14.1 If the Contractor fails to correct defective Work or persistently fails to carry out the Work in accordance with the Construction Contract, the Owner may, in writing, order the Contractor to stop the Work, or any portion thereof, until the cause for such order has been eliminated. However, this right of Owner to stop the Work will not give rise to any duty on the part of Owner to exercise this right for the benefit of the Contractor or any other person or entity.
- 8.15 Owner's Right to Carry out the Work.
- 8.15.1 If the Contractor defaults or neglects to carry out the Work in accordance with the Construction Contract and fails within seven (7) days after receipt of written notice from Owner to commence and continue correction of such default or neglect with diligence and promptness, Owner may, after seven (7) days following receipt by the Contractor of any additional written notice and without prejudice to any other remedy he may have, commence and correct such deficiencies. In such case, an appropriate Change Order will be issued deducting from the payments then or thereafter due the Contractor the cost of correcting such deficiencies. If the payments then or thereafter due the Contractor are not sufficient to cover such amount, the Contractor will pay the difference to the Owner within thirty (30) days after receipt of written demand therefor.
- 8.16 Owner or Architect/Engineer will prepare Change Orders.
- 8.17 Owner will approve and monitor the Schedule.

8.18 THE OWNER'S RIGHT TO PERFORM WORK AND TO AWARD SEPARATE CONTRACTS

- 8.18.1 The Owner reserves the right to perform work related to the Project with his own forces, and award separate contracts in connection with other portions of the Project.
- 8.18.2 When separate contracts are awarded for different portions of the Project or other work on the site, the term "contractor" in the Construction Contract in each case shall mean the contractor who executes such separate agreements with the Owner for Construction Services.
- 8.18.3 The Contractor shall coordinate the Work with other contractors and with the Owner and the Owner's labor crews, if any. The Contractor must incorporate the work of the Owner and its separate contractors into the Contractor's project schedule. If information is not included in the Construction Documents, the Owner or Architect/Engineer will timely provide the Contractor with sufficient information to allow the Contractor to incorporate work by the Owner and its separate contractors into the schedule.
- 8.18.4 The Contractor shall afford the Owner and its other contractors reasonable opportunity for the introduction and storage of their materials and equipment and the execution of their work, and shall connect and coordinate his Work with theirs as required by the Construction Contract.
- 8.18.5 If any part of the Work depends for proper execution or results upon the work of the Owner or any other contractor, the Contractor shall, prior to proceeding with the Work, promptly report to the Owner and Architect/Engineer any apparent discrepancies or defects in such other work that render it unsuitable for such proper execution and results. Failure of the Contractor so to report shall constitute an acceptance of the Owner's or separate contractors' work as fit and proper to receive his Work.
- 8.18.6 Contractor may share responsibility for defective work not reported, yet known by Contractor to be deficient.
- 8.18.7 Should the Contractor wrongfully cause damage to the Work or property of the Owner, or to other work on the site, the Contractor shall promptly remedy such damage.
- 8.18.8 Should the Contractor wrongfully cause damage to the Work or property of any other contractor, the Contractor shall upon due notice promptly attempt to settle with such other contractor by agreement, or otherwise to resolve the dispute. If such separate contractor sues or initiates a proceeding against the Owner on account of any damage alleged to have been caused by the Contractor, the Owner shall notify the Contractor who shall defend such proceedings at the Contractor's expense. If any judgment or award against the Owner arises therefrom the Contractor shall pay or satisfy it and shall reimburse the Owner for all attorneys' fees and court or other costs which the Owner has incurred. The Owner shall have the right to select counsel for any such defense.

ARTICLE 9 – ARCHITECT/ENGINEER'S RESPONSIBILITIES

- 9.1 Architect/Engineer will coordinate and cooperate with Owner and Contractor to best support the progress of the Work. Architect/Engineer's authority to act on behalf of Owner is limited to that defined herein. Unless defined in its Construction Documents, Architect/Engineer will have no responsibility for construction means and methods, sequencing, logistics, phasing, procedures, safety precautions, or other attributes of the physical performance of the Work.
- 9.2 Architect/Engineer will provide administration of the Contract between Owner and the Contractor as provided herein and per the General and Supplemental Terms and Conditions, if any, of the Contract. Owner will provide Architect/Engineer with a copy of the executed contract between Owner and the Contractor, including the GCs and Supplemental Conditions of the Contract.
- 9.3 Architect/Engineer and, as appropriate to the progress of the Work, its subconsultants will attend progress meetings and make weekly site visits after the start of construction to generally determine if the Work is proceeding in accordance with the Contract Documents. Architect/Engineer will not make exhaustive or continuous on-site inspections to check the quality or quantity of the Work.
- 9.4 The purpose for Architect/Engineer's attendance at progress meetings is threefold: (i) to aid in the coordination, cooperation, and understanding of Project requirements and the resolution of conflicts as

described by the Contract Documents; (ii) to report to Owner identified or known deviations from the Contract Documents and from the most recent construction schedule submitted by the Contractor; and (iii) to observe and comment on the quality of subcontractors' work at the outset of its installation.

- 9.5 As part of its attendance at progress meetings, Architect/Engineer will participate with Owner in "1st Work" observations to observe the quality and compliance of subcontractors' work at outset of its installation. The purpose and intent is to establish an acceptable installation quality for each component of the Work at the start of such work rather than to find defective work and require its correction later.
- 9.6 Architect/Engineer will recommend rejection of Work that does not conform with Contract Documents and which cannot readily be corrected.
- 9.7 Architect/Engineer will respond to all Requests for Information (RFI) within four (4) days unless otherwise agreed in advance. This four (4) maximum duration includes reviews, collected and coordinated between all reviewing (engineering) disciplines. Architect/Engineer will endeavor to provide immediate or expedited reviews as needed and prioritized.
- 9.8 Submittals.
- 9.8.1 Architect/Engineer will review submittals in accordance with and to support Schedule. Submittals include without limitation, product data and information, shop drawings, samples, etc. In general, each submittal will be reviewed and returned to the Contractor within fourteen (14) days unless otherwise agreed in advance. This fourteen (14) day duration includes reviews, collected and coordinated between all reviewing disciplines. Reviews will be performed on incomplete submittals as needed to support construction progress. The Contractor will be required to prepare a Submittal Schedule as general guidance and to assist Architect/Engineer's planning.
- 9.8.2 Architect/Engineer will only review a particular shop drawing, product data, and samples two (2) times. Owner can recover from Contractor any costs that Architect/Engineer may have incurred for necessary additional review and Owner will withhold that amount from any payment due the Contractor pending the resolution of the matter. However, if Owner determines that Architect/Engineer's approvals have been withheld unfairly, the provisions of this sub-subparagraph will not apply.
- 9.9 Architect/Engineer will provide necessary clarifications of the Construction Documents either from its office or at the site. Services of Architect/Engineer and/or its consultants or subconsultants will be provided depending on the nature of the specific problem needing clarification.
- 9.10 Architect/Engineer will provide all interpretations of Construction Documents and details of incidental services necessary to the proper execution of the Work, including the selection of colors, textures, and finishes.
- 9.11 Architect/Engineer will participate in and aid resolution of systems conflicts and Work coordination. Such services will be provided in a timely manner to facilitate Work progress.
- 9.12 Extra work caused Architect/Engineer and its consulting engineers or subconsultants, as applicable, by the necessity for multiple repeated visits to the job site to study, direct, and observe the correction of improper Work will be paid for by the Contractor. Central Health may recover any costs from Contractor that Architect/Engineer may have otherwise pursued against Central Health for additional services described in this Subparagraph and Central Health will withhold that amount from any payment due the Contractor pending the resolution of the matter.
- 9.13 Architect/Engineer's Review of Contract Payments.
- 9.13.1 Architect/Engineer will participate and cooperate with Owner and Contractor in joint reviews of Contractor's Application of Payments. Based on Architect/Engineer's observations and evaluations

of the Contractor's Work, Architect/Engineer will review, on a monthly basis, Contractor's Applications for Payment and will certify amounts due to the Contractor. Architect/Engineer will act to protect Owner, but will act in good faith. Any corrections to the Contractor's Application for Payment will be sent to the Contractor's Project Manager and Owner's Project Manager by Architect/Engineer.

9.14 Architect/Engineer's Review of Contractor's Changes in the Work.

9.14.1 Architect/Engineer may only authorize minor changes in the Work. A minor change is a change that does not increase the cost of the Work or the time required for Contractor's performance. Minor changes will generally conform to Contract Documents.

9.14.2 Architect/Engineer will assist Owner in reviewing Contractor's proposed changes. Architect/Engineer will advise Owner on the proposed changes' impact to labor effort, materials cost, and the approved time for completion. Architect/Engineer's review will be timely, but in no event, later than ten (10) days after receipt of a request for change.

9.15 Construction Completion.

9.15.1 Upon Contractor's request for a substantial completion inspection of the Work or a portion of the Work, Architect/Engineer will make joint field observations and reviews of construction with Owner and Contractor to determine whether Contractor has completed Work in accordance with interim milestone dates or durations as defined in the Contract, if any.

9.15.2 Architect/Engineer will make a joint final field observation of construction with Owner and Contractor.

9.15.3 Architect/Engineer will prepare punch lists identifying deficiencies in the Work. Architect/Engineer will prepare one punch list for each area that is substantially complete and will perform one follow up inspection of each punch list area to confirm that identified deficiencies (from initial punch list for each area) are corrected. Architect/Engineer will also participate with Owner and Contractor in pre-punch list inspections of each type of space to establish and define minimum Work levels to be completed prior to Architect/Engineer's punch list inspections. Owner can recover from Contractor any costs that Architect/Engineer may have incurred for additional services described in this subparagraph, and Owner will withhold that amount from any payment due the Contractor pending the resolution of the matter. However, if Owner determines that Architect/Engineer's approvals have been withheld unfairly, the provisions of this sub-subparagraph will not apply.

ARTICLE 10 - CONTRACTOR'S RESPONSIBILITIES

10.1 The Contractor acknowledges that it is experienced in constructing projects substantially similar to the Project.

10.2 Except as otherwise required in the Contract Documents, Architectural and Engineering services are not included in this Contract.

10.3 Threshold inspections are not included in this Contract. However, Contractor will schedule and coordinate performance of threshold inspections, if any.

10.4 Contractor will perform the Work in strict accordance with all applicable laws, codes, rules, regulations, and any other requirements of authorities having jurisdiction over the Project in effect when the Contract is established, including any applicable rules, regulations, guidelines, and advisories promulgated by the City, County, and/or State as applicable.

10.5 Contractor expressly acknowledges that the Work called for under this Agreement and the Contract Documents may be in a geographical area prone to abnormal weather, high or excessive heat, tropical storms, and hurricanes

("Severe Weather"). Contractor recognizes that effects from Severe Weather may: (a) cause extended delays on the part of Subcontractors performing work on the Project; (b) result in labor and material shortages; (c) result in contract defaults on the part of Subcontractors; (d) result in Subcontractors not being able to honor previous prices and time commitments; (e) cause the cost of labor and materials to rise to an unknown extent, and; (f) result in other extended time and cost impacts to the Project. The Owner recognizes that the Project may necessarily be shut down for a reasonable period of time preceding, during, and following Severe Weather occurring on or near the Project. Contractor may be entitled to an increase in the Contract Sum and/or an extension of time, due to delay incurred by Contractor, occasioned by the effects of such Severe Weather. If the Project is shut down by Owner or governing authority with jurisdiction over the Project due to Severe Weather, the Contractor may be entitled to recover its reasonable, direct, documented, and tangible costs resulting from such shutdown. Contractor acknowledges that any such weather conditions will not be considered "unforeseen" conditions for the purposes of this Agreement. Contractor will comply with any hurricane policies or procedures promulgated by Owner or local or state regulatory authorities. Owner acknowledges that such policies and procedures may impact the progress of the Work.

10.6 Review of Contract Documents.

10.6.1 The Contractor will exercise due diligence in carefully studying the Contract Documents and will report to Owner, in a timely manner, any error, inconsistency, or omission he may discover. The report will be in the form of a RFI. For purposes of this paragraph, the RFI will be considered "timely" if it is provided as soon as practicable but in no event later than seven (7) days after the Contractor's discovery of the error, inconsistency or omission. Should the Contractor fail to timely report such errors, inconsistencies, or omissions in the Contract Documents and such delay results in additional costs to the Owner and/or in schedule delays, the Contractor will not be entitled to a Contract Time extension or an increase in the Contract Sum for additional Work, incidental damages, or Project delays unless the Contractor demonstrates to Owner's satisfaction that such additional costs and/or Project delays would have resulted even if the RFI had been timely issued. The Contractor will perform no portion of the Work at any time without the necessary part of the Contract Documents or, where required, approved shop drawings, product data, or samples for such portion of the Work.

10.6.2 If the Contractor observes that any of the Contract Documents are at variance with applicable laws, statutes, building codes, or regulations in any respect, he will promptly notify Owner in writing. Any necessary changes will be accomplished by appropriate Change Order.

10.7 Without limit, the Contractor will:

10.7.1 Monitor, direct, and coordinate the Work of the Subcontractors with the activities and responsibilities of the Owner, its consultants, the Architect/Engineer and Contractor to complete the Project in accordance with the Contract Documents.

10.7.2 Monitor and assess the adequacy of the Subcontractors' personnel and equipment, as well as the availability of materials and supplies to meet the schedule. Take appropriate action to ensure that Subcontractors supply sufficient manpower, material, and equipment to meet schedule and Contract requirements. Develop and maintain a project log that records, on a daily basis, the number and types of personnel and equipment on the project site for all Subcontracts. Provide Project Manager with copies of all daily project logs with summaries of such logs in monthly reports to Project Manager.

10.7.3 Promptly advise Owner if any Subcontractor is in material breach of its Contract or appears unable to perform its scope of work.

10.8 Supervision and Construction Procedures.

10.8.1 The Contractor will designate a representative authorized to act on the Contractor's behalf with respect to the Project. The designated representative will be Owner's primary contact during Construction and will be available as required for the benefit of the Project and Owner. The designated

representative will be authorized to act on behalf of and bind the Contractor in all matters related to Construction including, but not limited to, execution of Change Orders and Applications for Payment.

- 10.8.2 The Contractor will supervise and direct the Work, using his best skill and attention. He will be solely responsible for all construction means, methods, techniques, sequences and procedures, and for coordinating all portions of the Work.
- 10.8.3 The Contractor will be responsible to Owner for the acts and omissions of his employees, Subcontractors, and their agents and employees, and for other persons performing any of the Work under a contract with the Contractor.
- 10.8.4 The Contractor will not be relieved from his obligations to perform the Work either by the activities or duties of Owner or Architect/Engineer in his administration of the Contract, or by inspections, tests, or approvals required in accordance with Contract Documents by persons other than the Contractor.
- 10.8.5 In the execution of the Contract, the Contractor must comply with all applicable state and federal laws, including but not limited to laws concerned with labor, equal employment opportunity, safety and minimum wages. THE CONTRACTOR WILL MAKE HIMSELF FAMILIAR WITH AND AT ALL TIMES WILL OBSERVE AND COMPLY WITH ALL FEDERAL, STATE AND LOCAL LAWS, ORDINANCES AND REGULATIONS THAT IN ANY MANNER AFFECT THE CONDUCT OF THE WORK, AND WILL INDEMNIFY, SAVE AND HOLD HARMLESS OWNER AND ITS OFFICIAL REPRESENTATIVES AGAINST ANY CLAIM TO THE EXTENT ARISING FROM VIOLATION OF ANY SUCH LAW, ORDINANCE, OR REGULATION BY HIMSELF OR BY HIS SUBCONTRACTORS, SUPPLIERS, CONSULTANTS, OR EMPLOYEES.
- 10.8.6 The Contractor will perform all services specifically allocated to it by the Contract Documents as well as those services reasonably inferable from the Construction Documents as necessary for completion of the Work and the Project. Contractor agrees to perform these services using his best efforts, skills, judgments, and abilities.
- 10.8.7 The Contractor will organize and maintain a qualified and skilled staff as necessary for the duration of the construction Work at the Project site with clearly defined lines of authority and communication as necessary to coordinate and direct the Work, monitor the progress of the Subcontractors, and enforce and ensure quality standards in the Work...
- 10.8.8 The Contractor will cooperate with the Owner and its Architect/Engineer and will endeavor to further and protect the goals and interests of the Owner and the Project. The Contractor will complete the Project in an expeditious and economical manner consistent with the interests of Owner and in accordance with the Schedule.
- 10.8.9 The Contractor will establish procedures for communication and coordination among the Project Team, Subcontractors, separate contractors, and others with respect to all aspects of the construction of the Project, and implement such procedures.
- 10.8.10 The Contractor will establish and maintain a numbering and tracking system for all Project records, including changes, RFIs, submittals, and supplementary instructions and will provide updated records at each Owner's meeting and when requested.

10.9 Schedule

- 10.9.1 The Contractor will develop a critical path method schedule ("**Schedule**") for Project Team review and Owner approval that coordinates and integrates activities on the Project, including the Contractor's services, the Architect/Engineer's administrative and observation services, the work of other consultants and suppliers, and Owner's activities with the anticipated construction schedules for other

contractors. The Schedule must identify all major milestones through Project Final Completion. The Schedule will be created and maintained in format acceptable to Owner. Once approved by Owner, the Schedule will become the "Project Baseline Schedule." The Schedule will be provided to Owner in both electronic and hardcopy formats.

- 10.9.2 The Schedule will include other detailed schedule activities as needed for the Project or directed by Owner including, without limit, Owner-managed work under separate contracts such as long lead procurement activities and durations, furniture, fixtures and equipment, project security, property protection, life-safety systems integration with building automation and monitoring systems, telephone, information technology data-transmission systems, and computer technology systems, and other systems identified by Owner or required for the Project.
- 10.9.3 The Contractor will update the Schedule throughout the Project and in accordance with Contract Documents. Bi-weekly updates are required to track ongoing activities and to provide a "look-ahead" for subsequent Work and activities. Monthly updates will track overall Project progress. More frequent updates to track overall Project progress or specific work will be provided at Owner direction.
- 10.9.4 All schedule updates will be tracked against the approved Project Baseline Schedule. The Project Baseline Schedule will not be adjusted without Owner approval. Schedule format will clearly identify and show Project Baseline Schedule activities, milestones, durations and similar information, and progress and status compared to the Baseline.
- 10.10 Construct the Work in strict accordance with the Contract Documents within the time required by Owner approved Project Baseline Schedule.
- 10.11 Attend Owner's regularly scheduled Project progress meetings and fully advise the Project Team of the Project status including schedule, costs, quality, and changes. Prepare and issue to Owner and Architect/Engineer meeting minutes for each Project progress meeting, and other significant meetings. Issue meeting minutes within three (3) days of the meeting.
- 10.12 In addition to attending Owner's regularly scheduled Project progress meetings, the Contractor will schedule, direct, and attend interim progress meetings with other members of the Project Team as required to maintain Project progress. The Contractor will record and distribute the minutes of each interim progress meeting to each Project Team member. The minutes will identify critical activities that require action and the dates by which each activity must be completed.
- 10.13 Coordinate and accept, as required, delivery and installation of Owner-procured material and equipment.
- 10.14 Provide and pay for all labor, materials, equipment, tools, construction equipment and machinery, transportation, and all other facilities and services necessary for the proper execution and completion of the Work in strict accordance with the requirements of the Contract Documents.
- 10.15 Obtain building permits and special permits for permanent improvements as required by law or the Construction Documents. Assist Owner and Architect/Engineer in obtaining all approvals required from authorities having jurisdiction over the Project.
- 10.16 The Contractor represents and warrants to the Owner and the Architect/Engineer that all materials and equipment furnished and installed under this Contract will be new unless otherwise specified, and that the Work will be of good quality, free from faults and defects, and in strict conformance with the Construction Documents. Any portion of the Work not conforming to these requirements, including substitutions not properly approved and authorized, may be considered defective. If required by the Owner, the Contractor shall furnish satisfactory evidence as to the kind and quality of materials and equipment. The Contractor further represents and warrants to the Owner that all items delivered, and all services rendered will conform to the Construction Documents, and will be of merchantable quality, good workmanship, and free from defects. The Contractor further agrees to provide copies of applicable warranties and guaranties, including separate manufacturer or supplier warranties or guaranties to the Owner. Copies will be provided within ten (10) days

after the Certificate of Substantial Completion is issued. Limitations or conditions in manufacturer, vendor, or subcontractor warranties do not limit or condition Contractor's warranty to Owner. Return of merchandise under warranty shall be at the Contractor's expense.

10.17 Maintain and deliver the required documents that describe changes or deviations from the Construction Documents that occurred during construction and that reflect the actual "As Built" conditions of the completed Work.

10.18 Cost Control. The Contractor will without limit:

10.18.1 Maintain cost accounting records on authorized Work performed under unit costs, actual costs for labor and materials, or other basis requiring accounting records. Provide Owner access to these records and preserve them for a period of three (3) years after final payment, or as may be required by Owner due to continuing audit or discrepancies, litigation or similar issue, or as required by bonding or other agencies.

10.18.2 The Contractor is required to pay not less than the wage scale of the various classes of labor as shown on the "Prevailing Wage Schedule" provided by the Owner. The specified wage rates are minimum rates only, and the Contractor is encouraged to pay all laborers, workmen, and mechanics employed on this job no less than the living wage as established by Travis County at the time of contract award, even if the living wage exceeds the wages set forth in the minimum wage scale. However, the Owner will not consider any claims for additional compensation made by the Contractor because of payment by the Contractor of any wage rates in excess of the applicable minimum rate contained in the Prevailing Wage Schedule.

10.18.3 Pursuant to the provisions of Chapter 2258 of the Texas Government Code Texas Civil Statutes, the Owner shall, subject to a final resolution of the matter, withhold an amount necessary to compensate the workers at the statutory wage rate and a penalty of sixty dollars (\$60.00) for each laborer, workman or mechanic employed, for each calendar day, or portion thereof, if such laborer, workman or mechanic is paid less than the said stipulated minimum rates for any work done under the Construction Contract, by him, or by any subcontractor under him. The Contractor and each Subcontractor shall keep, or cause to be kept, an accurate record showing the names and occupations of all laborers, workmen and mechanics paid less than the said stipulated minimum rates for any work done under the Construction Contract, by him, or by any subcontractor under him. The Contractor and each Subcontractor shall keep, or cause to be kept, accurate records showing the names and occupations of all laborers, workmen and mechanics employed in connection with the Work, and showing also the actual per diem wages paid to such workers, which record shall be open at all reasonable hours for the inspection by the Owner.

10.18.4 Certain public works require under the minimum wage schedule to list not only "Building Construction" wage rates but also "Incidental Paving and Utilities" wage rates. The Contractor's attention is called to the fact that all classes of work within the area of the building shall be paid "Building Construction" wage rates. A set of the applicable labor rates for public works projects is set forth in the Bidding Documents.

10.19 Quality Control. The Contractor will develop and implement a Quality Control Program for the purpose of preventing, tracking, and correcting deficiencies in the Work.

10.19.1 Contractor will require each Subcontractor to demonstrate initial work methodology, sequence, and quality as requested by Owner, Architect/Engineer, or as required by Contract Documents. Rejected work will immediately be removed or re-worked and re-constructed until accepted by Owner and the Architect/Engineer. Approved initial work may be included in the final work.

10.19.2 The Contractor will inspect the Work of Subcontractors and material suppliers to guard Owner against defects and deficiencies in the Work. The Contractor will check and report on all materials, equipment, systems, and related items to be incorporated in the Work, including, but not limited to, compliance with Construction Documents and verification of specific conformance to approved coordination drawings, certifications, shop drawings, submittals, mock-ups and similar items. Subcontractors and

material vendors will immediately be notified of identified deficiencies. All deficiencies will be added to and tracked in a quality deficiencies report and included in monthly reports to Owner. Deficiency reports will also be available for review and discussion in Progress Meetings. Inspections will be performed on- or off-site as required. Inspections will be handled as a General Conditions Cost item and the cost will be included in the Guaranteed Maximum Price. The Contractor will arrange for and coordinate inspection of the Work and materials by independent testing agencies in accordance with Contract Documents.

10.19.3 Contractor will promptly correct any defective Work at Contractor's sole expense, unless the Owner specifically agrees to accept the Work. Contractor will define corrective actions to be taken and provide schedules for related work. Corrective work will not be delayed unless Contractor receives Owner's approval to delay.

10.20 Reports and Project Site Documents. The Contractor will:

10.20.1 Record the progress of the Project and submit monthly, written progress reports to Owner and the Architect/Engineer including information on the Subcontractors' Work, the percentages of completion, and any other significant items and problems.

10.20.2 Keep a daily log of the progress of the Work, significant problems and accomplishments, etc. All daily reports will be available to Owner and the Architect/Engineer. The cost of all Project reporting will be a General Conditions Cost and included in the Contract Sum.

10.20.3 Take photographs to document existing site conditions, including those immediately adjacent to the Project site prior to the start of Work, and deliver a copy of such photographs to Owner. The Contractor will, at monthly intervals, take progress photographs. Progress photographs will be sufficient to encompass the entire Project site and provide visual detail of ongoing work. To the greatest extent possible, the photographs will be taken from the same vantage points as the previous month, subject to the varying opportunities and limitations of the site. Aerial photographs are not required. Digital photographs are acceptable, with electronic media containing photographs provided monthly to Owner and Architect.

10.20.4 Maintain at the Project Site records of all contracts, and a clean, dry, current, corrected, and bound set of Contract drawings. Also maintain bound specifications, shop drawings, submittals, certifications, operating manuals, warranties, and any other documents and revisions thereto that arise out of this Contract or the Work as further defined in the Contract Documents. Regularly post, correct, annotate, and update these documents to maintain records of both changes made by Owner and/or Architect/Engineer and to record As-Built conditions known by the Contractor. Owner may review these documents on a monthly basis to determine compliance with this section. The Architect, Owner, and Owner's testing, inspection and commissioning consultants will be able to rely upon the completeness and accuracy of these documents in order to perform their services.

10.20.5 Owner and Architect will have full and complete access to all Project documents prepared, maintained, and retained by the Contractor.

10.21 The Contractor will initiate, maintain, and supervise all safety precautions and programs in connection with the Work. The safety program will comply with all applicable requirements of the Occupational Safety and Health Act of 1970, all other applicable federal, state and local laws and regulations, and the Contract Documents.

10.21.1 The Contractor will provide, determine, and assign responsibilities for Site safety precautions and programs, temporary Project facilities, and equipment, materials, and services for common use of the Subcontractors. Contractor will verify that appropriate safety provisions are included in the Construction Documents.

10.22 Records and Confidentiality.

- 10.22.1 Records of Contractor's costs, reimbursable expenses pertaining to the Project and payments will be available to Owner or its authorized representative during business hours and will be retained for three (3) years after Final Payment or abandonment of the Project, unless Owner otherwise instructs Contractor in writing.
- 10.22.2 The Contractor will maintain appropriate accounting records of costs, expenses, and payrolls of employees working on the Project, for a period of three (3) years after final payment for completed services and all other pending matters concerning this Contract have been closed.
- 10.22.3 The Contractor will maintain information created, sent, or received under this Contract in accordance with all applicable laws and regulations.
- 10.23 Illegal Dumping. The Contractor will ensure that it and all of its Subcontractors and assigns prevent illegal dumping of litter in accordance with Title 5, *Texas Health and Safety Code*, Chapter 365.
- 10.24 The Contractor shall promptly correct all Work rejected by the Architect/Engineer or the Owner as defective or as failing to conform to the Construction Documents whether observed before or after Substantial Completion and whether or not fabricated, installed, or completed. The Contractor shall bear all costs of correcting such rejected Work, including any and all additional costs incurred by the Owner as a result thereof.
- 10.24.1 If any of the Work is found to be defective or not in accordance with the Construction Documents, the Contractor shall correct it promptly after receipt of a written notice from the Owner to do so unless the Owner has previously given the Contractor a written acceptance of such specific condition. This obligation shall survive termination of the Construction Documents. The Owner shall give such notice within ten (10) days after discovery of the condition.
- 10.24.2 The Contractor shall remove from the site all portions of the Work which are defective or non-conforming and which have not been corrected under subparagraphs 10.24.1 unless removal is waived in writing by the Owner.
- 10.24.3 If within one year after the date of Substantial Completion or such longer period of time as may be prescribed by law or regulations or by the terms of any special guarantees or warranty required by the Construction Documents, any Work is found to be defective, the Contractor shall promptly, without cost to Owner and in accordance with Owner's written instructions: (i) correct such defective Work or, if it has been rejected by Owner, remove it and replace it with Work that is not defective, and (2) satisfactorily correct and remove and replace any damage to other Work or the work of others resulting therefrom.
- 10.24.4 Nothing contained in this Section 10.24 shall be construed to establish a period of limitation with respect to any other obligation which the Contractor might have under the Construction Documents, including Section 10.16 hereof. The establishment of the specific obligation of the Contractor to correct the Work has no relationship to his obligation to comply with the Construction Documents, nor to proceedings which may be commenced to establish the Contractor's liability with respect to his obligations other than specifically to correct the Work.

ARTICLE 11 - DISPUTE RESOLUTION

- 11.1 Definition of Dispute. "**Dispute**" means any and all disagreements, questions, claims, or controversies arising out of or relating to this Contract, including the validity, construction, meaning, performance, effect, or breach of the Contract.
- 11.2 The Project Manager or his designee acts as the Owner representative in the issuance and administration of this Construction Contract. In the case of a dispute, any document, notice, or correspondence not issued by

or to the Purchasing Manager, or other authorized Owner person, is void unless otherwise stated in this Contract. If Contractor does not agree with any document, notice, or correspondence issued by the Purchasing Manager, or other authorized Owner person, Contractor must submit a written notice to the Project Manager within ten (10) days after receipt of the document, notice, or correspondence, outlining the exact point of disagreement in detail. If the matter is not resolved to Contractor's satisfaction, Contractor may submit a Notice of Appeal to the Owner or Project Manager, if the Notice is submitted within ten (10) days after receipt of the unsatisfactory reply. Contractor then has the right to be heard by Commissioners Court.

- 11.3 Negotiation. In the event of a Dispute between the parties, the parties will promptly and in good faith attempt to resolve the Dispute at the Project level through informal negotiation. A disputing party will give written notice of the Dispute to the other party that will contain a brief statement of the nature of the Dispute. If the parties are unable to resolve the Dispute within thirty (30) days of the adverse party's receipt of the initial written notice of Dispute, the parties will endeavor to convene a meeting between senior level decision-makers not previously engaged in the Dispute. If the parties are unable to resolve the Dispute at the senior level decision maker level within thirty (30) days of the failure to resolve the Dispute at the Project level, the parties agree to submit the Dispute to mediation as set forth herein.

ARTICLE 12 – CONTRACT SUSPENSION AND TERMINATION

12.1 Suspension.

12.1.1 Owner may suspend performance under this Contract as described in Sections 12.2 and 12.3 below by giving Contractor written Notice of Suspension (a "Notice of Suspension"). The "Effective Date of Suspension" will be, in the case of Suspension of Work for Cause, the date that Owner issues the Notice of Suspension and, in the case of Suspension of Work without Cause, seven (7) days after Owner issues the Notice of Suspension. Suspension will not result in termination of this Contract, and performance may be resumed in full force and effect within sixty (60) days of receipt by Contractor of written notice of reinstatement from Owner. Upon the Effective Date of Suspension, Contractor will follow the procedures described below:

12.1.2 Contractor will immediately phase out and discontinue all Work and will prepare a statement detailing the Work performed under this Contract prior to the Effective Date of Suspension. The statement will support Contractor's final Application for Payment for the Work that will be submitted and processed in accordance with Contract Documents.

12.1.3 Contractor will make the Work site secure and demobilize and remove or otherwise secure all tools and equipment. Owner will not be invoiced or responsible for any tools or equipment remaining on site during the Suspension period. Any and all project specific materials will be protected and secured to Owner's approval. With Owner approval, temporary utilities may remain connected.

- 12.2 Suspension of Work for Cause. Owner may, at any time without prior notice, suspend all or any part of the Work, if, in the Owner's sole discretion, it is considered reasonably necessary to do so to prevent or correct any condition of the Work which constitutes an immediate safety hazard or which may reasonably be expected to impair the integrity, usefulness, or longevity of the Work when completed. Owner will give the Contractor a written notice of suspension for cause, setting forth the reason for the suspension and identifying the Work to be suspended. Upon receipt of such notice, the Contractor will immediately stop the Work so identified. As soon as practicable following the issuance of such a notice, Owner will initiate and complete an investigation of the circumstances giving rise to the suspension and will issue a written determination of their cause.

12.2.1 The Contractor will not be entitled to an extension of time or compensation for delay resulting from a suspension if Owner's investigation determines that the cause was within the control of the Contractor. If the cause is determined not to have been within the control of the Contractor, and the suspension prevents the Contractor from completing the Work within the Contract Time, the suspension is an Excusable Compensable Delay. Suspension of Work under this provision will be no longer than reasonably necessary to identify and remedy the conditions giving rise to the suspension.

12.3 Suspension of Work for Owner's Convenience. Upon seven (7) business days' prior written notice to the Contractor, Owner may at any time without breach of the Construction Contract suspend all or any portion of the Work for a period of up to sixty (36) days for its own convenience. A Notice of Suspension issued by Owner will set forth the number of days for which the Work, or any portion of it, will be suspended, and the date on which the suspension of Work will cease. When such a suspension prevents the Contractor from completing the Work within the Contract Time, it will be an Excusable Compensable Delay. A Notice of Suspension may be modified by the Owner at any time. If Owner suspends the Work for its convenience for more than sixty (60) consecutive days, the Contractor may elect to terminate the Construction Contract pursuant to the provisions of this Article.

12.3.1 If the Project is suspended or abandoned in whole or in part for convenience for more than ninety (90) consecutive days, the Contractor will be compensated for Work performed prior to receipt of written notice from Owner of such suspension or abandonment. If the Project is resumed after being suspended for more than ninety (90) consecutive days, the Contractor's compensation may be equitably adjusted if, in the Owner's reasonable opinion, such adjustment is warranted.

12.4 Owner Termination.

12.4.1 If the Contractor is declared bankrupt by a court of competent jurisdiction, makes a general assignment for the benefit of his creditors, or if a receiver is appointed on account of his insolvency, or if he persistently or repeatedly refuses or fails, except in cases for which extension of time is provided, to supply enough properly skilled workmen or proper materials, or if he fails to make prompt payment to Subcontractors or to third parties for materials or labor, or persistently disregards laws, ordinances, rules, regulations, or order of any public authority having jurisdiction, or otherwise is guilty of a substantial violation of a provision of the Contract Documents, then Owner may, without prejudice to any right or remedy and after giving the Contractor and his surety, if any, seven (7) days' written notice, terminate the employment of the Contractor and take possession of the site and all materials, equipment, tools, construction equipment, and machinery thereon owned by the Contractor and may finish the Work by whatever method he may deem expedient. In such case, the Contractor will not be entitled to receive any further payment until the Work is finished.

12.4.2 If the cost to complete the Work exceeds the unpaid balance of the Contract Sum the Contractor will pay the difference to the Owner. The amount to be paid to the Contractor or to Owner, as the case may be, will be approved by Owner, upon application, in the manner provided in Article 6, and this obligation for payment will survive the termination of the Construction Contract.

12.5 Termination for Default.

12.5.1 Failure by either party in performing any material provisions will be a breach of contract, in which case, either party may require corrective action within ten (10) days after the date the breaching party receives written notice from the non-breaching party that cites the exact nature of the breach. Failure to take corrective action or failure to provide a satisfactory written reply excusing failure to take corrective action within the prescribed ten (10) days will constitute default. The defaulting party will be given a twenty (20) day period within which to show cause why the Construction Contract should not be terminated for default. The Contractor's surety will be copied on any notices to the Contractor and will be required at any meeting with the Contractor to discuss the default and any recovery plan. Owner may take whatever action are in its best interests. All notices of a breach(s) by the Contractor will be issued by the Purchasing Manager or Owner's legal representative only, and all replies from the Contractor will be made in writing to the Purchasing Manager or Owner's legal representative at the address provided herein. Notices issued to anyone other than the Purchasing Manager or Owner's legal representative will be void, and will be considered as not having been issued or received. The defaulting party will be liable for actual damages as stipulated in this Contract. Liquidated damages, if specified in the Contract, may also apply. Owner may also enforce the performance of this Contract in any manner allowed by law in the event of breach or default, and may contract with another party without further notification to the Contractor. At a minimum, the Contractor will be required to pay

any difference in the cost of securing the products or services covered by this Contract from another source because of Contractor's default, plus reasonable administrative costs. If termination for default occurs, Owner and its officials, agents, and representatives will not be liable for loss of any profits anticipated to be made from this Contract.

12.6 Termination for Convenience.

- 12.6.1 Owner reserves the right to terminate this Agreement for reasons other than default by Contractor, including for any reason deemed by Owner to serve the public interest, or resulting from any governmental law, ordinance, regulation, or court order, by delivering to Contractor a written notice (a "Notice of Termination for Convenience"), which will take effect on the third (3rd) day following receipt by Contractor ("Termination for Convenience"). In the event of Termination for Convenience, Owner and its officials, agents and representatives will not be liable for loss of any profits or opportunity costs.
- 12.6.2 Upon receipt of a Notice of Termination for Convenience and prior to the effective date of termination, Contractor will, unless the Notice of Termination for Convenience otherwise directs, immediately phase out and stop all Work in connection with the project and this Contract, and will proceed to promptly cancel all existing orders and contracts insofar as such orders and contracts are chargeable to this Agreement. Within thirty (30) days after receipt of a Notice of Termination for Convenience, the Contractor will submit an Application for Payment detailing the Work performed under this Agreement prior to the effective date of termination.
- 12.6.3 Upon satisfaction of the above conditions, Owner will pay the Contractor for approved services actually performed under this Contract prior to termination, less previous payments.
- 12.6.4 In the event of a no-cause termination (i.e., termination for Owner's convenience), the Contractor will be entitled to compensation for all services performed prior to the termination date, provided however, the Contractor has delivered to Owner such statements, accounts, reports, and other materials as required hereunder together with all reports, documents, and other materials prepared by the Contractor prior to termination. Upon such payment, Owner will have no further obligation to the Contractor.
- 12.6.5 Termination of this Contract will not relieve the Contractor or any of its employees, Subcontractors, or consultants of liability for violations of this Contract or for any act or omission, including negligence, of the Contractor related to the Project.

ARTICLE 13 - INDEMNITY

ARISING OUT OF OR RESULTING FROM ANY ACT OR OMISSION OF THE CONTRACTOR, ANY SUBCONTRACTOR, SUPPLIER, ANYONE DIRECTLY OR INDIRECTLY EMPLOYED BY ONE OR ALL OF THEM, OR ANYONE FOR WHOSE ACTS THE CONTRACTOR OR ITS SUBCONTRACTOR MAY BE LIABLE FOR, REGARDLESS OF WHETHER THE CLAIM, LOSS, CAUSE OF ACTION, SUIT, JUDGMENT, DAMAGE, OR EXPENSE IS CAUSED IN PART BY A PARTY INDEMNIFIED HEREUNDER.

- 13.1 In any and all claims against Owner or any of their agents or employees by any employee of the Contractor, any Subcontractor, anyone directly or indirectly employed by any of them, or anyone for whose acts either of them may be liable, the indemnification obligation under this paragraph will not be limited in any way by any limitation in the amount or type of damages or by compensation or benefits payable by or for the Contractor or any Subcontractor under workers' or workmen's compensation acts, disability benefits acts, or other employee benefit acts.
- 13.2 The Contractor's indemnification obligations hereunder will not extend to any claim, damage, loss, cause of action, suit, judgment, expense, or liability incurred by Owner or the Architect/Engineer and that results

primarily from the negligent preparation of the signed and sealed professional services work product provided for the Project.

- 13.3 PATENT AND COPYRIGHT INFRINGEMENT. CONTRACTOR WILL ALSO INDEMNIFY AND HOLD OWNER, ITS DIRECTORS, OFFICERS, AGENTS, CONSULTANTS, AND EMPLOYEES, HARMLESS FROM AND AGAINST ALL CLAIMS, LOSSES, CAUSES OF ACTION, SUITS, PROCEEDINGS, JUDGMENTS, COSTS, EXPENSES, AND LIABILITIES OF EVERY KIND, ARISING FROM INFRINGEMENT OR ALLEGED INFRINGEMENT OF ANY UNITED STATES PATENT OR COPYRIGHT THAT ARISE OUT OF ANY OF THE WORK PERFORMED BY THE CONTRACTOR OR THE CONTRACTOR'S USE OF, OR DIRECTION TO OWNER TO USE, ANY ARTICLE OR MATERIAL PROTECTED BY PATENT OR COPYRIGHT LAW ("PROTECTED MATERIALS"). UPON BECOMING AWARE OF A SUIT OR THREAT OF SUIT FOR PATENT OR COPYRIGHT INFRINGEMENT, OWNER WILL PROMPTLY NOTIFY THE CONTRACTOR AND THE CONTRACTOR WILL BE GIVEN FULL OPPORTUNITY TO NEGOTIATE A SETTLEMENT. THE CONTRACTOR DOES NOT WARRANT AGAINST INFRINGEMENT BY REASON OF OWNER'S OR ARCHITECT/ENGINEER'S DESIGN OR BY THEIR USE OF PROTECTED MATERIAL IN COMBINATION WITH OTHER MATERIALS OR IN THE OPERATION OF ANY PROCESS. IN THE EVENT OF LITIGATION, OWNER AGREES TO COOPERATE REASONABLY WITH CONTRACTOR AND PARTIES WILL BE ENTITLED, IN CONNECTION WITH ANY SUCH LITIGATION, TO BE REPRESENTED BY COUNSEL OF THEIR OWN CHOICE.
- 13.4 Duty to Defend. The Contractor will and does agree to defend Owner in all suits or proceedings that relate to any obligation under this Contract for which Contractor has agreed to indemnify Owner. The Contractor will undertake the defense of Owner at no cost to and in coordination with counsel for Owner, and the Contractor acknowledges that Owner is entitled to participate in the selection of counsel. Owner may defend a nonparty claim with counsel of its own choosing and without Contractor's participation if (1) the Contractor notifies Owner that it does not wish to defend the nonparty claim by midnight at the end of the tenth (10th) day after Owner notifies Contractor of the claim, (2) the Contractor fails to notify Owner of its desire to defend the nonparty claim within the same time period, (3) representation of the Contractor and Owner by the same counsel would, in the opinion of counsel, constitute a conflict of interest, or (4) Contractor fails to diligently and continuously conduct its defense of Owner. The costs incurred by Owner in undertaking its own defense, including but not limited to Attorneys' Fees, will constitute a portion of the indemnification duties set forth in this Agreement.
- 13.5 Claims Notification. If Contractor receives notice or becomes aware of any claim, or other action, including proceedings before an administrative agency, that is made or brought by any person, firm, corporation, or other entity against the Contractor or Owner, the Contractor will give written notice to Owner of: the claim or other action within three (3) business days after being notified of it or the threat of it; the name and address of the person, firm, corporation or other entity that made or threatened to make a claim, or that instituted or threatened to institute any type of action or proceeding; the basis of the claim, action or proceeding; the court or administrative tribunal, if any, where the claim, action, or proceeding was instituted; and the name or names of any person against whom this claim is being made or threatened. This written notice will be given in the manner provided by this Contract. Except as otherwise directed, the Contractor will furnish to Owner copies of all pertinent papers received by the Contractor with respect to these claims or actions.
- 13.6 The indemnities contained herein will survive the termination of this Contract for any reason whatsoever.

ARTICLE 14 - SPECIAL WARRANTIES

- 14.1 Notwithstanding anything to the contrary contained in this Contract, Owner and the Contractor agree and acknowledge that Owner is entering into this Contract in reliance on Contractor's represented expertise and ability to provide construction services. The Contractor agrees to use its best efforts, skill, judgment, and abilities to perform its obligations and to further the interests of Owner in accordance with Owner's requirements and procedures.
- 14.2 The Contractor represents and agrees that it will perform its services in accordance with the usual and customary standards of Contractor's profession or business and in compliance with all applicable national, federal, state, municipal, laws, regulations, codes, ordinances, orders and with those of any other body having

jurisdiction over the Project. The Contractor agrees to bear the full cost of correcting his negligent or improper work and services, those of its Subcontractors, and any harm caused by the negligent or improper work or services performed by Contractor or its Subcontractors.

- 14.3 The Contractor's duties will not be diminished by any approval by Owner nor will the Contractor be released from any liability by any approval by Owner, it being understood that Owner is ultimately relying upon the Contractor's skill and knowledge in performing the services required hereunder.
- 14.4 The Contractor represents and warrants that all persons connected with the Contractor and who are directly in charge of its services are duly registered and/or licensed under the laws, rules, and regulations of any authority having jurisdiction over the Project if registration is required.
- 14.5 The Contractor agrees to advise Owner of anything of any nature in any Construction Documents and plans, sketches, instructions, information, requirements, procedures, and other data supplied to the Contractor (by Owner or any other party) that is, in its opinion, unsuitable, improper, or inaccurate for the purposes for which the document or data is furnished.
- 14.6 The Contractor agrees to perform its services under this Contract in an expeditious and economical manner, consistent with good business practices, and the interests of Owner.
- 14.7 The Contractor represents and warrants that there are no obligations, commitments, or impediments of any kind that will limit or prevent performance of its obligations under this Agreement.
- 14.8 The Contractor represents and warrants that the individual executing this Contract on behalf of Contractor has been duly authorized to act for and to bind Contractor to its terms.
- 14.9 Except for the obligation of Owner to pay the Contractor certain fees, costs, and expenses pursuant to the terms of this Contract, Owner will have no liability to the Contractor or to anyone claiming through or under the Contractor by reason of the execution or performance of this Contract. Notwithstanding any obligation or liability of Owner to the Contractor, no present or future partner or affiliate of Owner or any agent, officer, director, employee, or consultant of Owner, or anyone claiming under or through Owner has or will have any personal liability to the Contractor or to anyone claiming through or under the Contractor by reason of the execution or performance of this Contract.
- 14.10 Debarment, Suspension and Other Responsibility Matters. Certification under this Section provides for compliance with certification requirements under 15 C.F.R. Part 26, "Government-wide Debarment and Suspension." By signing this Contract, the Contractor hereby certifies that, to the best of its knowledge and belief, it:
 - 14.10.1 Is not presently debarred suspended, proposed for debarment, declared ineligible or voluntarily excluded from covered transactions by any Federal department or agency;
 - 14.10.2 Has not within a three-year (3) period preceding this Contract been convicted of or had a civil judgment rendered against it for commission of fraud or a criminal offense in connection with obtaining, attempting to obtain, or performing a public (Federal, State, City of Austin or Travis County, Texas) transaction or contract under a public transaction; violation of Federal or State antitrust statutes or commission of embezzlement, theft, forgery, bribery, falsification or destruction of records, making false statements, or receiving stolen property;
 - 14.10.3 Is not presently indicted for or otherwise criminally or civilly charged by a governmental entity (Federal, State, City of Austin or Travis County, Texas) with commission of any of the offenses enumerated in 16.33.2; and
 - 14.10.4 Has not within a three-year (3) period preceding this Contract had one or more public transactions (Federal, State, City of Austin or Travis County, Texas) terminated for cause or default.

ARTICLE 15 – NOT USED

ARTICLE 16 - MISCELLANEOUS PROVISIONS

- 16.1 This Contract does not create and will not be construed as creating an employer/employee relationship, a partnership, or a joint venture unless otherwise negotiated and defined in a final agreement. The Contractor's services are and will remain throughout the term of this Contract those of an independent contractor. The Contractor agrees and understands that the Contractor is not and will not be entitled to any of the rights and privileges established for Owner's employees. Both parties expressly acknowledge and agree that none of the Contractor's employees have a contractual relationship with the Owner.
- 16.2 Assignment. This is a Contract for construction services, and the Contractor's interest in this Contract, duties hereunder, and/or fees due hereunder may not be assigned or delegated to a third party without specific Owner approval. Any assignment of this Contract without the Owner's prior approval is void. Owner may assign this Contract upon giving the Contractor fourteen (14) calendar days advance notice. It is acknowledged by the Contractor that no officer, agent, employee or representative of Owner has any authority to assign any part of this Contract unless expressly granted that authority by Owner's Purchasing Manager.
- 16.4 Binding Contract. This Contract will be binding upon the successors, assigns, administrators, and legal representatives of the parties to this Contract.
- 16.5 Entire Agreement/Modifications. This Contract supersedes all prior agreements, written or oral, between the Contractor and Owner and will constitute the entire agreement and understanding between the parties with respect to the Project. This Contract and each of its provisions will be binding upon the parties and may not be waived, modified, amended or altered except by a writing signed by the Contractor and Owner.
- 16.6 Headings. Headings and titles at the beginning of the various provisions of this Contract have been included only to make it easier to locate the subject matter covered by that provision or subsection and will not be used in construing this Contract.
- 16.7 Gender and Number. Words of any gender in this Contract will be construed to include any other gender, and words in either singular or plural form will be construed to include the other unless the context in the Contract clearly requires otherwise.
- 16.8 Conflicts among Documents. Contractor understands and agrees that, if a conflict is found to exist between the provisions of this Contract and any provision in a related RFP, RFQ or Proposal, the provisions within the final Contract will prevail.
- 16.9 Computation of Time. When any period of time is stated in this Contract, the time will be computed to exclude the first day and include the last day of period. If the last day of any period falls on a Saturday, Sunday, or a day that Owner has declared a holiday for its employees, the last day is the next business day that is not an Owner observed holiday. Any reference to "days" will mean calendar days unless otherwise stipulated.
- 16.10 Governing Law and Venue. This Contract and all of the rights and obligations of the parties and all of the terms and conditions hereunder will be construed, interpreted, and applied in accordance with and governed by and enforced under the laws of the State of Texas without reference to its conflicts of law provisions. Venue for any legal action arising from or related to this Contract or the Project will be in Travis County, Texas.
- 16.11 Waivers. No delay or omission by either party in exercising any right or power arising from non-compliance or failure of performance by the other party will impair or constitute a waiver of any such right or power. A waiver by either party of any covenant or condition of this Contract will not be construed as a waiver of any subsequent breach of that or of any other covenant or condition of the Contract.
- 16.12 Force Majeure. The parties acknowledge that this Agreement is being executed and will be performed during, or immediately following the termination of, a Declared Disaster resulting from the COVID-19 pandemic and expressly acknowledge that they have taken the effects of this Declared Disaster and its aftermath into account

in determining timelines and performance requirements stated in it and that this Declared Disaster or any subsequent disaster declaration concerning COVID-19 may not be used to excuse performance under this Contract. Neither party is financially liable to the other for any delays or failures in contract performance caused by federal or state laws or the rules, regulations, or orders of any public body or official purporting to exercise authority or control respecting the operations covered by this Contract, or caused by strikes not against the parties, actions of the elements, or acts of God and delays due to the above causes shall not be considered a breach of this Contract. These delays or failures to perform extend the period of performance for a period of time equal to the subsistence of the impossible conditions. If Force Majeure conditions exist, the party affected by them shall give the other party Notice within five working days after the conditions begin. If timely Notice is impractical due to the Force Majeure conditions, then the party must provide Notice in as timely a manner as practicable. If Notice is not provided timely, the party experiencing Force Majeure waives it as a defense.

- 16.13 No Third-Party Beneficiary. No provision of this Contract is intended to benefit any person or entity, nor will any person or entity not a party to this Contract have any right to seek to enforce or recover any right or remedy with respect hereto.
- 16.14 Appointment. Owner hereby expressly reserves the right from time to time to designate by notice to the Contractor a representative to act partially or wholly for Owner in connection with the performance of Owner's obligations. The Contractor will act only upon instructions received from the designated representative(s) unless otherwise specifically notified to the contrary.
- 16.15 Severability. Should any term or provision of this Contract be held invalid or unenforceable in any respect, the remaining terms and provisions will not be affected, and this Contract will be construed as if the invalid or unenforceable term or provision had never been included.
- 16.16 Conflict-of-Interest. The Contractor will complete the Conflict-of-Interest Questionnaire ("Questionnaire"), attached to this Contract as Attachment A, as required by Chapter 176 of the Local Government Code, and submit it together with this signed Contract. The Contractor will also complete the Disclosure of Interested Parties Form ("Form 1295"), attached to this Contract as Attachment I, which pursuant to Section 2252.908 of the Texas Government Code, must be filed with the Texas Ethics Commission no later than thirty (30) days after the execution of this Contract. (An electronic version of this Form 1295 is available here: https://www.ethics.state.tx.us/whatsnew/elf_filing_info.htm.) The Contractor will update this Questionnaire and Form 1295 if any statement on either document becomes incomplete or inaccurate. The updated document(s) must be submitted to Owner's Purchasing Manager, 1111 E. Cesar Chavez, Austin, Texas 78702, no later than the seventh (7th) business day after the date on which the Contractor becomes aware of an event that makes a statement in either of these documents incomplete or inaccurate.
- 16.17 Solicitation. The Contractor warrants that no persons or selling agency was or has been retained to solicit this Contract upon an understanding for a commission, percentage, brokerage, or contingent fee, excepting bona fide employees or bona fide established commercial selling agencies maintained by the Contractor to secure business. For breach or violation of this section, Owner will have the right to terminate this Contract without liability or to deduct from the Contract price or otherwise recover the full amount of such commission, percentage, brokerage or contingent fee.
- 16.18 Gratuities. Owner may terminate this Contract if it is found that gratuities of any kind were offered or given by the Contractor or any agent or representative to any official or employee of Owner with a view towards securing favorable treatment with respect to this Contract. In the event this Contract is terminated by Owner pursuant to this provision, Owner will be entitled, in addition to any other rights and remedies, to recover compensatory damages from the Contractor using the standard measure of damage calculation. The Contractor's employees, officers and agents will neither solicit nor accept gratuities, favors or anything of monetary value from Subcontractors or potential Subcontractors. The Contractor will establish safeguards to prohibit its employees from using their positions for a purpose that is or gives the appearance of being motivated by a desire for private gain for themselves or others, particularly those with whom they have family, business or other ties.

- 16.19 Funding Out. Despite anything to the contrary in this Contract, if, during budget planning and adoption, Owner fails to provide funding for this Contract for the following Owner fiscal year, Owner may terminate this Contract by giving the Contractor thirty (30) days written notice that this Contract is terminated due to the failure to fund it.
- 16.20 Owner Access and Audit. During the term of this Contract and for a period of three (3) years following termination of this Contract, Owner maintains the right to review and audit any of the books and records of the Contractor relating to the Contractor's performance and receipt of payments under this Contract. Owner may conduct its review or audit through its own employees, agents, or representatives or through independent external auditors or representatives retained by Owner. Owner will conduct such review or audit upon reasonable notice to the Contractor, at its own expense, and during regular business hours. The records will be retained beyond the third year if an audit is in progress, the findings of a completed audit have not been resolved satisfactorily, or litigation involving this Contract is not finally resolved.
- 16.21 Amendments. This Contract may be amended only by an instrument in writing that is signed by both parties. Amendments to this Contract will be effective as of the date stipulated therein. The Contractor acknowledges that no Owner officer, agent, employee, or representative has any authority to amend this Contract unless expressly granted that specific authority by Owner's Board of Managers.
- 16.22 Non-Waiver of Default. Neither failure nor delay on the part of Owner to exercise any right, remedy, power, or privilege available to it for Contractor's breach will operate as will a waiver of any preceding or succeeding breach of the same or any other provision, covenant, or condition, nor will any single or partial exercise of any right, remedy, power, or privilege preclude any other or future exercise by Owner of its rights, remedies, powers, or privileges. Moreover, any waiver to keep or perform any provision, covenant, or condition of this Contract will be deemed to be a waiver of.
- 16.23 Nondiscrimination: The Contractor will not discriminate on the grounds of race, color, or national origin in the selection and retention of Subcontractors or suppliers of materials and leases of equipment.
- 16.24 Solicitations for Subcontracts, Including Procurements of Materials and Equipment: In all solicitations either by competitive bidding or negotiation made by the Contractor for Work to be performed under a subcontract, including procurements of materials or equipment leases, each potential Subcontractor or supplier will be notified by the Contractor of the Contractor's obligations under this Contract and the sections relative to nondiscrimination on the grounds of race, color, or national origin.
- 16.25 Sanctions for Noncompliance: If the Contractor does not comply with the nondiscrimination provisions of this Contract, Owner may impose the sanctions that it determines are appropriate, including, but not limited to, withholding payments to Contractor under the Contract until Contractor complies, or until termination or suspension of the Contract, in whole or in part.
- 16.26 Incorporation of Provisions: The Contractor will include the provisions regarding nondiscrimination in every subcontract, including procurements of materials and leases of equipment, unless exempt by the regulations, or directives issued pursuant to them.
- 16.27 Public Information Act. Owner is subject to the provisions of the Texas Public Information Act ("PIA"). If Owner receives a request for disclosure of any information related to the good or services provided under this Contract or for information provided to Owner under this Contract that constitutes a record under the PIA, the information must qualify for an exception provided by the PIA to be withheld from public disclosure. The Contractor authorizes Owner to submit any information provided under the Contract or otherwise requested to be disclosed, including information that the Contractor has labeled as confidential or proprietary, to the Office of the Texas Attorney General for a determination as to whether any such information may be accepted from public disclosure under the PIA. If Owner does not have a good faith belief that information may be subject to an exception to disclosure under the PIA, Owner is not obligating itself by this Contract to submit the information to the Attorney General for a determination. Owner will have no obligation or duty to advocate the confidentiality of the Contractor's material to the Attorney General or to any other person or entity. It is the Contractor's responsibility and obligation to make any legal argument to the Attorney General or court of

competent jurisdiction regarding the exception of the information in question from disclosure. The Contractor waives any claim against and releases from liability Owner, its officers, directors, employees, agents, and attorneys with respect to disclosure of information provided under this Contract or otherwise created, assembled, maintained, or held by the Contractor, including that information marked as confidential or proprietary and determined by the Attorney General or a court of competent jurisdiction to be subject to disclosure under the Act. This section will survive the termination of this Contract.

16.28 Notices. All notices, consents, approvals, demands, requests, or other communications relied on by the parties will be in writing. Unless this Contract provides otherwise, written notice will be deemed to have been given when delivered in person to the designated representative of the Contractor or Owner or transmitted by fax machine to the last known business fax number of the designated representative. Mail notices are deemed effective upon receipt or on the third business day after the date of mailing, whichever is sooner. Fax notices are deemed effective the next business day after faxing.

16.28.1 The address of Owner for all purposes under this Contract will be:

President and CEO
Travis County Healthcare District d/b/a Central Health
1111 East Cesar Chavez Street
Austin, Texas 78702

16.28.2 The address of the Contractor for all purposes under this Contract will be as defined and listed on the Contract signature page.

16.28.3 The parties may make reasonable changes in the person or place designated for receipt of notices upon advance written notice to the other party.

BY SIGNING BELOW, the Parties have executed and bound themselves to this Agreement as of the day and year first above written.

Attachment A

Not Used

Attachment B – Contractor’s Project Schedule
(to be attached)

Attachment C – Contractor’s Schedule of Values
(to be attached)

Attachment D - Insurance

1. Insurance Schedules

1.1. The Contractor shall not commence Work under the Construction Contract until he has obtained all the insurance required hereunder and certificates of such insurance have been filed with and reviewed by the Owner. Acceptance of the insurance certificates by the Owner shall not relieve or decrease the liability of the Contractor. Owner shall be named as an additional insured on the policies. Contractor shall not change or modify the insurance coverage without prior notice to the Owner.

1.2. Unless otherwise provided for in the Contract Documents, the Contractor shall provide and maintain, until the Work covered in the Construction Contract is completed and accepted by the Owner, the minimum insurance coverages in the following schedule.

1.3. The minimum required limits may be achieved by purchasing an excess liability policy so long as such policy provides coverages at least as broad as the primary insurance.

1.3.1. Worker's Compensation and Employer's Liability Insurance

1.3.1.1. Worker's Compensation Insurance shall be as required by law and shall include an "all states" or "universal" endorsement.

1.3.1.2. Employer's Liability Insurance shall be written for not less than \$500,000 per occurrence.

1.3.1.3. Policy shall also include the following endorsements in favor of County:

1.3.1.4. Waiver of Subrogation (Form TE2046A)

1.3.1.5. Thirty (30) day Notice of Cancellation (Form TE0202A)

1.3.2. Commercial General

1.3.2.1. Minimum Limits:

1.3.2.2. Per Occurrence \$2,000,000

1.3.2.3. Aggregate \$2,000,000

1.4. The following coverages must be specifically insured and certified with no internal sub-limits. A separate aggregate limit is acceptable for the Products/Completed Operations hazard:

1.4.1. Independent Contractors Contingent Liability

1.4.2. Products/Completed Operations Liability

1.4.3. Contractual Liability

1.4.4. "X, C, U" Hazard Liability (if applicable)

1.4.5. Personal Injury Liability including claims related to employment

1.4.6. Broad Form Property Damage Liability, or deletion of the "Care, Custody, and Control" exclusion

1.4.7. Owned, Hired and Non-Owned Automobile Liability

1.4.8. Waiver of Defense of Municipal Liability Immunity

1.5. Policy shall also include the following endorsements in favor of County:

1.5.1. Waiver of Transfer of Recovery against others in favor of Owner

1.5.2. Thirty (30) day Notice of Cancellation (Form TE0202A)

1.5.3. County named as additional insured (Form TE9901B)

1.5.3.1.1. Builders Risk Insurance

1.5.3.1.1.1. Completed value form in an amount equal to the initial contract amount plus Architect fees on a replacement cost basis.

1.5.3.1.1.1.2. The policy shall name as insured the Owner, the Contractor, and all subcontractors on an equal basis.

1.5.3.1.1.1.3. The policy shall be written on an "All Risk" form, to include at least the perils of Fire, Lightning and extended coverage theft, vandalism, malicious mischief, and collapse. Coverage shall continue until acceptance of the Work.

- 1.6. This furnishing of evidence of the required insurance coverages, is one of the Contractor's initial requirements of the Construction Contract that must be performed before a Notice to Proceed can be issued, and if not provided within 15 calendar days after receipt of the Notice of Award, may result in forfeiture of the Contractor's Bid Security. All insurance policies shall be open to inspection by the Owner, and copies of policies shall be submitted to the Owner upon written request. The Contractor is responsible for the payment of all premiums and deductibles.
- 1.7. The contractual liability is to be written on a blanket basis for all written or oral contracts, or specifically endorsed to acknowledge the contractual relationship between the insured and the Travis County Healthcare District. The insurance companies providing coverage must have at least an A.M. Best rating of B+VII and will be subject to the Owner's approval.
- 1.8. All certificates of insurance shall provide that the insurance company shall give the Travis County Healthcare District d.b.a Central Health an affirmative statement, with no qualifications, that thirty (30) days prior written notice will be given to Central Health in the event of policy cancellation, non-renewal or material reduction in coverage provided under the policy, including impairment of any aggregate limits less than \$2,000,000. If policies are written on a "claims made" basis, the retroactive date must be coincident with the date of execution of the Construction Contract. The "other insurance" clause is not applicable to Central Health, where Central Health is an additional insured, and it is intended that the policies covering both Central Health and the Contractor be considered primary coverage. If excess coverage is provided to meet the required policy terms, it must follow the form of the primary coverage.
- 1.9. A waiver of subrogation in favor of Travis County Healthcare District will be endorsed to all policies. Travis County Healthcare District will be named as an additional insured where the Healthcare District's interest may appear.

Attachment E – Liquidated Damages

In the event the Contractor fails to achieve Substantial Completion of the work within the Contract Time specified in the contract, as may be extended by change order or excusable delay, the amount per day given in the following schedule will be deducted from the money due or to become due the Contractor, not as a penalty, but as liquidated damages.

From More than	To and Including	Amount of Liquidated Damages per Working Day
\$ 0	\$ 100,000	\$ 200
100,000	500,000	450
500,000	1,000,000	550
1,000,000	2,000,000	700
2,000,000	5,000,000	850
5,000,000	10,000,000	1,300
10,000,000	15,000,000	1,700
over 15,000,000		2,000

Attachment H – Performance & Payment Bonds

PERFORMANCE BOND

KNOW ALL PERSONS BY THESE PRESENTS:

That we, _____ as Principal, and the other undersigned as Surety, are held and firmly bound to Travis County, Texas in the penal sum of _____ Dollars (\$ _____), lawful money of the United States, well and truly to be paid to Travis County, Texas, and we bind ourselves, our heirs, successors, executors, and administrators, jointly and severally, firmly by this document.

Whereas, the above-bound Principal has entered into the foregoing Contract with Travis County, Texas, attached hereto, and whereas, pursuant to Texas Government Code Chapter 2253, said Principal is required before commencing the work provided for in said Contract to execute a Bond in the amount of said Contract.

CSP 2108-001 General Contractor for Del Valle Health & Wellness Center

The condition of this obligation is such that if the above-bound Principal, his or its heirs, successors, executors, and administrators must well and faithfully do and perform each and every, all and singular, the work in accordance with the Plans, Specifications, and Contract Documents, including warranty in Paragraph 5.17 (Guarantee Against Defective Work), as provided for in said Contract aforesaid, then this obligation will be null and void; otherwise, it is to remain in full force and effect.

Terracon Project No. 96205256

Dear Mr. Lamp:

We have completed the Geotechnical Engineering services for the above referenced project. This study was performed in general accordance with Terracon Proposal No. P96205256, Revision 1 dated September 21, 2020. This report presents the findings of the subsurface exploration and provides geotechnical recommendations concerning earthwork, subgrade preparation, and the design and construction of foundations, pavements, and site improvements for the proposed project.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning this report or if we may be of further service, please contact us.

Sincerely,
Terracon Consultants, Inc.

Diego Munar Castaneda, P.E.
Project Geotechnical Engineer

Bryan S. Moulin, P.E.
Senior Principal, Geotechnical Department Manager

Geotechnical Engineering Report
Southeast Travis County Wellness Center
7050 Elroy Road
Austin, Texas
Terracon Project No. 96205256
February 24, 2021

INTRODUCTION

This report presents the results of our subsurface exploration and geotechnical engineering services performed for the proposed Central Health Facility project to be located at 7050 Elroy Road in Austin, Texas. This project was authorized by Central Health through issuance of Task Order 001 on October 9, 2020 and performed under the terms of a Professional Services Agreement between Terracon and Central Health dated July 27, 2018. This study was performed in general accordance with Terracon Proposal No. P96205256, Revision 1 dated September 21, 2020. The purpose of these services is to provide information and geotechnical engineering recommendations relative to:

- Subsurface soil conditions
- Groundwater conditions
- Site preparation and earthwork
- Lateral earth pressures
- Foundation design and construction
- Floor slab design and construction
- Seismic site classification
- Pavement design and construction

The geotechnical engineering Scope of Services for this project included the advancement of ten (10) test borings designated B-1 through B-6, and P-1 through P-4 to depths ranging from approximately 25 to 10 feet below existing site grades.

Maps showing the site and boring locations are shown in the **Site Location** and **Exploration Plan** sections, respectively. The results of the laboratory testing performed on soil samples obtained from the site during the field exploration are included on the boring logs in the **Exploration Results** section.

SITE CONDITIONS

The following description of site conditions is derived from our site visit in association with the field exploration and our review of publicly available geologic and topographic maps.

Item	Description
Parcel Information	The project is located at 7050 Elroy Road in Austin, Texas. See Site Location

Item	Description
Existing Improvements	Undeveloped.
Current Ground Cover	Soils and grass.
Existing Topography	Based on a Topographic Survey dated August 21, 2020, the site slopes from ~EL 500 feet in the southwest downhill to ~EL 493 feet in the east.
Geology	Based on our review of available geologic information and the samples obtained from the test borings, the study area appears to lie within an area characterized by the Taylor Group clay of Upper Cretaceous Age. The Taylor Group generally consists of highly plastic expansive clay soils ranging in color from tan to dark gray.

PROJECT DESCRIPTION

Our initial understanding of the project was provided in our proposal and was discussed during project planning. A period of collaboration has transpired since the project was initiated, and our final understanding of the project conditions is as follows:

Item	Description
Information Provided	<ul style="list-style-type: none"> ■ Email, Geotech Scope of Services document, and Topographic Survey provided by Mr. Steven Lamp with Central Health on August 27, 2020. ■ Concept Site Plan provided by Ms. Rachel Toronjo with Central Health on December 14, 2020.
Proposed Structures	Based on the information provided by the Client, we understand that the project includes the construction of the following; <ul style="list-style-type: none"> ■ A single-story Health Facility with a footprint of approximately 18,000 square feet (SF). ■ Associated parking, driveway, and drive-thru areas.
Building Construction	Steel-frame or wood-frame assumed
Finished Floor Elevation	Unknown but anticipated to be ≤ 2 feet from existing grades.
Maximum Loads	Unknown but anticipated to be lightly loaded.
Grading/Slopes	Unknown but assumed to be ≤ 2 feet from existing grades. Slopes assumed to be no steeper than 3H:1V (Horizontal to Vertical).
Below-Grade Structures	None anticipated
Free-Standing Retaining Walls	None anticipated
Pavements	We assume both rigid (concrete) and flexible (asphalt) pavement sections should be considered.

GEOTECHNICAL CHARACTERIZATION

We have developed a general characterization of the subsurface conditions based upon our review of the subsurface exploration, laboratory data, geologic setting and our understanding of the project. This characterization, termed GeoModel, forms the basis of our geotechnical calculations and evaluation of site preparation and foundation options. Conditions encountered at each exploration point are indicated on the individual logs. The individual logs can be found in the **Exploration Results** section and the GeoModel can be found in the **Figures** section of this report.

As part of our analyses, we identified the following model layers/strata within the subsurface profile. For a more detailed view of the model layer/stratum depths at each boring location, refer to the GeoModel.

Model Layer/ Stratum	Layer Name	General Description
1	Surficial Fat Clays	Dark brown to brown to grayish brown, medium stiff to hard, Fat Clay (CH)
2	Deeper Fat Clays	Light brown to orangish brown to tan, very stiff to hard, Fat Clay (CH)

Groundwater

The boreholes were observed while drilling and after completion for the presence and level of groundwater. Groundwater was not observed in the borings while drilling, nor for the short duration the borings could remain open. However, this does not necessarily mean no groundwater may be present at the site as groundwater conditions can (and likely will) vary between the time of the geotechnical investigation and the timeframe of construction activities.

Groundwater seepage is possible at this site, particularly in the form of seepage traveling along pervious seams/fissures in the soil and/or along soil stratum interfaces. Due to the low permeability of the soils encountered in the borings, a relatively long period may be necessary for a groundwater level to develop and stabilize in a borehole. Long term observations in piezometers sealed from the influence of surface water are often required to define groundwater levels in materials of this type. Please contact us if this is desired. Groundwater conditions should be evaluated immediately prior to construction.

Groundwater level fluctuations occur due to seasonal variations in the amount of rainfall, runoff and other factors not evident at the time the borings were performed. Therefore, groundwater levels during construction or at other times in the life of the structure may be higher or lower than the levels indicated on the boring logs. The possibility of groundwater level fluctuations should be considered when developing the design and construction plans for the project.

GEOTECHNICAL OVERVIEW

Based on our test borings, expansive soils (Stratum 1/2 soils) that exhibit a high to very high potential for volumetric change during moisture variations are present at the site near the ground surface. Based on existing grades, the soils at the site exhibit a Potential Vertical Rise (PVR) of up to 6½ inches as estimated by the Texas Department of Transportation (TxDOT) Method TEX-124-E.

This report provides recommendations to help mitigate the effects of soil shrinkage and expansion. However, even if these procedures are followed, some movement and (at least minor) cracking in the structure should be anticipated. The severity of cracking and other damage such as uneven floor slabs will probably increase if modification of the site results in excessive wetting or drying of the expansive soils. Eliminating the risk of movement and distress may not be feasible, but it may be possible to further reduce the risk of movement if significantly more expensive measures are used during construction. We can discuss these additional measures if desired.

The high plasticity fat clay could become problematic with typical earthwork and construction traffic, especially after precipitation events. Effective drainage should be completed early in the construction sequence and maintained after construction to avoid potential issues. Additional site preparation recommendations including subgrade improvement and fill placement are provided in the **Earthwork** section.

The **Shallow Foundations** section addresses the support of the structure on a monolithic slab-on-grade foundation or spread/strip footing foundation bearing into select fill. Alternatively, the **Deep Foundations** section addresses support of the building on drilled piers bearing into Stratum 2 soils. The **Building Subgrade Preparation** section addresses slab support of the structure.

Lateral earth pressures are provided for on-site retaining walls (i.e., double-formed walls) in the **Lateral Earth Pressures** section.

Asphaltic concrete and/or portland cement concrete pavement systems are recommended for this site. The **Pavements** section addresses the design of pavement systems.

Slope inclinations and construction recommendations are provided for cut and fill slopes (embankments). The **Slope Stability** section addresses cut and fill slopes.

The **General Comments** section provides an understanding of the report limitations.

EARTHWORK

Earthwork is anticipated to include clearing and grubbing, excavations, and fill placement. The following sections provide recommendations for use in the preparation of specifications for the work. Recommendations include critical quality criteria, as necessary, to render the site in the

state considered in our geotechnical engineering evaluation for foundations, floor slabs, and pavements.

Site Preparation

Construction areas should be stripped of all vegetation, loose soils, fill soils, top soils, and other unsuitable material currently present at the site. We recommend that Terracon be retained to assist in evaluating exposed subgrades during earthwork so that unsuitable materials, if any, are removed at the time of construction.

Proof-Rolling

Once initial subgrade elevations have been achieved (i.e., after cuts but prior to fills), the exposed subgrade in all construction areas (except landscaping) should be carefully and thoroughly proof-rolled with a 20-ton pneumatic roller, fully-loaded dump truck, or similar equipment to detect weak zones in the subgrade. Weak areas detected during proof-rolling, zones containing debris or organics, and voids resulting from removal of tree roots, fill, etc. should be removed and replaced with soils exhibiting similar classification, moisture content, and density as the adjacent in-situ soils (or flowable fill). Proper site drainage should be maintained during construction so that ponding of surface runoff does not occur and cause construction delays and/or inhibit site access.

Moisture-Conditioned Subgrade

After proof-rolling, and just prior to placement of fill, the exposed soil subgrade in all construction areas (except landscaping) should be evaluated for moisture and density through field density testing. If the moisture and/or density requirements do not meet the moisture and density requirements below, the subgrade should be scarified to a minimum depth of 6 inches, moisture conditioned and compacted as per the fill compaction requirements.

Temporary Groundwater Control

Although not encountered during our drilling operations, groundwater seepage is likely to be encountered during construction, especially after periods of wet weather. Temporary groundwater control during construction would typically consist of perimeter gravel-packed drains sloping toward common sump areas for groundwater collection and removal. Placement of drain laterals within the excavation could be required to remediate isolated water pockets.

Fill Material Types

Fill required to achieve design grade should be classified as select/structural fill and general fill. Select/structural fill is material used below, or within 5 feet of structures. General fill is material used to achieve grade in paving, non-reinforced earthen slopes, landscape, or other general

areas (non-structural areas). Earthen materials used for select fill and general fill should meet the following material property requirements:

Fill Type ¹	USCS Classification	Acceptable Specifications
Imported Select/Structural Fill ^{2,3}	CL, SC, and/or GC	<ul style="list-style-type: none"> ■ TxDOT Item 247, Type A, Grade 3, OR ■ Percent Retained on No. 4 Sieve \leq 40 percent with $7 \leq PI \leq 20$ and rocks \leq 4 inches in maximum dimensions, OR ■ Crushed concrete (TxDOT Item 247, Type D, Grade 3 or better)
Paving Fill and General Fill ⁴	CH, CL, SC and/or GC	<ul style="list-style-type: none"> ■ On-Site Soils: Rocks \leq 4 inches in maximum dimension ■ Imported Soils: $PI \leq 50$; Rocks \leq 4 inches in maximum dimension

1. Structural and general fill should consist of approved materials free of organic matter and debris. A sample of each material type should be submitted to the Geotechnical Engineer for evaluation prior to use on this site.
2. As an alternative to the Acceptable Specifications above, a low-plasticity granular material which does not meet these specifications may be used only if approved by Terracon.
3. Based on the laboratory testing performed during this exploration, the excavated onsite soils are not suitable for re-use as select fill. We do not recommend these soils be considered for re-use as select fill when planning budgets. Select fill will need to be imported.
4. Excavated on-site soils, if free of organics, debris, and rocks larger than 4 inches may be considered for re-use as fill in pavement, landscape, or other general areas. Please note that the on-site soils exhibit high to very high shrink/swell potential. For economic reasons, expansive soils are often used in pavement and/or flatwork areas. The owner should be aware that the risk exists for future movements of the subgrade soils which may result in movement and/or cracking of pavement and/or flatwork. If paving fill is imported, the PI should not exceed 50.

Fill Compaction Requirements

Recommended compaction and moisture content criteria for engineered fill materials are as follows.

Material Type		Minimum Compaction Requirement (%) ¹	Moisture Content Range (%)	Maximum Loose Lift Thickness (in) ²
Select/Structural Fill		95 ³	-3 to +3	8 inches
Moisture Conditioned Building Subgrade	PI \leq 25	95	-3 to +3	
	PI $>$ 25	92	+2 to +6	

Material Type		Minimum Compaction Requirement (%) ¹	Moisture Content Range (%)	Maximum Loose Lift Thickness (in) ²
Paving Fill, Paving Subgrade and General Fill	PI ≤ 25	95	-3 to +3	
	PI > 25	95	Optimum to +4	
Crushed Limestone Base (beneath pavements)		100 ⁴	-3 to +3	

1. Per the Standard Proctor Test (ASTM D 698).
2. Fill lift thickness must be reduced (typically 4 to 6 inches) if light compaction equipment is used, as is customary within a few feet of retaining walls and utility trenches.
3. **For fills greater than 5 feet in depth, if any, the compaction should be increased to at least 100 percent of the ASTM D 698 maximum dry unit weight.**
4. Per TEX-113-E.

Utility Trench Backfill

Leaking pipes underneath and/or near the foundations will increase the moisture content of the surrounding subgrade soils and will likely result in a PVR greater than discussed for these soils. For low permeability subgrades, utility trenches are a common source of water infiltration and migration. Utility trenches penetrating beneath the building should be effectively sealed to restrict water intrusion and flow through the trenches, which could migrate below the building. We recommend constructing an effective clay or flowable fill “trench plug” that extends at least 2 feet out from the face of the building exterior. The clay fill/flowable fill should be placed to completely surround the utility line and it should fill the utility trench completely in width and height, with the exception of topsoil at the surface. If clay plug is used, it should be fat clay with a minimum PI of 30 and should be compacted to comply with the water content and compaction recommendations for moisture conditioned building subgrade fill as specified in **Fill Compaction Requirements**. If flowable fill is used, it should be in accordance with TxDOT Item 401 or COA Item 402S.

In the event that the proposed structure is to be designed as structurally suspended slab without building pad preparation, utility lines will be placed in backfilled trenches surrounded by highly expansive clays capable of moving cyclically throughout the year as much as 6½ inches. This level of movement can lead to bending, cracking, or separation of utility connections. After surrounding the utility pipe with bedding material, utility trenches should be backfilled with similar soils as the surrounding subsurface (i.e. select fill within the building pad and on-site clays in landscaping and paving areas). In unpaved areas outside of the building, the utility trenches should be capped with a trench cap of fat clays at least 18 inches thick. Joints and connections to the building should be designed by the MEP as flexible connections to tolerate the potential soil movements. If the slab is elevated with a crawl space, the utilities could be hung from the bottom of the slab above the fat clay soils. Hanging utilities will still require flexible connections where they connect into underground portions of the utility.

Grading and Drainage

The performance of the proposed structure will not only be dependent upon the quality of construction, but also upon the stability of the moisture content of the near surface soils. Therefore, we highly recommend that site drainage be developed so that ponding of surface runoff near the structure does not occur. Accumulation of water near the structure may cause significant moisture variations in soils adjacent to the structure, thus increasing the potential for structural distress.

Effective drainage away from the structure must be provided during construction and maintained through the life of the proposed project. Infiltration of water into excavations should be prevented during construction. It is important that foundation soils are not allowed to become wetted. All grades must provide effective drainage away from the structure during and after construction. The most effective way to achieve this would be to provide concrete aprons (i.e., concrete sidewalks/pavements directly abutting the building) around the exterior perimeter of the structure for at least 6 feet (1 foot wider than the select fill overbuild). The concrete should be sloped to provide drainage away from the structure and all joints should be sealed, particularly those directly abutting the structure. In lieu of providing concrete aprons and if sloping unpaved ground is planned around the structure, then the select fill overbuild (recommended 5 feet beyond the building limits) should be excavated to a depth of at least 2 feet below final grades, removed and replaced with a minimum of 2 feet of moisture conditioned and compacted on-site fat clay soils. The fat clay soils should be compacted and moisture conditioned as per the **Fill Compaction Requirements** section of this report. This procedure is recommended to reduce the possibility of surface runoff infiltrating into the more pervious select fill soils and ponding below the proposed building. We would be glad to discuss other measures (e.g. horizontal or vertical barriers) to reduce moisture infiltration in unpaved areas, if desired. Exposed (unpaved) ground should be sloped at a minimum of 5 percent away from the structure for at least 10 feet beyond the perimeter of the structure. Locally, flatter grades may be necessary to transition ADA access requirement for flatwork.

Roof runoff and surface drainage should be collected and discharged away from the structure to prevent wetting of the foundation soils. Roof gutters should be installed and connected to downspouts and pipes directing roof runoff at least 10 feet away from the structure, or discharged on to positively sloped pavements.

Sprinkler mains and spray heads should preferably be located at least 5 feet away from the structure such that they cannot become a potential source of water directly adjacent to the structure. In addition, the owner and/or builder should be made aware that placing large bushes and trees adjacent to the structures may cause significant moisture variations in the soils underlying the structures. In general, tree roots can adversely influence the subsurface soil moisture content to a distance of 1 to 1½ times the mature height of the tree and beyond the tree canopy. Watering of vegetation should be performed in a timely and controlled manner and

prolonged watering should be avoided. Landscaped irrigation adjacent to the foundation units should be minimized or eliminated. Special care should be taken such that underground utilities do not develop leaks with time.

After building construction and landscaping, final grades should be verified to document effective drainage has been achieved. Grades around the structure should also be periodically inspected and adjusted as necessary as part of the structure's maintenance program. Where paving or flatwork abuts the structure, a maintenance program should be established to effectively seal and maintain joints and prevent surface water infiltration. Water permitted to pond next to the structure can result in greater soil movements than those discussed in this report. Estimated movements described in this report are based on effective drainage for the life of the structure and cannot be relied upon if effective drainage is not maintained.

Earthwork Construction Considerations

Excavations, for the proposed structure and utilities, are anticipated to be accomplished with conventional construction equipment. Upon completion of filling and grading, care should be taken to maintain the subgrade water content prior to construction of floor slabs. Construction traffic over the completed subgrades should be avoided as much as possible. The site should also be graded to prevent ponding of surface water on the prepared subgrades or in excavations. Water collecting over, or adjacent to, construction areas should be removed. If the subgrade desiccates, saturates, or is disturbed, the affected material should be removed, or the materials should be scarified, moisture conditioned, and recompacted, prior to floor slab construction.

As a minimum, excavations should be performed in accordance with OSHA 29 CFR, Part 1926, Subpart P, "Excavations" and its appendices, and in accordance with any applicable local, and/or state regulations.

Construction site safety is the sole responsibility of the contractor who controls the means, methods, and sequencing of construction operations. Under no circumstances shall the information provided herein be interpreted to mean Terracon is assuming responsibility for construction site safety, or the contractor's activities; such responsibility shall neither be implied nor inferred.

Construction Observation and Testing

The earthwork efforts should be documented under the direction of the Geotechnical Engineer. This should include documentation of adequate removal of vegetation and top soil, proof-rolling and mitigation of areas delineated by the proof-roll to require mitigation and density/moisture testing of subgrade and fills. In the event that unanticipated conditions are encountered, the Geotechnical Engineer should be contacted to evaluate the conditions.

Each lift of compacted fill should be tested, evaluated, and reworked as necessary until approved by the Geotechnical Engineer prior to placement of additional lifts. Fill should be tested for density and water content at a frequency of at least one test for every 5,000 square feet per lift of compacted fill in the building areas (with a minimum of 3 tests per lift) and 10,000 square feet per lift in pavement areas. A minimum of one density and water content test should be conducted for every 100 linear feet of compacted utility trench backfill in paving areas.

In addition to the documentation of the essential parameters necessary for construction, the continuation of the Geotechnical Engineer into the construction phase of the project provides the continuity to maintain the Geotechnical Engineer’s evaluation of subsurface conditions, including assessing variations and associated design changes.

SHALLOW FOUNDATIONS

If the site has been prepared in accordance with the requirements noted in **Earthwork** and **Building Subgrade Preparation**, the following design parameters are applicable for shallow foundations.

Design Parameters – Monolithic Slab-On-Grade

A monolithic slab-on-grade foundation system (either conventionally reinforced or post-tensioned) would be appropriate to support the proposed structure provided subgrade preparation as described in **Building Subgrade Preparation** is followed. The slab foundation design parameters presented in the tables below are based on the criteria published by the Building Research Advisory Board (BRAB), the Prestressed Concrete Institute (PCI), and the Wire Reinforcement Institute (WRI), and the Post-Tensioning Institute (PTI) 3rd Edition. These are essentially empirical design methods and the recommended design parameters are based on our understanding of the proposed project, our interpretation of the information and data collected as a part of this study, our area experience, and the criteria published in the BRAB, PCI, and WRI, and PTI design manuals.

Conventional Slab and Beam System Parameters	
Description	Design Parameter
Minimum Embedment of Grade Beams below Final Grade ¹	18 inches
Bearing Stratum	Select Fill
Bearing Pressures (allowable) ²	Net Dead plus Sustained Live Load – 1,700 psf Net Total Load – 2,500 psf
Subgrade Modulus (k) ³	100 pci

Conventional Slab and Beam System Parameters	
Description	Design Parameter
Approximate Potential Vertical Rise (PVR)	About 1-inch ^{4,5}
<ol style="list-style-type: none"> 1. Embedment is to reduce surface water migration below the foundation elements and to develop proper end bearing and is not based on structural considerations. The grade beam width and depth should be properly evaluated by the structural engineer. Grade beams may be thickened and widened at interior column locations to serve as spread footings at these concentrated load areas. 2. Grade beams should bear on compacted select fill. 3. Several design methods use the modulus of subgrade reaction, k, to account for soil properties in design of flat, floor slabs. The modulus of subgrade reaction is a spring constant that depends on the kind of soil, the degree of compaction, and the moisture content. Based on our recommendations provided in Building Subgrade Preparation, the above indicated subgrade modulus can be used for design of a flat, grade-supported floor slab. 4. Differential movements may result from variances in subsurface conditions, loading conditions and construction procedures. We recommend that measures be taken whenever practical to increase the tolerance of the building to post-construction foundation movements. An example of such measures would be to provide frequent control joints for exterior masonry veneers and interior sheetrock walls (particularly near doors and windows) to control cracking across such walls and concentrate movement along the joints. 5. The building subgrade should be properly prepared as described in Building Subgrade Preparation. 	

BRAB/WRI/PCI Parameters			
Description	Design Parameter		
Design Plasticity Index (PI) ¹	BRAB/WRI/PCI	Prepared Subgrade ²	31
Climatic Rating (C _w)	17		
Unconfined Compressive Strength	1.0 tsf		
Soil Support Index (C) for BRAB	Prepared Subgrade ²		0.83
<ol style="list-style-type: none"> 1. The BRAB effective PI is equal to the near surface PI if that PI is greater than all of the PI values in the upper 15 feet. If the near-surface PI is not highest (i.e., after the building pad is prepared), then the effective PI is the weighted average of the upper 15 feet. The WRI/PCI effective PI is always the weighted average of the PI values in the upper 15 feet. 2. The building subgrade should be properly prepared as described in Building Subgrade Preparation. 			

Post Tensioning Institute (PTI) Parameters ¹	
Description	Design Parameter
Depth of Seasonal Moisture Change ²	10 to 15 feet
Plasticity Index ³	Select Fill – 15 Stratum 1 Soils – 51 to 68 Stratum 2 Soils – 44 to 54

Post Tensioning Institute (PTI) Parameters ¹		
Description	Design Parameter	
Percent Finer than 2 Microns ³	Select Fill – 20 (estimated)	
	Stratum 1 Soils – 35 (estimated)	
	Stratum 2 Soils - 30 (estimated)	
Soil Fabric Factor	1.0	
Approximate Thornthwaite Moisture Index	-12	
Estimated Constant Soil Suction	3.5 pF	
Range of Soil Suction	3.0 to 4.5 pF	
Edge Moisture Variation Distance, e_m ^{4,5}	Center Lift	9.0 feet ⁶
	Edge Lift	4.5 feet ⁶
Differential Soil Movement, y_m ⁵	Center Lift	1.0 inches ⁶
	Edge Lift	1.4 inches ⁶

1. Based on our analysis of the field and laboratory data, design parameters were computed using the Addendum to the 2004 Post-Tensioning Institute (PTI) method¹ for slab-on-grade design and the subsequent Errata to the Addendum approved by the PTI Slab-on-Grade Committee on February 7, 2008.
2. The moisture beneath a shallow foundation will change in response to wetting and drying conditions around the foundation perimeter. The moisture condition has a significant effect on slab behavior and is highly variable with time, changing seasonally, with annual climate conditions, drainage patterns, ground cover, and vegetation (trees and shrubs).
3. The plasticity index and the clay mineral percentage are values of the soil that can be estimated by laboratory tests, and, although variable from location to location, remain relatively constant with time.
4. The maximum moisture variation distance is termed the edge moisture variation distance, e_m , and is an important factor governing the design of post-tensioned floor slabs. The e_m is related to percent fine clay and climatic conditions as well as other parameters, such as soil fabric factor and unsaturated diffusion coefficient.
5. The differential movements, y_m , and edge moisture variation distances, e_m , were calculated by modeling soil profiles using the commercial software program VOLFLO as recommended by the PTI manual.
6. Values may be used provided subgrade preparation is implemented as described in **Building Subgrade Preparation**.

Design Parameters – Footings

As an alternative to a monolithic slab-on-grade foundation system, spread/strip footings may be considered. Principal column and wall loads for the proposed structure may also be supported on

¹. Post-Tensioning Institute, "Addendum No. 1 to the 3rd Edition of the Design of Post-Tensioned Slabs-on-Ground", Post-Tensioning Institute, Phoenix, AZ, May 2007.

isolated (spread) and/or continuous (strip) footings. Design parameters for spread/strip footing foundations are provided below.

Description	Design Parameter
Bearing Stratum ¹	Select Fill
Minimum Embedment Below Final Grade ²	24 inches
Minimum Footing Dimensions	Spread – 3 feet by 3 feet square Strip – 18 inches wide
Allowable Bearing Pressures ^{3,4}	Net dead plus sustained live load – 1,700 psf Net allowable total load – 2,500 psf
Approximate Total Movement ⁵	1-inch
Estimated Differential Movement ⁶	½ to ¾ inch
Nominal (unfactored) Passive Resistance ⁷	330 psf per foot of depth
Coefficient of Sliding Resistance ⁸	0.35
Nominal (unfactored) Uplift Resistance ⁹	Foundation Weight (150 pcf) & Soil Weight (120 pcf)

1. Unsuitable or soft soils must be over-excavated and replaced per the recommendations presented in **Earthwork** and the building area should be prepared as per **Building Subgrade Preparation**.
2. To bear within select fill soils.
3. Whichever condition yields a larger bearing area.
4. Values provided are for maximum loads noted in **Project Description**.
5. The estimated post-construction settlement of the shallow footings is assuming proper construction practices are followed.
6. Differential settlements may result from variances in subsurface conditions, loading conditions and construction procedures. The settlement response of the footings will be more dependent upon the quality of construction than upon the response of the subgrade to the foundation loads.
7. Passive resistance should be neglected in the first 12 inches below finished grades. Care should be taken to avoid disturbance of the footing bearing area since loose material could increase settlement and decrease resistance to lateral loading. If the footing is formed during construction, the open space between the footings and the in-situ soils should be backfilled with concrete.
8. Lateral loads transmitted to the footings will be resisted by a combination of soil-concrete friction on the base of the footings and passive pressure on the side of the footings. We recommend that the allowable frictional resistance be limited to 500 psf.
9. The nominal values should be reduced by an appropriate factor of safety to compute allowable values.

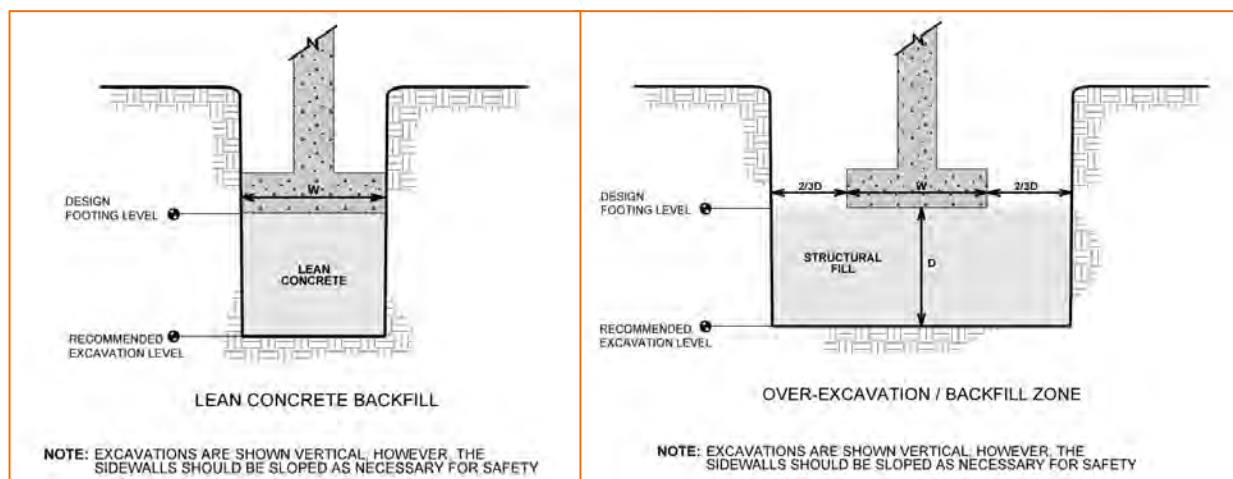

Foundation Construction Considerations

Footings/Grade beams should be neat excavated, if possible. If neat excavation is not possible, the foundation should be properly formed. If a toothed bucket is used, excavation with this bucket

should be stopped approximately 6 inches above final grade of the footings and the footing excavation be completed with a smooth-mouthed bucket or by hand labor. Debris in the bottom of the excavation should be removed prior to steel reinforcement placement. The foundation excavation should be sloped sufficiently to create internal sumps for runoff collection and removal. If surface runoff water or groundwater seepage in excess of ½-inch accumulates at the bottom of the foundation excavation, it should be collected, removed, and not allowed to adversely affect the quality of the bearing surface.

If utilized, the post-tensioned slab-on-grade construction technique should be carefully observed by qualified personnel. The sophistication of this construction procedure requires careful attention to details such as concrete integrity and anchorages, along with tendon spacing, support, covering, and stressing. Poor construction could result in a non-functional slab foundation system.

If unsuitable bearing soils are encountered at the base of the planned footing excavation (such as low strength or disturbed soils), the footing excavations should be deepened to expose suitable bearing materials. The footings could then bear directly on these soils at the lower level, on lean concrete backfill placed in the excavations, or on compacted structural fill backfilled in the excavations and compacted as in **Earthwork**. This is illustrated in the figure below.

Concrete should be placed as soon as possible after excavation to reduce bearing soil disturbance. Soils at bearing level that become disturbed or saturated should be removed prior to placing reinforcing steel and concrete. Adequate water control/dewatering system will aid in minimizing the need for over-excavation and backfill of any soils disturbed by prolonged exposure. It is important that the foundation subgrade not be disturbed by construction activities (e.g., setting forms and placing reinforcing steel). If disturbance occurs, we recommend that the disturbed soils be removed and that the foundation subgrade be protected with the placement of a lean concrete “mud mat”.

Foundation Construction Observation

The performance of the foundation system for the proposed structure will be highly dependent upon the quality of construction. Thus, we recommend that the foundation construction be monitored by Terracon to identify the proper bearing strata and depths and to help evaluate foundation construction. We would be pleased to develop a plan for foundation observation to be incorporated in the overall quality assurance program.

DEEP FOUNDATIONS

Drilled Pier Design Parameters

Soil design parameters are provided below in the **Drilled and Underreamed Pier Design Summary** table for the design of drilled and underreamed pier foundations. The values presented for allowable side friction and end bearing include a factor of safety.

Drilled and Underreamed Pier Design Summary	
Description	Drilled Pier Design Parameters
Bearing Stratum ¹	Stratum 2 soils
Minimum Embedment below FFE	20 feet
Minimum Pier Shaft Diameter	18 inches
End Bearing Pressure (net allowable) ²	Net dead plus sustained live load – 15,000 psf Net total load – 22,000 psf
Side Friction (net allowable) ³	800 psf
Ratio of Underream Diameter to Shaft Diameter ⁴	2:1 to 3:1
Estimated Uplift Force (nominal unfactored) ^{5,6,7}	30*D for prepared subgrade areas 65*D for unprepared subgrade areas
Minimum Percentage of Steel ^{5,6,7}	½ percent
Approximate Total Settlement ^{8,9}	1-inch maximum
Estimated Differential Settlement ^{8,9}	Approximately ½ to ¾ of total maximum

1. To bear within the Stratum 2 soils.
2. Whichever condition yields a larger bearing area.
3. Side friction should be neglected in the upper 10 feet of the pier in contact with soil and lower portion of the pier equal to one underream diameter above the bottom of the pier. Permanently cased pier sections, if any, may not be accounted towards the side friction capacity.
4. In addition to having an adequate bearing area to support compressive loads, the diameter of the underream should be large enough to overcome uplift forces on the pier without causing a local soil failure

to the overlying soils. We recommend that the ratio of an underream diameter to shaft diameter be larger than 2:1 to withstand uplift forces due to soil expansion. However, in no case should this ratio exceed 3:1.

5. The amount of reinforcing steel required can be computed by assuming that the dead load of the structure surcharges the pier, the above estimated force acts vertically on the shaft, and the minimum pier length and embedment is sufficient in withstanding the uplift on the pier itself. The amount of required steel, as calculated by the structural engineer, should extend the entire pier length and in no case should the percentage of steel be less than ½ percent. The equation for uplift force does not include a factor of safety.
6. Uplift force (in kips) is used to calculate pier reinforcing steel. The term “D” is the pier diameter in feet.
7. The recommended minimum embedment depth of the piers below FFE should be sufficient in withstanding soil-related uplift forces. Please note that the uplift force equation given above is intended for calculating the required reinforcing steel and is not intended for calculating pier embedment to overcome soil uplift forces. Additional reinforcing steel may be needed to resist external structural uplift forces.
8. Provided proper construction practices are followed. For adjacent piers, we recommend a minimum edge-to-edge spacing of at least 2 underream diameters (or 3 underream diameters center to center) based on the larger pier diameter of the two adjacent piers. In locations where this minimum spacing criterion cannot be accomplished, Terracon should be contacted to evaluate the locations on a case-by-case basis.
9. Will result from variances in the subsurface conditions, loading conditions and construction procedures, such as cleanliness of the bearing area or flowing water in the shaft.

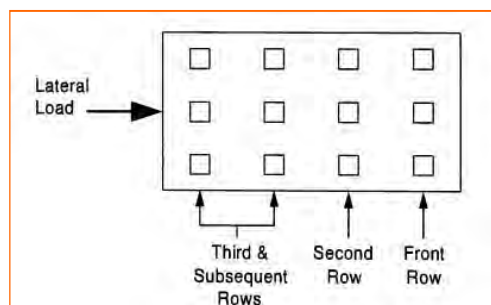

Drilled Pier Lateral Loading

The following table lists input values for use in LPILE analyses. LPILE will estimate values of k_h and E_{50} based on strength; however, non-default values of k_h should be used where provided. Since deflection or a service limit criterion will most likely control lateral capacity design, no safety/resistance factor is included with the following lateral parameters.

Stratum ^{1, 3}	L-Pile Soil Model	S_u (psf) ²	γ (pcf) ²	ϵ_{50} ²
1	Stiff Clay w/o Free Water	1,000	120	0.007
2	Stiff Clay w/o Free Water	3,000	125	0.005

1. See **Subsurface Profile** in **Geotechnical Characterization** for more details on Stratigraphy.
2. Definition of Terms:
 S_u : Undrained shear strength
 γ : Total unit weight
 ϵ_{50} : Non-default E50 strain
3. For modeling lateral resistance, we recommend that the upper 2 feet be ignored due to possible disturbance during construction, installation of utility trenches, installation of landscaping around the perimeter, and to possible changes to the site over time in future additions/expansions.

When piers are used in groups structurally connected together with a large pier cap or mat, the lateral capacities of the piers in the second, third, and subsequent rows of the group should be reduced as compared to the capacity of a single, independent shaft. Guidance for applying p-multiplier factors to the p values in the p-y curves for each row of pier foundations within a pier group are as follows:

- Front row: $P_m = 0.8$;
- Second row: $P_m = 0.4$
- Third and subsequent row: $P_m = 0.3$.

For the case of a single row of piers supporting a laterally loaded grade beam, group action for lateral resistance of piers would need to be considered when spacing is less than three pier diameters (measured center-to-center). However, spacing closer than $3D$ (where D is the diameter of the pier) is not recommended, due to potential for the installation of a new pier disturbing an adjacent installed pier, likely resulting in axial capacity reduction.

The load capacities provided herein are based on the stresses induced in the supporting soil strata. The structural capacity of the piers should be checked to assure they can safely accommodate the combined stresses induced by axial and lateral forces. Lateral deflections of piers should be evaluated using an appropriate analysis method, and will depend upon the pier's diameter, length, configuration, stiffness and "fixed head" or "free head" condition. We can provide additional analyses and estimates of lateral deflections for specific loading conditions upon request. The load-carrying capacity of piers may be increased by increasing the diameter and/or length.

Drilled Pier Construction Considerations

Drilled pier foundations should be augered and constructed in a continuous matter, per the current version of American Concrete Institute's "Standard Specification for the Construction of Drilled Piers" ACI 336. Concrete should be placed in the pier excavations following drilling, and evaluation for proper bearing stratum, embedment, and cleanliness. The piers should not be allowed to remain open overnight before concrete placement. Surface runoff or groundwater seepage accumulating in the excavation should be pumped out and the condition of the bearing surface should be evaluated immediately prior to placing concrete. Drilling equipment with

insufficient torque and/or augers/bits/core barrels that are not suited for variable conditions will likely result in poor production rates.

Although groundwater was not encountered during our field program, zones of groundwater inflow and/or sloughing soils are a possibility during pier construction at this site. Therefore, provisions should be incorporated into the plans and specifications to utilize casing to control sloughing and/or groundwater seepage during pier construction.

The use of casing should help to minimize groundwater inflow into the pier excavation. If soil sloughing or groundwater seepage is encountered at the proposed depth of a pier, it may be necessary to extend the excavation to a depth where the casing can control sloughing and/or seal off groundwater. If seepage persists even after casing installation and casing extension, the water should be pumped out of the excavation immediately prior to placing concrete. If groundwater inflow is too severe to be controlled by pumping, the concrete should be tremied to the full depth of the excavation to effectively displace the water. In this case, a “clean-out” bucket should be used to remove loose soil and/or rock fragments from the pier bottom before placing steel and concrete.

Concrete should exhibit slump as designated in Structural Engineer’s specifications. A design concrete slump of 6 to 8 inches helps to facilitate removal of casings and reduces the possibility of concrete arching/honeycombing. Under no circumstance should loose soil be placed in the space between the casing and the pier sidewalls. The concrete should be placed using a rigid tremie or by the free-fall method provided the concrete falls to its final position through air without striking the sides of the hole, the reinforcing steel cage, or any other obstruction. A drop chute should be used for this free-fall method.

While withdrawing casing, care should be exercised to maintain concrete inside the casing at a sufficient level to resist earth and hydrostatic pressures acting on the casing exterior. Arching of the concrete, loss of seal, mixing of the surrounding soil and water with fresh concrete, and other problems can occur during casing removal and result in contamination of the drilled shaft. These conditions should be considered during the design and construction phases. Placement of loose soil backfill should not be permitted around the casing prior to removal.

The drilled shaft installation process should be monitored under the direction of the Geotechnical Engineer. The Geotechnical Engineer should document the shaft installation process including soil and groundwater conditions encountered, consistency with expected conditions, and details of the installed shaft.

Grade Beams between Drilled Piers

Grade beams spanning between drilled piers may be cast at-grade provided the subgrade in the beam areas is prepared as outlined in **Building Subgrade Preparation**. Grade beams should be

designed to span across the drilled pier foundations without subgrade support, due to stress/strain incompatibility between different bearing materials at varying depths.

In the event that the proposed building is to be designed as structurally suspended slabs without building pad preparation, grade beams spanning between drilled piers should be protected from the expansive soil movement at this site. A minimum 12-inch void provided below the grade beams should allow the expansive clays to swell without causing distress in the grade beams. The sides of the void should be protected with permanent rigid soil retainers so that the soil will not slough beneath the grade beams and thus fill the void. The above also applies to any individual isolated piers, if any, outside of the building footprint. If these isolated piers are overlain by larger pier caps or grade beams, then those caps/beams should also be protected from the clays by using void forms.

We recommend that on-site fat clay soils ($LL \geq 50$; $PI > 30$) be utilized for backfill adjacent to grade beams/panels at the exterior surface of the structure (to reduce potential infiltration of surface water into the subgrade areas). The exterior backfill should be compacted as outlined in **Earthwork**. On the interior sides of the perimeter grade beams/panels, backfill should consist of properly compacted select fill or flowable fill (COA Item 402 or TxDOT Item 401), not sand or gravel. Compaction of select fill on the interior sides of beams or panels (i.e., the pour strips) should be performed by the Earthwork Contractor's personnel and equipment, not by concrete or utility contractors inexperienced with proper soil placements and compaction.

Foundation Construction Observation

The performance of the foundation system for the proposed structure will be highly dependent upon the quality of construction. Thus, we recommend that the foundation installation be monitored by Terracon to identify the proper bearing strata and depths and to help evaluate foundation construction. We would be pleased to develop a plan for foundation monitoring to be incorporated in the overall quality assurance program.

SEISMIC CONSIDERATIONS

The seismic design requirements for buildings and other structures are based on Seismic Design Category. Site Classification is required to determine the Seismic Design Category for a structure. The Site Classification is based on the upper 100 feet of the site profile defined by a weighted average value of either shear wave velocity, standard penetration resistance, or undrained shear strength in accordance with Section 20.4 of ASCE 7 and the International Building Code (IBC). Based on the soil properties encountered at the site and as described on the exploration logs and results, it is our professional opinion that the **Seismic Site Classification is D**. Subsurface explorations at this site were extended to a maximum depth of 25 feet. The site properties below the boring depth to 100 feet were estimated based on our experience and knowledge of geologic

conditions of the general area. Additional deeper borings or geophysical testing may be performed to confirm the conditions below the current boring depth.

BUILDING SUBGRADE PREPARATION

The subgrade soils are comprised of high to very high plasticity clays exhibiting the potential to shrink/swell with changes in water content. However, construction of the floor slab and revising site drainage creates the potential for gradual increased water contents within the clays. Increases in water content will cause the clays to swell and potentially damage the floor slab.

Due to the potential for significant moisture fluctuations of subgrade material beneath the select fill pad, the exposed final subgrade should be prepared as discussed in the first three sub-sections of **Earthwork**.

The most positive way to minimize the potential for foundation distress resulting from volumetric changes would be to suspend the building above the subgrade on drilled pier foundations with a crawl space or void boxes under the slab and beams. An alternative to this foundation type would be to prepare the subgrade to reduce the shrink/swell potential of the near-surface soils and use grade-supported floor slabs as mentioned below. Although subgrade preparation does help to reduce the shrink/swell potential of the subgrade, a degree of risk of subgrade movements (and corresponding foundation distress) remains if grade-supported floor slabs are to be utilized.

The following sections provide options for floor slab systems and the subgrade preparation for each system. One option is to use a structurally suspended floor slab system, which would not require any extensive subgrade preparation. The other option is a grade-supported floor slab system which would require extensive subgrade preparation.

The post-construction performance of the foundation will likely be influenced more by post-construction volumetric changes of the subgrade due to in-situ moisture variations than upon settlement due to foundation loads. Settlement response of select fill supported slabs will be influenced as much by the quality of construction and fill placements as by soil-structure interaction. Therefore, it is essential that the recommendations for foundation construction be strictly followed during the construction phases of the building pad and foundation.

Structurally Suspended Floor Slab System

For a structurally suspended floor slab system, we recommend a minimum 12-inch void space be provided beneath the floor slabs and the drilled pier foundation system be designed to carry the additional loads. When void forms are used, special care needs to be taken to avoid potential collapse during concrete placement.

The use of a structurally suspended floor slab in conjunction with drilled piers would eliminate the need for subgrade preparation as discussed in the following section. However, a higher uplift force would need to be considered for the drilled pier foundation system as mentioned in **Deep Foundations**.

Due to the absence of subgrade preparation, the native subgrade and/or general fill soils below the floor slab will be subject to drying and wetting during construction. This could lead to additional shrink/swell and possibly even construction access difficulties. To reduce this potential, we recommend either a thin (3 to 4 inches) non-reinforced mud slab or 6 to 8 inches of crushed limestone base material be installed as soon as possible over the exposed Stratum 1 soils and/or general fill once finished grades below the floor slab are established. If crushed limestone base is used the material will provide a better working surface for construction workers, equipment, and traffic, especially during and after periods of wet weather, but it is not intended to function as a capillary break or moisture barrier for the slab.

If the subgrade elevation beneath the floor slab is lower than that of the exterior ground surface in any areas, we recommend that a series of surface drains be placed such that water accumulating in the void space beneath the slab and the subgrade can be properly collected and removed. Sloping the subgrade toward these drains in a manner where water cannot accumulate adjacent to any of the foundation units is recommended. The above can also be accomplished by sloping the subgrade beneath and outside the building to provide positive drainage away from foundation units. In addition, proper ventilation should be provided to reduce the possibility that a high humidity environment could develop in the void space areas.

Any utilities that penetrate into the building subgrade should exhibit flexible connections such that any shrink/swell movements observed in the clays do not damage the utilities. Failure to implement flexible connections can cause damage to the utilities (i.e. bursting pipes). In addition, we recommend that in areas where utilities cross any grade beams, the top of the pipe be at least 6 inches below any void spaces beneath the grade beams.

Grade-Supported Floor Slab System

While the grade-supported floor slab option is not as effective as a structurally suspended floor slab in reducing slab movements, it does represent a compromise between economics and risk of slab distress. If a grade-supported floor slab is utilized, we recommend that the soils immediately below the lowest-level slab be prepared as stated below to reduce the potential for foundation movements associated with volumetric changes of the underlying clay soils due to moisture variation. If drilled piers are the foundation system used, grade beams should continue to be designed as mentioned in **Deep Foundations**.

A select fill pad combined with a moisture conditioned clay subgrade may be implemented in order to reduce post-construction shrink/swell movements to approximately 1-inch. The table below

provides options for various preparation options depending on the amount of select fill desired below the bottom of the floor slab.

Preparation Option	Select Fill Thickness, feet	Moisture Conditioned Clay Thickness (below select fill), feet	Total Building Pad Thickness, feet
1	9	0.5	9.5
2	8	2	10
3	7	4	11

1. As an example, if option 3 is selected, we recommend that the on-site clay soils be removed to a depth of 11 feet below the bottom of the floor slab. At least 4 feet of the excavated soils should be moisture conditioned as outlined in **Earthwork**. The moisture conditioned clay soils should not be allowed to dry out prior to subsequent lift placements. For option 3, select fill should be placed as outlined in **Earthwork** in order to provide a select fill pad of 7 feet below the floor slab.

The exposed building subgrade should be proof-rolled as discussed in **Earthwork**, prior to placement of the moisture conditioned subgrade. The above subgrade preparation recommendations should be applied to an area extending a minimum of 5 feet outside of building areas including attached walkways and any other architectural members. We suggest the use of crushed limestone base in the upper 6 inches of the select fill pad from a standpoint of construction access during wet weather, as well as from a standpoint of floor slab support.

For any flatwork (sidewalk, ramps, etc.) outside of the building area which will be sensitive to movement, subgrade preparation as discussed above should be considered to reduce differential movements between the flatwork and the adjacent building. If subgrade preparation as given above for building areas is not implemented in the exterior flatwork areas, those areas may be susceptible to post-construction movements in excess of that given above.

The potential movement values indicated are based upon moisture variations in the subgrade due to circumstances such as moisture increases due to rainfall and loss of evapotranspiration. In circumstances where significant water infiltration beneath the floor slab occurs (such as a leaking utility line or water seepage from outside the buildings resulting from poor drainage), movements in isolated floor slab areas could potentially be in excess of those indicated in this report.

Where floor slabs are tied to perimeter walls or turn-down slabs to meet structural or other construction objectives, our experience indicates differential movement between the walls and slabs will likely be observed in adjacent slab expansion joints or floor slab cracks beyond the length of the structural dowels. The Structural Engineer should account for potential differential settlement through use of sufficient control joints, appropriate reinforcing or other means. Saw-cut control joints should be placed in the slab to help control the location and extent of cracking. For additional recommendations refer to the ACI Design Manual.

Although the indicated preparation options are anticipated to reduce cracking in the floor slab, differential movements at entryways may cause difficulty in opening and closing doors. If the floor

slab is doweled into the perimeter grade beams to control movement, the resulting soil pressures may cause cracks to develop inside of the dowel bars, adjacent to the exterior walls. However, if the floor is not doweled at these locations, a “trip hazard” could result due to the resulting differential movements at entry ways, and difficulty in opening and closing doors could develop.

The use of a vapor retarder should be considered beneath concrete slabs on grade covered with wood, tile, carpet, or other moisture sensitive or impervious coverings, or when the slab will support equipment sensitive to moisture. When conditions warrant the use of a vapor retarder, the slab designer should refer to ACI 302 and/or ACI 360 for procedures and cautions regarding the use and placement of a vapor retarder.

Floor Slab Construction Considerations

Design recommendations for floor slabs assume the requirements in **Earthwork** have been followed. Specific attention should be given to positive drainage away from the structure and positive drainage of the subgrade and select fill pad beneath the floor slab.

Finished subgrade within and for at least 10 feet beyond the floor slab should be protected from traffic, rutting, or other disturbance and maintained in a relatively moist condition until floor slabs are constructed. If the subgrade should become damaged or desiccated prior to construction of floor slabs, the affected material should be removed and structural fill should be added to replace the resulting excavation. Final conditioning of the finished subgrade should be performed immediately prior to placement of the floor slab support course. Attention should be paid to high traffic areas that were rutted and disturbed earlier, and to areas where backfilled trenches are located.

LATERAL EARTH PRESSURES

Design Parameters

Site retaining walls with unbalanced backfill levels on opposite sides should be designed for earth pressures at least equal to values indicated in the following table. Earth pressures will be influenced by structural design of the walls, conditions of wall restraint, methods of construction and/or compaction and the strength of the materials being restrained. Two wall restraint conditions are shown. Active earth pressure is commonly used for design of free-standing cantilever retaining walls and assumes wall movement. The "at-rest" condition assumes no wall movement and is commonly used for basement walls, loading dock walls, or other walls restrained at the top. The recommended design lateral earth pressures do not include a factor of safety and do not provide for possible hydrostatic pressure on the walls (unless stated). The recommendations in this section apply to those walls (i.e., double-formed walls) which are installed in open cut or embankment fill areas such that the backfill extends out from the base at an angle of at least 45 degrees from vertical for the entire height and length of the wall.

Lateral Earth Pressure Design Parameters				
Backfill Type	Estimated Total Unit Weight, pcf ¹	Lateral Earth Pressure Coefficients ^{2, 3}		
		At Rest, K _o	Active, K _A	Passive, K _P
Crushed Limestone	135	0.45	0.3	3.5
Clean Sand	120	0.5	0.35	3.0
Clean Gravel	120	0.45	0.3	3.5
Granular Select Fill	130	0.47	0.32	3.2

1. Compaction should be maintained between 95 and 100 percent of Standard Proctor (ASTM D 698) maximum dry density. Overcompaction can produce lateral earth pressure coefficients in excess of those provided.
2. For active earth pressure, wall must rotate about base, with top lateral movements 0.002 H to 0.004 H, where H is wall height. For passive earth pressure, wall must move horizontally to mobilize resistance.
3. Coefficients represent nominal (unfactored) values. Appropriate safety factors should be applied.

The above values do not include a hydrostatic or ground-level surcharge component. To prevent hydrostatic pressure build-up, retaining walls should incorporate functional drainage (via free-draining aggregate or manufactured drainage mats) within the backfill zone. The effect of surcharge loads, where applicable, should be incorporated into wall pressure diagrams by adding a uniform horizontal pressure component equal to the applicable lateral earth pressure coefficient times the surcharge load, applied to the full height of the wall.

All retaining walls should be checked against failure due to overturning, sliding and overall slope stability. Such an analysis can only be performed once the dimensions of the wall and cut/fill scenarios are known. For retaining wall bearing capacity design, we recommend the following parameters.

Bearing Material	Coefficient of Sliding Resistance	Maximum Allowable Sliding Resistance, psf	Maximum Allowable Footing Bearing Pressure, psf
On-site Soils ^{1,2}	0.3	300	2,000
Select Fill ³	0.35	500	2,500

1. There exists a higher movement potential for any retaining walls bearing on the on-site soils (up to 6½ inches). If lower movement potential is desired, please contact us so that we may provide additional recommendations.
2. Frequent joints should be provided throughout the length of the retaining wall to reduce cracking due to differential movements caused by the shrink/swell movement of the fat clay subgrade.
3. If the subgrade is prepared as recommended in **Building Subgrade Preparation**, the values for Select Fill may be considered.

We recommend that a “buffer zone” of at least 5 feet wide be applied between pavement areas and retaining walls (with a minimum height of 4 feet or more). This buffer zone should be increased to 10 feet for building areas. These recommended buffer zones are to reduce the potential of distress from any long-term (“creep”) movements of the wall and backfill. Pedestrian sidewalks may be exempted from the above criteria, however some distress could still be observed in the sidewalks due to movements of the retaining walls and backfill.

Subsurface Drainage for Site Retaining Walls

A perforated rigid plastic drain line installed behind the base of walls and extending below adjacent grade is recommended to prevent hydrostatic loading on the walls. The invert of a drain line around an exterior retaining wall should be placed near foundation bearing level. The drain line should be sloped to provide positive gravity drainage to daylight or to a sump pit and pump. The drain line should be surrounded by clean, free-draining granular material having less than 10 percent passing the No. 8 sieve, such as No. 57 aggregate. The free-draining aggregate should be encapsulated in a filter fabric. The granular fill should extend to within 2 feet of final grade, where it should be capped with compacted cohesive fill to reduce infiltration of surface water into the drain system.

As an alternative to free-draining granular fill, a pre-fabricated drainage structure may be used. A pre-fabricated drainage structure is a plastic drainage core or mesh which is covered with filter fabric to prevent soil intrusion and is fastened to the wall prior to placing backfill.

PAVEMENTS

General Pavement Comments

Pavement designs are provided for the traffic conditions and pavement life conditions as noted in the following sections of this report. A critical aspect of pavement performance is site preparation. Pavement designs, noted in this section, must be applied to the site, which has been prepared as recommended in the **Earthwork** section.

Pavement designs are intended to provide structural sections with adequate thickness over a particular subgrade such that wheel loads are reduced to a level the subgrade can support. Support characteristics of the subgrade for pavement design do not account for shrink/swell movements of an expansive clay subgrade, such as the Stratum 1 soils encountered on this project. Thus, the pavement may be adequate from a structural standpoint, yet still experience cracking and deformation due to shrink/swell related movement of the subgrade. It is therefore important to minimize moisture changes in the subgrade to reduce shrink/swell movements. Proper site perimeter drainage should be provided so that infiltration of surface water from unpaved areas surrounding the pavement is minimized.

Lime treatment of the Stratum 1 fat clay subgrade is suggested to enhance the workability and support characteristics of the subgrade as well as to provide a barrier to reduce moisture infiltration in the underlying clay subgrade. The lime treatment also helps to reduce the shrink/swell potential of the lime-treated layer. We should note that if lime treatment is planned, we recommend that the subgrade soils be investigated for the presence of sulfates during construction. Excessive concentrations of sulfates in the soils can result in poor performance of

lime-treated subgrade. Based on numerous research studies performed by education institutions, regulatory agencies, and both public and private entities, soils that contain significant amounts of soluble sulfates are not optimal candidates for lime treatment and may result in excessive heave and subsequent distress to the pavements. Soluble sulfate levels of up to 3,000 ppm or less are generally considered to be acceptable for lime treatment. Soluble sulfate levels between 3,000 ppm and 10,000 ppm in clay soils are generally considered to be moderate to high and pose a greater risk to successful traditional lime treatment. In our prior experience near this site vicinity, the Stratum 1 dark brown to brown clays typically have lower sulfate content levels than the underlying Stratum 2 light brown to tan clays; thus if lime treatment is implemented, we suggest that only the Stratum 1 dark brown to brown clays be used with lime.

Although lime treatment of the subgrade will likely reduce differential movement and heave in the new pavement system, some differential movement will likely occur. Cracking of the concrete pavement due to differential movements should be expected.

Pavement Design Parameters

Design of Asphaltic Concrete (HMAC) pavements are based on the procedures outlined in the 1993 Guideline for Design of Pavement Structures by the American Association of State Highway and Transportation Officials (AASHTO-1993). Design of Portland Cement Concrete (PCC) pavements are based upon American Concrete Institute (ACI) 330R-01; Guide for Design and Construction of Concrete Parking Lots.

Detailed traffic loads and frequencies were not available, however we anticipate that traffic will consist primarily of passenger vehicles in the parking areas and passenger vehicles combined with emergency vehicles, occasional garbage trucks, service and delivery trucks in driveways. If heavier traffic loading is expected or other traffic information is available, Terracon should be provided with the information and allowed to review the pavement sections provided herein. Tabulated below are the assumed traffic frequencies and loads used to design pavement sections for this project.

Pavement Area	Traffic Design Index	Description
Parking Areas (Passenger Vehicles Only)	DI-1	Light traffic – (ESALs ¹ <5) Passenger cars and pickup trucks, no regular use by heavily loaded two axle trucks or lightly loaded larger vehicles.
Driveways	DI-2 ²	Light to medium traffic – (5≤ESALs≤20) Passenger cars and pickup trucks with no more than 50 heavily loaded two-axle trucks or lightly loaded three axle trucks per day. No regular use by heavily loaded trucks with three or more axles.

1. 18-kip equivalent single axle load applications.

2. For Fire Lanes to withstand the occasional HS-20 loading of 32,000 pounds per axle and up to 90,000-pound gross truck weight, use DI-2 pavements or thicker.

Pavement Section Thicknesses

The following tables provides options for HMAC and PCC pavement sections.

Asphaltic Concrete Design				
Layer	Thickness (inches)			
	DI-1		DI-2	
	Option 1A	Option 1B	Option 2A	Option 2B
Asphaltic Concrete (HMAC)	2.0	2.0	2.5	2.5
Crushed Limestone Base	12.0	15.0	13.0	16.0
Lime Treated Subgrade ¹	8.0	-	8.0	-
Moisture Conditioned Subgrade	-	6.0	-	6.0

1. In our prior experience near this site vicinity, the Stratum 1 dark brown to brown clays typically have lower sulfate content levels than the underlying Stratum 2 light brown to tan clays; thus if lime treatment is implemented, we suggest that only the Stratum 1 dark brown to brown clays be used with lime.

Portland Cement Concrete Design		
Layer	Thickness (inches)	
	DI-1	DI-2 ¹
Reinforced Concrete (PCC)	5	6
Moisture Conditioned Subgrade	6	6

1. For the DI-2 traffic loading conditions, the reinforced concrete thickness may be reduced by ½ inch if the clay subgrade is lime treated to a depth of at least 8 inches instead of moisture conditioned
2. We recommend that dumpster pads and loading dock areas be constructed of at least 7-inches of reinforced concrete pavement. The concrete pad areas should be designed so that the vehicle wheels of the collection truck are supported on the concrete while the dumpster is being lifted to support the large wheel loading imposed during waste collection. Dumpster areas that are not designed in this manner often experience localized failures due to large wheel loading imposed during waste collection. Reinforced concrete pavements typically result in better performance and less maintenance than flexible pavement systems in these truck areas.

Rigid PCC pavements will perform better than HMAC pavements in areas where short-radii turning and braking are expected (i.e. entrance/exit aprons) due to better resistance to rutting and shoving. In addition, PCC pavements will perform better in areas subject to large or sustained loads, such as loading docks, dumpster enclosures, and loading/unloading areas.

Areas for parking of heavy vehicles, concentrated turn areas, and start/stop maneuvers could require thicker pavement sections. Edge restraints (i.e. concrete curbs or aggregate shoulders) should be planned along curves and areas of maneuvering vehicles. As an option, thicker sections could be constructed to decrease future maintenance.

Pavement Materials

Presented below are our recommended material requirements for the various pavement sections.

Item	Value
Hot Mix Asphaltic Concrete (HMAC) ¹	Plant mixed, hot laid Type D (Fine-Grade Surface Course) meeting the specifications in TxDOT Item 340 or COA Item 340.
Reinforced Portland Cement Concrete (PCC)	28-day flexural strength (third-point loading) ≥ 500 psi, or 28-day compressive strength ≥ 3,500 psi
Crushed Limestone Base ²	TxDOT Item 247, Type A, Grade 1-2 or COA Item 210 compacted as outlined in Earthwork .
Lime Treated Subgrade ^{3,4}	If soil subgrade consists of high PI (≥30) with ≤ 15% gravel, lime treatment as per TxDOT Item 260 is applicable either through dry placement or slurry placement.
Moisture Conditioned Subgrade ⁵	As outlined in Earthwork .

1. For acceptance and payment evaluation purposes, we recommend the use of the provisions in COA Item 340.
2. Each lift of base should be thoroughly proof-rolled just prior to placement of subsequent lifts and/or asphalt. Particular attention should be paid to areas along curbs, above utility trenches, and adjacent to landscape islands, manholes, and storm drain inlets. Preparation of the base material should extend at least 24 inches behind curbs.
3. We anticipate that approximately 6 to 10 percent hydrated lime will be required to treat the subgrade soils. We suggest 8% lime be used for bidding purposes with add/deduct line items for 1 to 2% lime above or below the base bid items. Prior to the application of lime to the subgrade, the optimum percentage of lime to be added should be determined based on Plasticity Index (TEX-112-E) and/or pH (ASTM D 6276) laboratory tests conducted on mixtures of the subgrade soils with lime. Subgrade soil samples should be obtained from the pavement areas at the proposed final subgrade elevation. Please note that these tests require up to 5 business days to complete.
4. The lime should initially be blended with a mixing device such as a Pulvermixer, sufficient water added, and allowed to cure for at least 48 hours. After curing, mixing should continue until gradation requirements of TxDOT Item 260.4 are achieved. The mixture should then be moisture adjusted and compacted as outlined in Earthwork. Preparation of the lime-treated subgrade should extend at least 24 inches behind curbs, or edge of pavements, whichever is greater.
5. Subgrade should not dry out or become saturated prior to pavement construction. The pavement subgrade should be thoroughly proof-rolled as outlined in **Earthwork**. Particular attention should be paid to areas along curbs, above utility trenches, and adjacent to landscape islands, manholes, and storm drain inlets. Preparation of the moisture conditioned subgrade should extend at least 24 inches behind curbs.

Presented below are our recommendations for the construction of the reinforced concrete pavements.

Item	Value
Reinforcing Steel	#3 bars spaced at 18 inches on center in both directions. Rebar should be placed at midpoint of concrete section and supported on chairs prior to concrete placement.
Control (i.e., Contraction) Joint Spacing	In accordance with ACI 330R, control joints should be spaced no greater than 12.5 feet for 5-inch thick concrete and 15 feet for 6-inch thick or greater concrete. If sawcut, control joints should be cut within 6 to 12 hours of concrete placement. Sawcut joint should be at least ¼ of the slab thickness.
Expansion (i.e., Isolation) Joint Spacing	ACI 330R indicates that regularly spaced expansion joints may be deleted from concrete pavements, except adjacent to structures, manholes, inlets, light poles, etc. Therefore, the installation of expansion joints is optional and should be evaluated by the design/construction team. Expansion joints, if not sealed and maintained can allow infiltration of surface water into the subgrade.
Dowels at Expansion Joints	¾-inch smooth bars, 18 inches in length, with one end treated to slip, spaced at 12 inches on centers at each joint, and placed level at midpoint of concrete section.

Pavement Drainage

On most projects, rough site grading is accomplished relatively early in the construction phase. Fills are placed and compacted in a uniform manner. However, as construction proceeds, excavations are made into these areas, dry weather may desiccate some areas, rainfall and surface water saturates some areas, heavy traffic from concrete and other delivery vehicles disturbs the subgrade, and many surface irregularities are filled in with loose soils to temporarily improve subgrade conditions. As a result, the pavement subgrade should be carefully evaluated as the time for pavement construction approaches. This is particularly important in and around utility trench cuts. All pavement areas should be moisture conditioned and properly compacted to the recommendations in this report immediately prior to paving. Thorough proof-rolling of pavement areas should be performed no more than 36 hours prior to surface paving. Proof-rolling should be repeated if the site received rainfall prior to paving. Any problematic areas should be reworked and compacted at that time.

Openings in pavements, such as landscaped islands, are sources for water infiltration into surrounding pavement systems. Water can collect in the islands and migrate into the surrounding subgrade soils thereby degrading support of the pavement. This is especially applicable for islands with raised concrete curbs, irrigated foliage, and low permeability near-surface soils. The

civil design for the pavements with these conditions should include features to restrict or to collect and discharge excess water from the islands. Examples of features are self-contained planters, edge drains connected to the storm water collection system, longitudinal subdrains, or other suitable outlet, and impermeable barriers preventing lateral migration of water such as a cutoff wall installed to a depth below the pavement structure.

Pavements should be sloped to provide rapid drainage of surface water. Water allowed to pond on or adjacent to the pavements could saturate the subgrade and contribute to premature pavement deterioration. In addition, the pavement subgrade should be graded sufficiently to provide positive drainage within the granular base section.

Pavement Maintenance

The pavement sections represent minimum recommended thicknesses and, as such, periodic maintenance should be anticipated. Therefore, preventive maintenance should be planned and provided for through an on-going pavement management program. Maintenance activities are intended to slow the rate of pavement deterioration and to preserve the pavement investment. Maintenance consists of both localized maintenance (e.g. crack and joint sealing and patching) and global maintenance (e.g. surface sealing). Preventive maintenance is usually the priority when implementing a pavement maintenance program. Additional engineering observation is recommended to determine the type and extent of a cost-effective program. Even with periodic maintenance, some movements and related cracking may still occur and repairs may be required.

Pavement performance is affected by its surroundings. In addition to providing preventive maintenance, the civil engineer should consider the following recommendations in the design and layout of pavements:

- Final grade adjacent to paved areas should slope down from the edges at a minimum 2%.
- Subgrade and pavement surfaces should have a minimum 2% slope to promote proper surface drainage.
- Install perimeter pavement drainage systems (i.e., French drains) surrounding areas anticipated for frequent wetting.
- Install joint sealant and seal cracks immediately.
- Seal all landscaped areas in or adjacent to pavements to reduce moisture migration to subgrade soils.
- Place compacted, low permeability backfill against the exterior side of curb and gutter.
- Construct curb, gutter and/or sidewalk directly on clay subgrade soils rather than on granular base course materials.

SLOPE STABILITY

Cut Slopes

The table below provides the recommended slope inclinations for both permanent cut slopes and temporary cut slopes. In our opinion, cut slopes at the inclinations discussed below should be stable against a large-scale slide, however the potential for sloughing of loose soils zones exists.

Slope Type	Maximum Slope Inclinations
Temporary	1½(H):1(V) in on-site soils
Permanent	3(H):1(V) in on-site soils ¹

1. For slopes to be used by mowers or other maintenance equipment, slightly flatter 4H:1V slopes are generally preferable.

Exposed cut slopes will also be susceptible to further erosion due to the nature of the on-site soils. Installation of erosion control measures in such areas would be beneficial in reducing the potential slope stability which could result from excessive erosion. In addition to initial erosion control measures, the cut slopes should be periodically checked for erosion (particularly after heavy rainfall events) and maintenance performed on areas exhibiting erosion.

In regards to worker safety, Occupation Safety and Health Administration (OSHA) Safety and Health Standards require the protection of workers adjacent to excavations. The OSHA guidelines and directives should be adhered by the Contractor during construction to provide a safe working environment.

Buffer Zones Adjacent to Cut Slopes

Excavation methods could result in decreased slope stability. To allow for some sloughing to occur, we recommend that a “buffer zone” at least 5 feet wide adjacent to pavement and other general areas be provided between the proposed construction areas and the permanent cut slopes (both at the toe and the crest). If buildings are planned near these areas, the buffer zones should be increased to at least 10 feet. This should help reduce the possibility of sloughing soils/rock from contacting the adjacent improvements on the downhill side and from undermining the improvements on the uphill side.

Embankment Fill Slopes

The table below provides the recommended slope inclinations for embankment fill slopes.

Slope Type	Maximum Slope Inclinations
Embankment Fill Slopes ^{1,2}	3(H):1(V) ³

1. For slopes to be used by mowers or other maintenance equipment, slightly flatter 4H:1V slopes are generally preferable.
2. Fill placement for the embankments should proceed as outlined in **Earthwork**.
3. If steeper permanent slopes in cuts or embankments (natural soils or fill soils) are planned for final grading, then additional services will be required by Terracon to perform detailed slope stability analyses.

The embankment slopes should be properly protected from erosion. The use of rock rip-rap, erosion control fabrics, and/or vegetation is common. In addition to initial erosion control measures, the embankments should be periodically checked for erosion (particularly after heavy rainfall events) and maintenance performed on areas exhibiting erosion.

GENERAL COMMENTS

Our analysis and opinions are based upon our understanding of the project, the geotechnical conditions in the area, and the data obtained from our site exploration. Natural variations will occur between exploration point locations or due to the modifying effects of construction or weather. The nature and extent of such variations may not become evident until during or after construction. Terracon should be retained as the Geotechnical Engineer, where noted in this report, to provide observation and testing services during pertinent construction phases. If variations appear, we can provide further evaluation and supplemental recommendations. If variations are noted in the absence of our observation and testing services on-site, we should be immediately notified so that we can provide evaluation and supplemental recommendations.

Our Scope of Services does not include either specifically or by implication any environmental or biological (e.g., mold, fungi, bacteria) assessment of the site or identification or prevention of pollutants, hazardous materials or conditions. If the owner is concerned about the potential for such contamination or pollution, other studies should be undertaken.

Our services and any correspondence or collaboration through this system are intended for the sole benefit and exclusive use of our client for specific application to the project discussed and are accomplished in accordance with generally accepted geotechnical engineering practices with no third-party beneficiaries intended. Any third-party access to services or correspondence is solely for information purposes to support the services provided by Terracon to our client. Reliance upon the services and any work product is limited to our client, and is not intended for third parties. Any use or reliance of the provided information by third parties is done solely at their own risk. No warranties, either express or implied, are intended or made.

Site characteristics as provided are for design purposes and not to estimate excavation cost. Any use of our report in that regard is done at the sole risk of the excavating cost estimator as there

may be variations on the site that are not apparent in the data that could significantly impact excavation cost. Any parties charged with estimating excavation costs should seek their own site characterization for specific purposes to obtain the specific level of detail necessary for costing. Site safety, and cost estimating including, excavation support, and dewatering requirements/design are the responsibility of others. If changes in the nature, design, or location of the project are planned, our conclusions and recommendations shall not be considered valid unless we review the changes and either verify or modify our conclusions in writing.

GEOMODEL

Southeast Travis County Wellness Center ■ Austin, TX
 Terracon Project No. 96205256

This is not a cross section. This is intended to display the Geotechnical Model only. See individual logs for more detailed conditions.

Model Layer	Layer Name	General Description
1	Surficial Fat Clays	Dark brown to brown to grayish brown, medium stiff to hard, Fat Clay (CH)
2	Deeper Fat Clays	Light brown to orangish brown to tan, very stiff to hard, Fat Clay (CH)

LEGEND

- Fat Clay
- Fat Clay with Gravel

NOTES:
 Layering shown on this figure has been developed by the geotechnical engineer for purposes of modeling the subsurface conditions as required for the subsequent geotechnical engineering for this project. Numbers adjacent to soil column indicate depth below ground surface.

ATTACHMENTS

EXPLORATION AND TESTING PROCEDURES

Field Exploration

Central Health prescribed the following number of boring and depths.

Planned Location	Number of Borings	Planned Boring Depth (feet) ¹
Proposed Building Area	6	25 feet
Proposed Parking/Driveway Area	4	10 feet
TOTAL	10	Maximum Footage of 190 feet

1. Below ground surface.

Boring Layout and Elevations: Unless otherwise noted, Terracon personnel provided the boring layout. Coordinates were obtained with a handheld GPS unit (estimated horizontal accuracy of about ± 10 feet) and approximate elevations were obtained by interpolation from a Topographic Survey dated August 21, 2020. If elevations and a more precise boring layout are desired, we recommend borings be surveyed following completion of fieldwork.

Subsurface Exploration Procedures: We advanced the borings with a truck-mounted rotary drill rig using continuous flight augers (solid stem and/or hollow stem, as necessary, depending on soil conditions). Four to five samples were obtained in the upper 10 feet of each boring and at intervals of 5 feet thereafter. Soil sampling was performed using thin-wall tube (shelby tubes) and/or split-barrel sampling procedures. The split-barrel samplers were driven in accordance with the standard test method for standard penetration test (SPT) and split-barrel sampling of soils (ASTM D1586/D1886M-18). We observed and recorded groundwater levels during drilling and sampling. For safety purposes, all borings were backfilled with auger cuttings after their completion.

The sampling depths, penetration distances, and other sampling information were recorded on the field boring logs. The samples were placed in appropriate containers and taken to our soil laboratory for testing and classification by a Geotechnical Engineer. Our exploration team prepared field boring logs as part of the drilling operations. These field logs included visual classifications of the materials encountered during drilling and our interpretation of the subsurface conditions between samples. Final boring logs were prepared from the field logs. The final boring logs represent the Geotechnical Engineer's interpretation of the field logs and include modifications based on observations and tests of the samples in our laboratory.

Laboratory Testing

The project engineer reviewed the field data and assigned laboratory tests to understand the engineering properties of the various soil strata, as necessary, for this project. Procedural

Geotechnical Engineering Report

February 24, 2021 ■ Terracon Project No. 96205256

standards noted below are for reference to methodology in general. In some cases, variations to methods were applied because of local practice or professional judgment. Standards noted below include reference to other, related standards. Such references are not necessarily applicable to describe the specific test performed.

- ASTM D2216 Standard Test Methods for Laboratory Determination of Water (Moisture) Content of Soil and Rock by Mass
- ASTM D4318 Standard Test Methods for Liquid Limit, Plastic Limit, and Plasticity Index of Soils
- ASTM D422 Standard Test Method for Particle-Size Analysis of Soils
- ASTM D2166/D2166M Standard Test Method for Unconfined Compressive Strength of Cohesive Soil
- ASTM D4546 Standard Test Method for One-Dimensional Swell or Collapse of Soils

The laboratory testing program often included examination of soil samples by an engineer. Based on the material's texture and plasticity, we described and classified the soil samples in accordance with the Unified Soil Classification System.

			10.0	484+/-		3.0 tsf (HP)								
		Boring Terminated at 10 Feet	10											

Stratification lines are approximate. In-situ, the transition may be gradual.

Hammer Type: Automatic

Advancement Method:
Dry Augered 0 to 10 feet

See [Exploration and Testing Procedures](#) for a description of field and laboratory procedures used and additional data (If any).

Notes:

Abandonment Method:
Boring backfilled with Auger Cuttings and/or Bentonite

See [Supporting Information](#) for explanation of symbols and abbreviations.

Approximate surface elevation from Topographic Survey dated 08/21/20

WATER LEVEL OBSERVATIONS

No free water observed

General Notes

Unified Soil Classification System

City of Austin (COA) MSWL Form

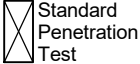

Note: All attachments are one page unless noted above.

GENERAL NOTES

DESCRIPTION OF SYMBOLS AND ABBREVIATIONS

Southeast Travis County Wellness Center ■ Austin, TX

Terracon Project No. 96205256

SAMPLING	WATER LEVEL	FIELD TESTS
 Shelby Tube  Standard Penetration Test	 Water Initially Encountered  Water Level After a Specified Period of Time  Water Level After a Specified Period of Time  Cave In Encountered Water levels indicated on the soil boring logs are the levels measured in the borehole at the times indicated. Groundwater level variations will occur over time. In low permeability soils, accurate determination of groundwater levels is not possible with short term water level observations.	N Standard Penetration Test Resistance (Blows/Ft.) (HP) Hand Penetrometer (T) Torvane (DCP) Dynamic Cone Penetrometer UC Unconfined Compressive Strength (PID) Photo-Ionization Detector (OVA) Organic Vapor Analyzer

DESCRIPTIVE SOIL CLASSIFICATION

Soil classification as noted on the soil boring logs is based Unified Soil Classification System. Where sufficient laboratory data exist to classify the soils consistent with ASTM D2487 "Classification of Soils for Engineering Purposes" this procedure is used. ASTM D2488 "Description and Identification of Soils (Visual-Manual Procedure)" is also used to classify the soils, particularly where insufficient laboratory data exist to classify the soils in accordance with ASTM D2487. In addition to USCS classification, coarse grained soils are classified on the basis of their in-place relative density, and fine-grained soils are classified on the basis of their consistency. See "Strength Terms" table below for details. The ASTM standards noted above are for reference to methodology in general. In some cases, variations to methods are applied as a result of local practice or professional judgment.

LOCATION AND ELEVATION NOTES

Exploration point locations as shown on the Exploration Plan and as noted on the soil boring logs in the form of Latitude and Longitude are approximate. See [Exploration and Testing Procedures](#) in the report for the methods used to locate the exploration points for this project. Surface elevation data annotated with +/- indicates that no actual topographical survey was conducted to confirm the surface elevation. Instead, the surface elevation was approximately determined from topographic maps of the area.

STRENGTH TERMS

RELATIVE DENSITY OF COARSE-GRAINED SOILS (More than 50% retained on No. 200 sieve.) Density determined by Standard Penetration Resistance		CONSISTENCY OF FINE-GRAINED SOILS (50% or more passing the No. 200 sieve.) Consistency determined by laboratory shear strength testing, field visual-manual procedures or standard penetration resistance		
Descriptive Term (Density)	Standard Penetration or N-Value Blows/Ft.	Descriptive Term (Consistency)	Unconfined Compressive Strength Qu, (tsf)	Standard Penetration or N-Value Blows/Ft.
Very Loose	0 - 3	Very Soft	less than 0.25	0 - 1
Loose	4 - 9	Soft	0.25 to 0.50	2 - 4
Medium Dense	10 - 29	Medium Stiff	0.50 to 1.00	4 - 8
Dense	30 - 50	Stiff	1.00 to 2.00	8 - 15
Very Dense	> 50	Very Stiff	2.00 to 4.00	15 - 30
		Hard	> 4.00	> 30

RELEVANCE OF SOIL BORING LOG

The soil boring logs contained within this document are intended for application to the project as described in this document. Use of these soil boring logs for any other purpose may not be appropriate.

Criteria for Assigning Group Symbols and Group Names Using Laboratory Tests ^A				Soil Classification		
				Group Symbol	Group Name ^B	
Coarse-Grained Soils: More than 50% retained on No. 200 sieve	Gravels: More than 50% of coarse fraction retained on No. 4 sieve	Clean Gravels: Less than 5% fines ^C	$Cu \geq 4$ and $1 \leq Cc \leq 3$ ^E	GW	Well-graded gravel ^F	
			$Cu < 4$ and/or $[Cc < 1 \text{ or } Cc > 3.0]$ ^E	GP	Poorly graded gravel ^F	
		Gravels with Fines: More than 12% fines ^C	Fines classify as ML or MH	GM	Silty gravel ^{F, G, H}	
			Fines classify as CL or CH	GC	Clayey gravel ^{F, G, H}	
	Sands: 50% or more of coarse fraction passes No. 4 sieve	Clean Sands: Less than 5% fines ^D	$Cu \geq 6$ and $1 \leq Cc \leq 3$ ^E	SW	Well-graded sand ^I	
			$Cu < 6$ and/or $[Cc < 1 \text{ or } Cc > 3.0]$ ^E	SP	Poorly graded sand ^I	
		Sands with Fines: More than 12% fines ^D	Fines classify as ML or MH	SM	Silty sand ^{G, H, I}	
			Fines classify as CL or CH	SC	Clayey sand ^{G, H, I}	
Fine-Grained Soils: 50% or more passes the No. 200 sieve	Silts and Clays: Liquid limit less than 50	Inorganic:	$PI > 7$ and plots on or above "A" line	CL	Lean clay ^{K, L, M}	
			$PI < 4$ or plots below "A" line ^J	ML	Silt ^{K, L, M}	
		Organic:	Liquid limit - oven dried	< 0.75	OL	Organic clay ^{K, L, M, N}
			Liquid limit - not dried			Organic silt ^{K, L, M, O}
	Silts and Clays: Liquid limit 50 or more	Inorganic:	PI plots on or above "A" line	CH	Fat clay ^{K, L, M}	
			PI plots below "A" line	MH	Elastic Silt ^{K, L, M}	
		Organic:	Liquid limit - oven dried	< 0.75	OH	Organic clay ^{K, L, M, P}
			Liquid limit - not dried			Organic silt ^{K, L, M, Q}
	Highly organic soils:	Primarily organic matter, dark in color, and organic odor			PT	Peat

^A Based on the material passing the 3-inch (75-mm) sieve.

^B If field sample contained cobbles or boulders, or both, add "with cobbles or boulders, or both" to group name.

^C Gravels with 5 to 12% fines require dual symbols: GW-GM well-graded gravel with silt, GW-GC well-graded gravel with clay, GP-GM poorly graded gravel with silt, GP-GC poorly graded gravel with clay.

^D Sands with 5 to 12% fines require dual symbols: SW-SM well-graded sand with silt, SW-SC well-graded sand with clay, SP-SM poorly graded sand with silt, SP-SC poorly graded sand with clay.

$$Cu = D_{60}/D_{10} \quad Cc = \frac{(D_{30})^2}{D_{10} \times D_{60}}$$

^F If soil contains $\geq 15\%$ sand, add "with sand" to group name.

^G If fines classify as CL-ML, use dual symbol GC-GM, or SC-SM.

^H If fines are organic, add "with organic fines" to group name.

^I If soil contains $\geq 15\%$ gravel, add "with gravel" to group name.

^J If Atterberg limits plot in shaded area, soil is a CL-ML, silty clay.

^K If soil contains 15 to 29% plus No. 200, add "with sand" or "with gravel," whichever is predominant.

^L If soil contains $\geq 30\%$ plus No. 200 predominantly sand, add "sandy" to group name.

^M If soil contains $\geq 30\%$ plus No. 200, predominantly gravel, add "gravelly" to group name.

^N $PI \geq 4$ and plots on or above "A" line.

^O $PI < 4$ or plots below "A" line.

^P PI plots on or above "A" line.

^Q PI plots below "A" line.

Certification of Compliance with Ch. 25-1-83 – Applications Relating to a Closed Municipal Solid Waste Landfill

Site Address: **7050 Elroy Road**
Austin, Texas

Complete Section A if your site is:

- Less than or equal to 1 acre and **not** within a landfill buffer as shown on the City of Austin Closed Landfills maps.

Complete Section B if your site is:

- Greater than 1 acre; or
- Less than or equal to 1 acre **and** within a landfill buffer as shown on the City of Austin Closed Landfills map.

See back of form for information on where to obtain a map of Austin area closed landfills or how to obtain information about state development regulations.

Section A

The site for which I am submitting an application for subdivision, site plan, or building permit is less than 1 acre, is not within a landfill buffer, and I am not aware of any information indicating the site may contain any portion of a municipal waste landfill.

Signature of Applicant

Print Name

Section B

In our opinion, the subject site does not contain a municipal solid waste landfill as referenced in TAC Ch. 330, Subch. T. This opinion is based on information gathered using:

- TCEQ Soil Test 2
- TCEQ Soil Test 3 --- Based upon geotechnical borings presented in Terracon Report No. 96205256, no evidence of an existing closed municipal solid waste landfill was encountered.

Signature of Professional Engineer

Diego Munar Castaneda, P.E.

SECTION 01 10 00 – SUMMARY OF WORK

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Contract Description.
- B. Owner-Supplied Products.
- C. Contractor's Use of Premises.
- D. Coordination.
- E. Warranty of Construction.

1.02 CONTRACT DESCRIPTION

- A. The project consists of: A new community health and wellness center to include clinic dental and pharmacy.

1.03 OWNER-SUPPLIED PRODUCTS

- A. It shall be the Contractor's responsibility as part of this work to install equipment where indicated on plans and in accordance with the manufacturer requirements making all required connections to building systems to provide a functional installation and working piece of equipment.

1.04 CONTRACTOR'S USE OF PREMISES

- A. Confine operations at site to areas permitted by law, permits, ordinances, and Contract Documents. Coordinate use of premises under direction of the Owner's Representative.
- B. Do not unreasonably encumber site with materials or equipment. Do not load the structure with that will damage or endanger the Work.
- C. Assume full responsibility for protection and safekeeping of products stored on premises. Move any stored products which interfere with operations of Owner. Obtain and pay for use of additional storage or work areas needed for operations.
- D. Refer to sheet E2.1 that shows acceptable contractor lay down area. Provide interior lay down area staging area if available.

1.05 COORDINATION

- A. Coordinate Work of the various specification sections to assure efficient and orderly sequence of installation of construction elements, with provisions for accommodating items to be installed by others, and at a later date.
- B. In the event other contractors are doing work in the same area simultaneously with this project, coordinate proposed construction with that of the other contractors.

- C. Coordinate space requirements and installation of mechanical, plumbing, fire protection, and electrical Work which are indicated diagrammatically on drawings. Follow routing shown for pipes, ducts, and conduits as closely as practicable; make runs parallel with lines of building. Utilize spaces efficiently to maximize accessibility for other installations, for maintenance, and for repairs.
- D. Resolve piping and conduit interference's by giving precedence to pipelines which require a stated grade for proper operation.
- E. In finished areas, conceal pipes, ducts and wiring in the construction. Coordinate locations of fixtures and outlets with finish elements including equipment furnished by Owner.

1.06 WARRANTY OF CONSTRUCTION

- A. For a period of one year from date of substantial completion (or for longer warranty or guarantee periods stipulated elsewhere), warrant that all work conforms to the Contract requirements and is free of any defect of equipment, materials or workmanship. Under the terms of this warranty, remedy at no expense to the Owner, any such failure to conform or any such defect. All movable or adjustable items must remain in proper operating condition throughout the warranty period. Assume responsibility and pay for replacement or repair of adjacent materials or work which may be damaged due to failure of work or repair or replacement of work.

PART 2 PRODUCTS

PART 3 EXECUTION

Not Used

END OF SECTION

SECTION 01 20 00 – PRICE AND PAYMENT PROCEDURES

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Schedule of Values
- B. Applications for Payment
- C. Change Procedures
- D. Defect Assessment
- E. Unit Prices

1.02 CHANGE PROCEDURES

- A. Submittals: Submit name of individual authorized to receive change documents, and be responsible for informing others in Contractor's employ or Subcontractors of changes to the Work.
- B. Carefully study and compare Contract Documents before proceeding with fabrication and installation of Work. Promptly advise Owner and Architect/Engineer of any error, inconsistency, omission, or apparent discrepancy.
- C. Requests for Interpretation (RFI) and Clarifications: Allot time in construction scheduling for liaison with Owner & Architect/Engineer; establish procedures for handling queries and clarifications.
- D. Advise and include Owner in all RFI, change and similar communications.
- E. Execution of Change Orders: Architect/Engineer will issue Change Orders for signatures of parties as provided in Conditions of the Contract. All change orders must be approved by Owner.
- F. Correlation of Contractor Submittals:
 - 1. Promptly revise Schedule of Values and Application for Payment forms to record each authorized Change Order as separate line item and adjust Contract Sum/Price.
 - 2. Promptly enter changes in Project Record Documents.

1.03 DEFECT ASSESSMENT

- A. For Owner and Contractor responsibilities for defective work, refer to Construction Agreement.

1.04 UNIT PRICES

- A. Authority: Measurement methods are delineated in individual specification sections.

- B. Measurement methods delineated in individual specification sections complement criteria of this section. In event of conflict, requirements of individual specification section govern.
 - 1. The Contractor shall take measurements and compute quantities.
- C. Unit Quantities: Quantities and measurements indicated in Bid Form are for contract purposes only. Actual quantities provided shall determine payment.
 - 1. When actual Work requires more or fewer quantities than those quantities indicated, provide required quantities at unit sum/prices contracted.
- D. Payment Includes: Full compensation for required labor, products, tools, equipment, plant and facilities, transportation, services and incidentals; erection, application or installation of item of the Work; overhead and profit unless otherwise noted.
- E. Final payment for Work governed by unit prices will be made on basis of actual measurements and quantities accepted by Architect/Engineer multiplied by unit sum/price for Work incorporated in or made necessary by the Work.
- F. Measurement of Quantities:
 - 1. Weigh Scales: Inspected, tested and certified by applicable state Weights and Measures department within past year.
 - 2. Platform Scales: Of sufficient size and capacity to accommodate conveying vehicle.
 - 3. Metering Devices: Inspected, tested and certified by applicable state department within the past year.
 - 4. Measurement by Weight: Concrete reinforcing steel, rolled or formed steel or other metal shapes will be measured by handbook weights. Welded assemblies will be measured by handbook or scale weight.
 - 5. Measurement by Volume: Measured by cubic dimension using mean length, width and height or thickness.
 - 6. Measurement by Area: Measured by square dimension using mean length and width or radius.
 - 7. Linear Measurement: Measured by linear dimension, at item centerline or mean chord.
 - 8. Stipulated Sum/Price Measurement: Items measured by weight, volume, area or linear means or combination, as appropriate, as completed item or unit of the Work.
- G. Unit Price Schedule:
 - 1. Item 1: Section 31 63 29 – Drilled Piers. Refer to Article 1.03, Unit Prices. For increase in length of piers longer than the base length, the per lineal foot costs shall be as follows

\$ _____ per lineal foot for 18 inch diameter piers.
\$ _____ per lineal foot for 24 inch diameter piers.
\$ _____ per lineal foot for 36 inch diameter piers.

2. Item 2: Section 31 63 29 – Drilled Piers. Refer to Article 1.03, Unit Prices. For decrease in length of piers shorter than the base length, the per lineal foot costs as follows:

\$ _____ per lineal foot for 18 inch diameter piers.
\$ _____ per lineal foot for 24 inch diameter piers.
\$ _____ per lineal foot for 36 inch diameter piers.

The deduct unit price shall not be less than two thirds of the add unit price.

3. Item 3: Section 31 63 29 – Drilled Piers. Refer to Article 1.03, Unit Prices. If casing of piers is required, the cost per lineal foot shall be as follows:

\$ _____ per lineal foot for 18 inch diameter piers.
\$ _____ per lineal foot for 24 inch diameter piers.
\$ _____ per lineal foot for 36 inch diameter piers.

4. Item 4: Section 07 26 13-Moisture Control System: Provide a unit price to furnish and apply a moisture control system as specified. The unit price shall include the cost for preparing the concrete floor in accordance with this section.

\$ _____ per square foot.

PART 2 PRODUCTS

Not Used

PART 3 EXECUTION

Not Used

END OF SECTION

SECTION 01 30 00 – ADMINISTRATIVE REQUIREMENTS

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Coordination and Project conditions.
- B. Preconstruction meeting.
- C. Site mobilization meeting.
- D. Progress meetings.
- E. Preinstallation meetings.
- F. Closeout meeting.
- G. Cutting and patching.
 - 1. Cutting existing concrete pavement for installation of:
 - a. Chain link fence and gates posts.
 - b. Pipe bollards.
 - 2. Cutting holes in existing exterior masonry veneer, EIFS and or metal wall panels sheathing and gypsum wallboard for installation of new piping and conduits.
- H. Special procedures.

1.02 COORDINATION AND PROJECT CONDITIONS

- A. Coordinate scheduling, submittals and Work of various sections of Project Manual to ensure efficient and orderly sequence of installation of interdependent construction elements, with provisions for accommodating items installed later.
- B. Verify utility requirements and characteristics of operating equipment are compatible with building utilities. Coordinate work of various sections having interdependent responsibilities for installing, connecting to, and placing in service, operating equipment.
- C. Coordinate space requirements, supports, and installation of mechanical and electrical Work indicated diagrammatically on Drawings. Follow routing shown for pipes, ducts, and conduit, as closely as practicable; place runs parallel with lines of building. Utilize spaces efficiently to maximize accessibility for other installations, for maintenance, and for repairs.
- D. In finished areas except as otherwise indicated, conceal pipes, ducts, and wiring within construction. Coordinate locations of fixtures and outlets with finish elements.
- E. Coordinate completion and clean-up of Work of separate sections in preparation for Substantial Completion.
- F. Coordinate with Owner access to site for correction of defective Work and Work not in

accordance with Contract Documents, to minimize disruption of Owner's activities.

1.03 PRECONSTRUCTION MEETING

- A. Contractor will schedule meeting after Notice to Proceed.
- B. Attendance Required: Owner, Engineer and Contractor.
- C. Agenda:
 - 1. Execution of Owner-Contractor Agreement.
 - 2. Distribution of Contract Documents.
 - 3. Submission of list of Subcontractors, schedule of values, and progress schedule.
 - 4. Designation of personnel representing parties in Contract and Engineer.
 - 5. Procedures and processing of field decisions, submittals and substitutions, applications for payments, proposal request, Change Orders, and Contract closeout procedures.
 - 6. Scheduling.
- D. Contractor shall record minutes and distribute copies within three days after meeting to participants, with one copy to Engineer, Owner and those affected by decisions made. Refer to Contractor Agreement for additional requirements.
- E. Agenda:
 - 1. Use of premises by Owner and Contractor.
 - 2. Security and housekeeping procedures.
 - 3. Schedules.
 - 4. Application for payment procedures.
 - 5. Procedures for testing.
 - 6. Procedures for maintaining record documents.
 - 7. Requirements for start-up of equipment.
 - 8. Inspection and acceptance of equipment put into service during construction period.
- F. Record minutes and distribute copies within four days after meeting to participants, with one copy to Engineer and Owner and those affected by decisions made.

1.04 PROGRESS MEETINGS

- A. Contractor shall schedule and administer meetings throughout progress of the Work at

maximum biweekly intervals.

- B. Make arrangements for meetings, prepare agenda with copies for participants, and preside at meetings.
- C. Attendance Required: Job superintendent, major subcontractors and suppliers, Owner, Engineer, as appropriate to agenda topics for each meeting.
- D. Agenda:
 - 1. Review minutes of previous meetings.
 - 2. Review of Work progress.
 - 3. Field observations, problems, and decisions.
 - 4. Identification of problems impeding planned progress.
 - 5. Review of submittals schedule and status of submittals.
 - 6. Review of off-site fabrication and delivery schedules.
 - 7. Maintenance of progress schedule.
 - 8. Corrective measures to regain projected schedules.
 - 9. Planned progress during succeeding work period.
 - 10. Coordination of projected progress.
 - 11. Maintenance of quality and work standards.
 - 12. Effect of proposed changes on progress schedule and coordination.
 - 13. Address safety and access/coordination concerns.
 - 14. Other business relating to Work.
- E. Record minutes and distribute copies within four days after meeting to participants, with one copy to Engineer and Owner and those affected by decisions made.

1.05 PREINSTALLATION MEETINGS

- A. When required in individual specification sections, convene pre-installation meetings at Project site prior to commencing work of specific section.
- B. Require attendance of parties directly affecting, or affected by, Work of specific section.
- C. Notify Engineer three days in advance of meeting date unless otherwise noted in the individual specification sections.
- D. Prepare agenda and preside at meeting:

1. Review conditions of installation, preparation and installation procedures.
2. Review coordination with related work.
- E. Record minutes and distribute copies within four days after meeting to participants, with one copy each to Architect/Engineer, Owner and those affected by decisions made.
- F. Notify Owner 48 in advance of any utility and service outages required to perform the work.

1.08 CLOSEOUT MEETING

- A. Contractor to schedule Project closeout meeting with sufficient time to prepare for Substantial Completion. Contractor to preside over meeting and be responsible for meeting minutes.
- B. Attendance required: Contractor, Major Subcontractors, Architect/Engineer, Owner and others appropriate to agenda.
- C. Notify Architect/Engineer and Owner one week in advance of the meeting.
- D. Minimum Agenda:
 1. Start-up facilities and systems.
 2. Operations and maintenance manuals.
 3. Testing, adjusting and balancing.
 4. System demonstration and observation.
 5. Operation and maintenance instructions for Owner's personnel.
 6. Contractor's inspection of Work.
 7. Contractor's preparation of an initial punch list.
 8. Procedure to request Engineer inspection to determine date of Substantial Completion.
 9. Planned progress during succeeding work period.
 10. Coordination of project progress.
 11. Maintenance of quality and work standards.
 12. Effect of proposed changes on Progress Schedule and construction.
 13. Other business relating to Work.

PART 2 PRODUCTS

Not Used

PART 3 EXECUTION

3.01 CUTTING AND PATCHING

- A. Employ skilled and experienced installer to perform cutting and patching of the following materials:
 - 1. Existing concrete paving to install fence and gate posts.
 - 2. Existing concrete paving to install pipe bollards.
 - 2. Existing exterior masonry veneer, EIFS and or metal panel in order to install piping.
 - 3. Exterior sheathing and interior gypsum wall board in order to install conduit and piping.
- B. Execute cutting, fitting and patching including excavation to complete Work and to:
 - 1. Fit the several parts together, to integrate with other Work.
 - 2. Uncover Work to install or correct ill-timed Work.
 - 3. Remove and replace defective and non-conforming Work.
 - 4. Provide openings in elements of Work for penetrations of mechanical and electrical Work.
- C. Execute work by methods to avoid damage to other Work, and to provide proper surfaces to receive patching and finishing.
- D. Cut masonry and concrete materials using masonry saw or core drill.
 - 1. Prior to cutting concrete paving locate and map the following items using a Ferrosan or other approved method to measure the size and depth of the embedded material and to map the position and arrangement of the embedded material:
 - a. Reinforcing steel
 - b. Steel conduit
 - c. Steel embedments
- E. Restore Work with new products in accordance with requirements of Contract Documents.
- F. Fit Work tight to pipes, sleeves, ducts, conduit and other penetrations through surfaces.
- G. Maintain integrity of wall, ceiling or floor construction; completely seal voids.
- H. At penetrations of exterior walls completely seal penetrations as follows:
 - 1. Where piping penetrates existing exterior veneer masonry, EIFS and or metal wall panels seal annular space around pipe with Dowsil 790 sealant and backer rod recommended by sealant manufacturer for material being sealed.
 - a. Other acceptable manufacturer and products:
 - 1) Pecora Corp.- 890 NST
 - 2) Tremco Inc. – Spectrem 1
 - 2. Where piping penetrates existing exterior wall sheathing behind veneer masonry

and or metal wall panels seal annular space with sealant compatible with existing AWB.

- I. Refinish surfaces to match adjacent finishes. For continuous surfaces, refinish to nearest intersection; for assembly, refinish entire unit.
- J. Identify hazardous substances or conditions exposed during the Work to Architect/Engineer for decision or remedy.

3.02 ALTERATION PROCEDURES

- A. Where designated areas of existing facility are to be occupied by Owner during progress of construction, cooperate with Owner in scheduling operations to minimize conflict and to permit Owner's continuous usage.
 - 1. Perform Work not to interfere with operations of occupied areas.
 - 2. Keep utility and service outages to a minimum and perform only after written approval of Owner.
 - 3. Clean Owner-occupied areas daily. Clean spillage, overspray and heavy collection of dust in Owner-occupied areas immediately.
 - a. Notify Owner 48 hours in advance of any utility and service outages required to perform the work.
 - 4. Where existing acoustical ceiling panels are removed to perform above ceiling work, reinstall acoustical ceiling panel at the end of each work day.
- A. Materials: Match existing with new products for patching and extending work.
- B. Employ skilled and experienced installer to perform alteration work.
- C. Cut, move or remove items as necessary for access to alterations and renovation Work. Replace and restore at completion.
- D. Remove unsuitable material not marked for salvage, including rotted wood, corroded metals, and deteriorated masonry and concrete. Replace materials as specified for finished Work.
- E. Remove debris and abandoned items from area and from concealed spaces.
- F. Prepare surface and remove surface finishes to permit installation of new work and finishes.
- G. Close openings daily in exterior surfaces to protect existing work from weather and extremes of temperature and humidity. Provide means for end of day inspection.
- H. Remove, cut, and patch Work in manner to minimize damage and to permit restoring products and finishes to match existing condition.
- I. Refinish existing visible surfaces to remain in renovated rooms and spaces, to match existing condition for each material, with neat transition to adjacent finishes.

- J. Where new Work abuts or aligns with existing, provide smooth and even transition. Patch Work to match existing adjacent Work in texture and appearance.
- K. When finished surfaces are cut so that smooth transition with new Work is not possible, terminate existing surface along straight line at natural line of division and submit recommendation to Architect/Engineer for review.
- L. Where change of plane of 1/8 inch or more occurs, request instructions from Architect/Engineer.
- M. Patch or replace portions of existing surfaces which are damaged, lifted, discolored or showing other imperfections due to construction activities.
- N. Finish surfaces as specified in individual product sections.

END OF SECTION

SECTION 01 33 00 – SUBMITTAL PROCEDURES

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Submittal procedures.
- B. Construction progress schedules.
- C. Proposed products list.
- D. Product data.
- E. Shop Drawings.
- F. Samples.
- G. Design data.
- H. Test reports.
- I. Certificates.
- J. Manufacturer's instructions.
- K. Manufacturer's field reports.
- L. Construction photographs.
- M. Contractor review.

1.02 SUBMITTAL PROCEDURES

- A. Refer to Construction Agreement.

1.03 CONSTRUCTION PROGRESS SCHEDULES

- A. Refer to Construction Agreement.

1.04 PROPOSED PRODUCTS LIST

- A. Within 15 days after date of Notice to Proceed, submit list of major products proposed for use, with name of manufacturer, trade name, and model number of each product.
- B. For products specified only by reference standards, give manufacturer, trade name, model or catalog designation, and reference standards.

1.05 PRODUCT DATA

- A. Product Data: Submit to Architect/Engineer and Owner for review for limited purpose of checking for conformance with information given and design concept expressed in Contract

Documents.

- B. Submit via Newforma.
- C. Mark each copy to identify applicable products, models, options and other data. Supplement manufacturers' standard data to provide information specific to this Project.
- D. Indicate product utility and electrical characteristics, utility connection requirements, and location of utility outlets for service for functional equipment and appliances.
- E. After review, produce copies and distribute in accordance with Submittal Procedures article and for record documents described in Section 01 70 00 – Execution and Closeout Requirements.

1.06 SHOP DRAWINGS

- A. Shop Drawings: Submit to Architect/Engineer for review for limited purpose of checking for conformance with information given and design concept expressed in Contract Documents.
- B. Indicate special utility and electrical characteristics, utility connection requirements, and location of utility outlets for service for functional equipment and appliances.
- C. When required by individual specification sections, provide Shop Drawings signed and sealed by professional engineer responsible for designing components shown on Shop Drawings.
 - 1. Include signed and sealed calculations to support design.
 - 2. Submit drawings and calculations in form suitable for submission to and approval by authorities having jurisdiction.
 - 3. Make revisions and provide additional information when required by authorities having jurisdiction.
- D. Submit either electronically or in the form of one reproduction.
- E. After review, produce copies and distribute in accordance with Submittal Procedures article and for record documents described in Section 01 70 00 – Execution and Closeout Requirements

1.07 SAMPLES

- A. Samples: Submit to Architect/Engineer for review for limited purpose of checking for conformance with information given and design concept expressed in Contract Documents.
- B. Samples for Selection as Specified in Product Sections:
 - 1. Submit to Architect/Engineer for aesthetic, color or finish selection.
 - 2. Submit samples of finishes from full range of manufacturers' standard colors, in custom colors selected, textures, and patterns for Architect/Engineer selection.

3. Include photo image of product sample.
 - C. Submit samples to illustrate functional and aesthetic characteristics of Products, with integral parts and attachment devices. Coordinate sample submittals for interfacing work.
 - D. Include identification on each sample, with full Project information.
 - E. Submit number of samples specified in individual specification sections; Architect/Engineer will retain one sample.
 - F. Reviewed samples which may be used in the Work are indicated in individual specification sections.
 - G. Samples will not be used for testing purposes unless specifically stated in specification section.
 - H. After review, produce duplicates and distribute in accordance with Submittal Procedures article and for record documents purposes described in Section 01 70 00 – Execution and Closeout Requirements.
- 1.08 DESIGN DATA
- A. Submit for Architect/Engineer's knowledge as contract administrator or for Owner.
 - B. Submit for information for limited purpose of assessing conformance with information given and design concept expressed in Contract Documents.
- 1.09 TEST REPORTS
- A. Submit for Architect/Engineer's knowledge as contract administrator or for Owner.
 - B. Submit test reports for information for limited purpose of assessing conformance with information given and design concept expressed in Contract Documents.
- 1.10 CERTIFICATES
- A. When specified in individual specification sections, submit certification by manufacturer, installation/application subcontractor, or Contractor to Architect/Engineer, in quantities specified for Product Data.
 - B. Indicate material or product conforms to or exceeds specified requirements. Submit supporting reference data, affidavits and certifications as appropriate.
 - C. Certificates may be recent or previous test results on material or Product, but must be acceptable to Architect/Engineer.
- 1.11 MANUFACTURER'S INSTRUCTIONS
- A. When specified in individual specification sections, submit printed instructions for delivery, storage, assembly, installation, startup, adjusting and finishing, to Architect/Engineer for delivery to Owner in quantities specified for Product Data.
 - B. Indicate special procedures, perimeter conditions requiring special attention, and special environmental criteria required for application or installation.

1.12 MANUFACTURER'S FIELD REPORTS

- A. Submit reports for Architect/Engineer's benefit as contract administrator or for Owner.
- B. Submit report in duplicate within 5 days of observation to Architect/Engineer for information.
- C. Submit for information for limited purpose of assessing conformance with information given and design concept expressed in Contract Documents.

1.13 CONSTRUCTION PHOTOGRAPHS

- A. Provide digital images of site and construction throughout progress of Work.
- B. Each month submit digital images with Application for Payment.
- C. Digital Images: Label CD or Flash drive with Project Name, contract number, Month taken.
- D. Submit a computer disk with all digital images sorted in chronological sequence.

1.14 CONTRACTOR REVIEW

- A. Contractor to review for compliance with contract Documents and approve submittals before transmitting to Architect/Engineer.
- B. Contractor Responsible for:
 - 1. Determination and verification of materials including manufacturer's catalog numbers.
 - 2. Determination and verification of field measurements and field construction criteria.
 - 3. Checking and coordinating information in submittal with requirements of Work and of Contract Documents.
 - 4. Determination and accuracy and completeness of dimensions and quantities.
 - 5. Confirmation and coordination of dimensions and field conditions of Site.
 - 6. Construction means, techniques, sequences and procedures.
 - 7. Safety precautions.
 - 8. Coordination and performance of Work of all trades.

END OF SECTION

SECTION 01 40 00 – QUALITY REQUIREMENTS

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Quality control and control of installation.
- B. Tolerances.
- C. References.
- D. Testing and inspection services.
- E. Manufacturers' field services.
- F. Labeling.
- G. Examination.
- H. Preparation.

1.02 QUALITY CONTROL AND CONTROL OF INSTALLATION

- A. Monitor quality control over suppliers, manufacturers, products, services, site conditions, and workmanship, to produce Work of specified quality.
- B. Comply with manufacturers' instructions, including each step in sequence.
- C. When manufacturers' instructions conflict with Contract Documents, request clarification from Architect/Engineer before proceeding.
- D. Perform Work by persons qualified to produce required and specified quality.
- E. Verify field measurements are as indicated on Shop Drawings or as instructed by manufacturer.
- F. Secure products in place with positive anchorage devices designed and sized to withstand stresses, vibration, physical distortion, or disfigurement.

1.03 TOLERANCES

- A. Monitor fabrication and installation tolerance control of products to produce acceptable Work. **Do not permit tolerances to accumulate.**
- B. Comply with manufacturers' tolerances. When manufacturers' tolerances conflict with Contract Documents, request clarification from Architect/Engineer before proceeding.
- C. Adjust products to appropriate dimensions; position before securing products in place.

1.04 REFERENCES

- A. For products or workmanship specified by association, trade or other consensus standards, comply with requirements of standard, except when more rigid requirements are specified or are required by applicable codes.
- B. Conform to reference standard by date of issue current on date of Contract Documents, except where specific date is established by code.
- C. Obtain copies of standards where required by product specification sections.
- D. When specified reference standards conflict with Contract Documents, request clarification from Architect/Engineer before proceeding.
- E. Neither contractual relationships, duties, nor responsibilities of parties in Contract nor those of Architect/Engineer shall be altered from Contract Documents by mention or inference otherwise in reference documents.

1.05 MANUFACTURERS' FIELD SERVICES

- A. Provide manufacturers field services where individual specification sections, require material or product suppliers or manufacturers to provide qualified staff personnel to observe site conditions, conditions of surfaces and installation, quality of workmanship, start-up of equipment, test, adjust and balance of equipment and as applicable, and to initiate instructions when necessary.
- B. Submit qualifications of observer to Architect/Engineer 30 days in advance of required observations. Observer subject to approval of Architect/Engineer.
- C. Report observations and site decisions or instructions given to applicators or installers that are supplemental or contrary to manufacturers' written instructions.
- D. Refer to Section 01 33 00 – Submittal Procedures “Manufacturers' Field Reports” article.

1.06 LABELING

- A. Attach label from agency approved by authority having jurisdiction for products, assemblies and systems required to be labeled by applicable code.
- B. Label Information: Include manufacturer's or fabricator's identification, approved agency identification and the following information, as applicable, on each label:
 - 1. Model number.
 - 2. Serial number.
 - 3. Performance characteristics.

PART 2 PRODUCTS

Not Used

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verify existing site conditions and substrate surfaces are acceptable for subsequent Work. Beginning new Work means acceptance of existing conditions.
- B. Verify existing substrate is capable of structural support or attachment of new Work being applied or attached.
- C. Examine and verify specific conditions described in individual specification sections.
- D. Verify utility services are available, of correct characteristics, and in correct locations.

3.02 PREPARATION

- A. Clean substrate surfaces prior to applying next material or substance.
- B. Seal cracks or openings of substrate prior to applying next material or substance.
- C. Apply manufacturer required or recommended substrate primer, sealer or conditioner prior to applying new material or substance in contact or bond.

END OF SECTION

SECTION 01 45 23 – CONCRETE IN-SITU RELATIVE HUMIDITY AND PH TESTING

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Provide in-situ concrete relative humidity and surface pH testing to all concrete specified to be covered with floor coverings or resinous coatings. Includes concrete placed below, on and above grade
 - 1. At lightweight concrete floors, provide in-situ concrete relative humidity and pH tests.
- B. Testing shall take place after allowing concrete to dry for a minimum of 90 days. Testing to be scheduled no less than one and no more than three weeks prior to scheduled flooring installation.

1.02 RELATED SECTIONS

- A. Section 09 30 00 – Tiling.
- B. Section 09 65 00 – Resilient Flooring.
- C. Section 09 68 13 – Tile Carpeting.

1.03 REFERENCES

- A. ASTM F2170-11 – Standard Test Method for Determining Relative Humidity in Concrete Floor Slabs Using In-Situ Probes
- B. ASTM F710-05 – Standard Practice for Preparing Concrete Floors and Other Monolithic Floors to Receive Resilient Flooring.

1.04 SUBMITTALS

- A. Report all test results in chart form listing test dates, time, depth of test well, in-situ temperature, relative humidity and pH levels.
- B. List test locations on chart and show same on floor plan.
- C. Deliver results in duplicate for distribution to Architect and General Contractor.

1.05 QUALITY ASSURANCE

- A. Independent Testing Agency
 - 1. Certified by the International Concrete Restoration Institute as a Tier 2 concrete moisture-testing technician.
 - 2. Other agency with verifiable experience
- B. Digital Meter and Calibrated Humidity probes

1. Minimum two-point probe calibration
- C. Wide range pH paper, and distilled or de-ionized water.

PART 2 PRODUCTS

2.01 MANUFACTURERS

- A. Humidity and Temperature probe kit as manufactured by Vaisala or equal.
- B. pH test paper as manufactured by Micro Essential Laboratory or equal.

PART 3 EXECUTION

3.01 QUANTIFICATION OF RELATIVE HUMIDITY

- A. The test site should be maintained at the same temperature and humidity conditions as those anticipated during normal occupancy. These temperature and humidity levels should be maintained for 48 hours prior and during test period. If meeting this criterion is not possible, then minimum conditions should be 75 ± 10 degrees F and 50 ± 10 percent relative humidity. When a building is not under HVAC control, a recording hygrometer or data logger shall be in place recording conditions during the test period. A transcript of this information must be included with the test report.
- B. The number of in-situ relative humidity test sites is determined by the square footage of the facility. Perform three tests for the first 1,000 square feet and one additional test for each additional 1,000 square feet.
- C. Determine the thickness of the concrete slab, typically from construction documents.
- D. Utilizing a roto-hammer drill test holes to the appropriate depth as follows:
 1. Slab drying from top only (slab on grade, slab on metal deck) drill-to depth from top of slab 40 percent of slab thickness.
 2. Slab drying from top and bottom (elevated structural slab not poured in metal deck) drill-to depth from top of slab 20 percent of slab thickness.
 3. Hole diameter shall not exceed outside diameter of the insertable test sleeve by more than 0.04 inch. Drilling operation must be dry.
- E. Vacuum all concrete dust from test hole.
- F. Insert a hole liner, or sleeve, to the full depth of test hole, assuring that the liner is capped or plugged at the end protruding from the concrete surface.
- G. Permit the test site to acclimate or equilibrate for 72 hours prior to taking relative humidity readings.
- H. Remove the sleeve plug and place a probe into the sleeve assuring that it reaches the bottom of the test hole. The test probe must be at temperature equilibration with the

concrete slab.

- I. Read and record temperature and relative humidity at the test site.

3.02 QUANTIFYING PH LEVEL

- A. At or near the relative humidity test site perform pH test.
 1. Place several drops of water onto the concrete surface to form a puddle approximately 1 inch in diameter.
 2. Allow the water to set for approximately 60 seconds.
 3. Dip the pH paper into the water and remove immediately, compare color to chart provided by paper supplier to determine pH reading
- B. Record and report results.

END OF SECTION

SECTION 01 45 29 – TESTING LABORATORY SERVICES FOR STRUCTURAL TESTS AND SPECIAL INSPECTIONS

PART 1 GENERAL

1.01 SCOPE

- A. A qualified independent testing laboratory and inspection agency and/or geotechnical engineering service, selected and paid by Owner and approved by Architect, will perform special inspection, professional testing and laboratory services specified herein.
- B. Testing and inspecting agency shall make and perform all inspections and tests in accordance with the rules and regulations of Building Code, local authorities, Specifications of ASTM, and these Contract Documents.
- C. Materials and workmanship not meeting required standards or performance obligations are to be removed and replaced. Replacement and subsequent testing shall be at Contractor's expense.
- D. Where terms "Special Inspector," "Inspector" and "Laboratory" are used, they mean and refer to an officially designated and accredited inspector of testing laboratory or geotechnical service engaged by Owner.
- E. Where the term "Geotechnical Service" is used, it means an agency specializing in soil analysis and professional geotechnical engineering, which is under the direction of a licensed engineer or licensed geologist and which is retained by the Owner for construction phase testing and inspection of foundation construction and earthwork. It may be the same agency as the laboratory.
- F. Where the term "Geotechnical Engineer" is used, it means the licensed design professional in responsible charge of the subsurface investigation and report from which the building foundation system is derived. He may be a member of the geotechnical service engaged by the Owner to perform construction phase services.
- G. Testing, inspection and certifications specified in other sections of these Specifications shall be paid by Contractor, unless otherwise indicated, and shall be by agencies approved by Architect.
- H. Laboratory inspection shall not relieve Contractor or fabricator of his responsibility to furnish materials and workmanship in accordance with Contract Documents.

1.02 QUALIFICATIONS

- A. Testing and inspecting agencies shall meet requirements of ASTM E329, "Standard Specification for Agencies Engaged in the Testing and/or Inspection of Materials Used in Construction" and ASTM E543, "Standard Practice for Agencies Performing Nondestructive Testing." Special inspectors shall be qualified persons who have demonstrated competence to the satisfaction of the building official for inspection of the particular type of construction requiring special inspection.
- B. Testing and inspecting agencies shall be insured against errors and omissions by a professional liability insurance policy having a limit of liability not less than \$500,000.00.

- C. Special inspection and testing services of testing agency shall be under the direction of a Licensed Engineer licensed in the State of Texas, charged with engineering managerial responsibility and having at least 5 years of engineering experience in inspection and testing of construction materials.
 - 1. Laboratory: Authorized to operate in State of Texas.
 - 2. Laboratory Staff: Maintain full-time Registered Engineer on staff to review services.
 - 3. Testing Equipment: Calibrated at reasonable intervals with devices of an accuracy traceable to National Bureau of Standards or accepted values of natural physical constants.
- D. Testing, inspections and source quality control may occur on or off project site. Perform off-site testing as required by Architect/Engineer or Owner.
- E. Special inspectors monitoring concrete work shall be ACI certified inspectors.
- F. Special inspectors performing structural steel inspection shall be currently certified AWS Certified Welding Inspectors (CWI), in accordance with provisions of AWS QCI, "Standard and Guide for Qualification and Certification of Welding Inspectors." Special inspector may be supported by assistant special inspectors who may perform specific inspection functions under supervision of the special inspector. Assistant special inspectors shall be currently certified AWS Certified Associate Welding Inspectors (CAWI). Work of assistant special inspectors shall be regularly monitored by the special inspector, generally on a daily basis.
- G. Prior to start of Work, submit agency name, address and telephone number, name of full-time licensed Engineer in responsible charge, and name of each Special Inspector who will inspect the work.
- H. Submit copy of report of laboratory facilities inspection made by NIST Construction Materials Reference Laboratory during most recent inspection, with memorandum of remedies of any deficiencies reported by the inspection.

1.03 RESPONSIBILITIES OF CONTRACTOR

- A. See respective technical sections for specific requirements.
- B. Deliver to the laboratory, without cost to Owner, adequate quantities of representative samples of materials proposed for use which are required to be tested.
- C. Advise inspecting agency and Architect sufficiently in advance of construction operations to allow inspecting agency to complete any required checks or tests and to assign personnel for field inspection and testing as specified.
- D. Notify inspecting agency of each day's construction operations expected to require special inspection, at least 48 hours in advance of such operations, to allow Special Inspector to complete any required checks or tests in a timely manner.
- E. Provide adequate facilities for safe storage and proper curing of concrete test samples on project site for the first 24 hours and also for subsequent field curing, as required by ASTM C31.

- F. Furnish such nominal labor and equipment as is required to assist laboratory personnel in obtaining and handling samples at the site and in accessing work for special inspection.
- G. Furnish concrete mix designs, in accordance with ACI 301, Section 3.9, made by an independent testing laboratory or qualified concrete supplier. Where mix designs by an independent testing laboratory are required, laboratory shall be selected and paid by Contractor.
- H. Obtain required inspections or approvals of Building Official. All inspection requests and notifications required by Building Code Section 110 of the 2015 IBC are responsibility of Contractor.
- I. Provide current welder certifications for each welder to be employed.
- J. Furnish fabrication/erection inspection and testing of all welds in accordance with AWS D1.1, Chapter 6.
- K. Submit prequalification of all welding procedures to be used in executing the work.
- L. Review and sign the Statement of Special Inspections in conjunction with other responsible parties prior to the initiation of construction.
- M. Testing and employment of testing agency or laboratory shall not relieve Contractor of obligation to perform work in accordance with requirements of Contract Documents.
- N. Retesting or re-inspection required because of non-conformance to specified requirements shall be performed by same independent firm on instructions by Architect/Engineer. Payment for retesting or re-inspection will be charged to Contractor by deducting testing chargers from Contract Sum/Price.

1.04 AUTHORITY AND DUTIES OF SPECIAL INSPECTOR AND TESTING LABORATORY

- A. Special inspector shall keep records of inspections. The special inspector shall furnish inspection reports to the building official, Contractor, Architect and the registered design professional in responsible charge.
 - 1. Reports shall indicate that work inspected was done in conformance with approved construction documents.
 - 2. Discrepancies shall be brought immediately to the attention of the Contractor for correction.
 - 3. If the discrepancies are not corrected, the discrepancies shall be brought to the attention of the building official and to the Architect prior to the completion of that phase of the work.
 - 4. A final report documenting required special inspections and correction of any discrepancies shall be submitted at a date to be agreed upon prior to the start of work, by the permit applicant and the building official.
- B. Perform all special inspection and testing duties as required by Chapter 17 of the International Building Code and as herein specified.

- C. Special inspector or other representatives of testing laboratory, who have reviewed and are familiar with the project and specifications, shall participate in all preconstruction conferences. They shall coordinate material testing and inspection requirements with Contractor and his subcontractors consistent with planned construction schedule. They shall attend, throughout the course of the project, such conferences as may be required or requested to address quality control issues.
- D. Test and/or inspect the work assigned for conformance with the approved construction documents, specifications and applicable material and workmanship provisions of the building code. Perform testing and inspection in a timely manner to avoid delay of work.
- E. Submit test and/or inspection reports to the Building Official, Contractor, the Architect, the Structural Engineer of Record and other designated persons in accordance with the schedule in the Statement of Special Inspections.
- F. Review and sign the Statement of Special Inspections in conjunction with other responsible parties prior to the initiation of construction.
- G. Laboratory personnel shall inspect and/or test materials, assemblies, specimens, and work performed including design mixes, methods, and techniques and report to Architect progress thereof.
- H. If material furnished and/or work performed fails to meet requirements of Contract Documents, laboratory inspector shall promptly notify both Contractor and Architect of such failure.
- I. Special inspectors do not act as foremen, or perform other duties for Contractor. Work will be checked as it progresses, but failure to detect any defective work or materials shall not, in any way, prevent later rejection when such defect is discovered.
- J. Special inspector is not authorized to revoke, alter, relax, enlarge, or release any requirement of the Contract Documents or to approve or accept any portion of work, except where such approval is specifically called for in Specifications.

1.05 SUBMITTALS

- A. Submit Copies of Reports of Each and Every Inspection and Test as Follows: Owner - 1, Contractor - 2, Architect - 1 and Engineer - 1. Copy concrete cylinder breaks to concrete supplier.
- B. Test Reports Shall Include:
 - 1. Date issued.
 - 2. Project title and number.
 - 3. Name of inspector.
 - 4. Date and time of sampling or inspection.
 - 5. Identification of product and specifications section.

6. Location in the Project.
 7. Type of test/inspection.
 8. Date of test/inspection.
 9. Results of test/inspection.
 10. Conformance with Contract Documents.
 11. When requested by Architect, provide interpretation of results.
- C. State in report all details of each inspection and test. Indicate compliance or noncompliance with requirements of Contract Documents. Also state in report any and all unsatisfactory conditions.
- D. In addition to furnishing a written report, notify Contractor verbally of any uncorrected conditions or failures to comply with requirements of Contract Documents and immediately fax or email corresponding report to Architect and Engineer.
- E. At completion of each trade or branch of work requiring inspecting and/or testing, submit an interim report attesting to satisfactory completion of that work and full compliance with requirements of Contract Documents.
- F. Upon completion of all work which requires special inspection, submit a final report documenting required special inspections and correction of any deficiencies noted in the inspections. Final report shall bear the seal of the supervising licensed engineer for the testing and inspection agency.
- G. Submit copies of test results, sealed by a Licensed Engineer, to municipal authorities having jurisdiction, as they may require or request.

1.06 REFERENCED STANDARDS

- A. Latest adopted edition of all standards referenced in this Section shall apply, unless noted otherwise. In case of conflict between these Contract Documents and a referenced standard, Contract Documents shall govern. In case of conflict between these Contract Documents and the Building Code, the more stringent shall govern.
- B. ASTM C1077 – Standard Practice for Laboratories Testing Concrete and Concrete Aggregates for Use in Construction and Criteria for Laboratory Evaluation.
- C. ASTM C1093 – Standard Practice for Accreditation of Testing Agencies for Unit Masonry.
- D. ASTM D3740 – Standard Practice for Minimum Requirements for Agencies Engaged in the Testing and/or Inspection of Soil and Rock as Used in Engineering Design and Construction.
- E. ASTM E329 – Standard Specification for Agencies Engaged in Construction Inspection and/or Testing.
- F. ASTM E543 – Standard Practice for Agencies Performing Nondestructive Testing.

PART 2 PRODUCTS

Not Used

PART 3 EXECUTION

3.01 EXISTING CONDITIONS

- A. The testing laboratory shall examine the existing structure in areas where new construction will tie in as defined on the Drawings.
 - 1. General condition of framing in areas to be loaded or altered: Configuration and evidence of excessive corrosion or other damage shall be reported.
- B. Work with the Contractor in regard to accessibility and removal of finishes to permit visual examination of affected areas.
- C. Provide a report indicating acceptability of existing framing before new construction begins.

3.02 PIER DRILLING OPERATION

- A. A representative of the Owner's geotechnical consultant shall provide services herein specified.
- B. Special inspector shall make continuous inspections of drilled pier construction to check the following for compliance with the approved soils report and the Contract Documents:
 - 1. Verify soundness of bearing stratum and desired penetration.
 - 2. Verify placement locations, plumbness and pier dimensions including shaft diameter and length.
 - 3. Verify reinforcing steel size, grade, quantity and placement.
 - 4. Monitor condition of hole and removal of water and loose material from bottom. Verify cleanliness/preparation of sides to develop skin friction.
 - 5. Verify compliance with specified time limit regarding how long holes are permitted to stand open, exposed to air, before placing concrete.
 - 6. Monitor placement of concrete and use of tremie or pumps.
 - 7. Monitor the extraction of casing, if used.
- C. Special inspector shall furnish complete pier log showing diameter, top and bottom elevations of each pier, casing required or not required, bell size, actual penetration into bearing stratum, elevation of top of bearing stratum, volume of concrete used, and deviations from specified tolerances.

3.03 BUILDING PAD

- A. A representative of the Owner's geotechnical consultant shall perform testing and

inspection specified herein, unless noted otherwise. Inspections at the jobsite shall be carried out by a designated special inspector in accordance with the Building Code.

- B. Contractor shall make available to geotechnical service, free of charge, adequate samples of each fill and backfill material from proposed sources of supply.
- C. A 50-pound sample of each type of off-site and site-excavated material proposed for use shall be given to geotechnical service by Contractor between 10 and 30 calendar days prior to start of specified work. Analyze samples as required to provide a soil description and to determine compliance with gradation and quality requirements, and test as follows:
 - 1. Tests for liquid limit of soils in accordance with ASTM D4318.
 - 2. Tests for plastic limit of soils and plasticity index of soils in accordance with ASTM D4318.
 - 3. Tests for moisture/density relations of soil in accordance with ASTM D698 or D1557, as applicable.
- D. Furnish a report for each individual test, describing variances from specified requirements and state whether material is acceptable for intended use.
- E. Inspect underslab drainage material and placement for compliance with specified gradation, quality and compaction.
- F. Inspect excavated subgrade, confirm elevation and identify to Contractor any remaining unsuitable material which must be removed, and any soft areas which must be recompacted.
- G. Inspect and test prepared subgrade after initial rolling and compaction of scarified surface, before the placement of any fill.
- H. Continuously inspect placement, lift thickness and compaction of all fill materials, including continuous inspection of moisture conditioning of onsite soils. Verify fill material compliance with specified material properties.
- I. Make in-place compaction test for moisture content and density relations, and density of materials-in-place to determine that backfill and fill materials have been compacted to specified density. Tests shall be made at the following frequencies:
 - 1. One test for each 5000 square feet of area of each lift placed under building or floor slab. Stagger test locations in each lift from those in previous lift. A minimum of three tests will be required of each lift.
 - 2. One test for each 100 linear feet, or portion thereof, of each lift placed against foundation walls, with locations staggered as above.
 - 3. One test of each lift placed below any isolated footing or similar support and every 100 linear feet under continuous footings, with locations taken on a different side in each case, from the lift below.
- J. Check and report on compliance with the approved soils report and the Contract Documents. Reports may be combined on a daily basis, if desired, provided that location

of each test and applicable lift are clearly identified and any problems are detailed.

3.04 FOOTING EXCAVATIONS

- A. The geotechnical service shall provide a special inspector who shall periodically inspect each concrete footing excavation to determine that proper bearing stratum is obtained, that material below footings are adequate to achieve the design bearing capacity, and that excavations are properly clean and dry before concrete is placed.

3.05 CONCRETE REINFORCING STEEL AND EMBEDDED METAL ASSEMBLIES

- A. A special inspector shall perform testing and inspection specified herein.
- B. Welds shall be inspected by a certified welding inspector.
- C. Inspect all concrete reinforcing steel prior to placing of concrete for compliance with Contract Documents and approved Shop Drawings. All instances of noncompliance with Contract Documents and approved Shop Drawings shall be immediately brought to Contractor attention for correction and then, if uncorrected, reported to Architect.
- D. Observe and Report on the Following:
 - 1. Number and size of bars. Include spacing of stirrups and column ties.
 - 2. Bending and lengths of bars.
 - 3. Splicing.
 - 4. Clearance to forms including chair heights.
 - 5. Clearance to sides and bottom of trench if soil-formed.
 - 6. Clearance between bars or spacing.
 - 7. Rust, form oil, and other contamination.
 - 8. Grade of steel. Verify that reinforcing being welded is ASTM A706.
 - 9. Securing, tying and chairing of bars.
 - 10. Excessive congestion of reinforcing steel.
 - 11. Installation of anchor bolts and placement of concrete around such bolts.
 - 12. Fabrication and installation of embedded metal assemblies, including visual inspection of all welds.
 - 13. Visually inspect studs and deformed bar anchors on embedded assemblies for compliance with Contract Documents. Check number, spacing and weld quality. If, after welding, visual inspection reveals that a sound weld or a full 360 degree fillet has not been obtained for a particular stud or bar, such stud or bar shall be struck with a hammer and bent 15 degrees off perpendicular and then bent back

into position. Anchors failing this test shall be replaced.

- E. Provide a qualified, experienced inspector to inspect reinforcing steel. Inspector shall have a minimum of three years of experience inspecting reinforcing steel in projects of similar size.

3.06 CONCRETE INSPECTION AND TESTING

- A. A special inspector shall perform testing and inspection specified herein, unless otherwise noted. Comply with ACI 311, "Guide for Concrete Inspection" and "ACI Manual of Concrete Inspection" SP-2.
- B. Receive and evaluate all proposed concrete mix designs submitted by Contractor. If mix designs comply with Drawings and Specifications, laboratory shall submit a letter to Architect certifying compliance. Mix designs not complying with Drawings and Specifications shall be returned by laboratory as unacceptable.
- C. Periodically inspect formwork for shape, location and dimensions of the concrete member being formed.
- D. Verify use of the required mix design.
- E. Secure composite samples of concrete at the jobsite in accordance with ASTM C172.
- F. Mold and cure 3 specimens from each sample in accordance with ASTM C31. Supervise curing and protection provided (by others) for test specimens in field, and transportation from field to laboratory. Test cylinders shall be stored in the field 24 hours and then be carefully transported to laboratory and cured in accordance with ASTM C31.
- G. Test specimens in accordance with ASTM C39. Two specimens shall be tested at 28 days for acceptance and 1 shall be tested at 7 days for information.
- H. Make 1 strength test (3 cylinders) for each 100 cubic yards, or fraction thereof, of each mix design of concrete placed in any 1 day.
- I. Make 1 slump test for each set of cylinders following procedural requirements of ASTM C143 and C172. Make additional slump tests whenever consistency of concrete appears to vary. Do not permit placement of concrete having a measured slump outside limits given on Drawings, except when approved by Architect. Slump tests corresponding to samples from which strength tests are made shall be reported with strength test results. Other slump tests need not be reported.
- J. Determine total air content of air entrained normal-weight concrete sample for each strength test in accordance with ASTM C231.
- K. Determine temperature of concrete sample for each strength test.
- L. Testing agency shall provide a competent inspector at the batch plant to observe the mixing of the first batch of each mix design destined for the project. Inspector shall examine concrete materials for compliance with Specifications and approved mix design, weighing and measuring devices, proportioning and mixing of materials, water and cement content, general operation of plant, and transportation of concrete to jobsite. Inspector shall verify that amount of free surface moisture contained in both fine and coarse aggregate has been

properly accounted for in concrete proportioning to achieve required consistency and water cement ratio. Once proper procedures and quality assurance program have been confirmed by the inspector, in-plant inspections may cease.

- M. Testing laboratory shall monitor addition of water to concrete at jobsite and length of time concrete is allowed to remain in the truck before placement. Inspector shall compare mixture with criteria on approved mix design and report any significant deviation to Architect, Contractor and concrete supplier. Do not permit addition of water which will exceed maximum water/cement ratio for the mix as given on approved mix design.
- N. Continuously observe placing of all concrete, except non-structural slabs-on-grade and sitework. Observe and report on placing method, consolidation, cold joints, length of drop, and displacement of reinforcement. Report deficiencies to Contractor immediately for corrective action. Inspections may be reduced to a periodic basis when all procedures have been deemed satisfactory by laboratory.
- O. Testing laboratory shall certify each delivery ticket indicating class of concrete delivered (or poured), amount of water added and time at which cement and aggregate was dispensed into truck, and time at which concrete was discharged from truck.
- P. Evaluation and Acceptance:
1. If measured slump, or air content of air entrained concrete, falls outside specified limits a check test shall be made immediately on another portion of same sample. In the event of a second failure, concrete shall be considered to have failed to meet requirements of the specifications, and shall not be used in structure.
 2. Strength level of concrete will be considered satisfactory if averages of all sets of three consecutive strength test results are equal to, or exceed, specified strength and no individual test result (average of two cylinders) is below specified strength by more than 500 psi.
- Q. Concrete Test Reports:
1. Reports shall be made and distributed immediately after respective tests or inspections are made.
 2. Where reports indicate deviations from Contract Documents, they shall also include a determination of probable cause of deviation and, where applicable, a recommendation for corrective action.
 3. Whenever testing laboratory recognizes a trend of decreasing quality in concrete due to changing seasons, conditions of curing, or other cause, this shall be brought to Architects attention, along with a recommendation for corrective action to be taken before materials fall below requirements of Specifications.
- R. Comply with ACI 311, "Guide for Concrete Inspection" and "ACI Manual of Concrete Inspection" (SP-2).
- S. Inspect application of curing compound and monitor all curing conditions to assure compliance with specification requirements. Report curing deficiencies to Contractor immediately and submit a written report to Architect.

3.07 POST-TENSIONING OF CONCRETE

- A. Verify certification of calibration of jacking equipment used in post-tensioning operations.
- B. Observe and report on placement and anchorage of tendons immediately prior to concreting.
- C. Verify periodically the strength of in-situ concrete strength prior to stressing of tendons and prior to removal of shores and forms from horizontal framing.
- D. Provide a qualified, experienced special inspector to observe stressing and elongation measurement of each tendon. Inspector shall have a minimum of 3 years of experience inspecting post-tensioning operations.
- E. Special inspector shall log and submit detailed reports of stressing and elongation of each tendon.
- F. Compare actual and required elongation of each tendon and actual and required load on each tendon. Grant permission to cut tails of tendons which are within specified tolerance, unless otherwise noted on Drawings, and submit reports of those which are not within specified tolerance, along with recommended corrective action, to Architect for further elevation. Forward a copy of all stressing reports to Architect for record.

3.08 TESTING NON-SHRINK GROUT

- A. Make one strength test for every 10 base plates grouted and for every 10 bags of grout used in joints between members.
- B. Each test shall consist of four cubes, two to be tested at seven days and two at 28 days, made and tested in accordance with ASTM C109, with the exception that grout shall be restrained from expansion by a top plate.

3.09 MASONRY

- A. Inspection:
 - 1. Provide a qualified inspector to inspect all structural masonry work on a periodic basis. Inspect work in progress at least once for each 5,000 square feet of wall laid, but not less than once each day, to check compliance with Contract Documents and applicable Building Code.
 - 2. Inspect the following:
 - a. Preparation of masonry prisms for testing.
 - b. All reinforcing steel (during or after placement).
 - c. Grout spaces (prior to grouting and prior to closing cleanouts).
 - d. Mortar mixing operations.
 - e. Bedding of mortar for each type of unit and placing of units.
 - f. Grouting operations.
 - g. Condition of units before laying for excessive absorption.
 - 3. Provide a report of each inspection.
- B. Field Compressive Tests for Grout:

1. Secure composite samples of grout at jobsite in accordance with ASTM C1019. Measure the slump at time of sampling in accordance with ASTM C143.
2. Mold and cure three specimens from each sample in accordance with ASTM C1019. Supervise curing protection provided (by others) for test specimens in the field and transportation from field to laboratory. Test specimens shall be stored in the field 48 hours and then be carefully transported to laboratory and cured in a moist room conforming to ASTM C511.
3. Cap and test specimens in accordance with ASTM C39. Two specimens shall be tested at 28 days for acceptance and one specimen shall be tested at seven days for information.
4. Make one strength test (three specimens) for each 10 cubic yards of grout placed but not less than one strength test for each 5,000 square feet of wall area.

C. Prism Tests:

1. Make prism tests in advance of operations using materials under same conditions and with same bonding arrangement as for structure. Observe and inspect actual construction of prisms. Moisture content of unit at time of laying, consistency of mortar, and width and thickness of mortar joints shall be same as used in structure.
2. Cure and test prisms in accordance with applicable provisions of ASTM C1314. Test five specimens of each type of masonry unit before delivering material to jobsite and submit results for approval. During construction, test three specimens of each type of masonry unit for each 5,000 square feet of wall placed.
3. Standard age of test specimens is 28 days, but seven-day tests may be used, provided relationship between seven day and 28-day strengths is established by test for materials used.
4. Build prisms of hollow masonry units the same width as unit by 16 inches long in plan and 16 inches high, using specified masonry units, applying mortar to only face shells. Do not fill hollow core with grout. Compute value of ultimate net compressive strength by dividing ultimate load by net face shell area of masonry units (length X twice face shell thickness).
5. Build brick prisms one brick width and length in plan and five bricks high, using full bed joints as specified. Compute ultimate compressive strength by dividing ultimate load by net area of masonry units.
6. Build prisms on job using same materials and methods as for wall construction. Store prisms in a place where they will be undisturbed for two days and have approximately same curing conditions as wall construction. After two days, transport to laboratory in a manner which will not disturb mortar bond and then cure and test as set forth under ASTM C1314.
7. When average strength of a set of prisms falls below specified compressive strength (F'_m), masonry corresponding to the test shall be deemed unacceptable. In such case, notify Architect and Contractor immediately.

3.10 STRUCTURAL STEEL

- A. Inspect structural steel during fabrication and during and after erection for conformance with Contract Documents and Shop Drawings. Review and report on fabricator's quality control procedures and capabilities.
- B. Shop Inspection:
 - 1. Periodic inspection of fabrication process, including welding, to monitor effectiveness of quality control program. Inspection of shop welding to be "verification inspection," in accordance with AWS D1.1, Chapter 6.
 - 2. Continuous inspection of complete and partial penetration groove welds, multi-pass fillet welds and single-pass fillet welds greater than 5/16 inch.
 - 3. Ultrasonic testing of all full penetration welds.
 - 4. Examination of installation of shop welded shear studs.
- C. Field Inspection:
 - 1. Proper erection of all pieces.
 - 2. Proper installation of all bolts, including checking of calibration of impact wrenches used with high-strength bolts.
 - 3. Plumbness of structure and proper bracing.
 - 4. Proper painting and galvanizing.
 - 5. Continuous inspection of welding process for penetration welds and fillet welds larger than 5/16 inch, and periodic inspection of all other welding while in progress.
 - 6. Application of joint details at each connection
 - 7. Visual examination of all completed welds.
 - 8. Ultrasonic testing of all penetration field welds.
 - 9. Installation of field welded shear studs.
 - 10. Inspect all shop-fabricated members, upon arrival at jobsite, for member straightness and alignment and for defects incurred during transit and handling.
 - 11. Measure and record camber of all beams upon arrival and before erection for compliance with specified camber. Measure lying flat with web horizontal. Members outside specified camber tolerance shall be returned to shop for correction.
 - 12. Proper grouting of column base plates.
- D. Qualifications of Welders: Fabricator and erector shall provide testing laboratory with names of welders to be employed on work, along with certification that each welder has passed qualification tests within the last year, using procedures covered in American Welding Society "Structural Welding Code – Steel," D1.1, latest edition. Verify all welder

qualifications.

E. Inspection of Field Welding Shall Include the Following:

1. Visually inspect fillet welds for size, soundness and proper return around ends. Check for seams, folds and delaminations.
2. Ultrasonically test all penetration welds in accordance with ASTM E164.
3. Inspect surfaces to be welded. Surface preparations, fit-up and cleanliness of surface shall be noted. Electrodes shall be checked for size, type and condition.
4. Welding inspector shall be present during alignment and fit-up of members being welded, and shall check for correct surface preparation of root openings, sound weld metal, and proper penetration in root pass. Where weld has not penetrated completely, inspector shall order joint to be chipped down to sound metal, or gouged out, and re-welded. Root passes shall be thoroughly inspected for cracks. All cracks shall be gouged out and rewelded to 2 inches beyond each end of crack.
5. Inspector shall check that all welds have been marked with welder's symbol and shall mark welds requiring repairs and shall make a re-inspection. Inspector shall maintain a written record of all welds. Work completed and inspected shall receive an identification mark by the inspector. Unacceptable material and work shall be identified by word "reject" or "repair" marked directly on material.
6. Testing agency shall advise Owner and Architect of any shop and/or field conditions which, in his opinion, may require further tests and examination by means other than specified. Such further tests and examinations shall be performed as authorized by Owner and Architect.
7. Owner reserves the right to use ultrasonic or radiographic inspection to verify adequacy of all welds. Testing procedures and acceptance criteria shall be as specified in AWS D1.1.
8. All welded connections between primary members of ductile moment resisting space frames shall be tested for compliance with UBC Standard No. 27-6 in addition to project specifications. As a minimum this shall include:
 - a. Ultrasonic or radiographic testing of all full penetration welds contained in joints and splices.
 - b. Ultrasonic or radiographic testing of partial penetration groove welds used in column splices.
 - c. When subjected to through thickness weld shrinkage strains, base metal thicker than 1-1/2 inches shall be ultrasonically inspected for discontinuities behind such welds after joint completion.
 - d. Any material discontinuities shall be accepted or rejected on basis of the defect rating in accordance with (larger reflector) criteria of UBC Standard No. 27-6.

F. Inspection of Bolted Construction Shall be in Accordance with AISC Specification for Structural Steel Buildings and as Follows:

1. All bolts shall be visually inspected to ensure plies have been brought into snug

contact.

2. High-strength bolting shall be inspected in accordance with Section 9 of "Specifications for Structural Joints Using ASTM A325 or A490 Bolts."
 3. For all high-strength bolts, unless specifically noted on Drawings to require only "snug-tight" installation, inspector shall observe required jobsite testing and calibration, and shall confirm procedure to be used does provide required tension. He then shall monitor the work to assure tested procedures are routinely followed. Tightening by calibrated wrench and turn-of-the-nut method without match-marking shall be continuously inspected.
 4. For slip-critical connections, inspect contact surfaces for compliance with specifications prior to bolting.
 5. Verify markings on bolts, nuts and washers to comply with ASTM Standards,
- G. Inspection of Stud Welding Shall be in Accordance with Section 7.8, of the AWS Structural Welding Code, D1.1, and as follows:
1. A minimum of two shear studs shall be welded at start of each production period in order to determine proper generator, control unit and stud welder setting. These studs shall be capable of being bent 45 degrees from vertical without weld failure.
 2. When temperature is below 32 degrees F, one stud in each 100 shall be tested after cooling. Studs shall not be welded below 0 degrees F or when surface is wet with rain or snow. If stud fails in weld, two new studs shall pass the test before resumption of welding.
 3. Visually inspect studs for compliance with Contract Documents. Check number, spacing and weld quality. If, after welding, visual inspection reveals a sound weld or a full 360-degree fillet has not been obtained for a particular stud, such stud shall be struck with a hammer and bent 15 degrees off perpendicular in the direction away from missing weld. Studs failing this test shall be replaced.

3.11 EXPANSION BOLT INSTALLATION

- A. Inspect drilling of each hole and installation of each expansion bolt, including hole size, hole preparation, number, spacing, anchor size, installation of grout or adhesive (where applicable) and anchor installation, for compliance with Contract Documents and shop drawings.
- B. Verify installation torque for each expansion bolt for compliance with manufacturer's installation instructions.

3.12 OPEN WEB JOISTS

- A. Inspect all joists either in plant or at jobsite for conformance with specified fabrication requirements. Check welded connections between web and chord, splices and straightness of members.
- B. Inspect installation of joists at jobsite. Check connections to supporting members, chord extensions, number of rows of bridging, and bridging connections for conformance with

Contract Documents and referenced standards.

- C. Inspect manufacturer's certificate of compliance.
- D. Check welder qualification certificates for both shop and field welding operators.

3.13 METAL FLOOR DECK

A. Field Inspection Shall Consist of the Following:

1. Check types, gauges and finishes for conformance with Contract Documents and Shop Drawings.
2. Examination for proper erection of all metal deck, fastenings, reinforcing of holes, deck reinforcing, miscellaneous deck supports, hanger tabs, shear studs, deck closures, painting or other coating.
3. Certification of welders.
4. Field welded shear studs used to fasten metal floor decking to supporting steel shall be inspected and tested as described in the paragraph addressing structural steel.

3.14 METAL ROOF DECK

A. Field Inspection Shall Consist of the Following:

1. Checking types, gauges and finishes for conformance with Contract Documents and Shop Drawings.
2. Examination for proper erection of all metal deck, including fastenings at supports and side laps, reinforcing of holes, and miscellaneous deck supports.
3. Certification of welders, under AWS D1.3 "Structural Welding Code – Sheet Steel."
4. Visual inspection of at least 25 percent of all welds.

3.15

3.16

3.17 EXTERIOR INSULATION AND FINISH SYSTEM (EIFS) WATER-RESISTIVE BARRIER COATING

- A. A water-resistive barrier coating complying with ASTM E2570 shall be inspected when installed over a sheathing substrate.

3.18 CONCRETE IN-SITU RELATIVE HUMIDITY, AND Ph TESTING

- A. Refer to Section 01 45 23 for requirements.

3.19

3.20 PENETRATION FIRESTOPS AND FIRE-RESISTANT JOINT SYSTEMS

- A. Refer to Section 07 84 00- Firestopping for requirements for inspecting and testing penetration firestop systems and fire-resistant joint systems.

END OF SECTION

SECTION 01 50 00 – TEMPORARY FACILITIES AND CONTROLS

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Temporary Utilities:
 - 1. Temporary electricity.
 - 2. Temporary lighting for construction purposes.
 - 3. Temporary heating.
 - 4. Temporary cooling.
 - 5. Temporary ventilation.
 - 6. Telephone service.
 - 7. Temporary water service.
 - 8. Temporary sanitary facilities.
- B. Construction Facilities:
 - 1. Field offices and sheds.
 - 2. Vehicular access.
 - 3. Parking.
 - 4. Progress cleaning and waste removal.
 - 5. Project identification.
 - 6. Traffic regulation.
 - 7. Fire prevention facilities.
- C. Temporary Controls:
 - 1. Barriers.
 - 2. Enclosures and fencing.
 - 3. Security.
 - 4. Water control.
 - 5. Dust control.

6. Erosion and sediment control.
7. Noise control.
8. Pest control.
9. Pollution control.
10. Rodent control.

D. Removal of utilities, facilities and controls.

1.02 TEMPORARY ELECTRICITY

- A. Owner will pay cost of energy used. Exercise measures to conserve energy.
- B. Provide temporary electric feeder from electrical service at location as directed by Owner. Do not disrupt Owner's use of service.
- C. Complement existing power service capacity and characteristics as required for construction operations.
- D. Provide power outlets, with branch wiring and distribution boxes located as required for construction operations. Provide flexible power cords as required for portable construction tools and equipment.
- E. Provide main service disconnect and over-current protection at convenient location.
- F. Permanent convenience receptacles may not be utilized during construction.
- G. Provide distribution equipment, wiring and outlets to provide single phase branch circuits for power and lighting.
 1. Provide 20 ampere duplex outlets, single phase circuits for power tools for every 500 square feet of active work area.
 2. Provide 20 ampere, single-phase branch circuits for lighting.

1.03 TEMPORARY LIGHTING FOR CONSTRUCTION PURPOSES

- A. Provide and maintain incandescent lighting for construction operations to achieve minimum lighting level of 2 watts/ square feet.
- B. Provide and maintain 1 watt/ square feet lighting to entire site after dark for security purposes.
- C. Provide and maintain 0.25 watt/ square feet HID lighting to interior work areas after dark for security purposes.
- D. Provide branch wiring from power source to distribution boxes with lighting conductors, pigtailed, and lamps for specified lighting levels.
- E. Maintain lighting and provide routine repairs.

- F. Permanent building lighting may not be utilized during construction.

1.04 TEMPORARY HEATING

- A. Provide and pay for heating devices and heat as needed to maintain specified conditions for construction operations.
- B. Enclose building prior to activating temporary heat in accordance with Enclosures article in this section.
- C. Maintain minimum ambient temperature of 50 degrees F in areas where construction is in progress, unless indicated otherwise in product sections.

1.05 TEMPORARY COOLING

- A. Provide and pay for cooling devices and cooling as needed to maintain specified conditions for construction operations.
- B. Enclose building prior to activating temporary cooling in accordance with Enclosures article in this section.
- C. Maintain maximum ambient temperature of 80 degrees F in areas where construction is in progress, unless indicated otherwise in specifications.

1.06 TEMPORARY VENTILATION

- A. Ventilate enclosed areas to achieve curing of materials, to dissipate humidity, and to prevent accumulation of dust, fumes, vapors or gases.

1.07 TELEPHONE SERVICE

- A. Provide, maintain and pay for telephone service to field office at time of project mobilization.
- B. Provide, maintain and pay for WiFi service to field office at time of project mobilization for the duration of the project work. Provide access to WiFi to Owner reps and Design Team members.

1.08 TEMPORARY WATER SERVICE

- A. Owner will pay cost of temporary water. Exercise measures to conserve water. Utilize Owner's existing water system, extend and supplement with temporary devices as needed to maintain specified conditions for construction operations.
- B. Extend branch piping with outlets located so water is available by hoses with threaded connections. Provide temporary pipe insulation to prevent freezing.

1.09 TEMPORARY SANITARY FACILITIES

- A. Provide and maintain required facilities and enclosures. Existing facility use is not permitted. Provide facilities at time of project mobilization.

1.10 FIELD OFFICES AND SHEDS

- A. Office: Weather tight, with lighting, electrical outlets, heating, cooling and ventilating equipment, and equipped with sturdy furniture drawing rack, and drawing display table.
- B. Provide space for Project meetings, with table and chairs to accommodate eight persons.
- C. Locate offices and sheds minimum distance of 30 feet from new structures.
- D. Do not use permanent facilities for field offices or for storage.
- E. Construction: Portable or mobile buildings, or buildings constructed with floors raised above ground, securely fixed to foundations with steps and landings at entrance doors.
 - 1. Construction: Structurally sound, secure, weather-tight enclosures for office and storage spaces. Maintain during progress of Work; remove when no longer needed at completion of Work.
 - 2. Temperature Transmission Resistance of Floors, Walls and Ceilings: Compatible with occupancy and storage requirements.
 - 3. Interior Materials in Offices: Sheet type materials for walls and ceilings, pre-finished or painted; resilient floors and bases.
 - 4. Lighting for Offices: 50 ft C at desktop height, exterior lighting at entrance doors.
 - 5. Interior Materials in Storage Sheds: As required to provide specified conditions for storage of products.
- F. Environmental Control:
 - 1. Heating, Cooling, and Ventilating for Offices: Automatic equipment to maintain comfort conditions 68 degrees F heating and 76 degrees F cooling.
 - 2. Storage Spaces: Heating and ventilation as needed to maintain products in accordance with Contract Documents; lighting for maintenance and inspection of products.
- G. Storage Areas and Sheds: Size to storage requirements for products of individual Sections, allowing for access and orderly provision for maintenance and for inspection of products to requirements of Section 01 60 00 – Product Requirements.
- H. Preparation: Fill and grade sites for temporary structures sloped for drainage away from buildings.
- I. Installation:
 - 1. Install office spaces ready for occupancy 15 days after date fixed in Notice to Proceed.
 - 2. Parking: Two hard surfaced parking spaces for use by Owner and Architect/Engineer, connected to office by hard surfaced walk.
 - 3. Employee Residential Occupancy: Not allowed on Owner's property.

- J. Maintenance and Cleaning:
 - 1. Daily janitorial services for offices; periodic cleaning and maintenance for office and storage areas.
 - 2. Maintain approach walks free of mud, water and snow.
- K. Removal: At completion of Work remove buildings, foundations, utility services, and debris. Restore areas.

1.11 VEHICULAR ACCESS

- A. Construct temporary all-weather access roads from public thoroughfares to serve construction area, of width and load bearing capacity to accommodate unimpeded traffic for construction purposes.
- B. Construct temporary bridges and culverts to span low areas and allow unimpeded drainage.
- C. Extend and relocate vehicular access as Work progress requires, provide detours as necessary for unimpeded traffic flow.
- D. Location approved by Owner.
- E. Provide unimpeded access for emergency vehicles. Maintain 20-foot-wide driveways with turning space between and around combustible materials.
- F. Provide and maintain access to fire hydrants and control valves free of obstructions.
- G. Provide means of removing mud from vehicle wheels before entering streets.
- H. Do not use designated existing on-site roads for construction traffic.

1.12 PARKING

- A. Provide temporary gravel surface parking areas to accommodate construction personnel.
- B. Locate as approved by Owner.
- C. When site space is not adequate, provide additional offsite parking.
- D. Use of designated existing onsite streets and driveways used for construction traffic is not permitted. Tracked vehicles not allowed on paved areas.
- E. Use of designated areas of existing parking facilities used by construction personnel is not permitted.
- F. Do not allow heavy vehicles or construction equipment in parking areas.
- G. Do not allow vehicle parking on existing pavement.
- H. Permanent Pavements and Parking Facilities:

1. Prior to Substantial Completion, bases for permanent roads and parking areas may be used for construction traffic.
 2. Avoid traffic loading beyond paving design capacity. Tracked vehicles not allowed.
 3. Use of permanent parking structures is not permitted.
- I. Maintenance:
1. Maintain traffic and parking areas in sound condition free of excavated material, construction equipment, products, mud, snow and ice.
- J. Removal, Repair:
1. Remove temporary materials and construction before Substantial Completion.
 2. Remove underground work and compacted materials to depth of 2 feet; fill and grade site as specified.
 3. Repair existing facilities damaged by use, to original condition.
- K. Mud from Site Vehicles: Provide means of removing mud from vehicle wheels before entering streets.

1.13 PROGRESS CLEANING AND WASTE REMOVAL

- A. Maintain areas free of waste materials, debris and rubbish. Maintain site in clean and orderly condition.
- B. Remove debris and rubbish from pipe chases, plenums, attics, crawl spaces, and other closed or remote spaces, prior to enclosing spaces.
- C. Broom and vacuum clean interior areas prior to start of surface finishing and continue cleaning to eliminate dust.
- D. Collect and remove waste materials, debris and rubbish from site weekly and dispose off-site.
- E. Open free-fall chutes are not permitted. Terminate closed chutes into appropriate containers with lids.

1.14 PROJECT IDENTIFICATION

- A. Project Identification Sign:
1. One painted sign, 32 square feet area, and bottom 6 feet above ground.
 2. Content:
 - a. Project number, title, logo and name of Owner as indicated on Contract Documents.
 - b. Names and titles of authorities.
 - c. Names and titles of Architect/Engineer and Consultants.

- d. Name of Prime Contractor.
3. Graphic Design, Colors, Style of Lettering: Designated by Architect/Engineer.
- B. Project Informational Signs:
 1. Painted informational signs of same colors and lettering as Project Identification sign, or standard products; size lettering for legibility at 100-foot distance.
 2. Provide sign at each field office, storage shed and directional signs to direct traffic into and within site. Relocate as Work progress requires.
 3. No other signs are allowed without Owner permission except those required by law.
- C. Design sign and structure to withstand 60 miles/hour wind velocity.
- D. Sign Painter: Experienced as professional sign painter for minimum three years.
- E. Finishes, Painting: Adequate to withstand weathering, fading and chipping for duration of construction.
- F. Show content, layout, lettering, color, foundation, structure, sizes and grades of members.
- G. Sign Materials:
 1. Structure and Framing: New wood, structurally adequate.
 2. Sign Surfaces: Exterior grade plywood with medium density overlay, minimum 3/4 inch thick, standard large sizes to minimize joints.
 3. Rough Hardware: Galvanized.
 4. Paint and Primers: Exterior quality; two coats; sign background white.
 5. Lettering: Exterior quality paint; contrasting colors.
- H. Installation:
 1. Install project identification sign within 15 days after date fixed by Notice to Proceed.
 2. Erect at location of high public visibility adjacent to main entrance to site.
 3. Erect supports and framing on secure foundation, rigidly braced and framed to resist wind loadings.
 4. Install sign surface plumb and level, with butt joints. Anchor securely.
 5. Paint exposed surfaces of sign, supports and framing.
- I. Maintenance: Maintain signs and supports clean, repair deterioration and damage.

- J. Removal: Remove signs, framing, supports and foundations at completion of Project and restore area.

1.15 TRAFFIC REGULATION

A. Signs, Signals and Devices:

1. Post-Mounted and Wall-Mounted Traffic Control and Informational Signs: As approved by authority having jurisdiction.
2. Traffic Cones and Drums, Flares and Lights: As approved by authority having jurisdiction.
3. Flagperson Equipment: As required by authority having jurisdiction.

B. Flag Persons: Provide trained and equipped flag persons to regulate traffic when construction operations or traffic encroach on public traffic lanes.

C. Flares and Lights: Use flares and lights during hours of low visibility to delineate traffic lanes and to guide traffic.

D. Haul Routes:

1. Consult with authority having jurisdiction, establish public thoroughfares to be used for haul routes and site access.
2. Confine construction traffic to designated haul routes.
3. Provide traffic control at critical areas of haul routes to regulate traffic, to minimize interference with public traffic.

E. Traffic Signs and Signals:

1. Provide signs at approaches to site and on site, at crossroads, detours, parking areas, and elsewhere as needed to direct construction and affected public traffic.
2. Provide, operate and maintain traffic control signals to direct and maintain orderly flow of traffic in areas under Contractor's control, and areas affected by Contractor's operations.
3. Relocate as Work progresses to maintain effective traffic control.

F. Removal:

1. Remove equipment and devices when no longer required.
2. Repair damage caused by installation.
3. Remove post settings to depth of 2 feet.

1.16 FIRE PREVENTION FACILITIES

A. Prohibit smoking within buildings under construction.

- B. Establish fire watch for cutting and welding and other hazardous operations capable of starting fires. Maintain fire watch before, during and after hazardous operations until threat of fire does not exist.
- C. Portable Fire Extinguishers: NFPA 10; 10-pound capacity, 4A-60B: C UL rating.
 - 1. Provide minimum one fire extinguisher in every construction trailer and storage shed.
 - 2. Provide minimum one fire extinguisher on roof during roofing operations using heat producing equipment.

1.17 BARRIERS

- A. Provide barriers to prevent unauthorized entry to construction areas.
- B. Protect non-owned vehicular traffic, stored materials, site and structures from damage.

1.18 ENCLOSURES AND FENCING

- A. Construction: Commercial grade chain link fence.
- B. Provide 6-foot-high fence around construction site; equip with vehicular and pedestrian gates with locks.
- C. Exterior Enclosures:
 - 1. Provide temporary weather-tight closure of exterior openings to accommodate acceptable working conditions and protection for products, to allow for temporary heating and maintenance of required ambient temperatures identified in individual specification sections, and to prevent entry of unauthorized persons. Provide access doors with self-closing hardware and locks.

1.19 SECURITY

- A. Security Program:
 - 1. Protect Work, existing premises from theft, vandalism and unauthorized entry.
 - 2. Initiate program at project mobilization.
 - 3. Maintain program throughout construction period until Owner occupancy
- B. Entry Control:
 - 1. Restrict entrance of persons and vehicles into Project site.
 - 2. Allow entrance only to authorized persons with proper identification.
 - 4. Maintain log of workers and visitors, make available to Owner on request.

1.20 WATER CONTROL

- A. Grade site to drain. Maintain excavations free of water. Provide, operate and maintain pumping equipment.
- B. Protect site from puddling or running water. Provide water barriers as required to protect site from soil erosion.

1.21 DUST CONTROL

- A. Execute Work by methods to minimize raising dust from construction operations.
- B. Provide positive means to prevent air-borne dust from dispersing into atmosphere.

1.22 EROSION AND SEDIMENT CONTROL

- A. Plan and execute construction by methods to control surface drainage from cuts and fills, from borrow and waste disposal areas. Prevent erosion and sedimentation.
- B. Minimize surface area of bare soil exposed at one time.
- C. Provide temporary measures including berms, dikes and drains, and other devices to prevent water flow.
- D. Construct fill and waste areas by selective placement to avoid erosive surface silts or clays.
- E. Periodically inspect earthwork to detect evidence of erosion and sedimentation; promptly apply corrective measures.

1.23 NOISE CONTROL

- A. Provide methods, means and facilities to minimize noise produced by construction operations.

1.24 PEST CONTROL

- A. Provide methods, means and facilities to prevent pests and insects from damaging the Work and entering facility.

1.25 POLLUTION CONTROL

- A. Provide methods, means and facilities to prevent contamination of soil, water and atmosphere from discharge of noxious, toxic substances, and pollutants produced by construction operations.
- B. Comply with pollution and environmental control requirements of authorities having jurisdiction.

1.26 RODENT CONTROL

- A. Provide methods, means and facilities to prevent rodents from accessing or invading premises.

1.27 REMOVAL OF UTILITIES, FACILITIES AND CONTROLS

- A. Remove temporary utilities, equipment, facilities and materials prior to Substantial Completion inspection.
- B. Remove underground installations to minimum depth of 2 feet. Grade site as indicated on Drawings.
- C. Clean and repair damage caused by installation or use of temporary work.
- D. Restore existing and permanent facilities used during construction to original condition.
 - 1. Restore permanent facilities used during construction to specified condition.

END OF SECTION

SECTION 01 60 00 – PRODUCT REQUIREMENTS

PART1 GENERAL

1.01 SECTION INCLUDES

- A. Products.
- B. Product delivery requirements.
- C. Product storage and handling requirements.

1.02 PRODUCTS

- A. Furnish products of qualified manufacturers suitable for intended use. Furnish products of each type by single manufacturer unless specified otherwise.

1.03 PRODUCT DELIVERY REQUIREMENTS

- A. Transport and handle products in accordance with manufacturer's instructions.
- B. Promptly inspect shipments to ensure products comply with requirements, quantities are correct, and products are undamaged.
- C. Provide equipment and personnel to handle products by methods to prevent soiling, disfigurement or damage.

1.04 PRODUCT STORAGE AND HANDLING REQUIREMENTS

- A. Store and protect products in accordance with manufacturers' instructions.
- B. Store with seals and labels intact and legible.
- C. Store sensitive products in weather-tight, climate-controlled, enclosures in an environment favorable to product.
- D. For exterior storage of fabricated products, place on sloped supports above ground.
- E. Provide bonded off-site storage and protection when site does not permit onsite storage or protection.
- F. Cover products subject to deterioration with impervious sheet covering. Provide ventilation to prevent condensation and degradation of products.
- G. Store loose granular materials on solid flat surfaces in well-drained area. Prevent mixing with foreign matter.
- H. Provide equipment and personnel to store products by methods to prevent soiling, disfigurement or damage.
- I. Arrange storage of products to permit access for inspection. Periodically inspect to verify products are undamaged and are maintained in acceptable condition.

PART 2 PRODUCTS

PART 3 EXECUTION

Not Used

END OF SECTION

SECTION 01 70 00 – EXECUTION AND CLOSEOUT REQUIREMENTS

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Closeout procedures.
- B. Final cleaning.
- C. Starting of systems.
- D. Demonstration and instructions.
- E. Testing, adjusting and balancing.
- F. Protecting installed construction.
- G. Project record documents.
- H. Operation and maintenance data.
- I. Manual for materials and finishes.
- J. Manual for equipment and systems.
- K. Spare parts and maintenance products.
- L. Product warranties and product bonds.
- M. Maintenance service.

1.02 CLOSEOUT PROCEDURES

- A. Submit written certification that Contract Documents have been reviewed, Work has been inspected, and that Work is complete in accordance with Contract Documents and ready for Architect/Engineer's review.
- B. Provide submittals to Architect/Engineer required by authorities having jurisdiction.
- C. Submit final Application for Payment identifying total adjusted Contract Sum, previous payments, and sum remaining due.

1.03 FINAL CLEANING

- A. Execute final cleaning prior to final project assessment.
- B. Clean interior and exterior glass, surfaces exposed to view; remove temporary labels, stains and foreign substances, polish transparent and glossy surfaces, vacuum carpeted and soft surfaces.
- C. Clean equipment and fixtures to sanitary condition with cleaning materials appropriate to

surface and material being cleaned.

- D. Replace filters of operating equipment.
- E. Clean debris from roofs, gutters, downspouts and drainage systems.
- F. Clean site; sweep paved areas, rake clean landscaped surfaces.
- G. Remove waste and surplus materials, rubbish and construction facilities from site.

1.04 STARTING OF SYSTEMS

- A. Coordinate schedule for startup of various equipment and systems.
- B. Notify Architect/Engineer and Owner seven days prior to startup of each item.
- C. Verify each piece of equipment or system has been checked for proper lubrication, drive rotation, belt tension, control sequence, and for conditions which may cause damage.
- D. Verify tests, meter readings, and specified electrical characteristics agree with those required by equipment or system manufacturer.
- E. Verify wiring and support components for equipment are complete and tested.
- F. Execute start-up under supervision of applicable manufacturer's representative and Contractors' personnel in accordance with manufacturers' instructions.
- G. When specified in individual specification Sections, require manufacturer to provide authorized representative to be present at site to inspect, check and approve equipment or system installation prior to startup, and to supervise placing equipment or system in operation.
- H. Submit a written report in accordance with Section 01 33 00 - Submittal Procedures that equipment or system has been properly installed and is functioning correctly.

1.05 DEMONSTRATION AND INSTRUCTIONS

- A. Demonstrate operation and maintenance of products to Owner's personnel two weeks prior to date of Substantial Completion.
- B. Demonstrate Project equipment by a qualified manufacturer's representative who is knowledgeable about the Project.
- C. For equipment or systems requiring seasonal operation, perform demonstration for other season within six months.
- D. Utilize operation and maintenance manuals as basis for instruction. Review contents of manual with Owner's personnel in detail to explain all aspects of operation and maintenance.
- E. Demonstrate startup, operation, control, adjustment, troubleshooting, servicing, maintenance and shutdown of each item of equipment at scheduled time and at designated location.

- F. Prepare and insert additional data in operations and maintenance manuals when need for additional data becomes apparent during instruction.
- G. Required instruction time for each item of equipment and system is specified in individual sections.

1.06 TESTING, ADJUSTING AND BALANCING

Note to editor: If a mechanical consultant other than O'Connell Robertson's engineers are designing the HVAC system, architect to verify if their outside HVAC engineering consultant has a section 23 05 93 Testing, Adjusting and Balancing or another section that addresses TAB and that within this section they have an article that addresses TAB procurement.

- A. Refer to Section 23 05 93 Testing, Adjusting and Balancing for TAB procurement.
- B. Reports will be submitted by independent firm to Architect/Engineer indicating observations and results of tests and indicating compliance or non-compliance with requirements of Contract Documents.

1.07 PROTECTING INSTALLED CONSTRUCTION

- A. Protect installed Work and provide special protection where specified in individual specification sections.
- B. Provide temporary and removable protection for installed products. Control activity in immediate work area to prevent damage.
- C. Provide protective coverings at walls, projections, jambs, sills and soffits of openings.
- D. Protect finished floors, stairs, and other surfaces from traffic, dirt, wear, damage or movement of heavy objects, by protecting with durable sheet materials.
- E. Prohibit traffic or storage upon waterproofed or roofed surfaces. When traffic or activity is necessary, obtain recommendations for protection from waterproofing or roofing material manufacturer.
- F. Prohibit traffic from landscaped areas.

1.08 PROJECT RECORD DOCUMENTS

- A. Maintain on site one set of the following record documents; record actual revisions to the Work:
 - 1. Drawings.
 - 2. Specifications.
 - 3. Addenda.
 - 4. Change Orders and other modifications to the Contract.
 - 5. Reviewed Shop Drawings, Product Data and Samples.

6. Manufacturer's instruction for assembly, installation and adjusting.
- B. Ensure entries are complete and accurate, enabling future reference by Owner.
- C. Store record documents separate from documents used for construction.
- D. Record information concurrent with construction progress, not less than weekly.
- E. Specifications: Legibly mark and record at each product section description of actual products installed, including the following:
 1. Manufacturer's name and product model and number.
 2. Product substitutions or alternates utilized.
 3. Changes made by Addenda and modifications.
- F. Record Drawings and Shop Drawings: Legibly mark each item to record actual construction including:
 1. Measured depths of foundations in relation to finish floor datum.
 2. Measured horizontal and vertical locations of underground utilities and appurtenances, referenced to permanent surface improvements.
 3. Measured locations of internal utilities and appurtenances concealed in construction, referenced to visible and accessible features of the Work.
 4. Field changes of dimension and detail.
 5. Details not on original Contract Drawings.
- G. Submit documents to Architect/Engineer with claim for final Application for Payment.

1.09 OPERATION AND MAINTENANCE DATA

- A. Submit data bound in 8-1/2 by 11 inch (A4) text pages, three-ring capacity expansion binders with durable plastic covers.
- B. Prepare binder cover with printed title "Operation and Maintenance Instructions," title of project, and subject matter of binder when multiple binders are required.
- C. Internally subdivide binder contents with permanent page dividers, logically organized as described below; with tab titling clearly printed under reinforced laminated plastic tabs.
- D. Drawings: Provide with reinforced punched binder tab. Bind in with text; fold larger drawings to size of text pages.
- E. Contents: Prepare Table of Contents for each volume, with each product or system description identified, typed on white paper, in three parts as follows:
 1. Part 1: Directory, listing names, addresses and telephone numbers of Architect/Engineer, Contractor, subcontractors and major equipment suppliers.

2. Part 2: Operation and maintenance instructions arranged by system and subdivided by specification section. For each category, identify names, addresses and telephone numbers of subcontractors and suppliers. Identify the following:
 - a. Significant design criteria.
 - b. List of equipment.
 - c. Parts list for each component.
 - d. Operating instructions.
 - e. Maintenance instructions for equipment and systems.
 - f. Maintenance instructions for special finishes, including recommended cleaning methods and materials, and special precautions identifying detrimental agents.
3. Part 3: Project documents and certificates, including the following:
 - a. Shop Drawings and product data.
 - b. Air and water balance reports.
 - c. Certificates.
 - d. Originals of warranties and bonds.

1.10 MANUAL FOR MATERIALS AND FINISHES

- A. Submit two copies of preliminary draft or proposed formats and outlines of contents before start of Work. Architect/Engineer will review draft and return one copy with comments.
- B. For equipment, or component parts of equipment put into service during construction and operated by Owner, submit documents within ten days after acceptance.
- C. Submit one copy of completed volumes 15 days prior to final inspection. Draft copy be reviewed and returned after final inspection, with Architect/Engineer comments. Revise content of document sets as required prior to final submission.
- D. Submit two sets of revised final volumes in final form within 10 days after final inspection.
- E. Building Products, Applied Materials, and Finishes: Include product data, with catalog number, size, composition and color and texture designations. Include information for re-ordering custom manufactured products.
- F. Instructions for Care and Maintenance: Include manufacturer's recommendations for cleaning agents and methods, precautions against detrimental agents and methods, and recommended schedule for cleaning and maintenance.
- G. Moisture Protection and Weather Exposed Products: Include product data listing applicable reference standards, chemical composition, and details of installation. Include recommendations for inspections, maintenance and repair.
- H. Additional Requirements: As specified in individual product specification sections.
- I. Include listing in Table of Contents for design data, with tabbed fly sheet and space for insertion of data.

1.11 MANUAL FOR EQUIPMENT AND SYSTEMS

- A. Submit two copies of preliminary draft or proposed formats and outlines of contents before start of Work. Architect/Engineer will review draft and return one copy with comments.
- B. For equipment, or component parts of equipment put into service during construction and operated by Owner, submit documents within 10 days after acceptance.
- C. Submit one copy of completed volumes 15 days prior to final inspection. Draft copy be reviewed and returned after final inspection, with Architect/Engineer comments. Revise content of document sets as required prior to final submission.
- D. Submit two sets of revised final volumes in final form within 10 days after final inspection.
- E. Each Item of Equipment and Each System: Include description of unit or system, and component parts. Identify function, normal operating characteristics, and limiting conditions. Include performance curves, with engineering data and tests, and complete nomenclature and model number of replaceable parts.
- F. Panelboard Circuit Directories: Provide electrical service characteristics, controls and communications by label machine.
- G. Include color coded wiring diagrams as installed.
- H. Operating Procedures: Include startup, break-in and routine normal operating instructions and sequences. Include regulation, control, stopping, shutdown and emergency instructions. Include summer, winter and special operating instructions.
- I. Maintenance Requirements: Include routine procedures and guide for preventative maintenance and troubleshooting; disassembly, repair, and reassembly instructions; and alignment, adjusting, balancing and checking instructions.
- J. Include servicing and lubrication schedule, and list of lubricants required.
- K. Include manufacturer's printed operation and maintenance instructions.
- L. Include sequence of operation by controls manufacturer.
- M. Include original manufacturer's parts list, illustrations, assembly drawings, and diagrams required for maintenance.
- N. Include control diagrams by controls manufacturer as installed.
- O. Include Contractor's Coordination Drawings, with color-coded piping diagrams as installed.
- P. Include charts of valve tag numbers, with location and function of each valve, keyed to flow and control diagrams.
- Q. Include list of original manufacturer's spare parts, current prices, and recommended quantities to be maintained in storage.
- R. Include test and balancing reports as specified in Section 01 40 00 - Quality Requirements.
- S. Additional Requirements: As specified in individual product specification sections.

- T. Include listing in Table of Contents for design data, with tabbed dividers and space for insertion of data.

1.12 SPARE PARTS AND MAINTENANCE PRODUCTS

- A. Furnish spare parts, maintenance and extra products in quantities specified in individual specification sections.
- B. Deliver to Project site and place in location as directed by Owner; obtain receipt prior to final payment.

1.13 PRODUCT WARRANTIES AND PRODUCT BONDS

- A. Obtain warranties and bonds executed in duplicate by responsible subcontractors, suppliers and manufacturers, within ten days after completion of applicable item of work.
- B. Execute and assemble transferable warranty documents and bonds from subcontractors, suppliers and manufacturers.
- C. Verify documents are in proper form, contain full information, and are notarized.
- D. Co-execute submittals when required.
- E. Include Table of Contents and assemble in three-ring binder with durable plastic cover.
- F. Submit prior to final Application for Payment.
- G. Time of Submittals:
 - 1. For equipment or component parts of equipment put into service during construction with Owner's permission, submit documents within 10 days after acceptance.
 - 2. Make other submittals within ten days after Date of Substantial Completion, prior to final Application for Payment.
 - 3. For items of Work for which acceptance is delayed beyond Date of Substantial Completion, submit within ten days after acceptance, listing date of acceptance as beginning of warranty or bond period.

1.14 MAINTENANCE SERVICE

- A. Furnish service and maintenance of components indicated in specification sections for one year from date of Substantial Completion unless otherwise specified in the individual specification section.
- B. Examine system components at frequency consistent with reliable operation. Clean, adjust and lubricate as required.
- C. Include systematic examination, adjustment and lubrication of components. Repair or replace parts whenever required. Use parts produced by manufacturer of original component.

- D. Do not assign or transfer maintenance service to agent or Subcontractor without prior written consent of Owner.

PART 2 PRODUCTS

Not Used

PART 3 EXECUTION

Not Used

END OF SECTION

PART 1 - GENERAL

1.1 SCOPE

- A. The work under this Section is subject to requirements of the Contract Documents including Divisions 00 and 01.

1.2 DESCRIPTION

- A. Commissioning is a systematic process of ensuring all building systems perform interactively according to design intent and Owner's operational needs. Commissioning will encompass and coordinate traditionally separate functions of system documentation, installation checkout, equipment start-up, control system calibration and point-to-point checkout, testing and balancing, and functional performance testing. Commissioning is intended to achieve the following specific objectives according to the Contract Documents:
 - 1. Verify and document systems are installed and operate in accordance with the Contract Documents.
 - 2. Ensure O&M, maintenance training, and commissioning documentation requirements are complete.
 - 3. Provide Owner with functional buildings and/or systems with minimal operational problems at time of move-in.
- B. Commissioning does not take away from or reduce responsibility of system designers or installing contractors to provide a finished and fully functioning product.
- C. This section shall in no way diminish the responsibility of the Division 20, 21, 22, 23, 26, 27 and 28 Contractors, Subcontractors and Suppliers in performing all aspects of work and testing as outlined in the contract documents. Any requirements outlined in this section are in addition to requirements outlined in Division 20, 21, 22, 23, 26, 27, 28, and other applicable Divisions of the Specifications.

1.3 ABBREVIATIONS

- A. The following are common abbreviations used in the Specifications (definitions are found further in this Section):
 - 1. A/E - Architect and Design Engineers
 - 2. AEGB – Austin Energy Green Building
 - 3. BAS – Building Automation System
 - 4. BOD – Basis of Design
 - 5. BST – Black Site (Emergency Power) Test
 - 6. CxA – Commissioning Agent
 - 7. CM – Construction Manager
 - 8. CxT – Commissioning Team
 - 9. Cx – Commissioning

10. Cx Plan – Commissioning Plan
11. CC – Controls Contractor
12. EC – Electrical Contractor
13. FPT – Functional Performance Test
14. MC – Mechanical Contractor
15. OR – Owner's Representative
16. OPR – Owner's Project Requirements
17. PFC – Pre-functional checklist
18. TAB – Test, Adjust and Balance
19. RFI – Request for Information

1.4 DEFINITIONS

- A. Acceptance Criteria: Threshold of acceptable work quality or performance specified for a commissioning activity, including, but not limited to, construction checklists, performance tests, performance test demonstrations, commissioning tests and commissioning test demonstrations.
- B. Acceptance Phase: Phase of construction after startup and initial checkout when Functional Performance Tests, O&M documentation review and training occur.
- C. Basis-of-Design (BOD) Document: A document prepared by Owner, Architect, or Commissioning Authority that records concepts, calculations, decisions, and product selections used to comply with Owner's Project Requirements and to suit applicable regulatory requirements, standards, and guidelines.
- D. Black Site Test (BST): A comprehensive test of the functional performance of the building systems under emergency power. This test is intended to prove correct operation of systems under a complete failure of normal power sources.
- E. Commissioning: A quality-focused process for verifying and documenting that the facility and all of its systems and assemblies are planned, designed, installed, and tested to comply with Owner's Project Requirements. The requirements specified here are limited to the construction phase commissioning activities.
- F. Commissioning Authority (CxA): An entity engaged by Owner or Architect to lead the Commissioning Process.
- G. Commissioning Plan: A document, prepared by the Commissioning Authority, that outlines the organization, schedule, allocation of resources, and documentation requirements of commissioning. The commissioning plan is not part of the Contract Documents.
- H. Commissioning Portal: A website selected by the CxA to host the commissioning plan, pre-functional checklists, functional performance tests, and the commissioning issues list. The commissioning portal for

this project is "www.CxAlloy.com" and is accessible through standard internet web browsers (Chrome) and mobile devices (iPad).

- I. Commissioning Team: All parties involved in commissioning activities, including but not limited to, the Architect and Engineers (A/E), the Owner, the Commissioning Authority (CxA), and contractors installing systems to be commissioned.
- J. Construction Phase Commissioning Completion: The stage of completion and acceptance of commissioning when resolution of deficient conditions and issues discovered during commissioning and retesting until acceptable results are obtained has been accomplished.
- K. Contract Documents: Documents binding all parties involved in construction of this project (drawings, specifications, change orders, amendments, contracts, etc.).
- L. General Contractor: Contracted directly to Owner
- M. Control System: System and components associated with building automation system.
- N. Functional Performance Test (FPT): A written procedure for the testing of equipment based on the sequence of operation provided by the Engineer of Record and defined in the construction documents. Functional performance tests to be executed by the Contractor at the direction of the CxA.
- O. Issues List: A list of all issues discovered during commissioning.
- P. Monitoring: Recording of parameters (flow, current, status, pressure, etc.) of equipment operation using data loggers or trending capabilities of control systems.
- Q. Overridden Value: Writing over a sensor value in control system to see response of a system (e.g., changing outside air temperature value from 52°F to 72°F to verify economizer operation). See also "Simulated Signal"
- R. Owner's Project Requirements: A document written by Owner, Architect, or Commissioning Authority that details the functional requirements of a project and the expectations of how it will be used and operated, including Project goals, measurable performance criteria, cost considerations, benchmarks, success criteria, and supporting information.
- S. Owner's Witness: CxA, Owner's Project Manager, or Architect-designated witness authorized to authenticate test demonstration data and to sign completed test data forms.
- T. Phased Commissioning: Commissioning completed in phases (by floors, for example) due to size of structure or other scheduling issues.
- U. Pre-functional Checklist (PFC): A checklist produced by the CxA and executed by the contractor to verify that appropriate components are onsite, correctly installed, set up, calibrated, functional and ready for functional testing.
- V. Seasonal Testing: Deferred or additional testing to be conducted based on the variance of equipment operation due to seasonal changes in outside air and weather conditions.

- W. Simulated Condition: condition created for testing component or system (e.g., applying heat to space temperature sensor to monitor response of VAV box).
- X. Simulated Signal: Disconnecting sensor and using signal generator to send amperage, resistance or pressure to a transducer and/or DDC system to simulate value to the BAS.
- Y. Site Visit Report: A report produced by the CxA detailing the results of a site visit. Site Visit Reports generally contain a short narrative followed by an attachment of the Issues List.
- Z. Start-up: The activities where systems or equipment are initially tested and operated. Start-up is completed prior to functional testing.
- AA. Sub-contractor: Contractors of CM, and their sub-contractors, who provide and install building components and systems.
- BB. Systems Manual: A document prepared by the CxA based on documentation provided by the A/E team, the installing contractors, and the Commissioning Authority's completed Commissioning Plan. This document is intended to assist the Owner in continued operations and maintenance to the facility after building turnover. Contents include, but are not limited to:
 - 1. A sequence of operations for the building
 - 2. The building occupancy schedule.
 - 3. Equipment run-time schedules.
 - 4. Setpoints for all HVAC equipment.
 - 5. Set lighting levels throughout the commissioned spaces.
 - 6. Minimum outside air requirements.
 - 7. Any changes in schedules or setpoints for different seasons, days of the week, and times of day.
 - 8. A systems narrative describing the mechanical and electrical systems and equipment.
 - 9. A preventive maintenance plan for building equipment described in the systems narrative.
 - 10. A commissioning program that includes periodic commissioning requirements, ongoing commissioning tasks, and continuous tasks for critical facilities.
- CC. "Systems," "Assemblies," "Subsystems," "Equipment," and "Components": Where these terms are used together or separately, they shall mean "as-built" systems, assemblies, subsystems, equipment, and components.
- DD. Test: Performance tests, performance test demonstrations, commissioning tests, and commissioning test demonstrations.
- EE. Trend Data Report: A report produced by the monitoring and logging of setpoints and actual conditions over a period of time with the building automation system.

- FF. Warranty Review: A review of the commissioned equipment lead by the CxA with participation from the commissioning team. This review is conducted approximately 10 months after substantial completion, or two months prior to warranty expiration.

1.5 RELATED DOCUMENTS

- A. Owner's Project Requirements [OPR] and Basis-of-Design [BoD] documentation is included by reference for information only.
- B. The Commissioning Plan
- C. ASHRAE Guideline 0–2005
- D. ASHRAE Guideline 1.1–2007 for HVAC&R systems
- E. 2015 International Energy Conservation Code.
- F. Austin Energy Green Building (AEGB) Commercial Rating Guidebook (2016)

1.6 SUMMARY

- A. The contractor is responsible for the work of this section except where action by the commissioning authority, owner, or Engineer of Record is specifically noted.
- B. This specification is intended to define the Contractor's roles and responsibilities, pertaining to commissioning, in achieving both the Basic Commissioning Requirements and the Additional Commissioning Credit (OPTION 1) found in the AEGB Commercial Rating Guidebook.
- C. The methodologies employed in the commissioning process shall be consistent with those described in ASHRAE Guideline 0-2005 and ASHRAE Guideline 1.1–2007 for HVAC&R systems, and as specified in the AEGB Commercial Rating Guidebook, and the 2015 International Energy Conservation Code.
- D. If a conflict is noted between this 01 9113 Specification and any other portion of the documents, it is incumbent upon the Contractor to request clarification in accordance with project's general conditions.
- E. While the Commissioning Authority may participate in problem solving activities, ultimately responsibilities for design, compliance with all codes, scheduling, construction management, and cost estimating resides with the Contractor.

1.7 RELATED WORK

- A. Additional commissioning requirements may be found in the following sections of these specifications. The following sections apply to Work specified in this section:
 - 1. Basic Fire Suppression System Requirements: Refer to Division 21.
 - 2. Basic Plumbing System Requirements: Refer to Division 22.
 - 3. Basic HVAC System Requirements: Refer to Division 23.

4. Basic Electrical System Requirements: Refer to Division 26.
5. Basic Electrical Safety & Security Requirements: Refer to Division 28.

1.8 COMPENSATION

- A. Should Architect, Engineer, CxA, other Owner's witness, or Owner's staff be required to perform additional services or incur additional expenses due to actions/inactions of Contractor listed below, the Contractor shall compensate the Owner for all related additional services and expenses.
 1. Failure to provide timely notice of commissioning activities schedule changes.
 2. Contractor provides notification of Commissioning testing readiness and after Commissioning team member is on site it is determined that systems to be tested are not ready.
 3. Failure to meet acceptance criteria for test demonstrations.
 4. Failure to provide required commissioning team support including but not limited to; building automation technical support, testing adjusting and balancing (TAB) technical support, inability to access required systems and areas.
 5. Failure to schedule functional testing in a fashion that other onsite activities do not conflict with, hinder, delay, or prevent functional testing.
- B. CxA additional service rate: Contractor shall compensate Owner for such additional services and expenses at the rate of \$200 per labor hour plus \$1000 per round trip for personnel travelling, plus per diem allowances for meals and lodging according to current U.S. General Services Administration (GSA) Per Diem Rates.
- C. Other party additional service rates: As defined in additional services in other party contracts.

1.9 SYSTEMS TO BE COMMISSIONED

- A. The following systems shall be commissioned as part of this project:
 1. Mechanical:
 - a. All new Mechanical/HVAC equipment and associated controls (BAS) within project scope.
 2. Plumbing
 - a. Domestic cold and hot water systems and recirculation within project scope including piping, valving, emergency shut-offs, and fixture operations.
 3. Electrical
 - a. Electrical Distribution Systems
 - b. Emergency Power Systems
 - c. Lighting Controls
 4. Life Safety Systems
 - a. Fire alarm

- b. Sprinkler
- c. Smoke Evacuation
- d. Interfaces between above systems
- 5. Electronic Security Systems
- 6. Irrigation Systems
- 7. Renewable Energy Systems

1.10 COMMISSIONING TEAM

A. Members Appointed CxA/Owner:

- 1. CxA Project Manager and CxA Field Personnel
- 2. Owner's Architect and Engineering design team
- 3. Owner's Project Manager or Representative
- 4. Owner's facility maintenance staff

B. Members Appointed by Contractor:

- 1. Commissioning Coordinator: A person or entity employed by the Contractor to manage, schedule, and coordinate commissioning.
- 2. Project superintendent and other employees that Contractor may deem appropriate for a particular portion of the commissioning.
- 3. Subcontractors, installers, suppliers, and specialists that Contractor may deem appropriate for a particular portion of the commissioning. These team members shall, at a minimum, consist of the mechanical contractor, controls Contractor, TAB contractor, Electrical contractor, Plumbing Contractor, all other contractors installing and performing work on commissioned systems, and any necessary vendor representatives associated with commissioned systems.

C. Appointed team members shall have the authority to act on behalf of the entity they represent

1.11 COMMISSIONING DOCUMENTATION

A. Documentation provided by the Commissioning Authority

- 1. Commissioning Plan (Cx Plan)
 - a. The Cx Plan will be assembled by the CxA.
 - b. Cx Plan includes, at minimum:
 - 1) Narrative: A document describing the activities that will be accomplished during each phase of commissioning, including the personnel intended to accomplish each of the activities.

- 2) Equipment List: A listing of the specific equipment, appliances or systems subject to commissioning requirements and a listing of the checks and/or tests to be performed,
 - 3) Pre-functional Checklists (PFCs): Project specific checklists, referencing contract document requirements. PFC's are created by the CxA to be completed on the project by the installing contractor for all commissioned systems. PFCs are not start-up forms and do not serve as replacements to start-up documentation.
 - 4) Functional Performance Tests (FPTs): Tests which are created by the CxA designed to test the modes of each piece of equipment/system. These shall be created based on all modes indicated in the Sequences of Operation (SOO) provided within the Construction Documents (not controls submittals). They shall also fully document pertinent setpoints and actual readings quantitatively per building automation system reporting.
 - 5) Sample Issues List: A sample document illustrating the display format of documenting issues discovered during the commissioning process.
 - 6) Proposed deliverables schedule.
- c. The Cx Plan will be provided in PDF format to the Commissioning Team by the CxA
 - d. The Cx Plan will reside on a server accessible through the Commissioning Portal (www.CxAlloy.com). The CxA will provide members of the Commissioning Team login credentials.
- B. Documentation provided to the CxA by the Contractor
1. Submittals
 - a. Submittals shall be provided to CxA for all equipment and systems to be commissioned.
 - b. Provide to CxA concurrently with submission to Engineer of Record.
 2. Commissioning Plan Information:
 - a. Commissioning Coordinator shall provide listing of contractor-appointed Commissioning Team members to CxA to be assigned execution duties of PFC's. Contractor-appointed team members must be capable of interfacing with the Commissioning Portal.
 - b. Provide at least one team member for each subcontractor installing systems/equipment to be commissioned.
 - 1) Information listing for contractor-appointed team members shall include:
 - a) First and Last Name
 - b) Role
 - c) Email address to be used for login credentials to web application
 - d) Company
 - c. Coordinate with the commissioning team to provide schedule of commissioning activities integrated with the construction schedule.

- d. Provide all required commissioning plan information no more than 5 days after the Cx Kick-off Meeting.
3. PFCs:
- a. If CxA has authorized Contractor to complete PFC's in paper format or any other method in lieu of completing them through the Commissioning Portal, contractor shall submit completed PFCs to CxA for review. Contractor shall execute PFCs on the commissioning portal (CxAlloy.com) unless written permission to execute on paper is provided by CxA.
 - b. Keep status of Equipment and PFCs updated on CxAlloy Server under "Equipment Status" parameter and "PFC Status" parameter.
 - c. Complete and submit all PFC's provided in the Cx Plan to CxA.
 - d. Complete PFCs on CxAlloy server or submit paper copies to CxA prior to commencement of functional performance testing.
 - e. Sampling strategies are not acceptable.
 - f. Complete PFCs prior to commencement of functional performance testing.
4. Start-up Plan
- 1) Start-up plan shall be provided to CxA for all equipment to be commissioned.
 - 2) Submit completed manufacturer's start-up plan for each piece of equipment for which the respective manufacturer provides such form.
 - 3) Submit completed alternative start-up plan for each piece of equipment requiring start-up for which no manufacturer's start-up form exists.
- b. Submit completed start-up plan to CxA for review prior to commencement of functional performance testing.
 - c. PFC's shall not be used to replace or in lieu of start-up plan.
5. Trend Data Reports
- a. Provide trend data reports of points and at intervals as listed in the EOR sequences of operation.
 - b. Organize and group data points in reports by equipment as listed in the EOR's sequences of operation.
 - c. If the sequences of operation do not indicate points to be trended, provide trend data report for each point shown on the controls schematics that shall be reported to the Building Automation System.
 - d. If the sequence of operation does not indicate trend intervals, provide all points at equal and corresponding intervals of 5 minutes.
 - e. Duration of trend data for all points shall be no less than 7 consecutive days.

- f. Provide trend data reports to CxA in “.CSV” or “.XLSX” format or any other format which the CxA approves.
 - g. Provide sample submission illustrating the organization and format of the trend data to CxA for approval prior to trend data report submission.
 - h. Provide initial trend data reports to CxA no less than 2 weeks prior to scheduled functional testing for respective equipment.
 - i. Provide opposed season trend data reports for all equipment scheduled for opposed season testing in the same manner as required for the initial trend data reports with the following change:
 - 1) Contractor shall utilize a start date and time, for opposed season trend data reports, that is provided by the CxA. Contractor is responsible for requesting, in written form, the start date and time from the CxA no more than 90 days after the issuing of the Certificate of Occupancy.
6. Testing Readiness
- a. Submit “testing readiness” correspondence to CxA via email for each scheduled functional testing period no less than 3 business days prior to start date of the functional testing.
 - b. Testing readiness correspondence, for each system and piece of equipment to be tested during the respective functional testing period, shall include:
 - 1) Verification by the contractor that:
 - a) The equipment/system scheduled to be tested is complete and ready to test.
 - b) The equipment/system is communicating with the Building Automation System.
 - c) Building Automation System front end graphics are complete and will be available to be viewed in real time at the scheduled testing date.
 - d) Required contractor personnel are available for the duration and uninterrupted.
 - e) Scheduled functional testing will not be prevented, delayed, or hindered by other onsite activities such as, but not limited to, fire alarm testing, emergency power testing, and re-allocation of scheduled controls personnel.
 - 2) Any exceptions to scheduled testing.
7. Issues List Response
- a. If CxA has authorized Contractor to update the Issues List in paper format or any other method in lieu of responding through the Commissioning Portal, contractor shall submit “Issues List Response” response to CxA no later than one week after each issuance of a site visit report by the CxA. Contractor shall update Issues List responses on the commissioning portal (CxAlloy.com) unless CxA provides written permission to provide responses through other methods.

8. Systems Manual Data
 - a. Provide the following documentation for all commissioned equipment for inclusion into Systems Manual:
 - 1) "OPERATION AND MAINTENANCE DATA"
 - 2) "FINAL SEQUENCE OF OPERATION"
 - 3) "FINAL TEST, ADJUST, AND BALANCE(TAB) REPORT"
 - 4) "EQUIPMENT SETPOINTS"
 - 5) "EQUIPMENT SCHEDULES": Run-time schedules.
 - 6) "OCCUPANCY SCHEDULE": The final space occupancy schedule for all spaces in the project.
 - 7) "LIGHTING LEVELS": Set lighting levels throughout the commissioned spaces.
 - 8) "MINIMUM OUTSIDE AIR REQUIREMENTS"
 - 9) "EXCEPTIONS TO SCHEDULES AND SETPOINTS": Any changes in schedules or setpoints for different seasons, days of the week, and times of day.
 - 10) "MAINTENANCE SCHEDULE": Complete listing of preventative maintenance activities and associated frequencies for all commissioned equipment.
 - 11) "CONTRACTOR CONTACT INFORMATION" Complete listing of installing contractors categorized by systems for each system being commissioned.
 - b. Provide Systems Manual Data in "text searchable" PDF or other format approved by CxA.
 - c. Provide Systems Manual Data categorized in sections indicated above and labeled as such.
 - d. Provide Systems Manual Data to CxA no later than 90 days of the issuance for the certificate of occupancy.

1.12 QUALITY ASSURANCE

- A. Commissioning Coordinator Qualifications:
 1. Documented experience commissioning systems of similar complexity to those contained in these documents on at least 3 projects of similar scope and complexity.
 2. Capable of interfacing with the Commissioning Portal. Such operations include but are not limited to:
 - a. Adding Contractor personnel to commissioning portal (CxAlloy).
 - b. Responding to issues via web portal.
 - c. Tracking sub-contractors' progress in proper completion of checklists.
 - d. Executing tasks generated in the web application.

PART 2 - PRODUCTS

2.1 TEST EQUIPMENT, INSTRUMENTATION, AND TOOLS

- A. Test equipment and instrumentation required to perform the commissioning shall remain the property of Contractor unless otherwise indicated.
- B. Test equipment and instrumentation required to perform commissioning shall comply with the following criteria:
 - 1. Be manufactured for the purpose of testing and measuring tests for which they are being used and have an accuracy to test and measure system performance within the tolerances required to determine acceptable performance.
 - 2. Calibrated and certified.
 - a. Calibration performed and documented by a qualified calibration agency according to national standards applicable to the tools and instrumentation being calibrated. Calibration shall be current according to national standards or within test equipment and instrumentation manufacturer's recommended intervals, whichever is more frequent, but not less than within six months of initial use on Project. Calibration tags permanently affixed.
 - b. Repair and recalibrate test equipment and instrumentation if dismantled, dropped, or damaged since last calibrated.
 - 3. Maintain test equipment and instrumentation.
 - 4. Use test equipment and instrumentation only for testing or monitoring Work for which they are designed.

2.2 PROPRIETARY TEST EQUIPMENT, INSTRUMENTATION, AND TOOLS

- A. Proprietary test equipment, instrumentation, and tools are those manufactured or prescribed by tested equipment manufacturer and required for work on its equipment as a condition of equipment warranty, or as otherwise required to service, repair, adjust, calibrate, or perform work on its equipment.
 - 1. Identify proprietary test equipment, instrumentation, and tools required in the test equipment identification list submittal.
 - 2. Proprietary test equipment, instrumentation, and tools shall become the property of Owner at Substantial Completion.

PART 3 - EXECUTION

3.1 PREPARATION

- A. Review Cx Plan for accuracy and completeness.
- B. Document any exceptions to checklists and functional performance test criteria. Examples of exceptions include, but are not limited to:

1. Pre-fabricated kits or assemblies which do not correspond to details, specifications, or other the requirements of the contract documents, but have been approved by the Engineer of Record. Examples of such items include, but are not limited to:
 - a. Hydronic hose kits
 - b. Insulating, piping, and labeling of equipment
 - c. Prefabricated skid-mounted assemblies
 - d. Factory installed provisions for which the contract documents depict field installation.
2. Functional testing methods or sequences which cannot be used on the project or must be altered to depict correct function.

3.2 COMMISSIONING KICK-OFF MEETING

- A. Commissioning Coordinator shall schedule and host a commissioning kickoff meeting to be held on site directly prior to or after a regularly scheduled Owner/Architect/Contractor (OAC) meeting.
- B. Kickoff meeting shall be conducted prior to equipment and systems installation for commissioned systems.
- C. The commissioning coordinator shall contact the CxA for approval of meeting time no less than three weeks prior to the selected date.
- D. The following entities shall be invited to the meeting by the commissioning coordinator:
 1. Mandatory attendees:
 - a. Commissioning Authority
 - b. Commissioning coordinator
 - c. Controls contractor
 - d. Sub-contractors involved in the installation of commissioned systems and equipment.
 2. Other invitees:
 - a. Owner's representative
 - b. Architect
 - c. Engineer of Record
 - d. Testing, Adjusting, and Balancing Contractor
 - e. Any other commissioning team members appointed by the contractor, CxA, or Owner.
- E. CxA reserves the right to conduct the Commissioning kickoff meeting from a remote location. In such case, contractor must supply a proper electronic communications platform to provide sufficient audio and visual display for the onsite team to communicate with the CxA both visually and verbally. The communication platform shall be capable of logging into and joining a Microsoft Teams meeting invitation provided by the CxA. Commissioning coordinator is responsible for logging into meeting for onsite attendees.

3.3 OTHER MEETINGS

- A. Contractor shall notify CxA of any requested CxA involvement in meetings not specifically scheduled for commissioning activities. Contractor shall notify CxA of such requests no less than three days prior to each meeting and provide call-in information to the CxA in the instance that the CxA is unable to attend onsite.

3.4 PRE-FUNCTIONAL CHECKLISTS (PFCs)

- A. PFCs cannot modify or conflict with the Contract Documents.
- B. PFCs are provided by the CxA and are accessible to commissioning team members through the Commissioning Portal.
- C. PFCs are based on actual systems and equipment to be included in the Project. Requirements in the checklists reference the construction documents when applicable.
- D. Contractor shall execute the following tasks associated with PFCs:
 - 1. Execute PFCs on the Commissioning Portal.
 - 2. Photograph and upload high resolution digital photographs that clearly represent the requested picture to the PFC's where prompted.
 - 3. Contractor shall ensure that PFC completion is accurate and up to date with construction progress to within two weeks.
 - 4. Contractor shall note any conflicts between PFC requirements and construction conditions as issues to be tracked in the web application.
- E. The PFC for each piece of equipment must be completed prior to functionally testing the equipment.
- F. Contractor shall maintain the "PFC Status" parameter within two weeks up being current for each PFC in CxAlloy

3.5 TEST, ADJUST, AND BALANCE (TAB) REVIEW AND SAMPLING

- A. Provide preliminary TAB report to CxA for review no less than two weeks before scheduled TAB report sampling by CxA.
- B. Commissioning coordinator shall coordinate with CxA to schedule TAB report sampling. TAB sampling duration shall not exceed 20% of measurements. CxA reserves the right to require further contractor cooperation if any of the following conditions occur:
 - 1. Greater than 10% of sampled TAB readings are not within the allowable tolerances of TAB specifications.
- C. Contractor shall provide same TAB personnel and testing equipment to sample the TAB report as conducted the initial TAB activities.

3.6 FUNCTIONAL PERFORMANCE TESTS

- A. Functional Performance Tests cannot modify or conflict with the contract documents.
- B. Functional performance tests are provided by the CxA and are accessible to commissioning team members through the Commissioning Portal.
- C. Functional performance tests are written by the CxA and based on the sequences of operation available within the construction documents. The tests are not based on the approved controls submittals.
- D. Notify CxA of known controls conflicts between approved submittals and the sequence of operation within the construction documents prior to the scheduling of functional performance tests.
- E. Conduct functional tests at the direction of the CxA, who will document and verify functional testing results.
- F. Provide all personnel, materials, and equipment deemed necessary by the CxA for testing all commissioned systems and equipment. Such provisions include, but are not limited to:
 - 1. Qualified controls personnel: Controls technician shall have no less than five years of experience in programming and installing building automation system controls. Controls technician shall be familiar with and have participated in the controls programming for the systems being tested **at this project site.**
 - 2. Calibrated testing equipment.
 - 3. Ladders and other equipment necessary to access commissioned equipment.
 - 4. Personnel to demonstrate fire damper function to CxA and reset fire damper linkages to proper setting after testing.
 - 5. Test, Adjust, and Balancing personnel to verify air and water flow readings during testing.
 - 6. Factory authorized start-up and controls personnel for stand-alone controls which are not fully integrated into the building automation system. Examples of such systems may include:
 - a. Hot Water Boiler controls
 - b. Dedicated Outside Air Unit Controls
 - c. Manufacturer provided standard air handling unit controls.
- G. Contractor shall continue to provide personnel and resources to assist the CxA until all issues on the Issues List have been resolved.
- H. Schedule all functional performance testing with subcontractors and CxA. Proposed test dates shall not conflict with scheduled fire alarm testing, emergency power testing, or other activities that would delay or interrupt functional testing of commissioned systems.
- I. Provide no less than two weeks of notice of intent to test equipment for each proposed testing date.

- J. Functional testing of each piece of equipment shall not be commenced prior to the contractors submission of Trend Data Reports to the CxA for that equipment.
- K. Deferred Testing: During deferred testing, contractor shall provide CxA access to and usage of all provisions utilized during the original functional performance testing period.

3.7 COMMISSIONING ISSUES LIST

- A. Provide responses to all issues not assigned to other members of the Commissioning Team on the Commissioning Portal within one week of their posting on the Commissioning Portal. Responses shall be provided directly on the Commissioning Portal.
- B. For all issues for which the solution can be visually verified, contractor shall provide a high resolution digital photograph clearly depicting the issue resolution as an attachment in the issue response.
- C. Notify CxA in writing when all contractor-related issues have been resolved on the web portal.

3.8 COMMISSIONING TRAINING REQUIREMENTS

- A. Provide all training in accordance with specifications. If requirements in this specification conflict with training requirements indicated elsewhere in the construction documents, those requirements supersede the requirements listed in this section. Note this exception does not apply to conditions where this specification is an augmentation to other training requirements.
- B. Provide all training material to CxA prior to training activities.
- C. Unless specifications otherwise require training to be recorded in video format, all training for commissioned equipment and systems shall be provided as such:
 - 1. Notify CxA of all training and demonstrations of commissioned systems at least one week in advance
 - 2. Record with high resolution video and save as MP4, AVI, WMV, or other format approved by CxA.
 - 3. Any vocal descriptions provided in the training must be audible and distinguishable from ambient noise. This may require the Contractor to furnish a microphone to interface with video recording equipment while in equipment rooms or other areas with high volumes of ambient noise. CxA reserves to right to reject training videos which he deems inaudible and require Contractor to re-submit a version with clear audio.
 - 4. At the introduction of the training for each system, identify the manufacturer of the system as well as at least one service company qualified to provide maintenance and repair work on the associated equipment and systems.
 - 5. At conclusion of training, provide to CxA an Audio/Video recording of all training sessions in a digital format approved by the CxA.

3.9 CERTIFICATE OF CONSTRUCTION PHASE COMMISSIONING COMPLETION

- A. When Contractor considers that construction phase commissioning, or a portion thereof which Owner agrees to accept separately, is complete, Contractor shall prepare and submit to Owner and

Commissioning Authority, utilizing established standard submittal process as outlined in these documents, a comprehensive list of items to be completed or corrected. Failure to include an item on such list does not alter Contractor's responsibility to complete commissioning.

- B. Contractor shall promptly correct deficient conditions and issues discovered during commissioning. Costs of correcting such deficient conditions and issues, including additional testing and inspections, the cost of uncovering and replacement, and compensation for Architect's and Commissioning Authority's services and expenses made necessary thereby, shall be at Contractor's expense. Contractor shall document, via photograph when possible, all resolutions associated with commissioning issues.

3.10 COMMISSIONING WARRANTY REQUIREMENTS

- A. Provide to CxA all warranty materials within 90 days of issuing of certificate of occupancy.
- B. Commissioning Coordinator shall schedule and host a Warranty Review meeting to be held on site two months prior to the warranty period expiration. All members of the commissioning team shall be invited.
- C. Provide personnel to aide CxA in accessing commissioned equipment directly prior to the warranty review meeting.
- D. Warranty review meeting shall be scheduled no less than four weeks in advance of the proposed meeting date.

3.11 OPPOSED SEASON TESTING

- A. Contractor shall schedule and conduct, at the direction of the CxA, opposed season or "deferred" testing, as directed by the CxA, during no more than 8 months after initial functional testing dates.
- B. Contractor shall re-submit trend data reports according to requirements outlined in the "**TREND DATA REPORTS**" portion of this specification.
- C. Commissioning Coordinator shall submit the proposed opposed season testing date to CxA for approval no less than three weeks prior to the proposed testing date.
- D. Contractor shall provide to CxA, for the duration of opposed season testing, all provisions indicated in the "**FUNCTIONAL PERFORMANCE TEST**" section of this specification.

SECTION 033000 - CAST-IN-PLACE CONCRETE

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section includes cast-in-place concrete, including formwork, reinforcement, concrete materials, mixture design, placement procedures, and finishes, for the following:
 - 1. Pier caps.
 - 2. Plinths and grade beams:
 - 3. Slabs-on-grade.
 - 4. Spread footings.
 - 5. Walls.
 - 6. Elevated slabs and beams.
 - 7. Slabs on steel deck.
 - 8. Concrete topping slabs.
- B. Related Sections:
 - 1. Division 3 Section "Architectural Concrete" for general building applications of specially finished formed concrete.
 - 2. Division 3 Section "Concrete Topping" for emery- and iron-aggregate concrete floor toppings.
 - 3. Division 31 Section "Earth Moving" for drainage fill under slabs-on-grade.
 - 4. Division 32 Section "Concrete Paving" for concrete pavement and walks.

1.3 DEFINITIONS

- A. Cementitious Materials: Portland cement alone or in combination with one or more of the following: blended hydraulic cement, fly ash, metakaolin, and other pozzolans, slag cement and silica fume; subject to compliance with requirements.

1.4 ACTION SUBMITTALS FOR REVIEW

- A. Product Data: For each type of product indicated.
- B. Design Mixtures: For each concrete mixture. Submit alternate design mixtures when characteristics of materials, Project conditions, weather, test results, or other circumstances warrant adjustments.
 - 1. Indicate amounts of mixing water to be withheld for later addition at Project site.

2. Where LEED MR credits are pursued, include zero percent fly ash mixtures as a baseline mix design for each concrete mix strength indicated to have fly ash replacement.
- C. Steel Reinforcement Shop Drawings: Placing drawings that detail fabrication, bending, and placement. Include bar sizes, lengths, material, grade, bar schedules, stirrup spacing, bent bar diagrams, bar arrangement, splices and laps, mechanical connections, tie spacing, hoop spacing, and supports for concrete reinforcement.
- D. Formwork Shop Drawings: Prepared by or under the supervision of a qualified professional engineer detailing fabrication, assembly, and support of formwork.
 1. Shoring and Reshoring: Indicate proposed schedule and sequence of stripping formwork, shoring removal, and reshoring installation and removal.
- E. Control Joint and Construction Joint Layout: Indicate proposed control joints and construction joints required to construct the structure.
 1. Location of control joints and construction joints is subject to approval of the Architect and Engineer.

1.5 INFORMATIONAL SUBMITTALS

- A. Qualification Data: For Installer, manufacturer, testing agency.
- B. Welding certificates.
- C. Material Certificates: For each of the following, signed by manufacturers:
 1. Cementitious materials.
 2. Admixtures.
 3. Form materials and form-release agents.
 4. Steel reinforcement and accessories.
 5. Waterstops.
 6. Curing compounds.
 7. Floor and slab treatments.
 8. Bonding agents.
 9. Adhesives.
 10. Vapor retarders.
 11. Semirigid joint filler.
 12. Joint-filler strips.
 13. Repair materials.
- D. Material Test Reports: For the following, from a qualified testing agency, indicating compliance with requirements:
 1. Aggregates. Include service record data indicating absence of deleterious expansion of concrete due to alkali aggregate reactivity.
- E. Floor surface flatness and levelness measurements indicating compliance with specified tolerances.
- F. Field quality-control reports.

- G. Minutes of preinstallation conference.

1.6 QUALITY ASSURANCE

- A. Installer Qualifications: A qualified installer who employs on Project personnel qualified as ACI-certified Flatwork Technician and Finisher and a supervisor who is an ACI-certified Concrete Flatwork Technician.
- B. Manufacturer Qualifications: A firm experienced in manufacturing ready-mixed concrete products and that complies with ASTM C 94/C 94M requirements for production facilities and equipment.
 - 1. Manufacturer certified according to NRMCA's "Certification of Ready Mixed Concrete Production Facilities."
- C. Testing Agency Qualifications: An independent agency, acceptable to authorities having jurisdiction, qualified according to ASTM C 1077 and ASTM E 329 for testing indicated.
 - 1. Personnel conducting field tests shall be qualified as ACI Concrete Field Testing Technician, Grade 1, according to ACI CP-1 or an equivalent certification program.
 - 2. Personnel performing laboratory tests shall be ACI-certified Concrete Strength Testing Technician and Concrete Laboratory Testing Technician - Grade I. Testing Agency laboratory supervisor shall be an ACI-certified Concrete Laboratory Testing Technician - Grade II.
- D. Source Limitations: Obtain each type or class of cementitious material of the same brand from the same manufacturer's plant, obtain aggregate from single source, and obtain admixtures from single source from single manufacturer.
- E. Welding Qualifications: Qualify procedures and personnel according to AWS D1.4/D 1.4M, "Structural Welding Code - Reinforcing Steel."
- F. ACI Publications: Comply with the following unless modified by requirements in the Contract Documents:
 - 1. ACI 301, "Specifications for Structural Concrete," Sections 1 through 5.
 - 2. ACI 117, "Specifications for Tolerances for Concrete Construction and Materials."
- G. Concrete Testing Service: Engage a qualified independent testing agency to perform material evaluation tests and to design concrete mixtures.
- H. Preinstallation Conference: Conduct conference at Project site.
 - 1. Before submitting design mixtures, review concrete design mixture and examine procedures for ensuring quality of concrete materials. Require representatives of each entity directly concerned with cast-in-place concrete to attend, including the following:
 - a. Contractor's superintendent.
 - b. Independent testing agency responsible for concrete design mixtures.
 - c. Ready-mix concrete manufacturer.
 - d. Concrete subcontractor.
 - e. Special concrete finish subcontractor.

2. Review special inspection and testing and inspecting agency procedures for field quality control, concrete finishes and finishing, cold- and hot-weather concreting procedures, curing procedures, construction contraction and isolation joints, and joint-filler strips, semirigid joint fillers, forms and form removal limitations, shoring and reshoring procedures, vapor-retarder installation, anchor rod and anchorage device installation tolerances, steel reinforcement installation, floor and slab flatness and levelness measurement, concrete repair procedures, and concrete protection.

1.7 DELIVERY, STORAGE, AND HANDLING

- A. Steel Reinforcement: Deliver, store, and handle steel reinforcement to prevent bending and damage. Avoid damaging coatings on steel reinforcement.
- B. Waterstops: Store waterstops under cover to protect from moisture, sunlight, dirt, oil, and other contaminants.

PART 2 - PRODUCTS

2.1 FORM-FACING MATERIALS

- A. Smooth-Formed Finished Concrete: Form-facing panels that will provide continuous, true, and smooth concrete surfaces. Furnish in largest practicable sizes to minimize number of joints.
 1. Plywood, metal, or other approved panel materials.
 2. Exterior-grade plywood panels, suitable for concrete forms, complying with DOC PS 1, and as follows:
 - a. High-density overlay, Class 1 or better.
 - b. Medium-density overlay, Class 1 or better; mill-release agent treated and edge sealed.
 - c. Structural 1, B-B or better; mill oiled and edge sealed.
 - d. B-B (Concrete Form), Class 1 or better; mill oiled and edge sealed.
- B. Rough-Formed Finished Concrete: Plywood, lumber, metal, or another approved material. Provide lumber dressed on at least two edges and one side for tight fit.
- C. Forms for Cylindrical Columns, Pedestals, and Supports: Metal, glass-fiber-reinforced plastic, paper, or fiber tubes that will produce surfaces with gradual or abrupt irregularities not exceeding specified formwork surface class. Provide units with sufficient wall thickness to resist plastic concrete loads without detrimental deformation.
- D. Void Forms: Biodegradable paper surface, treated for moisture resistance, structurally sufficient to support weight of plastic concrete and other superimposed loads.
- E. Chamfer Strips: Wood, metal, PVC, or rubber strips, 3/4 by 3/4 inch, minimum.
- F. Rustication Strips: Wood, metal, PVC, or rubber strips, kerfed for ease of form removal.

- G. Form-Release Agent: Commercially formulated form-release agent that will not bond with, stain, or adversely affect concrete surfaces and will not impair subsequent treatments of concrete surfaces.
 - 1. Formulate form-release agent with rust inhibitor for steel form-facing materials.
- H. Form Ties: Factory-fabricated, removable or snap-off metal or glass-fiber-reinforced plastic form ties designed to resist lateral pressure of fresh concrete on forms and to prevent spalling of concrete on removal.
 - 1. Other than those specified in the following paragraphs, form ties encased in concrete shall be designed so that, after removal, no corrodible metal will remain closer than 1-1/2 inches to the plane of exposed concrete surface. The part of the tie to be removed shall be at least 1/2 inch diameter or be provided with a wood or metal cone at least 1/2 inch diameter and 1-1/2 inches long. Form ties in concrete exposed to view shall be the cone-washer type.
 - 2. Furnish ties that, when removed, will leave holes no larger than 1 inch in diameter in concrete surface.
 - 3. Form ties for exposed exterior and interior walls shall be as specified in the preceding paragraph except that the cones shall be of approved wood or plastic.
 - 4. Flat bar ties for panel forms shall have plastic or rubber inserts having a minimum depth of 1-1/2-in and sufficient dimensions to permit proper patching of the tie hole.
 - 5. Ties for liquid containment structures shall have an integral waterstop that is tightly welded to the tie.
 - 6. Common wire shall not be used for form ties.

2.2 STEEL REINFORCEMENT

- A. Recycled Content of Steel Products: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 25 percent.
- B. Domestic Steel: All steel shall be domestically manufactured, unless foreign sources are specifically accepted by the Owner.
- C. Reinforcing Bars: ASTM A 615/A 615M, Grade 60, deformed.
- D. Low-Alloy-Steel Reinforcing Bars: ASTM A 706/A 706M for all welded reinforcement, deformed.
- E. Plain-Steel Wire: ASTM A 82/A 82M, as drawn unless otherwise noted.
- F. Plain-Steel Welded Wire Reinforcement: ASTM A 185/A 185M, plain, fabricated from as-drawn steel wire into flat sheets.

2.3 REINFORCEMENT ACCESSORIES

- A. Joint Dowel Bars: ASTM A 615/A 615M, Grade 60, plain-steel bars, cut true to length with ends square and free of burrs.
- B. Zinc Repair Material: ASTM A 780, zinc-based solder, paint containing zinc dust, or sprayed zinc.

- C. Bar Supports: Bolsters, chairs, spacers, and other devices for spacing, supporting, and fastening reinforcing bars and welded wire reinforcement in place. Manufacture bar supports from steel wire, plastic, or precast concrete according to CRSI's "Manual of Standard Practice," of greater compressive strength than concrete and as follows:

1. For concrete surfaces exposed to view where legs of wire bar supports contact forms, use CRSI Class 1 plastic-protected steel wire or CRSI Class 2 stainless-steel bar supports.
2. For epoxy-coated reinforcement, use epoxy-coated or other dielectric-polymer-coated wire bar supports.
3. For zinc-coated reinforcement, use galvanized wire or dielectric-polymer-coated wire bar supports.

2.4 Mechanical Splices

- A. Provide mechanical splices to develop, in tension and compression, 125 percent of the minimum ASTM specified yield strength of the smaller bar being spliced. The following splicing systems are acceptable:

1. Lenton "Taper-threaded Splice"
2. Lenton "Cadweld"
3. Dayton Barsplice "BarGrip XL"
4. Dayton Barsplice "Grip-Twist"

2.5 CONCRETE MATERIALS

- A. Cementitious Material: Use the following cementitious materials, of the same type, brand, and source, throughout Project:

1. Portland Cement: ASTM C 150, Type I/II, gray. Supplement with the following:
 - a. Fly Ash: ASTM C 618, Class F.
 - 1) Class C fly ash is an acceptable alternative if concrete supplier provides certificate stating fly ash will not cause alkali-silica reaction with the aggregate.
 - b. Ground Granulated Blast-Furnace Slag: ASTM C 989, Grade 100 or 120.

- B. Silica Fume: ASTM C 1240, amorphous silica.

- C. Normal-Weight Aggregates: ASTM C 33, Class 1N coarse aggregate or better, graded. Provide aggregates from a single source with documented service record data of at least 10 years of satisfactory service in similar applications and service conditions using similar aggregates and cementitious materials.

1. Maximum Coarse-Aggregate Size: 1 inch nominal.
2. Fine Aggregate: Free of materials with deleterious reactivity to alkali in cement.

- D. Water: ASTM C 94/C 94M and potable.

2.6 ADMIXTURES

- A. Air-Entraining Admixture: ASTM C 260.
- B. Chemical Admixtures: Provide admixtures certified by manufacturer to be compatible with other admixtures and that will not contribute water-soluble chloride ions exceeding those permitted in hardened concrete. Do not use calcium chloride or admixtures containing calcium chloride.
1. Water-Reducing Admixture: ASTM C 494/C 494M, Type A.
 2. Retarding Admixture: ASTM C 494/C 494M, Type B.
 3. Water-Reducing and Retarding Admixture: ASTM C 494/C 494M, Type D.
 4. High-Range, Water-Reducing Admixture: ASTM C 494/C 494M, Type F.
 5. High-Range, Water-Reducing and Retarding Admixture: ASTM C 494/C 494M, Type G.
 6. Plasticizing and Retarding Admixture: ASTM C 1017/C 1017M, Type II.
- C. Set-Accelerating Corrosion-Inhibiting Admixture: Commercially formulated, anodic inhibitor or mixed cathodic and anodic inhibitor; capable of forming a protective barrier and minimizing chloride reactions with steel reinforcement in concrete and complying with ASTM C 494/C 494M, Type C.
1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Axim Italcementi Group, Inc.; CATEXOL CN-CI.
 - b. BASF Construction Chemicals - Building Systems; Rheocrete CNI.
 - c. Euclid Chemical Company (The), an RPM company; EUCON CIA.
 - d. Grace Construction Products, W. R. Grace & Co.; DCI.
 - e. Sika Corporation; Sika CNI.
- D. Non-Set-Accelerating Corrosion-Inhibiting Admixture: Commercially formulated, non-set-accelerating, anodic inhibitor or mixed cathodic and anodic inhibitor; capable of forming a protective barrier and minimizing chloride reactions with steel reinforcement in concrete.
1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
 - a. BASF Construction Chemicals - Building Systems; Rheocrete 222+.
 - b. Cortec Corporation; MCI- 2000.
 - c. Grace Construction Products, W. R. Grace & Co.; DCI-S.
 - d. Sika Corporation; FerroGard 901.
- E. Color Pigment: ASTM C 979, synthetic mineral-oxide pigments or colored water-reducing admixtures; color stable, nonfading, and resistant to lime and other alkalis.
1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - a. ChemMasters.
 - b. Davis Colors.
 - c. Dayton Superior Corporation.
 - d. Hoover Color Corporation.
 - e. Lambert Corporation.

- f. QC Construction Products.
- g. Rockwood Pigments NA, Inc.
- h. Scofield, L. M. Company.
- i. Solomon Colors, Inc.

2. Color: As selected by Architect from manufacturer's full range.

2.7 WATERSTOPS

- A. Flexible PVC Waterstops: CE CRD-C 572, with factory-installed metal eyelets, for embedding in concrete to prevent passage of fluids through joints. Factory fabricate corners, intersections, and directional changes.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

- a. Greenstreak.
- b. Vinylex Corp.

2. Profile: Ribbed with center bulb
3. Dimensions: 6 inches by 3/8 inch thick; nontapered.

- B. Self-Expanding Rubber Strip Waterstops: Manufactured rectangular or trapezoidal strip, bentonite-free hydrophilic polymer modified chloroprene rubber, for adhesive bonding to concrete, 3/8 by 3/4 inch.

1. Products: Subject to compliance with requirements, provide one of the following:

- a. Adeka Ultra Seal/OCM, Inc.; Adeka Ultra Seal.
- b. Greenstreak; Hydrotite.
- c. Vinylex Corp.; Swellseal.

2.8 VAPOR RETARDERS

- A. Sheet Vapor Retarder: Include manufacturer's recommended adhesive or pressure-sensitive tape to address seams, penetration repairs, and perimeter/edge seals. When the specifications or drawings conflict, the contractor shall perform to the most restrictive provision.

1. Vapor retarder membrane must have the following properties:

- a. Permeance as tested after mandatory conditioning (ASTM E 154 sections 8, 11, 12, 13) less than 0.02 Perms [grains/(ft²*hr*in.Hg)].
- b. Other performance criteria:
 - 1) Strength: ASTM E 1745, Class A
 - 2) Thickness: 15 mils minimum

2. Subject to compliance with requirements above, provide one of the following:

- a. Stego Industries, LLC; Stego Wrap 15 mil Class A.
- b. Meadows, W. R., Inc.; Perminator 15 mil.

- c. Fortifiber Building Systems Group; Moistop Ultra 15 mil.
- d. No substitutions.

2.9 FLOOR AND SLAB TREATMENTS

- A. Slip-Resistive Emery Aggregate Finish: Factory-graded, packaged, rustproof, nonglazing, abrasive, crushed emery aggregate containing not less than 50 percent aluminum oxide and not less than 20 percent ferric oxide; unaffected by freezing, moisture, and cleaning materials with 100 percent passing No. 8 sieve.
 1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Anti-Hydro International, Inc.; Emery.
 - b. Dayton Superior Corporation; Emery Tuff Non-Slip.
 - c. Lambert Corporation; EMAG-20.
 - d. L&M Construction Chemicals, Inc.; Grip It.
 - e. Metalcrete Industries; Metco Anti-Skid Aggregate.
- B. Slip-Resistive Aluminum Granule Finish: Factory-graded, packaged, rustproof, nonglazing, abrasive aggregate of not less than 95 percent fused aluminum-oxide granules.
 1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Anti-Hydro International, Inc.; A-H Alox.
 - b. BASF Construction Chemicals - Building Systems; Frictex NS.
 - c. L&M Construction Chemicals, Inc.; Grip It AO.
- C. Emery Dry-Shake Floor Hardener: Unpigmented, factory-packaged, dry combination of portland cement, graded emery aggregate, and plasticizing admixture; with emery aggregate consisting of no less than 60 percent of total aggregate content.
 1. Color: selected by Architect from manufacturer's full range.
- D. Metallic Dry-Shake Floor Hardener: Unpigmented, factory-packaged, dry combination of portland cement, graded metallic aggregate, rust inhibitors, and plasticizing admixture; with metallic aggregate consisting of no less than 65 percent of total aggregate content.
 1. Color: As selected by Architect from manufacturer's full range.
- E. Unpigmented Mineral Dry-Shake Floor Hardener: Factory-packaged dry combination of portland cement, graded quartz aggregate, and plasticizing admixture.
 1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
 - a. BASF Construction Chemicals - Building Systems; Maximent.
 - b. ChemMasters; ConColor.
 - c. Conspec by Dayton Superior; Conshake 500.
 - d. Dayton Superior Corporation; Quartz Tuff.
 - e. Edoco by Dayton Superior; Burke Non Metallic Floor Hardener 250.

- f. Euclid Chemical Company (The), an RPM company; Surfex.
 - g. Kaufman Products, Inc.; Tycron.
 - h. Lambert Corporation; Colorhard.
 - i. L&M Construction Chemicals, Inc.; Quartzplate FF.
 - j. Metalcrete Industries; Floor Quartz.
 - k. Scofield, L. M. Company; Lithochrome Color Hardener.
 - l. Symons by Dayton Superior; Hard Top.
- F. Pigmented Mineral Dry-Shake Floor Hardener: Factory-packaged, dry combination of portland cement, graded quartz aggregate, color pigments, and plasticizing admixture. Use color pigments that are finely ground, nonfading mineral oxides interground with cement.
- 1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
 - a. BASF Construction Chemicals - Building Systems; Mastercron.
 - b. ChemMasters; ConColor.
 - c. Conspec by Dayton Superior; Conshake 600 Colortone.
 - d. Dayton Superior Corporation; Quartz Tuff.
 - e. Edoco by Dayton Superior; Burke Non Metallic Floor Hardener 200 - 205.
 - f. Euclid Chemical Company (The), an RPM company; Surfex.
 - g. Kaufman Products, Inc.; Tycron.
 - h. Lambert Corporation; Colorhard.
 - i. L&M Construction Chemicals, Inc.; Quartz Plate FF.
 - j. Metalcrete Industries; Floor Quartz.
 - k. Scofield, L. M. Company; Lithochrome Color Hardener.
 - l. Symons by Dayton Superior; Color Hardener.
 - 2. Color: As selected by Architect from manufacturer's full range.

2.10 LIQUID FLOOR TREATMENTS

- A. VOC Content: Liquid floor treatments shall have a VOC content of 200 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
- B. Penetrating Liquid Floor Treatment: Clear, chemically reactive, waterborne solution of inorganic silicate or silicate materials and proprietary components; odorless; that penetrates, hardens, and densifies concrete surfaces.
 - 1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
 - a. ChemMasters; Chemisil Plus.
 - b. ChemTec Int'l; ChemTec One.
 - c. Conspec by Dayton Superior; Intraseal.
 - d. Curecrete Distribution Inc.; Ashford Formula.
 - e. Dayton Superior Corporation; Day-Chem Sure Hard (J-17).
 - f. Edoco by Dayton Superior; Titan Hard.
 - g. Euclid Chemical Company (The), an RPM company; Euco Diamond Hard.
 - h. Kaufman Products, Inc.; SureHard.
 - i. L&M Construction Chemicals, Inc.; Seal Hard.
 - j. Meadows, W. R., Inc.; LIQUI-HARD.

- k. Metalcrete Industries; Floorsaver.
 - l. Nox-Crete Products Group; Duro-Nox.
 - m. Symons by Dayton Superior; Buff Hard.
 - n. US SPEC, Division of US Mix Products Company; US SPEC Industraseal.
 - o. Vexcon Chemicals, Inc.; Vexcon StarSeal PS Clear.
- C. Penetrating Liquid Floor Treatments for Polished Concrete Finish: Clear, waterborne solution of inorganic silicate or silicate materials and proprietary components; odorless; that penetrates, hardens, and is suitable for polished concrete surfaces.
1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Advanced Floor Products; Retro-Plate 99.
 - b. L&M Construction Chemicals, Inc.; FGS Hardener Plus.
 - c. QuestMark, a division of CentiMark Corporation; DiamondQuest Densifying Impregnator Application.

2.11 CURING MATERIALS

- A. Evaporation Retarder: Waterborne, monomolecular film forming, manufactured for application to fresh concrete.
1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Axim Italcementi Group, Inc.; CATEXOL CimFilm.
 - b. BASF Construction Chemicals - Building Systems; Confilm.
 - c. ChemMasters; SprayFilm.
 - d. Conspec by Dayton Superior; Aquafilm.
 - e. Dayton Superior Corporation; Sure Film (J-74).
 - f. Edoco by Dayton Superior; BurkeFilm.
 - g. Euclid Chemical Company (The), an RPM company; Eucobar.
 - h. Kaufman Products, Inc.; Vapor-Aid.
 - i. Lambert Corporation; LAMBCO Skin.
 - j. L&M Construction Chemicals, Inc.; E-CON.
 - k. Meadows, W. R., Inc.; EVAPRE.
 - l. Metalcrete Industries; Waterhold.
 - m. Nox-Crete Products Group; MONOFILM.
 - n. Sika Corporation; SikaFilm.
 - o. SpecChem, LLC; Spec Film.
 - p. Symons by Dayton Superior; Finishing Aid.
 - q. TK Products, Division of Sierra Corporation; TK-2120 TRI-FILM.
 - r. Unitex; PRO-FILM.
 - s. Vexcon Chemicals, Inc.; Certi-Vex Envio Set.
- B. Absorptive Cover: AASHTO M 182, Class 2, burlap cloth made from jute or kenaf, weighing approximately 9 oz./sq. yd. when dry.
- C. Moisture-Retaining Cover: ASTM C 171, polyethylene film or white burlap-polyethylene sheet.
- D. Water: Potable.

- E. Clear, Waterborne, Membrane-Forming Curing Compound: ASTM C 309, Type 1, Class B, dissipating.
1. Products: Subject to compliance with requirements, products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Anti-Hydro International, Inc.; AH Curing Compound #2 DR WB.
 - b. BASF Construction Chemicals - Building Systems; Kure 200.
 - c. ChemMasters; Safe-Cure Clear.
 - d. Conspec by Dayton Superior; W.B. Resin Cure.
 - e. Dayton Superior Corporation; Day-Chem Rez Cure (J-11-W).
 - f. Edoco by Dayton Superior; Res X Cure WB.
 - g. Euclid Chemical Company (The), an RPM company; Kurez DR VOX; TAMMSCURE WB 30C.
 - h. Kaufman Products, Inc.; Thinfilm 420.
 - i. Lambert Corporation; AQUA KURE - CLEAR.
 - j. L&M Construction Chemicals, Inc.; L&M Cure R.
 - k. Meadows, W. R., Inc.; 1100-CLEAR.
 - l. Nox-Crete Products Group; Resin Cure E.
 - m. Right Pointe; Clear Water Resin.
 - n. SpecChem, LLC; Spec Rez Clear.
 - o. Symons by Dayton Superior; Resi-Chem Clear.
 - p. TK Products, Division of Sierra Corporation; TK-2519 DC WB.
 - q. Vexcon Chemicals, Inc.; Certi-Vex Enviocure 100.
- F. Clear, Waterborne, Membrane-Forming Curing Compound: ASTM C 309, Type 1, Class B, nondissipating, certified by curing compound manufacturer to not interfere with bonding of floor covering.
1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
 - a. Anti-Hydro International, Inc.; AH Clear Cure WB.
 - b. BASF Construction Chemicals - Building Systems; Kure-N-Seal WB.
 - c. ChemMasters; Safe-Cure & Seal 20.
 - d. Conspec by Dayton Superior; Cure and Seal WB.
 - e. Cresset Chemical Company; Crete-Trete 309-VOC Cure & Seal.
 - f. Dayton Superior Corporation; Safe Cure and Seal (J-18).
 - g. Edoco by Dayton Superior; Spartan Cote WB II.
 - h. Euclid Chemical Company (The), an RPM company; Aqua Cure VOX; Clearseal WB 150.
 - i. Kaufman Products, Inc.; Cure & Seal 309 Emulsion.
 - j. Lambert Corporation; Glazecote Sealer-20.
 - k. L&M Construction Chemicals, Inc.; Dress & Seal WB.
 - l. Meadows, W. R., Inc.; Vocomp-20.
 - m. Metalcrete Industries; Metcure.
 - n. Nox-Crete Products Group; Cure & Seal 150E.
 - o. Symons by Dayton Superior; Cure & Seal 18 Percent E.
 - p. TK Products, Division of Sierra Corporation; TK-2519 WB.
 - q. Vexcon Chemicals, Inc.; Starseal 309.
- G. Clear, Waterborne, Membrane-Forming Curing Compound: ASTM C 309, Type 1, Class B, 18 to 25 percent solids, nondissipating, certified by curing compound manufacturer to not interfere with bonding of floor covering.

1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
 - a. BASF Construction Chemicals - Building Systems; Kure-N-Seal W.
 - b. ChemMasters; Safe-Cure Clear.
 - c. Conspec by Dayton Superior; High Seal.
 - d. Dayton Superior Corporation; Safe Cure and Seal (J-19).
 - e. Edoco by Dayton Superior; Spartan Cote WB II 20 Percent.
 - f. Euclid Chemical Company (The), an RPM company; Diamond Clear VOX; Clearseal WB STD.
 - g. Kaufman Products, Inc.; SureCure Emulsion.
 - h. Lambert Corporation; Glazecote Sealer-20.
 - i. L&M Construction Chemicals, Inc.; Dress & Seal WB.
 - j. Meadows, W. R., Inc.; Vocomp-20.
 - k. Metalcrete Industries; Metcure 0800.
 - l. Nox-Crete Products Group; Cure & Seal 200E.
 - m. Symons by Dayton Superior; Cure & Seal 18 Percent E.
 - n. Vexcon Chemicals, Inc.; Starseal 0800.

- H. Clear, Solvent-Borne, Membrane-Forming Curing and Sealing Compound: ASTM C 1315, Type 1, Class A.
 1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
 - a. BASF Construction Chemicals - Building Systems; Kure-N-Seal 25 LV.
 - b. ChemMasters; Spray-Cure & Seal Plus.
 - c. Conspec by Dayton Superior; Sealcure 1315.
 - d. Dayton Superior Corporation; Day-Chem Cure and Seal (J-22UV).
 - e. Edoco by Dayton Superior; Cureseal 1315.
 - f. Euclid Chemical Company (The), an RPM company; Super Diamond Clear; LusterSeal 300.
 - g. Kaufman Products, Inc.; Sure Cure 25.
 - h. Lambert Corporation; UV Super Seal.
 - i. L&M Construction Chemicals, Inc.; Lumiseal Plus.
 - j. Meadows, W. R., Inc.; CS-309/30.
 - k. Metalcrete Industries; Seal N Kure 30.
 - l. Right Pointe; Right Sheen 30.
 - m. Vexcon Chemicals, Inc.; Certi-Vex AC 1315.
 2. VOC Content: Curing and sealing compounds shall have a VOC content of 200 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

- I. Clear, Waterborne, Membrane-Forming Curing and Sealing Compound: ASTM C 1315, Type 1, Class A.
 1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
 - a. BASF Construction Chemicals - Building Systems; Kure 1315.
 - b. ChemMasters; Polyseal WB.
 - c. Conspec by Dayton Superior; Sealcure 1315 WB.
 - d. Edoco by Dayton Superior; Cureseal 1315 WB.
 - e. Euclid Chemical Company (The), an RPM company; Super Diamond Clear VOX; LusterSeal WB 300.

- f. Kaufman Products, Inc.; Sure Cure 25 Emulsion.
- g. Lambert Corporation; UV Safe Seal.
- h. L&M Construction Chemicals, Inc.; Lumiseal WB Plus.
- i. Meadows, W. R., Inc.; Vocomp-30.
- j. Metalcrete Industries; Metcure 30.
- k. Right Pointe; Right Sheen WB30.
- l. Symons by Dayton Superior; Cure & Seal 31 Percent E.
- m. Vexcon Chemicals, Inc.; Vexcon Starseal 1315.

- 2. VOC Content: Curing and sealing compounds shall have a VOC content of 200 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

2.12 RELATED MATERIALS

- A. Expansion- and Isolation-Joint-Filler Strips: ASTM D 1751, asphalt-saturated cellulosic fiber or ASTM D 1752, cork or self-expanding cork.
- B. Semirigid Joint Filler: Two-component, semirigid, 100 percent solids, epoxy resin with a Type A shore durometer hardness of 80 per ASTM D 2240.
- C. Bonding Agent: ASTM C 1059/C 1059M, Type II, non-redispersible, acrylic emulsion or styrene butadiene.
- D. Reglets: Fabricate reglets of not less than 0.022-inch- thick, galvanized-steel sheet. Temporarily fill or cover face opening of reglet to prevent intrusion of concrete or debris.
- E. Dovetail Anchor Slots: Hot-dip galvanized-steel sheet, not less than 0.034 inch thick, with bent tab anchors. Temporarily fill or cover face opening of slots to prevent intrusion of concrete or debris.

2.13 REPAIR MATERIALS

- A. Repair Underlayment: Cement-based, polymer-modified, self-leveling product that can be applied in thicknesses from 1/8 inch and that can be feathered at edges to match adjacent floor elevations.
 - 1. Cement Binder: ASTM C 150, portland cement or hydraulic or blended hydraulic cement as defined in ASTM C 219.
 - 2. Primer: Product of underlayment manufacturer recommended for substrate, conditions, and application.
 - 3. Aggregate: Well-graded, washed gravel, 1/8 to 1/4 inch or coarse sand as recommended by underlayment manufacturer.
 - 4. Compressive Strength: Not less than 4000 psi at 28 days when tested according to ASTM C 109/C 109M.
- B. Repair Overlayment: Cement-based, polymer-modified, self-leveling product that can be applied in thicknesses from 1/4 inch and that can be filled in over a scarified surface to match adjacent floor elevations.
 - 1. Cement Binder: ASTM C 150, portland cement or hydraulic or blended hydraulic cement as defined in ASTM C 219.

2. Primer: Product of topping manufacturer recommended for substrate, conditions, and application.
3. Aggregate: Well-graded, washed gravel, 1/8 to 1/4 inch or coarse sand as recommended by topping manufacturer.
4. Compressive Strength: Not less than 5000 psi at 28 days when tested according to ASTM C 109/C 109M.

2.14 CONCRETE MIXTURES, GENERAL

- A. Prepare design mixtures for each type and strength of concrete, proportioned on the basis of laboratory trial mixture or field test data, or both, according to ACI 301.
 1. Use a qualified independent testing agency for preparing and reporting proposed mixture designs based on laboratory trial mixtures.
- A. Cementitious Materials: Limit percentage, by weight, of cementitious materials other than portland cement in concrete as follows:
 1. Fly Ash:
 - a. Piers: 40 percent.
 - b. Architecturally exposed concrete slabs: 10 percent
 - c. All concrete other than piers and architecturally exposed concrete slabs: 25 percent
 2. Combined Fly Ash and Pozzolan: 25 percent for all mixes except piers; 40 percent for piers.
 3. Ground Granulated Blast-Furnace Slag: 50 percent.
 4. Combined Fly Ash or Pozzolan and Ground Granulated Blast-Furnace Slag: 50 percent portland cement minimum, with fly ash or pozzolan not exceeding 25 percent at all mixes except for piers, which shall not exceed 40 percent.
 5. Silica Fume: 10 percent.
 6. Combined Fly Ash, Pozzolans, and Silica Fume: 35 percent with fly ash or pozzolans not exceeding 25 percent for all mixes except piers; 50 percent with fly ash or pozzolans not exceeding 40 percent for piers; and silica fume not exceeding 10 percent for all mixes.
 7. Combined Fly Ash or Pozzolans, Ground Granulated Blast-Furnace Slag, and Silica Fume: 50 percent with fly ash or pozzolans not exceeding 25 percent for all mixes except piers; 75 percent with fly ash or pozzolans not exceeding 40 percent for piers; silica fume not exceeding 10 percent for all mixes.
- B. Limit water-soluble, chloride-ion content in hardened concrete to 0.06 percent by weight of cement.
- C. Admixtures: Use admixtures according to manufacturer's written instructions.
 1. Use water-reducing, high-range water-reducing, or plasticizing admixture in concrete, as required, for placement and workability.

2. Use water-reducing and retarding admixture when required by high temperatures, low humidity, or other adverse placement conditions.
 3. Use water-reducing admixture in pumped concrete, concrete for heavy-use industrial slabs and parking structure slabs, concrete required to be watertight, and concrete with a water-cementitious materials ratio below 0.50.
 4. Use corrosion-inhibiting admixture in concrete mixtures where indicated.
- D. Color Pigment: Add color pigment to concrete mixture according to manufacturer's written instructions and to result in hardened concrete color consistent with approved mockup.

2.15 CONCRETE MIXTURES FOR BUILDING ELEMENTS

- A. Pier Caps, Plinths, Grade Beams, Slabs on Grade, Spread Footings, Walls, Elevated Slabs and Beams, Concrete on Metal Deck, and Topping Slabs: Proportion normal-weight concrete mixture as follows:
1. Minimum 28-day Compressive Strength: As indicated.
 2. Slump Limit: As indicated.
 3. Maximum Water-Cementitious Materials Ratio: As indicated.
 4. Air Content: As indicated.
 5. Maximum Aggregate Size: As indicated.

2.16 FABRICATING REINFORCEMENT

- A. Fabricate steel reinforcement according to CRSI's "Manual of Standard Practice."

2.17 CONCRETE MIXING

- A. Ready-Mixed Concrete: Measure, batch, mix, and deliver concrete according to ASTM C 94/C 94M and furnish batch ticket information.
1. When air temperature is between 85 and 90 deg F, reduce mixing and delivery time from 1-1/2 hours to 75 minutes; when air temperature is above 90 deg F, reduce mixing and delivery time to 60 minutes.
- B. Project-Site Mixing: Measure, batch, and mix concrete materials and concrete according to ASTM C 94/C 94M. Mix concrete materials in appropriate drum-type batch machine mixer.
1. For mixer capacity of 1 cu. yd. or smaller, continue mixing at least 1-1/2 minutes, but not more than 5 minutes after ingredients are in mixer, before any part of batch is released.
 2. For mixer capacity larger than 1 cu. yd., increase mixing time by 15 seconds for each additional 1 cu. yd..
 3. Provide batch ticket for each batch discharged and used in the Work, indicating Project identification name and number, date, mixture type, mixture time, quantity, and amount of water added. Record approximate location of final deposit in structure.

PART 3 - EXECUTION

3.1 FORMWORK

- A. Design, erect, shore, brace, and maintain formwork, according to ACI 301, to support vertical, lateral, static, and dynamic loads, and construction loads that might be applied, until structure can support such loads.
- B. Construct formwork so concrete members and structures are of size, shape, alignment, elevation, and position indicated, within tolerance limits of ACI 117.
- C. Limit concrete surface irregularities, designated by ACI 347 as abrupt or gradual, as follows:
 - 1. Class A, 1/8 inch for smooth-formed finished surfaces.
 - 2. Class B, 1/4 inch for rough-formed finished surfaces.
- D. Construct forms tight enough to prevent loss of concrete mortar.
- E. Fabricate forms for easy removal without hammering or prying against concrete surfaces. Provide crush or wrecking plates where stripping may damage cast concrete surfaces. Provide top forms for inclined surfaces steeper than 1.5 horizontal to 1 vertical.
 - 1. Install keyways, reglets, recesses, and the like, for easy removal.
 - 2. Do not use rust-stained steel form-facing material.
- F. Set edge forms, bulkheads, and intermediate screed strips for slabs to achieve required elevations and slopes in finished concrete surfaces. Provide and secure units to support screed strips; use strike-off templates or compacting-type screeds.
- G. Provide temporary openings for cleanouts and inspection ports where interior area of formwork is inaccessible. Close openings with panels tightly fitted to forms and securely braced to prevent loss of concrete mortar. Locate temporary openings in forms at inconspicuous locations.
- H. Chamfer exterior corners and edges of permanently exposed concrete unless noted otherwise in Drawings.
- I. Form openings, chases, offsets, sinkages, keyways, reglets, blocking, screeds, and bulkheads required in the Work. Determine sizes and locations from trades providing such items.
- J. Clean forms and adjacent surfaces to receive concrete. Remove chips, wood, sawdust, dirt, and other debris just before placing concrete.
- K. Retighten forms and bracing before placing concrete, as required, to prevent mortar leaks and maintain proper alignment.
- L. Coat contact surfaces of forms with form-release agent, according to manufacturer's written instructions, before placing reinforcement.

3.2 EMBEDDED ITEMS

- A. Place and secure anchorage devices and other embedded items required for adjoining work that is attached to or supported by cast-in-place concrete. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
 - 1. Install anchor rods, accurately located, to elevations required and complying with tolerances in Section 7.5 of AISC's "Code of Standard Practice for Steel Buildings and Bridges."
 - 2. Install reglets to receive waterproofing and to receive through-wall flashings in outer face of concrete frame at exterior walls, where flashing is shown at lintels, shelf angles, and other conditions.
 - 3. Install dovetail anchor slots in concrete structures as indicated.

3.3 VOID FORMS

- A. Install void forms in all locations shown on the Drawings. In general, void forms shall be placed below all structural elements supported by piers to separate these elements from the earth.
- B. Seal discontinuous ends of void forms and tape all joints with waterproof tape so that concrete will not enter the void space during placement of concrete. Do not leave gaps between void form sections.
- C. Premanufactured void forms with circular edges shall be used around all drilled piers.
- D. Do not allow any portion of void forms to fall within the circumference of piers causing a reduction in the bearing area.
- E. Protect void forms from water. Do not install void forms during wet weather or on wet ground. Void forms which become saturated prior to placement of concrete shall be removed and replaced.
- F. Exercise care in placement of concrete to avoid collapse of void form. If void forms collapse, soil beneath the concrete shall be dug out and a proper void space shall be created by installing soil retainers.
- G. Void forms under slabs shall be protected by a layer of one-eighth inch thick protection board followed by a vapor barrier or retarder per the specifications. Do not install void forms under soil supported slabs on grade.

3.4 SOIL RETAINERS

- A. Install soil retainers in straight, clean trenches at sides of void forms prior to concrete placement. The gaps between the trench and retainers must be properly positioned or backfilled prior to the placement of concrete. Do not cast the sides of concrete beams directly against the soil.
- B. Affix the soil retainers to the concrete beam with adhesive, pin/washer/load, or concrete hard nails spaced on 24 inch centers.

3.5 REMOVING AND REUSING FORMS

- A. General: Formwork for sides of beams, walls, columns, and similar parts of the Work that does not support weight of concrete may be removed after cumulatively curing at not less than 50 deg F for 24 hours after placing concrete. Concrete has to be hard enough to not be damaged by form-removal operations and curing and protection operations need to be maintained.
1. Leave formwork for beam soffits, joists, slabs, and other structural elements that supports weight of concrete in place until concrete has achieved at least 75 percent of its 28-day design compressive strength.
 2. Formwork supporting conventionally reinforced concrete shall not be removed until concrete has attained 75 percent of its specified 28 day compressive strength as established by tests of field cured cylinders. In the absence of cylinder tests, supporting formwork shall remain in place until the concrete has cured at a temperature of at least 50 degrees Fahrenheit for the minimum cumulative time periods given in ACI 347, Section 3.7.2.3. When the surrounding air temperature is below 50 degrees Fahrenheit, that time period shall be added to the minimum listed time period. Formwork for two-way conventionally reinforced slabs shall remain in place for at least the minimum cumulative time periods specified for one-way slabs of the same maximum span.
 3. Minimum cumulative curing times may be reduced by the use of high-early strength cement or forming systems which allow form removal without disturbing shores, but only after the Contractor has demonstrated to the satisfaction of the Architect that the early removal of forms will not cause excessive sag, distortion or damage to the concrete elements.
 4. Wood forms shall be completely removed. Provide temporary openings if required.
 5. Provide adequate methods of curing and thermal protection of exposed concrete if forms are removed prior to completion of specified curing time.
 6. Areas required to support construction loads in excess of 20 psf shall be reshored to properly distribute construction loading. Construction loads up to the rated live load capacity may be placed on unshored construction provided the concrete has attained the specified 28 day compressive strength.
 7. Obtaining concrete compressive strength tests for the purposes of form removal shall be the responsibility of the Contractor.
 8. Remove forms only if shores have been arranged to permit removal of forms without loosening or disturbing shores.
- B. Clean and repair surfaces of forms to be reused in the Work. Split, frayed, delaminated, or otherwise damaged form-facing material will not be acceptable for exposed surfaces. Apply new form-release agent.
- C. When forms are reused, clean surfaces, remove fins and laitance, and tighten to close joints. Align and secure joints to avoid offsets. Do not use patched forms for exposed concrete surfaces unless approved by Architect.

3.6 SHORES AND RESHORES

- A. Comply with ACI 318 and ACI 301 for design, installation, and removal of shoring and reshoring.
1. Do not remove shoring or reshoring until measurement of slab tolerances is complete.

3.7 VAPOR RETARDERS

- A. Sheet Vapor Retarders: Place, protect, and repair sheet vapor retarder according to ASTM E 1643 and manufacturer's written instructions.
1. Unroll vapor retarder with the longest dimension parallel with the direction of the concrete placement and face laps away from the expected direction of the placement whenever possible.
 2. Extend vapor retarder over footings and grade beams to a distance acceptable to the structural engineer or stop at impediments such as dowels and waterstops.
 3. Seal vapor retarder to slab perimeter/edge using manufacturer's recommended tape and remove dirt, debris, and mud from tape prior to concrete placement OR seal vapor retarder to footing/grade beam with double sided tape, termination bar, or both.
 4. Overlap all joints 6 inches and seal with manufacturer's tape.
 5. Apply tape to clean and dry vapor retarder.
 6. Seal all penetrations (including pipes) per manufacturer's instructions.
 7. No penetration of the vapor retarder is allowed except for reinforcing steel and permanent utilities.
 8. Repair damaged areas by cutting and patching with additional sheets, overlapping 6 inches and taping all sides with manufacturer's recommended tape.

3.8 STEEL REINFORCEMENT

- A. General: Comply with CRSI's "Manual of Standard Practice" for placing reinforcement.
1. Do not cut or puncture vapor retarder. Repair damage and reseal vapor retarder before placing concrete.
- B. Clean reinforcement of loose rust and mill scale, earth, ice, and other foreign materials that would reduce bond to concrete.
- C. Accurately position, support, and secure reinforcement against displacement. Locate and support reinforcement with bar supports to maintain minimum concrete cover. Do not tack weld crossing reinforcing bars.
1. Weld reinforcing bars according to AWS D1.4/D 1.4M, where indicated.
- D. Installation tolerances:
1. Top and bottom bars in slabs, girders, beams and joists:
 - a. Members 8" deep or less: $\pm 3/8"$
 - b. Members more than 8" deep: $\pm 1/2"$
 2. Concrete Cover to Formed or Finished Surfaces: $\pm 3/8"$ for members 8" deep or less; $\pm 1/2"$ for members over 8" deep, except that tolerance for cover shall not exceed 1/3 of the specified cover.
- E. Concrete Cover: As indicated.
- F. Splices: Provide standard reinforcement splices by lapping and tying ends. Comply with ACI 318 for minimum lap of spliced bars where not specified on the documents. No. 14 and 18 bars shall not be lap spliced.

- G. Mechanical Splices: Use for splicing of bars larger than no. 11 or where no. 11 bars are spliced to larger size bars and where indicated on the drawings. Comply with manufacturer's instructions for preparation of bars and installation procedures.
- H. Field Welding of Embedded Metal Assemblies: All paint and galvanizing shall be removed in areas to receive field welds. All areas where paint or galvanizing has been removed shall be field repaired with the specified paint or cold galvanizing compound, respectively.
- I. Set wire ties with ends directed into concrete, not toward exposed concrete surfaces.
- J. Install welded wire reinforcement in longest practicable lengths on bar supports spaced to minimize sagging. Lap edges and ends of adjoining sheets at least one mesh spacing. Offset laps of adjoining sheet widths to prevent continuous laps in either direction. Lace overlaps with wire.

3.9 JOINTS

- A. General: Construct joints true to line with faces perpendicular to surface plane of concrete.
- B. Construction Joints: Install so strength and appearance of concrete are not impaired, at locations indicated or as approved by Architect and Engineer.
 - 1. Place joints perpendicular to main reinforcement. Continue reinforcement across construction joints unless otherwise indicated. Do not continue reinforcement through sides of strip placements of floors and slabs.
 - 2. Form keyed joints as indicated. Embed keys as indicated on drawings.
 - 3. Locate joints for beams, slabs, joists, and girders in the middle third of spans. Offset joints in girders a minimum distance of twice the beam width from a beam-girder intersection.
 - 4. Locate horizontal joints in walls and columns at underside of floors, slabs, beams, and girders and at the top of footings or floor slabs.
 - 5. Space vertical joints in walls as indicated. Locate joints beside piers integral with walls, near corners, and in concealed locations where possible.
 - 6. Use a bonding agent at locations where fresh concrete is placed against hardened or partially hardened concrete surfaces.
 - 7. Use epoxy-bonding adhesive at locations where fresh concrete is placed against hardened or partially hardened concrete surfaces.
- C. Control Joints in Slabs-on-Grade: Form weakened-plane control joints, sectioning concrete into areas as indicated. Construct contraction joints for a depth equal to at least one-fourth of concrete thickness as follows:
 - 1. Grooved Joints: Form contraction joints after initial floating by grooving and finishing each edge of joint to a radius of 1/8 inch. Repeat grooving of contraction joints after applying surface finishes. Eliminate groover tool marks on concrete surfaces.
 - 2. Sawed Joints: Form contraction joints with power saws equipped with shatterproof abrasive or diamond-rimmed blades. Cut 1/8-inch- wide joints into concrete when cutting action will not tear, abrade, or otherwise damage surface and before concrete develops random contraction cracks.

- D. Isolation Joints in Slabs-on-Grade: After removing formwork, install joint-filler strips at slab junctions with vertical surfaces, such as column pedestals, foundation walls, grade beams, and other locations, as indicated.
 - 1. Extend joint-filler strips full width and depth of joint, terminating flush with finished concrete surface unless otherwise indicated.
 - 2. Terminate full-width joint-filler strips not less than 1/2 inch or more than 1 inch below finished concrete surface where joint sealants, specified in Section 079200 "Joint Sealants," are indicated.
 - 3. Install joint-filler strips in lengths as long as practicable. Where more than one length is required, lace or clip sections together.
- E. Doweled Joints: Install dowel bars and support assemblies at joints where indicated. Lubricate or asphalt coat one-half of dowel length to prevent concrete bonding to one side of joint.

3.10 WATERSTOPS

- A. Flexible Waterstops: Install in construction joints and at other joints indicated to form a continuous diaphragm. Install in longest lengths practicable. Support and protect exposed waterstops during progress of the Work. Field fabricate joints in waterstops according to manufacturer's written instructions.
- B. Self-Expanding Strip Waterstops: Install in construction joints and at other locations indicated, according to manufacturer's written instructions, adhesive bonding, mechanically fastening, and firmly pressing into place. Install in longest lengths practicable.

3.11 CONCRETE PLACEMENT

- A. Before placing concrete, verify that installation of formwork, reinforcement, and embedded items is complete and that required inspections have been performed.
- B. Do not add water to concrete during delivery, at Project site, or during placement unless approved by Engineer.
- C. Before test sampling and placing concrete, water may be added at Project site, subject to limitations of ACI 301.
 - 1. Do not add water to concrete after adding high-range water-reducing admixtures to mixture.
- D. Deposit concrete continuously in one layer or in horizontal layers of such thickness that no new concrete will be placed on concrete that has hardened enough to cause seams or planes of weakness. If a section cannot be placed continuously, provide construction joints as approved by the Engineer and Architect. Deposit concrete to avoid segregation.
 - 1. Deposit concrete in horizontal layers of depth to not exceed formwork design pressures and in a manner to avoid inclined construction joints.
 - 2. Consolidate placed concrete with mechanical vibrating equipment according to ACI 301.
 - 3. Do not use vibrators to transport concrete inside forms. Insert and withdraw vibrators vertically at uniformly spaced locations to rapidly penetrate placed layer and at least 6 inches into preceding layer. Do not insert vibrators into lower layers of concrete that

have begun to lose plasticity. At each insertion, limit duration of vibration to time necessary to consolidate concrete and complete embedment of reinforcement and other embedded items without causing mixture constituents to segregate.

- E. Deposit and consolidate concrete for floors and slabs in a continuous operation, within limits of construction joints, until placement of a panel or section is complete.
 - 1. Consolidate concrete during placement operations so concrete is thoroughly worked around reinforcement and other embedded items and into corners.
 - 2. Maintain reinforcement in position on chairs during concrete placement.
 - 3. Screed slab surfaces with a straightedge and strike off to correct elevations.
 - 4. Slope surfaces uniformly to drains where required.
 - 5. Begin initial floating using bull floats or darbies to form a uniform and open-textured surface plane, before excess bleedwater appears on the surface. Do not further disturb slab surfaces before starting finishing operations.

- F. Cold-Weather Placement: Comply with ACI 306.1 and as follows. Protect concrete work from physical damage or reduced strength that could be caused by frost, freezing actions, or low temperatures.
 - 1. When average high and low temperature is expected to fall below 40 deg F for three successive days, maintain delivered concrete mixture temperature within the temperature range required by ACI 301.
 - 2. Do not use frozen materials or materials containing ice or snow. Do not place concrete on frozen subgrade or on subgrade containing frozen materials.
 - 3. Do not use calcium chloride, salt, or other materials containing antifreeze agents or chemical accelerators unless otherwise specified and approved in mixture designs.

- G. Hot-Weather Placement: Comply with ACI 301 and as follows:
 - 1. Maintain concrete temperature below 90 deg F at time of placement. Chilled mixing water or chopped ice may be used to control temperature, provided water equivalent of ice is calculated to total amount of mixing water. Using liquid nitrogen to cool concrete is Contractor's option.
 - 2. Fog-spray forms, steel reinforcement, and subgrade just before placing concrete. Keep subgrade uniformly moist without standing water, soft spots, or dry areas.

3.12 FINISHING FORMED SURFACES

- A. Rough-Formed Finish: As-cast concrete texture imparted by form-facing material with tie holes and defects repaired and patched. Remove fins and other projections that exceed specified limits on formed-surface irregularities.
 - 1. Apply to concrete surfaces not exposed to public view.

- B. Smooth-Formed Finish: As-cast concrete texture imparted by form-facing material, arranged in an orderly and symmetrical manner with a minimum of seams. Repair and patch tie holes and defects. Remove fins and other projections that exceed specified limits on formed-surface irregularities.
 - 1. Apply to concrete surfaces exposed to public view, to receive a rubbed finish, to be covered with a coating or covering material applied directly to concrete.

- C. Rubbed Finish: Apply the following to smooth-formed finished as-cast concrete where indicated:
1. Smooth-Rubbed Finish: Not later than one day after form removal, moisten concrete surfaces and rub with carborundum brick or another abrasive until producing a uniform color and texture. Do not apply cement grout other than that created by the rubbing process.
 2. Grout-Cleaned Finish: Wet concrete surfaces and apply grout of a consistency of thick paint to coat surfaces and fill small holes. Mix one part portland cement to one and one-half parts fine sand with a 1:1 mixture of bonding admixture and water. Add white portland cement in amounts determined by trial patches so color of dry grout will match adjacent surfaces. Scrub grout into voids and remove excess grout. When grout whitens, rub surface with clean burlap and keep surface damp by fog spray for at least 36 hours.
 3. Cork-Floated Finish: Wet concrete surfaces and apply a stiff grout. Mix one part portland cement and one part fine sand with a 1:1 mixture of bonding agent and water. Add white portland cement in amounts determined by trial patches so color of dry grout will match adjacent surfaces. Compress grout into voids by grinding surface. In a swirling motion, finish surface with a cork float.
- D. Related Unformed Surfaces: At tops of walls, horizontal offsets, and similar unformed surfaces adjacent to formed surfaces, strike off smooth and finish with a texture matching adjacent formed surfaces. Continue final surface treatment of formed surfaces uniformly across adjacent unformed surfaces unless otherwise indicated.

3.13 FINISHING FLOORS AND SLABS

- A. General: Comply with ACI 302.1R recommendations for screeding, restraighening, and finishing operations for concrete surfaces. Do not wet concrete surfaces.
- B. Scratch Finish: While still plastic, texture concrete surface that has been screeded and bull-floated or darbied. Use stiff brushes, brooms, or rakes to produce a profile amplitude of 1/4 inch in one direction.
1. Apply scratch finish to surfaces indicated and to receive concrete floor toppings and to receive mortar setting beds for bonded cementitious floor finishes.
- C. Float Finish: Consolidate surface with power-driven floats or by hand floating if area is small or inaccessible to power driven floats. Restraighten, cut down high spots, and fill low spots. Repeat float passes and restraighening until surface is left with a uniform, smooth, granular texture.
1. Apply float finish to surfaces indicated, to receive trowel finish, and to be covered with fluid-applied or sheet waterproofing, built-up or membrane roofing, or sand-bed terrazzo.
- D. Trowel Finish: After applying float finish, apply first troweling and consolidate concrete by hand or power-driven trowel. Continue troweling passes and restraighten until surface is free of trowel marks and uniform in texture and appearance. Grind smooth any surface defects that would telegraph through applied coatings or floor coverings.

1. Apply a trowel finish to surfaces indicated, exposed to view, or to be covered with resilient flooring, carpet, ceramic or quarry tile set over a cleavage membrane, paint, or another thin-film-finish coating system.
 2. Finish surfaces to the following tolerances, according to ASTM E 1155, for a randomly trafficked floor surface:
 - a. Specified overall values of flatness at carpeted floors, F(F) 25; and of levelness, F(L) 20; with minimum local values of flatness, F(F) 17; and of levelness, F(L) 15.
 - b. Specified overall values of flatness at unpolished concrete exposed to view or to receive thin floorings, F(F) 35; and of levelness, F(L) 25; with minimum local values of flatness, F(F) 24; and of levelness, F(L) 17.
 - c. Specified overall values of flatness at polished concrete, F(F) 50; and of levelness, F(L) 30; with minimum local values of flatness, F(F) 35; and of levelness, F(L) 20.
 - d. Specified overall values of flatness for carpeted slabs on metal deck, F(F) 30; with minimum local values of flatness, F(F) 20.
 - e. Measurement of levelness at slabs on metal deck, 80% or more of the elevation points measured using ASTM procedures after deflection has occurred shall fall within a 3/4" envelope.
 3. Finish and measure surface so gap at any point between concrete surface and an unlevelled, freestanding, 10-ft.- long straightedge resting on two high spots and placed anywhere on the surface does not exceed 3/16 inch.
- E. Trowel and Fine-Broom Finish: Apply a first trowel finish to surfaces indicated and where ceramic or quarry tile is to be installed by either thickset or thin-set method. While concrete is still plastic, slightly scarify surface with a fine broom.
1. Comply with flatness and levelness tolerances for trowel-finished floor surfaces.
- F. Broom Finish: Apply a broom finish to exterior concrete platforms, steps, ramps, and elsewhere as indicated.
1. Immediately after float finishing, slightly roughen trafficked surface by brooming with fiber-bristle broom perpendicular to main traffic route. Coordinate required final finish with Architect before application.
- G. Slip-Resistive Finish: Before final floating, apply slip-resistive aluminum granule finish where indicated and to concrete stair treads, platforms, and ramps. Apply according to manufacturer's written instructions and as follows:
1. Uniformly spread 25 lb/100 sq. ft. of dampened slip-resistive aluminum granules over surface in one or two applications. Tamp aggregate flush with surface, but do not force below surface.
 2. After broadcasting and tamping, apply float finish.
 3. After curing, lightly work surface with a steel wire brush or an abrasive stone and water to expose slip-resistive aluminum granules.
- H. Dry-Shake Floor Hardener Finish: After initial floating, apply dry-shake floor hardener to surfaces according to manufacturer's written instructions and as follows:
1. Uniformly apply dry-shake floor hardener at a rate of 100 lb/100 sq. ft. unless greater amount is recommended by manufacturer.

2. Uniformly distribute approximately two-thirds of dry-shake floor hardener over surface by hand or with mechanical spreader, and embed by power floating. Follow power floating with a second dry-shake floor hardener application, uniformly distributing remainder of material, and embed by power floating.
3. After final floating, apply a trowel finish. Cure concrete with curing compound recommended by dry-shake floor hardener manufacturer and apply immediately after final finishing.

3.14 MISCELLANEOUS CONCRETE ITEMS

- A. Filling In: Fill in holes and openings left in concrete structures after work of other trades is in place unless otherwise indicated. Mix, place, and cure concrete, as specified, to blend with in-place construction. Provide other miscellaneous concrete filling indicated or required to complete the Work.
- B. Curbs: Provide monolithic finish to interior curbs by stripping forms while concrete is still green and by steel-troweling surfaces to a hard, dense finish with corners, intersections, and terminations slightly rounded.
- C. Equipment Bases and Foundations: Provide machine and equipment bases and foundations as shown on Drawings. Set anchor bolts for machines and equipment at correct elevations, complying with diagrams or templates from manufacturer furnishing machines and equipment.
- D. Steel Pan Stairs: Provide concrete fill for steel pan stair treads, landings, and associated items. Cast-in inserts and accessories as shown on Drawings. Screed, tamp, and trowel finish concrete surfaces.
- E. Protective slabs ("Mud slabs"): Concrete fill shall be normal weight concrete (2500 psi minimum) with a minimum thickness of 2". Finish slab to a wood float finish.

3.15 INSTALLATION OF NON-SHRINK GROUT UNDER BASEPLATES

- A. Grout under all load bearing baseplates. Comply with manufacturer's instructions. Do not dry pack.
- B. Mixing: Use a mechanical mixer. Add only enough water to make grout placeable. Do not mix more grout than can be placed in 20 minutes. Under no circumstances shall grout be retempered.

3.16 CONCRETE PROTECTING AND CURING

- A. General: Protect freshly placed concrete from premature drying and excessive cold or hot temperatures. Comply with ACI 306.1 for cold-weather protection and ACI 301 for hot-weather protection during curing.
- B. Evaporation Retarder: Apply evaporation retarder to unformed concrete surfaces if hot, dry, or windy conditions cause moisture loss approaching 0.2 lb/sq. ft. x h before and during finishing operations. Apply according to manufacturer's written instructions after placing, screeding, and bull floating or darbying concrete, but before float finishing.

- C. Formed Surfaces: Cure formed concrete surfaces, including underside of beams, supported slabs, and other similar surfaces. If forms remain during curing period, moist cure after loosening forms. If removing forms before end of curing period, continue curing for the remainder of the curing period.
- D. Unformed Surfaces: Begin curing immediately after finishing concrete. Cure unformed surfaces, including floors and slabs, concrete floor toppings, and other surfaces.
- E. Cure concrete according to ACI 308R-01 Guide to Curing Concrete (Reapproved 2008), by one or a combination of the following methods:
 - 1. Moisture Curing: Keep surfaces continuously moist for not less than seven days with the following materials:
 - a. Water.
 - b. Continuous water-fog spray.
 - c. Absorptive cover, water saturated, and kept continuously wet. Cover concrete surfaces and edges with 12-inch lap over adjacent absorptive covers.
 - 2. Moisture-Retaining-Cover Curing: Cover concrete surfaces with moisture-retaining cover for curing concrete, placed in widest practicable width, with sides and ends lapped at least 12 inches, and sealed by waterproof tape or adhesive. Cure for not less than seven days. Immediately repair any holes or tears during curing period using cover material and waterproof tape.
 - a. Moisture cure or use moisture-retaining covers to cure concrete surfaces to receive floor coverings.
 - b. Moisture cure or use moisture-retaining covers to cure concrete surfaces to receive penetrating liquid floor treatments.
 - c. Cure concrete surfaces to receive floor coverings with either a moisture-retaining cover or a curing compound that the manufacturer certifies will not interfere with bonding of floor covering used on Project.
 - 3. Curing Compound: Apply uniformly in continuous operation by power spray or roller according to manufacturer's written instructions. Recoat areas subjected to heavy rainfall within three hours after initial application. Maintain continuity of coating and repair damage during curing period.
 - a. Removal: After curing period has elapsed, remove curing compound without damaging concrete surfaces by method recommended by curing compound manufacturer unless manufacturer certifies curing compound will not interfere with bonding of floor covering used on Project.
 - 4. Curing and Sealing Compound: Apply uniformly to floors and slabs indicated in a continuous operation by power spray or roller according to manufacturer's written instructions. Recoat areas subjected to heavy rainfall within three hours after initial application. Repeat process 24 hours later and apply a second coat. Maintain continuity of coating and repair damage during curing period.

3.17 LIQUID FLOOR TREATMENTS

- A. Penetrating Liquid Floor Treatment: Prepare, apply, and finish penetrating liquid floor treatment according to manufacturer's written instructions.
 - 1. Remove curing compounds, sealers, oil, dirt, laitance, and other contaminants and complete surface repairs.
 - 2. Do not apply to concrete that is less than 14 days old.
 - 3. Apply liquid until surface is saturated, scrubbing into surface until a gel forms; rewet; and repeat brooming or scrubbing. Rinse with water; remove excess material until surface is dry. Apply a second coat in a similar manner if surface is rough or porous.
- B. Polished Concrete Floor Treatment: Apply polished concrete finish system to cured and prepared slabs to match accepted mockup.
 - 1. Machine grind floor surfaces to receive polished finishes level and smooth.
 - 2. Apply penetrating liquid floor treatment for polished concrete in polishing sequence and according to manufacturer's written instructions, allowing recommended drying time between successive coats.
 - 3. Continue polishing with progressively finer grit diamond polishing pads to gloss level to match approved mockup.
 - 4. Control and dispose of waste products produced by grinding and polishing operations.
 - 5. Neutralize and clean polished floor surfaces.
- C. Sealing Coat: Uniformly apply a continuous sealing coat of curing and sealing compound to hardened concrete by power spray or roller according to manufacturer's written instructions.

3.18 JOINT FILLING

- A. Prepare, clean, and install joint filler according to manufacturer's written instructions.
 - 1. Defer joint filling until concrete has aged at least six month(s) unless approved otherwise. Do not fill joints until construction traffic has permanently ceased.
- B. Remove dirt, debris, saw cuttings, curing compounds, and sealers from joints; leave contact faces of joint clean and dry.
- C. Install semirigid joint filler full depth in saw-cut joints and at least 2 inches deep in formed joints. Overfill joint and trim joint filler flush with top of joint after hardening.

3.19 CONCRETE SURFACE REPAIRS

- A. Defective Concrete: Repair and patch defective areas when approved by Architect. Remove and replace concrete that cannot be repaired and patched to Architect's approval.
- B. Patching Mortar: Mix dry-pack patching mortar, consisting of one part portland cement to two and one-half parts fine aggregate passing a No. 16 sieve, using only enough water for handling and placing.

- C. Repairing Formed Surfaces: Surface defects include color and texture irregularities, cracks, spalls, air bubbles, honeycombs, rock pockets, fins and other projections on the surface, and stains and other discolorations that cannot be removed by cleaning.
1. Immediately after form removal, cut out honeycombs, rock pockets, and voids more than 1/2 inch in any dimension to solid concrete. Limit cut depth to 3/4 inch. Make edges of cuts perpendicular to concrete surface. Clean, dampen with water, and brush-coat holes and voids with bonding agent. Fill and compact with patching mortar before bonding agent has dried. Fill form-tie voids with patching mortar or cone plugs secured in place with bonding agent.
 2. Repair defects on surfaces exposed to view by blending white portland cement and standard portland cement so that, when dry, patching mortar will match surrounding color. Patch a test area at inconspicuous locations to verify mixture and color match before proceeding with patching. Compact mortar in place and strike off slightly higher than surrounding surface. Patches exposed to view shall be approved by Architect and Engineer.
 3. Repair defects on concealed formed surfaces that affect concrete's durability and structural performance as determined by Engineer.
- D. Repairing Unformed Surfaces: Test unformed surfaces, such as floors and slabs, for finish and verify surface tolerances specified for each surface. Correct low and high areas. Test surfaces sloped to drain for trueness of slope and smoothness; use a sloped template.
1. Repair finished surfaces containing defects. Surface defects include spalls, popouts, honeycombs, rock pockets, crazing and cracks in excess of 0.01 inch wide or that penetrate to reinforcement or completely through unreinforced sections regardless of width, and other objectionable conditions.
 2. After concrete has cured at least 14 days, correct high areas by grinding.
 3. Correct localized low areas during or immediately after completing surface finishing operations by cutting out low areas and replacing with patching mortar. Finish repaired areas to blend into adjacent concrete.
 4. Correct other low areas scheduled to receive floor coverings with a repair underlayment. Prepare, mix, and apply repair underlayment and primer according to manufacturer's written instructions to produce a smooth, uniform, plane, and level surface. Feather edges to match adjacent floor elevations.
 5. Correct other low areas scheduled to remain exposed with a repair topping. Cut out low areas to ensure a minimum repair topping depth of 1/4 inch to match adjacent floor elevations. Prepare, mix, and apply repair topping and primer according to manufacturer's written instructions to produce a smooth, uniform, plane, and level surface.
 6. Repair defective areas, except random cracks and single holes 1 inch or less in diameter, by cutting out and replacing with fresh concrete. Remove defective areas with clean, square cuts and expose steel reinforcement with at least a 3/4-inch clearance all around. Dampen concrete surfaces in contact with patching concrete and apply bonding agent. Mix patching concrete of same materials and mixture as original concrete except without coarse aggregate. Place, compact, and finish to blend with adjacent finished concrete. Cure in same manner as adjacent concrete.
 7. Repair random cracks and single holes 1 inch or less in diameter with patching mortar. Groove top of cracks and cut out holes to sound concrete and clean off dust, dirt, and loose particles. Dampen cleaned concrete surfaces and apply bonding agent. Place patching mortar before bonding agent has dried. Compact patching mortar and finish to match adjacent concrete. Keep patched area continuously moist for at least 72 hours.

- E. Perform structural repairs of concrete, subject to Architect's approval, using epoxy adhesive and patching mortar.
- F. Repair materials and installation not specified above may be used, subject to Architect's and Engineer's approval.

3.20 FIELD QUALITY CONTROL

- A. Testing and Inspecting: Owner will engage a special inspector and qualified testing and inspecting agency to perform field tests and inspections and prepare test reports.
- B. Testing and Inspecting: Engage a qualified testing and inspecting agency to perform tests and inspections and to submit reports.
- C. Inspections:
 - 1. Steel reinforcement placement.
 - 2. Steel reinforcement welding.
 - 3. Headed bolts and studs.
 - 4. Verification of use of required design mixture.
 - 5. Concrete placement, including conveying and depositing.
 - 6. Curing procedures and maintenance of curing temperature.
 - 7. Verification of concrete strength before removal of shores and forms from beams and slabs.
- D. Concrete Tests: Testing of composite samples of fresh concrete obtained according to ASTM C 172 shall be performed according to the following requirements:
 - 1. Testing Frequency: Obtain one composite sample for each day's pour of each concrete mixture exceeding 5 cu. yd., but less than 25 cu. yd., plus one set for each additional 50 cu. yd. or fraction thereof.
 - 2. Testing Frequency: Obtain at least one composite sample for each 100 cu. yd. or fraction thereof of each concrete mixture placed each day.
 - a. When frequency of testing will provide fewer than five compressive-strength tests for each concrete mixture, testing shall be conducted from at least five randomly selected batches or from each batch if fewer than five are used.
 - 3. Slump: ASTM C 143/C 143M; one test at point of placement for each composite sample, but not less than one test for each day's pour of each concrete mixture. Perform additional tests when concrete consistency appears to change.
 - 4. Air Content: ASTM C 231, pressure method, for normal-weight concrete; ASTM C 173/C 173M, volumetric method, for structural lightweight concrete; one test for each composite sample, but not less than one test for each day's pour of each concrete mixture.
 - 5. Concrete Temperature: ASTM C 1064/C 1064M; one test hourly when air temperature is 40 deg F and below and when 80 deg F and above, and one test for each composite sample.
 - 6. Unit Weight: ASTM C 567, fresh unit weight of structural lightweight concrete; one test for each composite sample, but not less than one test for each day's pour of each concrete mixture.
 - 7. Compression Test Specimens: ASTM C 31/C 31M.

- a. Cast and laboratory cure two sets of two standard cylinder specimens for each composite sample.
 - b. Cast and field cure two sets of two standard cylinder specimens for each composite sample.
8. Compressive-Strength Tests: ASTM C 39/C 39M.
- a. Test one set of two field-cured specimens at 7 days and one set of two specimens at 28 days.
 - b. A compressive-strength test shall be the average compressive strength from a set of two specimens obtained from same composite sample and tested at age indicated.
9. When strength of field-cured cylinders is less than 85 percent of companion laboratory-cured cylinders, Contractor shall evaluate operations and provide corrective procedures for protecting and curing in-place concrete.
10. Strength of each concrete mixture will be satisfactory if every average of any three consecutive compressive-strength tests equals or exceeds specified compressive strength and no compressive-strength test value falls below specified compressive strength by more than 500 psi.
11. Test results shall be reported in writing to Architect, concrete manufacturer, and Contractor within 48 hours of testing. Reports of compressive-strength tests shall contain Project identification name and number, date of concrete placement, name of concrete testing and inspecting agency, location of concrete batch in Work, design compressive strength at 28 days, concrete mixture proportions and materials, compressive breaking strength, and type of break for both 7- and 28-day tests.
12. Nondestructive Testing: Impact hammer, sonoscope, or other nondestructive device may be permitted by Architect but will not be used as sole basis for approval or rejection of concrete.
13. Additional Tests: Testing and inspecting agency shall make additional tests of concrete when test results indicate that slump, air entrainment, compressive strengths, or other requirements have not been met, as directed by Architect. Testing and inspecting agency may conduct tests to determine adequacy of concrete by cored cylinders complying with ASTM C 42/C 42M or by other methods as directed by Architect.
14. Additional testing and inspecting, at Contractor's expense, will be performed to determine compliance of replaced or additional work with specified requirements.
15. Correct deficiencies in the Work that test reports and inspections indicate do not comply with the Contract Documents.
- E. Measure floor and slab flatness and levelness according to ASTM E 1155 within 48 hours of finishing.

3.21 PROTECTION OF LIQUID FLOOR TREATMENTS

- A. Protect liquid floor treatment from damage and wear during the remainder of construction period. Use protective methods and materials, including temporary covering, recommended in writing by liquid floor treatments installer.

END OF SECTION 033000

SECTION 03 54 16 - HYDRAULIC CEMENT UNDERLAYMENT

PART 1 GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings, general provisions of the Contract, and other related construction documents such as Division 1 specifications apply to this Section

1.02 SUMMARY

- A. This Section includes a cement-based self-leveling underlayment formulated for interior use.
- B. Related sections include the following:
 - 1. Section 01 45 23 – Concrete In-Situ Relative Humidity, and pH Testing.
 - 2. Section 03 30 00 - Cast-In-Place Concrete.
 - 3. Section 07 26 13 – Moisture Control System.
 - 4. Section 12 48 13 – Entrance Floor Mats and Frames: Installing hydraulic cement underlayment in the slab depression for entrance mat in order to provide a level surface for the entrance mat and frame.

1.03 REFERENCES

- A. ASTM C78- Standard Test Method for Flexural Strength of Concrete (Using Simple Beam with Third-Point Loading).
- B. ASTM C109M – Compressive Strength Air-Cure Only.
- C. ASTM C150 – Standard Specification for Portlane Cement.
- D. ASTM C348 – Flexural Strength of Hydraulic-Cement Mortars.
- E. ASTM E84 – Surface Burning Characteristics of Building Materials.
- F. ASTM F2170, Relative Humidity in Concrete Floor Slabs Using in situ Probes.
- G. ASTM 710 - Standard Practice for Preparing Concrete Floors to Receive Resilient Flooring.

1.04 SUBMITTALS

- A. Product Data: Submit manufacturer's product data and installation instructions for each material and product used. Include manufacturer's Material Safety Data Sheets.

1.05 QUALITY ASSURANCE

- A. Installation of the underlayment product must be completed by a factory-trained applicator using mixing equipment and tools approved by the manufacturer.

- B. Product must have a hydraulic cement-based inorganic binder content as the primary binder which includes Portland cement per ASTM C150: Standard Specification for Portland Cement and other specialty hydraulic cements.
- C. Manufacturer Experience: Provide products of this section by companies which have successfully specialized in production of this type of work for not less than 10 years. Contact manufacturer's representative prior to installation.

1.06 DELIVERY, STORAGE AND HANDLING

- A. Deliver products in original packaging, labeled with product identification, manufacturer, batch number and shelf life.
- B. Store products in a dry area with temperature maintained between 50 degrees and 85 degrees F (10 degrees and 29 degrees C) and Protect from direct sunlight.
- C. Handle products in accordance with manufacturer's printed recommendations.

1.07 PROJECT CONDITIONS

- A. Do not install material below 50 degrees F (10 degrees C) surface and air temperatures. These temperatures must also be maintained during and for 48 hours after the installation of products included in this section.

PART 2 PRODUCTS

2.01 MANUFACTURERS AND PRODUCTS

- A. Basis of Design: Contract Documents are based on manufacturer and product named. Other manufacturers with products having equivalent characteristics may be submitted in accordance with Conditions of the Contract and appropriate Division 1 sections. Submitted products shall meet or exceed the performance and physical properties identified in Article 2.01, Paragraph B, of this specification.
 - 1. Manufacturer: Ardex Engineered Cements.
 - 2. Product: Ardex K15 self-leveling underlayment concrete.
 - a. Primer for porous concrete: Ardex P51 primer.
- B. Performance and Physical Properties:
 - 1. Material: Portland cement-based underlayment.
 - 2. Compressive strength: 4,100 psi at 28 days per ASTM C109M.
 - 3. Flexural strength: 1,000 psi at 28 days, per ASTM C78.
 - 4. Maximum installation thickness without aggregate: 1-1/2 inches.
 - 5. Maximum installation thickness with aggregate: 5 inches.

6. VOC content: 0 g/L per SCAQMD 1168.

C. Approved manufacturers and products

1. USG Durock Speed Self-leveling Underlayment.

Note: At locations where the thickness of the underlayment does not exceed 1 inch provide USG Durock Quik-Cover Self-Leveling Underlayment.

2.02 WATER

A. Water shall be clean, potable and sufficiently cool (not warmer than 70 degrees F).

PART 3 EXECUTION

3.01 PREPARATION

A. Concrete Subfloors: Prepare substrate in accordance with manufacturer's instructions.

1. Prior to proceeding refer to ASTM F710 – Standard Practice for Preparing Concrete Floors to Receive Resilient Flooring. All concrete subfloors must be sound, solid, clean, and free of all oil, grease, dirt, curing compounds and any substance that might act as a bond breaker before priming. Mechanically clean if necessary using shot blasting or other. Acid etching and the use of sweeping compounds and solvents are not acceptable.

2. All cracks in the subfloor shall be repaired to minimize telegraphing through the underlayment.

3. Substrates shall be tested in accordance with Section 01 45 23 and corrected for moisture or any other conditions that could affect the performance of the underlayment or the finished floor covering. For areas where moisture vapor emissions exceed the limits required by the floor covering manufacturer, refer to Section 07 26 13 and install the appropriate moisture control system as recommended by underlayment manufacturer.

B. Joint Preparation:

1. Moving joints: Honor all expansion and isolation joints up through the underlayment.

a. Seal joints with Ardiseal RapidPlus as manufactured by Ardex.

2. Saw cuts and control joints: Fill all non-moving joints with Ardifix joint filler as manufactured by Ardex.

3.02 APPLICATION OF UNDERLAYMENT

A. Examine substrates and conditions under which materials will be installed. Do not proceed with installation until unsatisfactory conditions are corrected.

B. Coordinate installation with adjacent work to ensure proper sequence of construction.

Protect adjacent areas from contact due to mixing and handling of materials.

C. Priming:

1. Primer for standard absorbent concrete subfloors: Mix Ardex P-51 1:1 with water and apply evenly with a soft push broom. Do not leave any bare spots. Remove all puddles and excess primer. Allow to dry to a clear, thin film (minimum three hours; maximum 24 hours). Underlayment shall not be applied until the primer is dry. Primer coverage is approximately 400 to 600 square feet per gallon.
2. Primer for extremely absorbent concrete subfloors: Make an initial application of Ardex P-51 mixed with three parts water using a soft push broom. Do not leave any bare spots. Remove all puddles and excess primer. Allow to dry thoroughly before proceeding with the standard application of primer as described above for standard absorbent concrete.

D. Mixing: Comply with manufacturer's printed instructions and the following:

1. Add 7 quarts (6.5 L) of clean potable water per two 55-pound bag.
2. Mix using a 1/2-inch (650 rpm) low speed heavy-duty mixing drill with an Ardex T-1 mixing paddle. Do not overwater.

E. Application: Comply with manufacturer's printed instructions and the following:

1. Ardex K15 must be installed at a minimum thickness of 1/8 inch over the highest point in the floor, which typically results in an average thickness of 1/4 inch over the entire floor. Ardex K15 can be installed up to 1-1/2 inches over large areas neat, and up to 5 inches with the addition of proper aggregate. Ardex K15 can also be featheredged to match existing elevations.
2. Pour the liquid Ardex K15 and spread in place with the Ardex T-4 Spreader. Use the Ardex T-5 Smoother and featheredge and touch-up. Wear non-metallic cleats to avoid leaving marks in the liquid Ardex K15.

F. Curing

1. Ardex K15 can be walked on in two to three hours. Underlayment can accept all other finish floor covering materials after 16 hours at 70 degrees F and 50 percent relative humidity.

3.03 PROTECTION

- A. Prior to the installation of the entrance floor mat and frame, the surface of the underlayment should be protected from abuse by other trades by the use of plywood, Masonite or other suitable protection course.

END OF SECTION

SECTION 04 05 03 – MASONRY MORTAR AND GROUT

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Mortar for masonry.
- B. Mortar for stone.
- C. Mortar for cast stone.
- D. Grout for masonry.

1.02 RELATED SECTIONS

- A. Section 01 33 00 – Submittal Procedures.
- B. Section 01 40 00 – Quality Requirements.
- C. Section 01 45 29 – Testing Laboratory Services: Testing requirements.
- D. Section 01 60 00 – Product Requirements: Product substitution procedures.
- E. Section 04 20 00 – Unit Masonry: Installation of mortar and grout.
- F. Section 04 20 19 – Veneer Unit Masonry: Installation of mortar.
- G. Section 04 43 13 - Mortar-Placed Stone Veneer.
- H. Section 04 72 00 – Cast Stone Masonry: Installation of mortar.

1.03 REFERENCES

- A. American Concrete Institute:

- B. ASTM International:
 - 1. ASTM C94 – Standard for Ready-Mixed Concrete.
 - 2. ASTM C143 – Standard Test Method for Slump of Hydraulic-Cement Concrete.
 - 3. ASTM C144 – Standard Specification for Aggregate for Masonry Mortar.
 - 4. ASTM C150 – Standard Specification for Portland Cement.
 - 5. ASTM C207 – Standard Specification for Hydrated Lime for Masonry Purposes.

6. ASTM C270 – Standard Specification for Mortar for Unit Masonry.
7. ASTM C404 – Standard Specification for Aggregates for Masonry Grout.
8. ASTM C476 – Standard Specification for Grout for Masonry.
9. ASTM C780 – Standard Test Method for Pre-Construction and Construction Evaluation of Mortars for Plain and Reinforced Unit Masonry.
10. ASTM C979 – Standard Specification for Pigments for Integrally Colored Concrete.
11. ASTM C1586 – Standard Guide for Quality Assurance of Mortars.

1.04 SUBMITTALS

- A. Submit mortar mix designs indicating type and proportions of ingredients in compliance with the proportion specification of ASTM C270.
- B. Test and evaluation reports for mortar to ASTM C780 for aggregate ratio and water content.
- C. Submit grout mix designs indicating type and proportions of ingredients in compliance with ASTM C476 – Conventional Grout Proportions by Volume for fine and coarse grout.
- D. Submit product data under provisions of Section 01 33 00.
 1. Submit manufacturer of mortar pigment, procedures for mixing colored mortar.
 2. For each mortar material used, submit a letter of certification or a test report confirming that the materials meet the ASTM Standards listed under the Materials Section of Specification C270.
 3. For each grout material used, submit a letter of certification or a test report confirming that the materials meet ASTM Standards listed under the Materials Section of Specification C476.
 4. Obtain written acceptance of submittals prior to the purchase of the materials or methods requiring acceptance.
- E. Samples: Submit under provisions of Section 01 33 00.
- F. Samples: Submit two ribbons of each mortar color, illustrating color and color range.
- G. Submit test reports under provisions of Section 01 40 00.
- H. Submit manufacturer's certificate under provisions of Section 01 40 00 that products meet or exceed specified requirements.

1.05 QUALITY ASSURANCE

- A. Perform Work in accordance with the Building Code for Masonry Structures ACI 530/ASCE 5/TMS 402 and Specifications for Masonry Structures ACI 530.1/ASCE 6/TMS 602, and commentaries. Comply with edition referenced in applicable building code.

1.06 QUALITY ASSURANCE FOR MORTAR PIGMENT

- A. ASTM C979: Pigment shall not exceed 10 percent of the weight of Portland cement.
- B. Carbon Black shall not exceed 2 percent of the weight of Portland cement.

1.07 DELIVERY, STORAGE AND HANDLING

- A. Deliver products to site under provisions of Section 01 60 00.
- B. Store and protect products under provisions of Section 01 60 00.
- C. Maintain packaged materials clean, dry and protected against dampness, freezing and foreign matter.
- D. Stock pile and handle aggregates to prevent contamination from foreign materials.

1.08 ENVIRONMENTAL REQUIREMENTS

- A. Follow requirements for cold and hot weather construction in ACI 530.1/ASCE6.
 - 1. Cold Weather Requirements: When ambient air temperature is below 40 degrees F (4.4 degrees C), implement cold weather procedures.
 - 2. Hot Weather Requirements: When the ambient air temperature exceeds 100 degrees F (37.8 degrees C), or exceeds 90 degrees F (32.2 degrees C) with a wind velocity greater than 8 mph (12.9 km/hr), implement hot weather procedures.

PART 2 PRODUCTS

2.01 MORTAR MATERIALS

- A. Cementitious Materials:
 - 1. Portland Cement: ASTM C150, Type 1.
 - a. Color:
 - 1) Provide gray colored cement unless otherwise noted.
 - 2) At colored mortar, provide gray colored cement for mixing with mortar colors.
 - 2. Hydrated Lime: ASTM C207, Type S.
 - 3. The use of Masonry Cement will not be permitted.
- B. Sand: ASTM C144, Standard Masonry Type.
- C. Admixtures:
 - 1. No air-entraining admixtures or material containing air entraining admixture.
 - 2. No anti-freeze compounds shall be added to mortar.

3. No admixtures containing calcium chlorides shall be added to mortar.
 4. Set-retarding or set-accelerating, bond-modifying or corrosion-inhibiting admixtures are prohibited without written approval from the Architect and the governing building official.
- D. Water: Clean and Potable.
- E. Mortar Pigment:
1. Mortar Pigment shall be finely milled (95 percent to 99 percent minus 325 mesh particle size), 90 percent pure inorganic iron oxides. Carbon added for darker shades shall not exceed 4 percent. Color pigments shall be light fast, weather resistant, alkali resistant, water insoluble, lime proof, nonbleeding, free of deleterious fillers and extenders as manufactured by SGS Solomon Colors, Inc., H series colors.
 - a. At exterior clay masonry veneer: Mortar colors selected by Architect.
 - b. At exterior stone: Mortar color selected by Architect.
 - c. At cast stone: Mortar color selected by Architect.

2.02 GROUT MATERIALS

- A. This specification covers both fine and coarse grout for use in the construction of masonry structures.
1. Each type (fine and coarse) shall be classified as conventional grout, requiring mechanical consolidation by puddling or vibration when placed.
 2. Conventional grout shall be determined by the following method:
 - a. Proportions by volume for fine and coarse grout.
 3. Grout type:
 - a. Fine grout shall be manufactured with fine aggregates.
 - b. Coarse grout shall be manufactured with a combination of coarse and fine aggregates.
- B. Cementitious Materials:
1. Portland Cement: ASTM C150, Type 1.
 2. Hydrated Lime: ASTM C207, Type S.
- C. Aggregates:
1. Fine Aggregate: ASTM C404.
 2. Coarse Aggregate: ASTM C404.
- D. Water: Clean and Potable.

E. Admixtures:

1. No air-entraining admixtures or material containing air-entraining admixture.
2. No anti-freeze compounds shall be added to the grout.
3. No admixtures containing chlorides shall be added to the grout.
4. Set-retarding or set-accelerating, bond-modifying or corrosion-inhibiting admixtures are prohibited without written approval from the architect and the governing building official.

2.03 MORTAR MIXES

A. Mortar Mixes:

1. Mortar for calcium silicate brick veneer, stone veneer, and cast stone: ASTM C270, Type N using the proportion specification.
 - a. At the calcium silicate brick provide a Type N Portland cement-lime mix proportioned as follows:
 - 1) 1 part Portland cement, ASTM C150, Type 1).
 - 2) 1 part hydrated lime (ASTM C207, Type S.
 - 3) 6 parts masonry sand (ASTMC144).
2. Mortar for non-load-bearing concrete masonry walls; ASTM C270, Type S using the proportion specification.

2.04 GROUT MIXING

- A. Grout for Non-Structural Masonry: 8 to 11 inches slump unless otherwise indicated in the Structural General Notes: mixed in accordance with ASTM C476 grout.
- B. Provide grout proportions by volume for both fine and coarse conventional grout.
- C. Place grout within 1 hour from introducing water in the mixture and prior to initial set.

PART 3 EXECUTION

3.01 FIELD MORTAR MIXING

- A. Thoroughly mix mortar ingredients in accordance with ASTM C270 in quantities needed for immediate use.
 1. All cementitious materials and aggregate shall be mixed between three and five minutes in a mechanical batch mixer with the maximum amount of water to produce a workable consistency. Do not hand-mix mortar.
 2. Control batching procedures to ensure proper proportions by measuring materials by volume. Sand measurement by shovel count shall not be permitted.

- B. Maintain sand uniformly damp immediately before the mixing process.
- C. Do not use anti-freeze compounds to lower the freezing point of mortar.
- D. If water is lost by evaporation, re-temper with water only within two hours of initial mixing, re-temper with potable water.
- E. Discard all mortar which has begun to stiffen or is not used within two hours after initial mixing.
- F. Where required, mix mortar color in accordance with manufacturer's printed instructions to achieve uniformity of mix and coloration.

3.02 FIELD GROUT MIXING

- A. Grout shall comply with the requirements of Standard Specifications for Grout of Masonry, ASTM C476 for either fine grout or coarse grout. Transit mixed grout shall comply with ASTM C94.
 - 1. Under no circumstances will mortar be allowed to be placed periodically in the cavity as a substitute for poured grout. The operation shall be considered separate and distinct.
- B. Thoroughly mix grout ingredients in quantities needed for immediate use in accordance with ASTM C476 grout.
- C. Grout shall be of the consistency indicated such as to completely fill air spaces intended to receive grout. Refer to table for grout space requirements.

Grout space requirements

Grout type ¹	Maximum grout pour height, ft.	Minimum width of grout space, ^{2,3} in.	Minimum grout space dimensions for grouting cells of hollow units, ^{3,4} in. x in.
Fine	1	3/4	1-1/2 x 2
Fine	5	2	2 x 3
Fine	12	2-1/2	2-1/2 x 3
Fine	24	3	3 x 3
Coarse	1	1-1/2	1-1/2 x 3
Coarse	5	2	2-1/2 x 3
Coarse	12	2-1/2	3 x 3
Coarse	24	3	3 x 4

¹Fine and coarse grouts are defined in ASTM C476.

²For grouting between masonry wythes.

³Grout space dimension is the clear dimension between any masonry protrusion and shall be increased by the diameters of the horizontal bars within the cross section of the grout space.

⁴Area of vertical reinforcement shall not exceed 6 percent of the area of the grout space.

- D. Do not use anti-freeze compounds to lower the freezing point of grout.

3.03 INSTALLATION

- A. Install mortar and grout in accordance with Specifications for Masonry Structure, ACI 530.1/ASCE 6.
- B. Work grout into masonry cores and cavities to eliminate voids.
- C. Do not install grout in lifts greater than 16 inches without consolidating grout by rodding.
- D. Do not displace reinforcement while placing grout.
- E. Remove excess mortar from grout spaces.

3.04 FIELD QUALITY CONTROL

- A. Field inspection and testing will be performed under provisions of Section 01 45 29.
 - 1. Testing of grout mix: In accordance with ASTM C143 for slump.
 - 2. Field inspection of mortar: Verify by observation that the method of measuring material quantities used in construction accurately maintains the required proportions. Verify that the individual mortar materials being used are those approved for the project.
 - 3. Per ASTM C1586, use test method ASTM C780 to evaluate masonry mortar prepared at the construction site for the following properties:
 - a. Mortar aggregate ratio and water content, Test Method ASTM C780, Annex A4.
 - a. The measured volumetric proportions of the construction site produced mortar will then be compared to specification ASTM C270 Proportion Specification.

END OF SECTION

SECTION 04 20 00 – UNIT MASONRY

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Concrete masonry units.
- B. Reinforced unit masonry.
- C. Reinforcement, and accessories.

1.02 RELATED SECTIONS

- A. Section 01 33 00 – Submittal Procedures.
- B. Section 01 60 00 – Product Requirements: Product substitution procedures.
- C. Section 03 20 00 – Concrete Reinforcing: Steel reinforcing.
- D. Section 04 05 03 – Masonry Mortar and Grout: Mortar and grout.
- E. Section 04 20 19 – Veneer Unit Masonry: Masonry veneer.
- F. Section 07 27 26 – Fluid-Applied Membrane Air Barriers: Air barrier placed on exterior face of concrete block.
- G. Section 07 65 10 – Flexible Flashing: Installation of through wall flashing.

1.03 REFERENCES

- A. American Concrete Institute:
 - 1. ACI 530/ASCE 5/TMS 402 – Building Code Requirements for Masonry Structures. (Edition referenced in applicable building code.)
 - 2. ACI 530.1/ASCE 6/TMS 602 – Specifications for Masonry Structures. (Edition referenced in applicable building code.)
- B. ASTM International:
 - 1. ASTM A615 – Standard Specification for Deformed and Plain Carbon-Steel Bars for Concrete Reinforcement.
 - 2. ASTM C90 – Standard Specification for Load-Bearing Concrete Masonry Units.
 - 3. ASTM C426 – Standard Test Method for Linear Drying Shrinkage of Concrete Masonry Units.

1.04 SUBMITTALS

- A. Submit under provisions of Section 01 33 00.

- B. Product Data: Provide data for concrete masonry units and accessories.
- C. Manufacturer's Certificate: Certify that products meet or exceed specified requirements.

1.05 QUALITY ASSURANCE

- A. Perform Work in accordance with ACI 530/ASCE 5/TMS 402 and ACI 530.1/ASCE 6/TMS 602. (Edition referenced in the applicable building code.)

1.06 FINISH AND APPEARANCE

- A. All units shall be sound and free of cracks or other defects that interfere with the proper placement of the unit or significantly impair the strength or permanence of the construction. Minor cracks, incidental to the usual method of manufacture or minor chipping resulting from customary methods of handling in shipment and delivery, are not grounds for rejection.
- B. Five percent of a shipment containing chips, not larger than 1 inch in any dimension, or cracks not wider than 0.02 inch and not longer than 25 percent of the nominal height of the unit is permitted.
- C. The color and texture of units shall be specified by the Architect.
- D. A shipment shall not contain more than 5 percent of units, including broken units, that do not meet the requirements of A, B and C.

1.07 PERMISSIBLE VARIATIONS IN DIMENSIONS

- A. Standard Units: For standard units, no overall dimension (width, height and length) shall differ by more than $\pm 1/8$ inch from the specified dimensions.

1.08 QUALIFICATIONS

- A. Manufacturer: Company specializing in manufacturing the Products specified in this section with minimum 10 years of documented experience.
- B. Installer: Company specializing in performing work of this section with minimum five years of documented experience.

1.09 DELIVERY, STORAGE AND HANDLING

- A. Deliver, store, protect and handle products to site under provisions of Section 01 60 00.
- B. Store masonry units on elevated platforms, under cover, and in a dry location to prevent their deterioration or damage due to moisture, temperature changes, contaminants, corrosion and other causes. If units become wet, do not install until they are in an air-dried condition.
- C. Store masonry accessories, including metal items, to prevent corrosion and accumulation of dirt and oil.

1.10 PROJECT CONDITIONS

- A. Protection of Masonry: During erection, cover tops of walls with waterproof sheeting at end of each day's work. Cover partially completed masonry when construction is not in progress.

1.11 ENVIRONMENTAL REQUIREMENTS

- A. Hot and cold weather requirements: Follow requirements for cold and hot weather construction in ACI 530.1/ASCE 6/TMS 602.
 - 1. Hot Weather Requirements: In accordance with ACI 530.1 when ambient temperature is greater than 100 degrees F (38 degrees C) or ambient temperature is greater than 90 degrees F (32 degrees C) with a wind velocity greater than 8 mph.
 - 2. Cold Weather Requirements: In accordance with ACI 530.1 when ambient temperature or temperature of masonry units is less than 40 degrees F (4 degrees C).

1.12 COORDINATION

- A. Coordinate work under provisions of Section 01 30 00 – Administrative Requirements.

PART 2 PRODUCTS

2.01 CONCRETE MASONRY UNITS

- A. Hollow Load-Bearing Block Units (CMU): ASTM C90 medium weight, (oven dry density of concrete, lb/ft³ 105 to less than 125). Maximum Linear Drying Shrinkage shall be 0.065 percent as determined by ASTM Test Method C426. Provide units with the minimum average net area required to produce concrete unit masonry construction of the compressive strength indicated in this specification.
 - 1. The compressive strength based on net cross-sectional area shall be 1,800 psi for individual units and 2,000 psi for the average of three units.
- B. Provide hollow concrete masonry units with nominal face dimension of 8 inches and in the nominal thickness as shown on the Drawings.
- C. Shapes: Provide the following shapes for each masonry unit required:
 - 1. Regular Stretcher Units.
 - 2. Bond Beams.

2.02 REINFORCING STEEL

- A. Steel Reinforcing Bars, ASTM A615, Grade 60, Deformed.

2.03 MORTAR AND GROUT

- A. Mortar and Grout: As specified in Section 04 05 03.

2.04 FLEXIBLE FLASHINGS

- A. Through Wall Flexible Flashings: As specified in Section 07 65 10.

2.05 WEEP VENTS

- A. Weep Vents: As specified in Section 04 20 19.

2.06 ACCESSORIES

- A. Rebar Positioners: Hohmann & Barnard #RB hot-dip galvanized 9- gauge wire or approved equal.
- B. Cleaning Solution: Solution not harmful to masonry work or adjacent materials approved by block manufacturer

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verify that field conditions are acceptable and are ready to receive work.
- B. Verify items provided by other sections of work are properly sized and located.
- C. Verify that built-in items are in proper location and ready for roughing into masonry work.

3.02 COURSING

- A. Establish lines, levels and coursing indicated. Protect from displacement.
- B. Maintain masonry courses to uniform dimension. Form vertical and horizontal joints of uniform thickness.
- C. Concrete Masonry Units:
 - 1. Bond:
 - a. Running.
 - 2. Coursing: One unit and one mortar joint to equal 8 inches, for nominal 8-inch-high units.
 - 3. Mortar Joints: Concave.

3.03 PLACING AND BONDING

- A. Prior to placing masonry, remove laitance, loose aggregate and anything else that would prevent mortar from bonding.
- B. Bed and Head Joint Thickness: 3/8 inch.
- C. Bed Joint at Starting Course of Foundations: 1/4 inch minimum to 3/4 inch maximum.

- D. Hollow Units:
 - 1. Lay hollow masonry units with full mortar coverage on horizontal and vertical face shells.
 - 2. Bed webs in mortar in starting course on footings and where adjacent to cells or cavities to be filled with grout. At all walls specified to be solidly grouted, do not mortar cross webs.
 - a. Allow grout to come in direct contact with foundation or bearing surface.
 - 3. For starting course on footings where cells are not grouted, spread out full mortar bed including areas under cells.
 - 4. Vertical cells noted to be grouted shall be aligned and openings for grout shall be unobstructed.
 - 5. Remove masonry protrusions extending 1/2 inch or more into cells or cavities that are to be grouted.
- E. Buttering corners of joints or excessive furrowing of mortar joints are not permitted.
- F. Remove excess mortar as work progresses.
- G. Interlock external corners.
- H. Do not shift or tap masonry units after mortar has achieved initial set. Where adjustment must be made, remove mortar and replace.
- I. Unless otherwise required, do not wet concrete masonry.
- J. Perform job site cutting of masonry units with proper tools to provide straight, clean, unchipped edges. Prevent broken masonry unit corners or edges. Installation of masonry units with chipped corners shall not be permitted.
- K. Built-In Work: As construction progresses, build in items specified under this and other sections of the Specifications. Fill in solidly with masonry around built-in items.
- L. Cut mortar joints flush where air barriers are scheduled.
- M. At double-wythe walls, build inner wythe ahead of outer wythe to receive fluid applied membrane air barrier.

3.04 MASONRY FLASHING

- A. General:
 - 1. Coordinate with Section 07 65 10 – Flexible Flashing.
 - 2. Protect flexible flashing from damage. Prior to installing masonry, inspect flashing for any damage including punctures, tears or loose scrim. Immediately notify contractor of any damage to flexible flashing. Do not proceed with work until

flashing has been repaired or replaced in accordance with flexible flashing manufacturer's instructions.

3.05 GROUTED COMPONENTS

- A. Support and secure reinforcing bars from displacement. Maintain position within 1/2 inch of dimensioned position.
- B. Place and consolidate grout fill without displacing reinforcing.

3.06 GROUTED MASONRY

- A. Lay masonry units with core cells vertically aligned clear of mortar and unobstructed.
- B. Prior to placing grout verify the following:
 - 1. All head and bed joints are filled with mortar for the full thickness of the face shell.
 - 2. Where walls are partially grouted, the webs adjacent to the cores to be grouted shall be mortared to confine the grout.
 - 3. Where walls are solidly grouted, the cross webs shall not be mortared in order to allow the grout to flow between concrete block units.
 - 4. At the top of the foundation/footing the concrete surfaces is not covered with mortar in order to allow the grout to come in direct contact with the concrete.
 - 5. Where foundation dowels are installed, verify dowels align with the cores of the masonry units.
 - a. Dowels that interfere with the placement of the units may be bent a maximum of 1 inch horizontally for every 6 inches vertically.
 - b. Walls which are to be solidly grouted, saw cutting or chipping away a portion of the web to accommodate the dowel will be acceptable if approved by the Architect.
 - c. All dowel alignment issues shall be brought to the attention of the Architect.
 - 6. Allow mortar to cure 24 hours before placing grout for single-wythe masonry.
 - 7. Grout spaces shall be free of mortar droppings, debris, loose aggregates and any material deleterious to masonry grout. Use an air hose to remove debris.
- C. Reinforce masonry unit cores with reinforcement bars as indicated prior to grouting.
- D. Retain vertical reinforcement in position at top and bottom of cells and at intervals not exceeding 48 inches, using specified rebar positioners. Splice reinforcement in accordance with typical structural masonry details.
- E. Do not wet masonry unit surfaces in contact with grout prior to grout placement.
- F. Place grout in accordance with MSJC specifications.

- 1. Definitions:
 - a. Grout pour: The total height of masonry to be grouted before additional masonry is installed. Refer to Section 04 05 03 for the maximum grout pour height.
 - b. Grout lift: Amount of grout placed in a single continuous operation.
- 2. Low-lift grouting where the wall is constructed to pour heights up to 5 feet without cleanouts.
- 3. Grout lifts shall not exceed 5 feet.
- G. When grouting is stopped for more than one hour, terminate grout 1-1/2 inches below top of upper masonry unit to form a positive key for subsequent grout placement.
- H. Place grout within one hour from introducing water in the mixture and prior to initial set.
- I. Consolidation and Reconsolidation:
 - 1. Consolidate grout pours 12 inches or less in height by mechanical vibration or by puddling.
 - 2. Consolidate pours exceeding 12 inches in height by mechanical vibration and reconsolidate by mechanical vibration after initial water loss and settlement has occurred.

3.07 TOLERANCES

- A. Inspection: Prior to the start of masonry construction the masonry contractor shall verify:
 - 1. That foundations are constructed with tolerances conforming to the requirements of ACI 117.
 - 2. That vertical reinforcing dowels are positioned in accordance with the Contract Drawings.
 - 3. The masonry contractor shall notify the General Contractor or construction manager immediately of any discrepancies. The General Contractor or construction manager shall immediately notify the Architect of the discrepancies. The installation of masonry shall not proceed until all deficiencies have been corrected.

Copy of Section 3 – Foundations printed below for reference.

ACI 117

Section 3- Foundations (ref. 4)

3.2-Lateral alignment

3.2.1 Footings

As cast to the center of gravity as specified; 0.02 times width of footing in direction of misplacement but not more than.....2 in.
Supporting masonry.....1/2 in.

3.3-Level alignment

- 3.3.1 Footings
 - Top of footings supporting masonry.....1/2 in.
 - Top of other footings+1/2 in, -2 in.
- 3.4-Cross-sectional dimensions**
- 3.4.1 Footings
 - 3.4.1.1 Horizontal dimension of formed members.....+2 in. -1/2 in.
 - 3.4.1.2 Horizontal dimension of unformed members cast against soil,
2ft or less.....+3 in., -1/2 in.
greater than 2 ft but less than 6 ft.....+ 6 in., -1/2 in.
over 6 ft.....+12 in., -1/2 in.
 - 3.4.1.3 Vertical dimension (thickness).....-5 percent

B. Site Tolerances: Erect masonry within the following tolerances from the specified dimensions:

- 1. Dimensions of elements
 - a. In cross-section of elevation.....-1/4 inch, +1/2 inch.
 - b. Mortar joint thickness
 - bed.....±1/8 inch
 - head.....-1/4 inch, +3/8 in.
 - collar.....-1/4 inch, +3/8 in.
 - c. Grout space or cavity width.....-1/4 inch, +3/8 in.
- 2. Elements
 - a. Variation from level:
 - Bed joints.....±1/4 inch in 10 feet
.....±1/2 inch maximum
 - Top surface of bearing walls.....±1/4 inch in 10 feet
.....±1/2 inch maximum
 - b. Variation from plumb.....±1/4 inch in 10 feet
.....±3/8 inch in 20 feet
.....±1/2 inch maximum
 - c. True to a line.....±1/4 inch in 10 feet
.....±3/8 inch in 20 feet.
.....±1/2 inch maximum
 - d. Alignment of columns and walls (bottom versus top)
 -±1/2 inch for bearing walls
 -±3/4 inch for nonbearing walls
- 3. Location of elements
 - a. Indicated in plan.....±1/2 inch in 20 feet
.....±3/4 inch maximum
 - a. Indicated in elevation.....±1/4 inch in story height
.....±3/4 inch maximum

C. Maximum Variation for steel reinforcement:

- 1. Plus or minus 1/2 inch when distance from center line of steel to opposite face of masonry is 8 inches or less.

2. Plus or minus 1 inch when distance is between 8 and 24 inches.
3. Plus or minus 1-1/4 inches when distance is greater than 24 inches.
4. In walls, for vertical bars, 2 inches from the location along the length of the wall.

3.08 CLEANING

- A. Clean work under provisions of Section 01 70 00.
- B. Remove excess mortar and mortar smears as work progresses.
- C. Replace defective mortar. Match adjacent work.
- D. Clean soiled surfaces with cleaning solution.
- E. Use non-metallic tools in cleaning operations.

3.09 PROTECTION OF FINISHED WORK

- A. Protect finished Work under provisions of Section 01 70 00.
- B. Protect base of walls from mud and mortar splatter.
- C. Protect tops of masonry with waterproof coverings secured in place without damaging masonry. Provide coverings where masonry is exposed to weather when work is not in progress.

3.10 MASONRY WASTE DISPOSAL

- A. Recycling: Undamaged, excess masonry materials are contractor's property and shall be removed from the project site.
- B. Excess masonry waste: Remove and legally dispose of masonry waste off Owner's property. Do not use as fill material.

END OF SECTION

SECTION 04 20 19 – VENEER UNIT MASONRY

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Calcium silicate brick.
- B. Anchorage, and Accessories.

1.02 RELATED SECTIONS

- A. Section 01 33 00 – Submittal Procedures.
- B. Section 01 40 00 – Quality Requirements.
- C. Section 01 60 00 – Product Requirements: Product substitution procedures.
- D. Section 04 05 03 – Masonry Mortar and Grout: Mortar.
- E. Section 04 20 00 – Unit Masonry: Securing masonry anchors to concrete block.
- F. Section 04 72 00 – Cast Stone Masonry: Cast stone sills and copings.
- G. Section 05 40 00 – Cold-Formed Metal Framing: Exterior light-gauge steel framing for curtain wall.
- H. Section 06 10 53 – Miscellaneous Carpentry: Corrosion-resistant fasteners used to secure through wall flashing to treated wood nailers.
- I. Section 06 16 43 – Gypsum Sheathing: Glass-faced wall sheathing.
- J. Section 07 21 00 – Continuous Thermal Insulation: Board insulation installed in cavity.
- K. Section 07 27 26 – Fluid-Applied Membrane Air Barriers: Liquid membrane installed over glass-faced gypsum sheathing and/or concrete block or concrete back-up.
 - 1. Sealants used to seal masonry veneer anchors to the fluid applied membrane air barrier and penetrations of the fluid applied membrane air barrier by fasteners shall be compatible with fluid applied membrane air barrier specified in Section 07 27 26.
 - 2. Sealants used to seal masonry veneer anchors and penetrations of the fluid applied membrane air barrier by expansion anchors in concrete block and/or concrete back up shall be compatible with fluid applied membrane air barrier specified in Section 07 27 26.
- L. Section 07 65 10 - Flexible Flashing: Installation of through wall flashing.
- M. Section 07 90 00 – Joint Protection: Rod and sealant at control and expansion joints and perimeter joints.

6. ASTM B117- Standard Practice For Operating Salt Spray (Fog) Apparatus.
7. ASTM C73 – Standard Specification for Calcium Silicate Face Brick.
8. ASTM D1056- Standard Specification for Flexible Cellular Materials-Sponge or Expanded Rubber.

1.04 QUALITY ASSURANCE

- A. Perform Work in accordance with current ACI 530/ASCE 5/TMS 402 and ACI 530.1/ASCE 6/TMS 602.

1.05 MOCK-UP

A. Construct a sample panel showing:

1. Calcium Silicate Brick: Proposed color range, texture and bond.
2. Mortar.
3. Structural Backing.
4. Veneer Anchors.
5. Flashings and Sealing the Top of the Flashing.

6. Weep Vents.
 7. Wall Insulation.
 8. Air Barrier.
 9. Vertical Expansion Joint with Sealant and Backer Rod.
- B. Refer to Construction Drawings for design of sample panel.
- C. Locate where directed.
- D. Mock-up may not remain as part of the work.
- E. Do not start work until Architect has accepted sample panel.
- F. Use panel as standard of comparison for all masonry work built of the same material.
- G. Do not destroy or move panel until work is completed and accepted by the Owner.
- H. Mock up Notes

Phase One: Construct mock up using the following materials:

1. Metal stud back up.
2. 1/2-inch sheathing at metal stud back up.
3. Wood nailers around the perimeter of the window frame.
4. Air barrier material.
5. Window frame with glass.
6. Flashing window frame to air barrier membrane.
7. Loose lintel.
8. Through wall flashing at base of wall and above window head.
9. Masonry ties.
10. Board Insulation: Installed on half of the mock up.

Phase Two: After the mock up has been reviewed and approved install the following materials.

1. Masonry veneer.
2. Cast stone sill.
3. Sealants around the perimeter of the window frame and vertical control joint.

1.06 SUBMITTALS

- A. Submit under provisions of Section 01 33 00 – Submittal Procedures. Obtain written acceptance of submittals prior to the purchase of the materials or methods.
- B. Product Data: Provide data for fabricated ties and anchors, and accessories as specified.
- C. Samples: Provide five individual brick samples of each color specified to illustrate color, texture and extreme color range.
- D. Certificates: Submit certificates attesting compliance with applicable specifications for grades, types and classes included in these specifications.
- E. Hot- and cold-weather construction procedures for meeting the requirements of these specifications.

1.07 QUALIFICATIONS

- A. Installer: Company specializing in performing work of this section with minimum five years of documented experience.

1.08 PRE-INSTALLATION CONFERENCE

- A. Section 01 30 00 – Administrative Requirements: Pre-installation meeting.
- B. Convene minimum four weeks prior to commencing work of this section, at the project site. Give four weeks advance notice to the participants, including the contractor, mason contractor, and flashing installer. Advise the architect of the scheduled meeting date.

1.09 JOB CONDITIONS

- A. Protection of Work.
 - 1. Wall Covering:
 - a. During erection, cover top of wall with strong waterproof membrane at end of each day or shutdown.
 - b. Cover partially completed walls when work is not in progress.
 - c. Extend cover minimum 24 inches down sides, and hold cover securely in place.
- B. Protection of Flexible Flashing Membrane.
 - 1. Protect flexible flashing membrane from damage. Prior to installing masonry, inspect flashing for any damage including punctures, tears or loose scrim. Immediately notify contractor of any damage to flexible flashing. Do not proceed with work until flashing has been repaired or replaced in accordance with flexible flashing manufacturer's instructions.
- C. Staining:
 - 1. Prevent grout or mortar from staining the face of masonry to be left exposed.

- a. Remove immediately grout or mortar in contact with face of such masonry.
- b. Protect all sills, and projections from droppings of mortar; protect door jambs and corners from damage during construction.

1.10 DELIVERY, STORAGE AND HANDLING

- A. Deliver, store, protect and handle products to site under provisions of Section 01 60 00 – Product Requirements.
 1. Deliver calcium silicate brick in protective film. Prevent damage to units.
 2. Lift skids with proper and sufficiently long slings or forks with protection to prevent damage to units. Protect edges and corners.
 3. Store units in a manner designed to prevent damage and staining of units.
 4. Stack units on timbers or platforms at least 3 inches above grade.
 5. Place polyethylene or plastic film between wood and other finished surfaces of units when stored for extended periods of time.
 6. Cover stored units with protective enclosure if exposed to weather.

1.11 ENVIRONMENTAL REQUIREMENTS

- A. Hot and Cold Weather Requirements: Follow requirements for cold and hot weather construction in ACI 530.1/ASCE6/TMS 602 specifications for masonry structures.

1.12 COORDINATION

- A. Section 01 30 00 – Administrative Requirements: Coordination and Project Requirements.

PART 2 PRODUCTS

2.01 MANUFACTURER – CALCIUM SILICATE BRICK UNITS

- A. Arriscraft Architectural Linear Series Brick.

2.02 CALCIUM SILICATE BRICK UNITS

- A. Calcium Silicate Brick: ASTM C73, Grade SW; solid units that have been pressure formed and autoclaved.
 1. Size, texture and color:
 - a. Modular size: (t) 3 3/4 inches x (h) 2 3/8 inches x (l) varies up to 23 5/8 inches.
 - b. Texture: Smooth face brick.
 - c. Color: Midnight Gray.

2. At vertical expansion joints do not use the ends of calcium silicate bricks.

2.03 ANCHORAGE

- A. General: The design of the anchored masonry veneer is based on using the Prescriptive Design Methods for areas of high winds where velocity pressures exceeds 40 psf but does not exceed 55 psf for anchored masonry veneers in accordance with the Building Code Requirements for Masonry Structures TMS 402/ACI 530/ASCE 5 and the Specification for Masonry Structures TMS 602/ACI 530.1/ASCE 6 as adopted by the International Building Code. The year of the masonry code shall be in accordance with the International Building Code adopted by the Authority Having Jurisdiction.
 1. In areas of high winds where the wind velocity pressure does not exceed 55 psf and the building's mean roof height is less than or equal to 60 feet, install the masonry veneer anchors in accordance with the Reinforcement and Anchorage Article in Part 3 of this Section.
- B. Adjustable Masonry Veneer Anchors
 1. Provide two-piece assemblies for attachment over sheathing to metal studs and/or concrete/concrete block.
 - a. Anchor: Anchor system for brick, to metal stud, concrete block and/or concrete shall consist of the following:
 - 1) Back Plate: Provide 16 gauge plate.
 - 2) Size: Based on insulation thickness specified in Section 07 21 00 Continuous Thermal Insulation.
 - 3) Sheet metal shall conform to ASTM A1008. Anchor shall be hot-dip galvanizing after fabrication conforming to ASTM A153 Class B2, (1.5 oz./ft²).
 - 4) Products: HB-BL-407 by Hohmann & Barnard for anchoring to metal stud.
 - 5) Products: HB-BL-5407 by Hohmann & Barnard for anchoring to concrete block and/or concrete.
 - b. Tie: Provide masonry Vee Byna wire tie fabricated from cold-drawn steel wire 3/16 inch dia. conforming to ASTM A1064 (tensile strength). Hot-dip galvanizing after fabrication shall conform to ASTM A153 Class B2. Provide length of tie as required to provide a minimum of 2-inch embedment into the brick bed joint with minimum 5/8 inch mortar cover.
 - c. Steel drill screws for steel studs:
 - 1) Self-drilling self-tapping screws; hex washer head, size #10, lengths required to penetrate steel stud flange by not less than 3 exposed threads.
 - 2) Organic polymer coated with salt-spray resistance to red rust of more than 800 hours per ASTM B117.
 - 3) Provide neoprene sealing washers.
 - d. Expansion anchors for concrete and masonry:
 - 1) Hohmann and Barnard BL-523 Brass Expansion Bolt for use with HB-BL-5407 anchor.

2. Substitutions permitted in accordance with Section 01 60 00 – Product Requirements.

2.04 MORTAR

- A. Mortar: As specified in Section 04 05 03 – Masonry Mortar and Grout.

2.05 FLEXIBLE FLASHINGS

- A. Coordinate with Section 07 65 10 – Flexible Flashing.

2.06 ACCESSORIES

- A. Joint Filler: Closed-cell neoprene sponge conforming to ASTM D1056, 3 inch wide, 3/8 inch and 1 inch thick as manufactured by Hohmann and Barnard, Inc. or approved equivalent.
- B. Lintels: Steel lintels shall be hot-dip galvanized ASTM A36 and painted.
- C. Weep Vents: Quadro-Vent #QV 3/8 inch by 2-1/2 inches by 3-3/8 inches weep vents as manufactured by Hohmann & Barnard, Color: as selected by Architect, or approved equivalent.
- D. Cleaning Solution: Approved by brick manufacturer. Cleaning solution shall not be harmful to masonry work or adjacent material.

2.07 SEALANTS

- A. Sealants used to seal masonry veneer anchors to the fluid applied membrane air barrier and penetrations of the fluid applied membrane air barrier by fasteners shall be compatible with fluid applied membrane air barrier specified in Section 07 27 26.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Section 01 30 00 – Administrative Requirements: Coordination and project conditions.
- B. Verify that field conditions are acceptable and are ready to receive work.
- C. Verify items provided by other sections of work are properly sized and located.
- D. Verify built-in items are in proper location, and ready for roughing into masonry work.

3.02 PREPARATION

- A. Mix units for exposed unit masonry from several pallets or cubes as they are placed to produce uniform blend of colors and textures.
- B. Lay out walls in advance for accurate spacing of surface bond patterns with uniform joint widths and for accurate locating of openings, movement type joints, returns and offsets. Avoid the use of less-than-4 inch units at corners, jambs and where possible at other locations.

- C. Wetting of Brick: Where the ambient air temperature exceeds 100 degrees F or exceeds 90 degrees F with a wind velocity greater than 8 miles per hour, pre-wet brick units.
 - 1. Lay wetted units when surface dry.
- D. Cleaning Reinforcement: Before being placed, remove loose rust, ice and other coatings from reinforcement.

3.03 COURSING

- A. Establish lines, levels and coursing indicated. Protect from displacement.
- B. Maintain masonry courses to uniform dimension. Form bed and head joints of uniform thickness.
- C. Coursing Brick Units:
 - 1. Bond:
 - a. Random length coursed bond, with a minimum 4 inches overlap of vertical joints.
 - 2. Coursing:
 - a. Three units and three mortar joints to equal 8 1/4 inches.
 - 3. Mortar Joints: Concave.

3.04 PLACING AND BONDING

- A. Lay brick units in full bed of mortar, with full head joints, uniformly jointed with other work.
- B. Buttering corners of joints or furrowing of mortar joints are not permitted.
- C. Remove excess mortar as Work progresses.
- D. Interlock intersections and external corners, unless otherwise noted on the drawings.
- E. Do not shift or tap masonry units after mortar has achieved initial set. Where adjustment must be made, remove mortar and replace.
- F. Perform job site cutting of masonry units with a masonry splitter. Dress split ends to match face when exposed in wall. Prevent broken masonry unit corners or edges.
- G. Isolate top joint of masonry veneer walls from horizontal structural framing members, slabs and at locations shown.
- H. As construction progresses, build-in items specified under this and other sections of the specifications. Fill in solidly with masonry around built-in items.
- I. Leave joints around outside perimeters of exterior doors, window frames and other wall openings frames as indicated below:

1. Depth: Uniform 3/4 inch.
 2. Width: 1/2 inch.
- J. Lay all masonry with a 3/8-inch head and bed joints, except at foundation. Construct bed joint of the starting course of foundation with a thickness not less than 1/4 inch and not more than 3/4 inch.

3.05 WEEP VENTS

- A. Install weep vents in head joints in exterior wythes at 24 inches o. c. horizontally for brick above through-wall flashing, above lintels, and at bottom of walls. Above window and door openings install weep vents at 16 inches o.c. Install weep vents at top of walls spaced at 24 inches o.c.
1. All weep vents installed in conjunction with through wall flashing shall be placed directly on top of the horizontal surface of the through wall flashing. Do not place on top of the mortar bed joint at this location.

3.06 CAVITY BEHIND VENEER

- A. Do not permit mortar to drop or accumulate into cavity air space or to plug weeps.
- B. Slope beds toward cavity to minimize mortar protrusions into cavity. As work progresses, trowel mortar fins protruding into cavity flat against cavity face of brick.

3.07 ANCHORAGE

- A. Secure wall ties to stud framed back-up and embed into masonry veneer at maximum 16 1/2 inches o.c. vertically and 16 inches o.c. horizontally. Install additional anchors within 8 inches of all openings larger than 16 inches in either direction and at intervals around the perimeter not exceeding 16 1/2 inches on center vertically and 16 inches on center horizontally.
1. Install wall ties after fluid applied air barrier membrane is installed.
 - a. Coat back of anchor plate with sealant compatible with fluid applied air barrier membrane.
 2. Screw-attach veneer anchor to stud face; ensure full contact of veneer anchor to sheathing. Provide 2 screws per anchor.
 3. Install masonry Vee Byna wall tie at each veneer anchor location; install ties as exterior wythe of masonry construction progresses. Provide each anchor with one tie.
- B. Secure wall ties to concrete block back-up and/or concrete and embed into masonry veneer at maximum 16 1/2 inches o.c. vertically and 16 inches o.c. horizontally.
1. Install wall ties after fluid applied air barrier membrane is installed.
 - a. Coat back of anchor plate with sealant compatible with fluid applied air barrier membrane.

- b. Prior to installing expansion bolt fill drilled hole in concrete block and or concrete with sealant.
- 2. Attach veneer anchor to masonry or concrete surface using expansion bolts for masonry/concrete; ensure full contact of veneer anchor to face of wall surface. Provide 1 bolt per anchor.
- 3. Install masonry Vee Byna wall tie at each veneer anchor location; install ties as exterior wythe of masonry construction progresses. Provide each anchor with one tie.
- C. At vertical expansion and control joints, install additional anchors within 8 inches of joint at 16 ½ inches o.c. vertically.

3.08 FLEXIBLE MASONRY FLASHINGS

- A. Coordinate with Section 07 65 10 – Flexible Flashing.

3.09 LINTELS

- A. Install loose steel lintels over openings and were shown on Drawings.
- B. Maintain minimum 8-inch bearing on each side of opening.

3.10 MASONRY EXPANSION JOINTS

- A. Install masonry expansion joints at the following locations, unless otherwise indicated on Drawings:
 - 1. Exterior Walls: 20 feet on center and within 24 inches on each side of inside and outside corners.
 - 2. At changes in wall height.
 - 3. On one side of openings up to 6'-0" wide. At openings over 6'-0" wide provide joints on each side of opening.
 - 4. At changes in wall thickness.
 - 5. Above movement joints in foundations and floors.
 - 6. At offset and setbacks.
- B. Do not install adjustable masonry veneer anchors through expansion joints.
- C. Install joint filler in continuous lengths. Set face of joint filler 1-1/2 inches in from outside face of brick or block.
- D. Size expansion joint in accordance with Section 07 90 00 for sealant performance.

3.11 TOLERANCES

- A. Maximum variation from plumb in vertical lines and surfaces of columns, walls and arises:

1. 1/4 inch in 10 feet.
 2. 3/8 inch in a story height not to exceed 20 feet.
 3. 1/2 inch in 40 feet.
- B. Maximum variation from plumb for external corners, expansion joints, control joints and other conspicuous lines do not exceed:
1. 1/4 inch in 20 feet.
 2. 1/2 inch in 40 feet.
- C. For vertical alignment of head joints do not exceed:
1. $\pm 1/4$ inch in 10 feet.
 2. 1/2 inch maximum.
- D. Variation in level for bed joints and lines of exposed lintels, sills, parapets, horizontal grooves and other conspicuous lines do not exceed:
1. 1/4 inch 20 feet.
 2. 1/2 inch in 40 feet or longer.
- E. Variation of linear building line for position shown in plan and related portion of columns, walls and partitions do not exceed:
1. 1/2 inch in 20 feet.
 2. 3/4 inch in 40 feet or more
- F. Variation in cross-sectional dimensions for columns and thickness of walls from dimensions shown do not exceed:
1. -1/4 inch nor +1/2 inch.
- G. Variation in mortar joint thickness:
1. Do not vary from bed joint thickness indicated by more than:
 - a. $\pm 1/8$ inch with a maximum thickness limited to 1/2 inch.
 2. Do not vary bed joint thickness from bed joint thickness of adjacent course by:
 - a. More than 1/8 inch.
 3. Do not vary from head joint thickness indicated by more than:
 - a. $\pm 1/8$ inch.
 4. Do not vary head joint thickness from adjacent head joint thickness:

- a. \pm 1/8 inch.

3.12 CUTTING AND FITTING

- A. Cut and fit for conduit, sleeves and other penetrations indicated on Drawings. Coordinate with other sections of work to provide correct size, shape and location.
- B. Obtain approval prior to cutting or fitting masonry work not indicated or where strength of masonry work may be impaired.

3.13 CLEANING

- A. Clean work under provisions of Section 01 70 00 – Execution and Closeout Requirements.
- B. Promptly remove excess wet mortar. Clean calcium silicate brick using materials and methods as recommended by brick manufacturer.
- C. Replace defective mortar. Match adjacent work.
- D. Clean soiled surfaces with cleaning solution.
- E. Use non-metallic tools in cleaning operations.

3.14 MASONRY WASTE DISPOSAL

- A. Recycling: Undamaged, excess masonry materials are contractor's property and shall be removed from the project site.
- B. Excess masonry waste: Remove and legally dispose of masonry waste off Owner's property. Do not use as fill material.

END OF SECTION

SECTION 04 43 13 – MORTAR-PLACED STONE VENEER

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Limestone veneer.
- B. Anchorage, and accessories.

1.02 PRODUCTS INSTALLED BUT NOT FURNISHED UNDER THIS SECTION

- A. Section 05 50 00 – Metal Fabrications: Placement of loose steel lintels.

1.03 RELATED SECTIONS

- A. Section 01 33 00 – Submittal Procedures.
- B. Section 01 40 00 – Quality Requirements.
- C. Section 04 05 03 – Masonry Mortar and Grout: Mortar.
- D. Section 05 40 00 – Cold-Formed Metal Framing: Securing masonry anchors to metal stud framing.
- E. Section 06 10 53 – Miscellaneous Carpentry: Corrosion-resistant fasteners used to secure through wall flashing to treated wood nailers.
- F. Section 06 16 43 – Gypsum Sheathing: Glass-faced wall sheathing.
- G. Section 07 21 00 – Continuous Thermal Insulation: Board insulation installed in cavity.
- H. Section 07 27 26 – Fluid-Applied Membrane Air Barriers: Liquid membrane installed over glass-faced gypsum sheathing.
 - 1. Sealants used to seal masonry veneer anchors to the fluid applied membrane air barrier and penetrations of the fluid applied membrane air barrier by fasteners shall be compatible with fluid applied membrane air barrier specified in Section 07 27 26.
- I. Section 07 65 10 – Flexible Flashing: Installation of through wall flashing.
- J. Section 07 90 00 – Joint Protection: Rod and sealant at control and expansion joints and perimeter joints.

1. ASTM A153 – Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware.
2. ASTM A366 – Standard Specification for Commercial Steel (CS) Sheet, Carbon (0.15 Maximum Percent) Cold Rolled.
3. ASTM A1008 – Standard Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low Alloy, High-Strength Low Alloy with Improved Formability, Solution Hardened, and Bare Hardenable.
4. ASTM A1064 – Standard Specification for Carbon-Steel Wire and Welded Wire Reinforcement, Plain and Deformed, For Concrete.
5. ASTM C568 – Standard Specification for Limestone Dimension Stone.

1.05 QUALITY ASSURANCE

- A. Perform Work in accordance with current ACI 530/ASCE 5/TMS 402 and ACI 530.1/ASCE 6/TMS 602.

1.06 MOCK-UP

A. Construct a sample panel using the following materials:

1. Stone: Proposed color range, texture and bond.
2. Mortar.
3. Structural Backing.
4. Veneer Anchors.
5. Flashings and Sealing the Top of the Flashing.
6. Weep Vents.
7. Wall Insulation.
8. Air Barrier.
9. Vertical Expansion Joint with Sealant and Backer Rod.

B. Locate where directed.

C. Mock-up may not remain as part of the work.

D. Do not start work until Architect has accepted sample panel.

E. Use panel as standard of comparison for all masonry work built of the same material.

F. Do not destroy or move panel until work is completed and accepted by the Owner.

G. Mock up Notes

Phase One: Construct mock up using the following materials:

1. Metal stud back up.
2. 1/2 -inch sheathing at metal stud back up.
3. Wood nailers around the perimeter of the window frame.
4. Air barrier material.
5. Window frame with glass.
6. Flashing window frame to air barrier membrane.
7. Loose lintel.
8. Through wall flashing at base of wall and above window head.
9. Masonry ties.
10. Board Insulation: Installed on half of the mock up.

Phase Two: After the mock up has been reviewed and approved install the following materials.

1. Sealants around the perimeter of the window frame and vertical control joint.

1.07 SUBMITTALS

- A. Submit under provisions of Section 01 33 00 – Submittal Procedures. Obtain written acceptance of submittals prior to the purchase of the materials or methods.
- B. Product Data: Provide data for fabricated ties and anchors, and accessories as specified.
- C. Samples: Provide five individual stone samples of each color specified to illustrate color, texture and extreme color range.
- D. Certificates: Submit certificates attesting compliance with applicable specifications for grades, types and classes included in these specifications.
- E. Hot and cold weather construction procedures for meeting the requirements of these specifications.

1.08 QUALITY ASSURANCE

- A. Perform work in accordance with ACI 530 and ACI 530.1.
- B. Installer: Company specializing in performing work of this section with minimum five years

of documented experience.

- C. Source Limitations for Stone: Obtain each variety of stone, regardless of finish, from a single quarry or stone fabricator with resources to provide materials of consistent quality in appearance and physical properties.

1.09 PRE-INSTALLATION CONFERENCE

- A. Section 01 30 00 – Administrative Requirements: Pre-installation meeting.
- B. Convene minimum four weeks prior to commencing work of this section, at the project site. Give four weeks advance notice to the participants, including the contractor, mason contractor and flashing installer. Advise the Architect of the scheduled meeting date.

1.10 JOB CONDITIONS

- A. Protection of Work.
 - 1. Wall Covering:
 - a. During erection, cover top of wall with strong waterproof membrane at end of each day or shutdown.
 - b. Cover partially completed walls when work is not in progress.
 - c. Extend cover minimum 24 inches down sides, and hold cover securely in place.
- B. Protection of Flexible Flashing Membrane.
 - 1. Protect flexible flashing membrane from damage. Prior to installing masonry, inspect flashing for any damage including punctures, tears or loose scrim. Immediately notify contractor of any damage to flexible flashing. Do not proceed with work until flashing has been repaired or replaced in accordance with flexible flashing manufacturer's instructions.
- C. Staining:
 - 1. Prevent grout or mortar from staining the face of stone to be left exposed.
 - a. Remove immediately grout or mortar in contact with face of such stone.
 - b. Protect all sills, ledges and projections from droppings of mortar; protect door jambs and corners from damage during construction.

1.11 DELIVERY, STORAGE AND HANDLING

- A. Deliver, store, protect and handle products to site under provisions of Section 01 60 00 – Product Requirements.

1.12 ENVIRONMENTAL REQUIREMENTS

- A. Hot and Cold Weather Requirements: Follow requirements for cold and hot weather construction in ACI 530.1/ASCE6/TMS 602 specifications for masonry structures.

1.13 COORDINATION

- A. Section 01 30 00 – Administrative Requirements: Coordination and Project Requirements.
- B. Coordinate masonry work with installation of window and door anchors.

PART 2 PRODUCTS

2.01 MANUFACTURERS – STONE

- A. U.S. Stone Industries, LLC
 - 1. Stone type: Top Ledge Cottonwood

2.02 STONE FABRICATION

- A. Nominal Thickness: 3 5/8 inches. NOTE: Thickness of stone shall not exceed 3 5/8 inches.
- B. Size:
 - 1. Length: 23 5/8 inches.
 - 2. Height: 15 5/8 inches.
- C. Finish: Honed.
- D. Pattern and Coursing: Running bond
- E. Fabricate for 3/8 inch bed and head joints.

2.03 ANCHORAGE

- A. Adjustable Masonry Veneer Anchors
 - 3. Provide two-piece assemblies for attachment over sheathing to metal studs and/or concrete/concrete block.
 - a. Anchor: Anchor system for stone veneer to metal stud, concrete block and/or concrete shall consist of the following:
 - 1) Back Plate: Provide 14- gauge plate unless 12 -gauge is required based on wind loads and anchor spacing.
 - 2) Size: Based on insulation thickness specified in Section 07 21 00 – Continuous Thermal Insulation.
 - 3) Sheet metal shall conform to ASTM A1008. Anchor shall be hot-dip galvanizing after fabrication conforming to ASTM A153 Class B2, (1.5 oz./ft²).
 - 4) Products: HB-213 by Hohmann & Barnard.
 - 5) Products: HB-5213 by Hohmann & Barnard for anchoring to concrete block and/or concrete.
 - b. Tie: Provide masonry wire tie (pintle) fabricated from cold-drawn steel wire 3/16inch diameter conforming to ASTM A1064 (tensile strength). Hot-dip galvanizing after fabrication shall conform to ASTM A153 Class B2.

- Provide length of tie as required to provide a minimum of 2- inch embedment into the stone bed joint with minimum 5/8- inch mortar cover.
- c. Steel drill screws for steel studs:
 - 1) Self-drilling self-tapping screws; hex washer head, size #10, lengths required to penetrate steel stud flange by not less than 3 exposed threads.
 - 2) Organic polymer coated with salt-spray resistance to red rust of more than 800 hours per ASTM B117.
 - 3) Provide neoprene sealing washers.
 - d. Expansion anchors for concrete and masonry:
 - 1) Hohmann and Barnard BL-523 Brass Expansion Bolt.
2. Substitutions permitted in accordance with Section 01 60 00 – Product Requirements.
1. Substitutions permitted in accordance with Section 01 60 00 – Product Requirements.

2.04 MORTAR AND GROUT

- A. Mortar and Grout: As specified in Section 04 05 03 – Masonry Mortar and Grout.

2.05 FLEXIBLE FLASHINGS

- A. Coordinate with Section 07 65 10 – Flexible Flashing.

2.06 ACCESSORIES

- A. Joint Filler: Closed-cell neoprene sponge conforming to ASTM D1056, 3-inch-wide, 3/8 inch and 1 inch thick as manufactured by Hohmann and Barnard, Inc. or approved equivalent.
- B. Lintels: Steel lintels shall be hot-dip galvanized ASTM A36 and painted.
- C. Weep Vents: Quadro-Vent #QV 3/8 inch by 2-1/2 inch by 3-3/8 -inch weep vents as manufactured by Hohmann & Barnard, Color: White, or approved equivalent.
- D. Cleaning Solution: Approved by stone manufacturer. Cleaning solution shall not be harmful to stone work or adjacent material.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Section 01 30 00 – Administrative Requirements: Coordination and project conditions.
- B. Verify that field conditions are acceptable and are ready to receive work.
- C. Verify items provided by other sections of work are properly sized and located.

- D. Verify built-in items are in proper location and ready for roughing into masonry work.

3.02 PREPARATION

- A. Direct and coordinate placement of metal anchors supplied by other sections.
- B. Furnish temporary bracing during installation of stone work. Maintain in place until building structure provides permanent bracing.
- C. Mix units for exposed stone from several pallets or cubes as they are placed to produce uniform blend of colors and textures.
- D. Lay out walls in advance for accurate spacing of surface bond patterns with uniform joint widths and for accurate locating of openings, movement type joints, returns and offsets.
- E. Clean stone prior to erection. Do not use wire brushes or implements that mark or damage exposed surfaces.

3.03 INSTALLATION

- A. Cut stone at site to produce clean faces.
- B. Size stone units to fit opening dimensions and perimeter conditions.
- C. Wet absorptive stone in preparation for placement to minimize moisture suction from mortar.
- D. Arrange stone pattern in color uniformity and minimize visual variations, and in uniform blend of stone unit sizes.
- E. Arrange stone coursing in running bond with consistent joint width.
 - 1. Stone shall be coursed to match spacing of the masonry ties per Article 3.06 of this section.
- F. Set stone in full mortar setting bed and with full head joints.

3.04 WEEP VENTS

- A. Install weep vents in head joints in exterior wythes at 24 inches on center horizontally above through-wall flashing, above lintels and at bottom of walls. Above window and door openings install weep vents at 16 inches on center. Install weep vents at top of walls spaced at 24 inches on center.
 - 1. All weep vents installed in conjunction with through-wall flashing shall be placed directly on top of the horizontal surface of the through-wall flashing. Do not place on top of the mortar bed joint at this location.

3.05 CAVITY BEHIND VENEER

- A. Do not permit mortar to drop or accumulate into cavity air space or to plug weeps.
- B. Slope beds toward cavity to minimize mortar protrusions into cavity. As work progresses,

trowel mortar fins protruding into cavity flat against cavity face of stone.

3.06 REINFORCEMENT AND ANCHORAGE

- A. Secure wall ties to stud framed back-up and embed into stone veneer at maximum 16 inches on center vertically and 16 inches on center horizontally. Install additional anchors within 12 inches of all openings larger than 16 inches in either direction and at intervals around the perimeter not exceeding 16 inches on center each way.
1. Install wall ties after fluid applied air barrier membrane is installed.
 - a. Coat back of anchor plate with sealant compatible with fluid applied air barrier membrane.
 2. Screw-attach veneer anchor to stud face; ensure full contact of veneer anchor to sheathing. Provide two screws per anchor.
 3. Install masonry wall tie (pintle) at each veneer anchor location; install ties as exterior wythe of stone construction progresses. The legs of the pintle shall properly engage the back plate. **DO NOT INSTALL THE TIE BEYOND THE ALLOWABLE LIMITS OF ECCENTRICITY.**
- B. Secure wall ties to concrete block back-up and/or concrete and embed into stone veneer at maximum 16 inches on center vertically and 16 inches on center horizontally. Install additional anchors within 12 inches of all openings larger than 16 inches in either direction and at intervals around the perimeter not exceeding 16 inches on center each way.
1. Install wall ties after fluid applied air barrier membrane is installed.
 - a. Coat back of anchor plate with sealant compatible with fluid applied air barrier membrane.
 - b. Prior to installing expansion bolt fill drilled hole in concrete block and or concrete with sealant.
 2. Attach veneer anchor to masonry or concrete surface using expansion bolts for masonry/concrete; ensure full contact of veneer anchor to face of wall surface. Provide one bolt per anchor.
 3. Install masonry wall tie (pintle) at each veneer anchor location; install ties as exterior wythe of stone construction progresses. The legs of the pintle shall properly engage the back plate. **DO NOT INSTALL THE TIE BEYOND THE ALLOWABLE LIMITS OF ECCENTRICITY.**
- C. At vertical expansion and control joints, install additional anchors within 8 inches of joint at 16 inches on center vertically.
- D. At stone sills, secure stone to back-up framing with veneer anchors spaced at 16 inches on center. Seal all penetrations in through-wall flashing made by fasteners. Fasteners used to install anchors shall be compatible with stainless steel.

3.07 FLEXIBLE MASONRY FLASHINGS

- A. Coordinate with Section 07 65 10 – Flexible Flashing.

3.08 LINTELS

- A. Install loose steel lintels over openings and where shown on drawings.
- B. Maintain minimum 8- inch bearing on each side of opening.

3.09 EXPANSION JOINTS

- A. Install expansion joints at the following locations, unless otherwise indicated on Drawings:
 - 1. Exterior Walls: 20 feet on center and within 24 inches on each side of inside and outside corners.
 - 2. At changes in wall height.
 - 3. On one side of openings up to 6'-0" wide. At openings over 6'-0" wide provide joints on each side of opening.
 - 8. At offset and setbacks.
- B. Do not install adjustable stone veneer anchors through expansion joints.
- C. Install joint filler in continuous lengths. Set face of joint filler 1-1/2 inch in from outside face of stone.
- D. Size expansion joint in accordance with Section 07 90 00 for sealant performance.

3.10 CUTTING AND FITTING

- A. Cut and fit for conduit, sleeves and other penetrations indicated on Drawings. Coordinate with other sections of work to provide correct size, shape and location.
- B. Obtain approval prior to cutting or fitting masonry work not indicated or where strength of masonry work may be impaired.

3.11 CLEANING

- A. Clean work under provisions of Section 01 70 00 – Execution and Closeout Requirements.
- B. Promptly remove excess wet mortar from the face of the stone as work progresses. Do not use strong acids, overaggressive sandblasting or high-pressure cleaning methods.
- C. Replace defective mortar. Match adjacent work.
- D. Clean soiled surfaces with cleaning solution.
- E. Use non-metallic tools in cleaning operations.

3.12 MASONRY WASTE DISPOSAL

- A. Recycling: Undamaged, excess stone materials are contractor's property and shall be removed from the project site.

- B. Excess Stone Waste: Remove and legally dispose of masonry waste off Owner's property. Do not use as fill material.

END OF SECTION

SECTION 04 72 00 – CAST STONE MASONRY

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes:
 - 1. Cast stone sills
 - 2. Cast stone copings.
 - 3. Cast stone column caps
 - 4. Anchors and supports.
 - 5. Accessories.

1.02 RELATED SECTIONS

- A. Section 01 30 00 – Administrative Requirements: Pre-installation meeting.
- B. Section 01 33 00 – Submittal Procedures.
- C. Section 04 05 03 – Masonry Mortaring and Grouting: Mortar for setting cast stone units.
- D. Section 04 20 00 – Unit Masonry: Securing cast stone copings/caps to concrete block with threaded dowel pins.
- E. Section 04 20 19 – Veneer Unit Masonry: Installing cast stone sills.
- F. Section 04 43 13-Mortar-Placed Stone Veneer: Installing cast stone products as part of the mortar-placed stone assembly.
- G. Section 05 40 00 – Cold-Formed Metal Framing: Backup for cast stone veneer.
- H. Section 07 27 26 – Fluid-Applied Membrane Air Barriers: Air barrier placed behind cavity wall insulation.
- I. Section 07 65 10 – Flexible Flashing: Installation of through wall flashing.
- J. Section 07 90 00 – Joint Protection: Rod and sealant at joints.

B. The Masonry Society:

1. TMS MSJC – Building Code for Masonry Structures (ACI 530/ASCE 5/TMS 402), Specification for Masonry Structures (ACI 530.1/ASCE 6/TMS 602) and Commentaries. (Edition referenced by applicable building code.)

C. Cast Stone Institute:

1. Technical Manual, current edition.

1.04 DEFINITIONS

A. Cast Stone: A refined architectural concrete building unit manufactured to simulate natural cut stone, used in unit masonry applications.

1. Dry Cast Concrete Products: Manufactured from zero slump concrete.
 - a. Vibrant Dry Tamp (VDT) Casting Method: Vibratory ramming of earth moist, zero-slump concrete against a rigid mold until it is densely compacted.
 - b. Machine Casting Method: Manufactured from earth moist, zero-slump concrete compacted by machinery using vibration and pressure against a mold until it becomes densely consolidated.
2. Wet Cast Concrete Products – Manufactured from measurable slump concrete.
 - a. Wet Casting Method: Manufactured from measurable slump concrete and vibrated into a mold until it becomes densely consolidated.

1.05 SUBMITTALS

A. Section 01 33 00 – Submittal Procedures: Requirements for Submittals.

B. Shop Drawings:

1. Indicate cast-stone layout, profiles, cross-sections, reinforcement, exposed faces, joint arrangement, anchoring methods, anchors, annotation of stone types and their location.
2. Indicate cast-stone types and location.

C. Product Data: Submit data for cast stone units, wall ties, anchors, and other accessories.

D. Samples:

1. Submit four of each cast stone item, 12 by 12 inches in size illustrating profiles, finish, texture and color range.

2. Submit four of each anchor and illustrating material, configuration, and finish.
 - E. Test Reports: Indicate concrete mix design compressive strength and water absorption.
 - F. Manufacturer's Installation Instructions: Submit instructions for anchor attachment, cast stone cleaning, and special Project installation conditions.
 - G. Manufacturer's Certificate: Certify Products meet or exceed specified requirements.
- 1.06 QUALITY ASSURANCE
- A. Perform Work in accordance with Cast Stone Institute Technical Manual.
 - B. Perform Work in accordance with ACI 530 Building Code Requirements for Masonry Structures and ACI 530.1 Specification for Masonry Structures.
- 1.07 QUALIFICATIONS
- A. Manufacturer: Company specializing in manufacturing Products specified in this section with minimum five years of documented experience.
 1. Manufacturer shall have sufficient plant facilities to produce the shapes, quantities and size of cast stone required in accordance with the project schedule.
 - B. Installer: Company specializing in performing work of this section with minimum five years of documented experience approved by manufacturer.
- 1.08 MOCK-UP
- A. Section 01 40 00 – Quality Requirements: Requirements for mock-up.
 - B. Provide full-sized units to be incorporated into mock-up wall specified in Section 04 20 19 and 04 43 13.
 - C. Locate where directed by Architect/Engineer.
 - D. Remove mock-up when directed by Architect/Engineer.
- 1.09 PRE-INSTALLATION MEETINGS
- A. Section 01 30 00 – Administrative Requirements: Pre-installation meeting.
 - B. Convene minimum four weeks prior to commencing work of this section.
- 1.10 JOB CONDITIONS
- A. Protection of Work.
 1. Wall Covering:
 - a. During erection, cover top of wall with strong waterproof membrane at end of each day or shutdown.

- b. Cover partially completed walls when work is not in progress.
- c. Extend cover minimum 24 inches down sides, and hold cover securely in place.

B. Protection of Flexible Flashing Membrane.

- 1. Protect flexible flashing membrane from damage. Prior to installing masonry, inspect flashing for any damage including punctures, tears or loose scrim. Immediately notify contractor of any damage to flexible flashing. Do not proceed with work until flashing has been repaired or replaced in accordance with flexible flashing manufacturer's instructions.

C. Staining:

- 1. Prevent grout or mortar from staining the face of stone to be left exposed.
 - a. Remove immediately grout or mortar in contact with face of such stone.
 - b. Protect all sills, ledges and projections from droppings of mortar; protect corners from damage during construction.

1.11 DELIVERY, STORAGE AND HANDLING

- A. Section 01 60 00 – Product Requirements: Requirements for transporting, handling, storing and protecting products.
- B. Accept cast stone on site in manufacturer's protective packaging. Inspect for damage.
- C. Store cast stone on site covered and elevated above grade. Protect cast stone from damage, soiling, and staining.
- D. Provide ventilation to prevent condensation from forming on cast stone.

1.12 ENVIRONMENTAL REQUIREMENTS

- A. Section 01 60 00 – Product Requirements: Environmental conditions affecting products onsite.
- B. Cold Weather Requirements: In accordance with ACI 530.1 when ambient temperature or temperature of masonry units is less than 40 degrees F (4 degrees C).
- C. Hot Weather Requirements: In accordance with ACI 530.1 when ambient temperature is greater than 100 degrees F (38 degrees C) or ambient temperature is greater than 90 degrees F (32 degrees C) with wind velocity greater than 8 mph (13 km/h).

1.13 FIELD MEASUREMENTS

- A. Verify field measurements prior to fabrication.

1.14 COORDINATION

- A. Section 01 30 00 – Administrative Requirements: Requirements for Coordination.
- B. Coordinate cast stone work with veneer masonry, metal framed backup

PART 2 PRODUCTS

2.01 CAST STONE

- A. Product Description: ASTM C1364, architectural cast stone units fabricated by either dry casting or wet casting methods, with fine grained texture, simulating natural cut stone.
- B. Color and Finish:
 - 1. Color:
 - a. To be selected by Architect.
 - 2. All surfaces intended to be exposed to view shall have a fine-grained texture similar to natural stone, with no air voids in excess of 1/32 inch and the density of such voids shall be less than three occurrences per any 1 in.² and not obvious under direct daylight illumination at a 5-foot distance.
 - 3. Units shall exhibit a texture approximately equal to the approved sample when viewed under direct daylight illumination at a 10-foot distance.
 - a. ASTM D2244 permissible variation in color between units of comparable age subjected to similar weathering exposure.
 - 1) Total color difference – not greater than six units.
 - 2) Total hue difference – not greater than two units.

2.02 COMPONENTS

- A. Portland Cement: Type I or Type III; white; ASTM C150.
- B. Coarse Aggregates: Granite, quartz or limestone; ASTM C33; except for gradation; and are optional for the VDT casting method.
- C. Fine Aggregates: Manufactured or natural sands; ASTM C33; except for gradation.
- D. Colors: Inorganic iron oxide pigments; ASTM C979; except that carbon black pigments shall not be used.
- E. Admixtures: Comply with the following:
 - 1. ASTM C260 for air-entraining admixtures.
 - 2. ASTM C494/C 494M Types A-G for water reducing, retarding, accelerating and high range admixtures.
 - 3. Other admixtures: Integral water repellents and other chemicals, for which no ASTM Standard exists, shall be previously established as suitable for use in concrete by proven field performance or through laboratory testing.
 - 4. ASTM C618 mineral admixtures of dark and variable colors shall not be used in surfaces intended to be exposed to view.

5. ASTM C989 granulated blast furnace slag may be used to improve physical properties. Tests are required to verify these features.
- F. Water: Potable.
- G. Reinforcing Bars:
1. ASTM A 615/A 615M. Grade 40 or 60 steel galvanized or epoxy coated when cover is less than 1.5 inches.
 2. Welded Wire Fabric: ASTM A1064 where applicable for wet cast units.

2.03 ACCESSORIES

- A. Anchors and Supports: Stainless steel, ASTM A666, Type 302 or 304.
1. Sizes and Configurations: As required for vertical and horizontal support of cast stone.
 2. Cast stone sills: Hohmann and Barnard.
 - a. At ends of sills, #432 pin strap anchor, minimum 1/8 inch thick with 1/2 inch diameter dowels.
 - b. Between sills, #433 split dowel anchor, minimum 1/8 inch thick with 1/2 inch diameter dowels.
- B. Threaded Dowel Pin: Hohmann & Barnard #407, 1/2 inch diameter by 4 inches long unless otherwise noted made from stainless steel threaded rod Type 304.
- C. Mortar: As specified in Section 04 05 03.
1. Type N
 2. Color: Match cast stone units.
- D. Flashings: Section 07 65 10 – Flexible Flashing.
- E. Sealant: Type specified in Section 07 90 00, color to match cast stone color.
- F. Weep Vents: Quadro-Vent #QV 3/8 inch by 2-1/2 inch by 3-3/8- inch weep vents as manufactured by Hohmann & Barnard, Color: White, or approved equivalent.
- G. Cleaning Solution: As recommended by cast stone manufacturer.
- H. High density stone shims: MasonPro 3/8 inch by 2 inch by 2 inch high density plastic shims with compressive strength of 10,000 to 12,000 psi.

2.04 MIXES

- A. Comply with ASTM C1364.
- B. Physical properties: Provide the following:

1. Compressive Strength – ASTM C1194, Method C: 6,500 psi minimum for products at 28 days.
2. Absorption, Cold Water – ASTM C1195, Method A: 6 percent maximum at 28 days.
3. Air Content – ASTM C173 or C231: Provide sufficient air content to meet freeze-thaw requirements for wet cast products when air content is tested in accordance with Test Method C173 or Test Method C231. Air entrainment is not required for VDT products.
4. Freeze-thaw – ASTM C666 in accordance with ASTM C1364: The CPWL shall be less than 5 percent after 300 cycles of freezing and thawing.
5. Linear Drying Shrinkage – ASTM C426: Test and report in accordance with ASTM C1364.
6. Slump: No measurable slump for dry casting method.

2.05 FABRICATION

- A. Size and thickness: As indicated on Drawings.
- B. Use rigid molds, constructed to maintain cast stone units uniform in shape, size and finish.
- C. Form units to length required for joint layout indicated on Drawings. Field cutting to length is not permitted.
- D. Reinforce units in accordance with ASTM C1364 for safe handling and as indicated on shop drawings to resist structural loads.
 1. Minimum reinforcing shall be 0.25 percent of the cross-section area.
 2. Reinforcement shall be noncorrosive where faces exposed to weather are covered with less than 1.5 inches of concrete material. All reinforcement shall have minimum coverage of twice the diameter of the bars.
 3. Cast stone units greater than 24 inches in one direction shall be reinforced in that direction. Units less than 24 inches in both their length and width dimension shall be non-reinforced unless otherwise specified.
 4. Welded wire fabric reinforcing shall not be used in dry cast products.
- E. Embed anchors and other cast-in items.
- F. Form external corners to square joint profile.
- G. Slope exposed top surfaces of horizontal sills, copings, column caps surfaces for natural wash.
- H. Form drip slot in bottom surface of exterior units projecting more than 1/2 inch beyond face of wall. Size slot not less than 3/8- inch wide and 1/4 -inch deep; full width of projection.
- I. Curing: Cure units in a warm curing chamber approximately 100 degrees F at 95 percent

relative humidity for approximately 12 hours, or cure in a 95 percent moist environment at a minimum 70 degrees F for 16 hours after casting. Additional yard curing at 95 percent relative humidity shall be 350 degree-days (i.e. 7 days @ 50 degrees F or 5 days @ 70 degrees F) prior to shipping. Form cured units shall be protected from moisture evaporation with during blankets or curing compounds after casting.

- J. Remove cement film, if required, to achieve uniform appearance.

2.06 SOURCE QUALITY CONTROL

- A. Section 01 40 00 – Quality Requirements: Testing, inspection and analysis requirements.
- B. Maintain plant records and quality control program during production of cast stone units. Make records available upon request.
- C. Test and analyze three random specimens for each 500 cubic feet of fabricated cast stone units:
 - 1. Compressive Strength: In accordance with ASTM C1194.
 - 2. Cold Water Absorption: In accordance with ASTM C1195.
- D. Inspect and test for color variation.
- E. Test samples in accordance with ASTM D2244 for the following:
 - 1. Total Color Variation: In accordance with ASTM C1364. Not greater than 6 units.
 - 2. Total Hue Variation: In accordance with ASTM C1364. Not greater than 2 units.
- F. Make completed cast stone available for inspection at manufacturer's factory prior to packaging for shipment. Notify Owner at least seven days before inspection is allowed.
- G. Allow witnessing of factory inspections and test at manufacturer's test facility. Notify Owner at least seven days before inspections and tests are scheduled.

2.07 MANUFACTURING TOLERANCES

- A. Cross-section dimensions shall not deviate by more than $\pm 1/8$ inch from approved dimensions.
- B. Length of units shall not deviate by more than length/360 or $\pm 1/8$ inch, whichever is greater, not to exceed $\pm 1/4$ inch.
 - 1. Maximum length of any unit shall not exceed 15 times the average thickness of such unit unless otherwise agreed by the manufacturer.
- C. Warp, bow or twist of units shall not exceed length/360 or $\pm 1/8$ inch, whichever is greater.
- D. Location of dowel holes, anchor slots, false joints and similar features – on formed sides of unit, $1/8$ inch; on unformed sides of unit, $3/8$ - inch maximum deviation.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Section 01 30 00 – Administrative Requirements: Verification of existing conditions before starting work.
- B. Verify field conditions are acceptable and are ready to receive work.
- C. Verify items provided by other sections of work are properly sized and located.

3.02 PREPARATION

- A. Coordinate installation of anchors furnished to other sections.

3.03 INSTALLATION

- A. Establish lines, levels and coursing indicated. Protect from displacement.
- B. Maintain cast stone courses to uniform dimension. Form bed and head joints of uniform thickness.
- C. Cast Stone Coursing:
 - 1. Joint Location: As indicated on Shop Drawings.
 - 2. Joint width at stone to brick or stone to stone veneer units: 3/8 inch.
 - 3. Joint width at stone to stone: 3/8 inch.
 - 4. Stone to stone joints exposed on top: 3/8 inch.
- D. Placing and Bonding:
 - 1. Wet cast stone units with clear running water, just prior to setting.
 - 2. Install anchors to support and position cast stone.
 - 3. Threaded dowel pins: Drill hole in grout filled concrete block 1/2 inch larger than diameter of pin and depth as shown on drawings. Fill hole with non-shrink grout and insert pin. Space pins in accordance with cast stone shop drawings. Provide a minimum of two pins per piece of stone coping column cap. Seal around penetration in flashing with sealant specified in Section 07 65 10.
 - 4. Lay cast stone units in full bed of mortar at all bed joints.
 - 5. Stone sills, copings, column caps: Leave all exposed tops and head joints open to receive backer rod and sealant.
 - 6. At cast stone copings and column caps anchored to concrete block install 3/8-inch shims under cast stone copings and caps. Space shims at maximum 24 inches on center.

7. Fill all dowel holes with mortar or non-shrink grout.
 8. Do not shift or tap cast stone units after mortar has achieved initial set. Where adjustment is required, remove mortar and replace.
 9. Site cutting of cast stone units is not permitted.
- E. Weep vents:
1. At stone sills install weep vents in the horizontal position at 24 inches on center. Provide a minimum of two weep vents per sill.
 2. All weep vents installed in conjunction with through wall flashing shall be placed directly on top of the horizontal surface of the through wall flashing. Do not place on top of the mortar bed joint at this location.
- F. Cavity Wall: Do not permit mortar to drop or accumulate into cavity air space or to plug weeps. Build backup masonry wythe ahead of cast stone veneer to receive cavity insulation and air/vapor retarder adhesive.
- G. Through Wall Flashing: Install in accordance with Section 07 65 10 – Flexible Flashing.
- H. Control and Expansion Joints:
1. Install preformed control joint device in continuous lengths. Seal butt and corner joints.
 2. Size control joint in accordance with Section 07 90 00 for sealant performance.
 3. Form expansion joint as indicated on Drawings.

3.04 ERECTION TOLERANCES

- A. Section 01 40 00 – Quality Requirements: Tolerances.
- B. Maximum Variation of Joint Thickness: Plus 1/16 inch; minus 1/8 inch.
- C. Maximum Offset from Adjacent Unit: 1/8 inch.
- D. Maximum Variation from Plane of Wall: 1/4 inch in 10 feet and 1/2 inch in 20 feet or more.
- E. Maximum Variation from Plumb: 1/4 inch in each story non-cumulative; 1/2 inch in two stories or more.
- F. Maximum Variation from Level Coursing: 1/8 inch in 3 feet (3 mm/m) and 1/4 inch in 10 feet (6 mm/3 m); 1/2 inch in 30 feet (13 mm/9 m).

3.05 CLEANING

- A. Section 01 70 00 – Execution and Closeout Requirements: Requirements for cleaning.
- B. Remove excess mortar and sealant as work progresses.

- C. Replace defective mortar. Match adjacent work.
- D. Wet cast stone. Clean soiled surfaces with cleaning solution.
- E. Use non-metallic tools in cleaning operations.

3.06 PROTECTION OF FINISHED WORK

- A. Section 01 70 00 – Execution and Closeout Requirements: Requirements for protecting finished Work.
- B. Protect cast stone from contact with mortar, soil and other materials capable of staining or discoloring cast stone.

END OF SECTION

SECTION 051200 - STRUCTURAL STEEL FRAMING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section Includes:

1. Structural steel framing members and connections.
2. Deck support angles.
3. Shop welded shear studs.
4. Shop prime painting and touch up painting in field.
5. Temporary construction bracing.
6. Fabrication and erection inspection and testing.
7. Grout under baseplates and bearing plates.

- B. Related Sections:

1. Division 1 Section "Sustainable Project Design Requirements" for LEED standards and project requirements.
2. Division 1 Section "Quality Requirements" for independent testing agency procedures and administrative requirements.
3. Division 5 Section "Architecturally Exposed Structural Steel Framing" for additional requirements for architecturally exposed structural steel.
4. Division 5 Section "Steel Decking" for field installation of shear connectors through deck.
5. Division 5 Section "Metal Fabrications" for steel lintels and shelf angles not attached to structural-steel frame, miscellaneous steel fabrications, and other metal items not defined as structural steel.
6. Division 5 Section "Metal Stairs."
7. Division 9 Section "Exterior Painting", Division 9 Section "Interior Painting", and Division 9 Section "High-Performance Coatings" for surface-preparation and priming requirements.
8. Division 13 Section "Metal Building Systems" for structural steel.

1.3 DEFINITIONS

- A. Structural Steel: Elements of structural-steel frame, as classified by AISC 303, "Code of Standard Practice for Steel Buildings and Bridges."

1.4 PERFORMANCE REQUIREMENTS

- A. Connections: Provide details of simple shear connections required by the Contract Documents to be selected or completed by structural-steel fabricator, including comprehensive engineering analysis by a qualified professional engineer, to withstand loads indicated and comply with other information and restrictions indicated.
 - 1. Select and complete connections using schematic details indicated and AISC 360.
 - 2. Use LRFD; data are given at factored-load level.
- B. Moment Connections: Type FR, fully restrained.
- C. Construction: Braced frame.

1.5 ACTION SUBMITTALS FOR REVIEW

- A. Shop Drawings: Provide complete details and schedules for fabrication and shop assembly of steel members, erection plans, details, procedures, and diagrams showing sequence of erection of structural steel components.
 - 1. Include details of cuts, connections, splices, camber, holes, and other pertinent data.
 - 2. Include embedment drawings.
 - 3. Indicate welds by standard AWS symbols, distinguishing between shop and field welds, and show size, length, and type of each weld. Show backing bars that are to be removed and supplemental fillet welds where backing bars are to remain.
 - 4. Indicate type, size, and length of bolts, distinguishing between shop and field bolts. Identify pretensioned and slip-critical high-strength bolted connections.
 - 5. For structural-steel connections indicated to comply with design loads, include structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
- B. Shop drawings and erection drawings shall not be made by using reproductions of Contract Drawings.
- C. Structural steel members for which shop drawings have not been reviewed shall not be fabricated. Engineer's review shall cover general locations, member spacing, and details of design. Omission from shop drawings of any materials required by the Contract Documents shall not relieve the Contractor of the responsibility to furnish and install such materials, even though such shop drawings may have been reviewed.

1.6 INFORMATIONAL SUBMITTALS

- A. Product Data: For each type of product indicated.
- B. Structural Steel Connection Calculations: For each type of connection not specifically detailed on the Contract Drawings, submit connection details, design loads, and calculations signed and sealed by the qualified professional engineer responsible for their preparation. Submit design calculations prior to or with the steel shop drawings. Shop drawings containing connections for which calculations have not been submitted shall be returned unchecked as an incomplete submittal. Calculations will be retained for the Engineer's record purposes and will not be approved or returned.

1. Connections shall be designed in accordance with the requirements specified in the Structural Drawings and Specifications.
 2. Beam connections not covered by Contract Drawings: Submit a complete calculation for each different beam connection used and detailed on the shop drawings. Conditions which are similar may be grouped together so as to utilize a single connection design.
 3. Submit complete connection calculations for wind brace connections, truss connections, moment connections and other connections where specified on the Contract Drawings. Each calculation shall identify the location or locations for which the connection applies, the member mark(s) from the Contract Documents, the piece mark(s) from the shop drawings, the member size, the design loading(s), member size, and the end of the member to which the connection applies.
- C. Qualification Data: For qualified Installer, fabricator, and testing agency.
- D. Welding certificates.
- E. Paint Compatibility Certificates: From manufacturers of topcoats applied over shop primers, certifying that shop primers are compatible with topcoats.
- F. Mill test reports for structural steel, including chemical and physical properties.
- G. Product Test Reports: For the following:
1. Bolts, nuts, and washers including mechanical properties and chemical analysis.
 2. Direct-tension indicators.
 3. Tension-control, high-strength bolt-nut-washer assemblies.
 4. Shear stud connectors.
 5. Shop primers.
 6. Nonshrink grout.
- H. Source quality-control reports.

1.7 QUALITY ASSURANCE

- A. Fabricator Qualifications: Company specializing in performing the work of this section with minimum 5 years documented experience.
- B. Installer Qualifications: Company specializing in performing the work of this section with minimum 10 years documented experience.
- C. Shop-Painting Applicators: Qualified according to SSPC-QP 3, "Standard Procedure for Evaluating Qualifications of Shop Painting Applicators."
- D. Welding Qualifications: Qualify procedures and personnel according to AWS D1.1/D1.1M, "Structural Welding Code - Steel."
- E. The latest adopted edition of all standards referenced in this Section shall apply unless noted otherwise. In case of conflict between these Contract Documents and the referenced standard, the Contract Documents shall govern. In case of conflict between these Contract Documents and the Building Code, the more stringent shall govern.

- F. The Contractor shall furnish fabrication and erection inspection and testing of all welds in accordance with AWS D1.1, Chapter 6. Submit records of inspections and tests to the Owner's testing laboratory for their review. The fabrication and erection inspectors shall be AWS certified welding inspectors.
- G. All materials, fabrication procedures and field erection are subject to verification inspection and testing by the Owner's testing laboratory in both the shop and field. Such inspections and tests will not relieve the Contractor of the responsibility for providing materials and fabrication procedures in compliance with specified requirements.
- H. Qualifications for Welding Work: Contractor shall be responsible for qualifying welding operators in accordance with the AWS "Standard Qualification Procedure." Provide certification to Owner's testing laboratory that welders to be employed in the work have satisfactorily passed AWS qualification tests. Recertification of welders shall be Contractor's responsibility.
- I. Qualification of Welding Procedures: Contractor shall provide the testing laboratory with welding procedures which are to be used. Welding procedures shall be qualified prior to use in accordance with AWS D1.1, Part B.
- J. Comply with applicable provisions of the following specifications and documents:
 - 1. AISC's "Code of Standard Practice for Steel Buildings and Bridges" except that the following sentence in paragraph 4.2.1 shall not apply: "This approval constitutes the Owner's acceptance of all responsibility for the design adequacy of any detail configuration of connections developed by the fabricator as part of his preparation of these shop drawings.
 - 2. AISC's "Load and Resistance Factor Design Specification for Structural Steel Buildings."
 - 3. ASTM A6 "Specifications for General Requirements for Delivery of Rolled Steel Plates, Shapes, Sheet Piling, and Bars for Structural Use."
 - 4. AISC's "Specification for the Design of Steel Hollow Structural Sections."
 - 5. AISC's "Specification for Load and Resistance Factor Design of Single-Angle Members."
 - 6. RCSC's "Specification for Structural Joints Using ASTM A 325 or A 490 Bolts."
 - 7. AWS D1.1 "Structural Welding Code"
 - 8. SSPC (Steel Structures Painting Council), Painting Manuals, Volumes 1 and 2.
 - 9. UL "Fire Resistance Directory."
- K. Preinstallation Conference: Conduct conference at Project site.

1.8 DELIVERY, STORAGE, AND HANDLING

- A. Store materials to permit easy access for inspection and identification. Keep steel members off ground and spaced by using pallets, dunnage, or other supports and spacers. Protect steel members and packaged materials from corrosion and deterioration.
 - 1. Do not store materials on structure in a manner that might cause distortion, damage, or overload to members or supporting structures. Repair or replace damaged materials or structures as directed.
- B. Store fasteners in a protected place in sealed containers with manufacturer's labels intact.
 - 1. Fasteners may be repackaged provided Owner's testing and inspecting agency observes repackaging and seals containers.

2. Clean and relubricate bolts and nuts that become dry or rusty before use.
3. Comply with manufacturers' written recommendations for cleaning and lubricating ASTM F 1852 fasteners and for retesting fasteners after lubrication.

1.9 COORDINATION

- A. Coordinate selection of shop primers with topcoats to be applied over them. Comply with paint and coating manufacturers' recommendations to ensure that shop primers and topcoats are compatible with one another.
- B. Coordinate installation of anchorage items to be embedded in or attached to other construction without delaying the Work. Provide setting diagrams, sheet metal templates, instructions, and directions for installation.

PART 2 - PRODUCTS

2.1 STRUCTURAL-STEEL MATERIALS

- A. Recycled Content of Steel Products: Provide products with an average recycled content of steel products so postconsumer recycled content plus one-half of preconsumer recycled content is not less than the following:
 1. W-Shapes: 60 percent.
 2. Channels, Angles, S-Shapes: 60 percent.
 3. Plate and Bar: 25 percent.
 4. Cold-Formed Hollow Structural Sections: 25 percent.
 5. Steel Pipe: 25 percent.
 6. All Other Steel Materials: 25 percent.
- B. Recycled Content of Steel Products: Provide products with an average recycled content of steel products so postconsumer recycled content plus one-half of preconsumer recycled content is not less than 25 percent.
- C. Materials complying with first and second options in first paragraph below are widely available. Third and fourth options include specialty-steel materials; verify availability if required.
- D. Domestic Steel: All steel shall be domestically manufactured, unless foreign sources are specifically accepted by the Owner.
- E. W-Shapes: ASTM A 992/A 992M.
- F. Channels, Angles, S-Shapes: ASTM A 36/A 36M.
- G. Plate and Bar: ASTM A 36/A 36M, ASTM A 572/A 572M, Grade 50.
- H. Cold-Formed Hollow Structural Sections: ASTM A 500, Grade B, structural tubing.
- I. Steel Pipe: ASTM A 53/A 53M, Type E or S, Grade B.

1. Weight Class: As indicated.
2. Finish: Black except where indicated to be galvanized.

J. Welding Electrodes: Comply with AWS requirements.

2.2 BOLTS, CONNECTORS, AND ANCHORS

A. High-Strength Bolts, Nuts, and Washers: ASTM A 325, Type 1, heavy-hex steel structural bolts; ASTM A 563, Grade C, heavy-hex carbon-steel nuts; and ASTM F 436, Type 1, hardened carbon-steel washers; all with plain finish.

1. Direct-Tension Indicators: ASTM F 959, Type 325, compressible-washer type with plain finish.

B. High-Strength Bolts, Nuts, and Washers: ASTM A 490, Type 1, heavy-hex steel structural bolts; ASTM A 563, Grade DH, heavy-hex carbon-steel nuts; and ASTM F 436, Type 1, hardened carbon-steel washers with plain finish.

1. Direct-Tension Indicators: ASTM F 959, Type 490, compressible-washer type with plain finish. Direct-Tension Indicators shall be "Load Indicator Washers" as manufactured by Bethlehem Steel Corporation.

C. Tension-Control, High-Strength Bolt-Nut-Washer Assemblies: ASTM 1852, Type 1, heavy hex or round head steel structural bolts with splined ends; ASTM A 563 heavy hex carbon-steel nuts; and ASTM F 436 hardened carbon-steel washers. Tension control bolts shall be as manufactured by the LeJeune Bolt Company, Lakeville, Minnesota or Lohr Structural Fasteners, Inc., Humble, Texas. Tension control bolts may be used at the contractor's option in lieu of conventional high-strength bolts.

1. Finish: Plain.

D. Shear Connectors: ASTM A 108, Grades 1010 through 1020, headed-stud type, cold-finished carbon steel; AWS D1.1/D1.1M, Type B.

E. Headed Anchor Rods: ASTM A307 or ASTM F 1554, Grade 36, weldable, straight.

1. Nuts: ASTM A 563 heavy-hex carbon steel.
2. Plate Washers: ASTM A 36/A 36M carbon steel.
3. Washers: ASTM F 436, Type 1, hardened carbon steel.
4. Finish: Plain.

F. Threaded Rods: ASTM A 36/A 36M unless noted otherwise.

1. Nuts: ASTM A 563 heavy-hex carbon steel.
2. Washers: ASTM A 36/A 36M carbon steel.
3. Finish: Plain.

G. Clevises and Turnbuckles: Made from cold-finished carbon steel bars, ASTM A 108, Grade 1035.

H. Eye Bolts and Nuts: Made from cold-finished carbon steel bars, ASTM A 108, Grade 1030.

- I. Sleeve Nuts: Made from cold-finished carbon steel bars, ASTM A 108, Grade 1018.

2.3 PRIMER

- A. VOC Content: All paints and coatings applied to building interior shall meet limits of SCAQMD r1113. Rust preventive coatings shall meet limits of GC-03.
- B. Primer: Comply with Section 099113 "Exterior Painting," Section 099123 "Interior Painting," and Section 099600 "High-Performance Coatings."
- C. Primer: Fabricator's standard lead- and chromate-free, nonasphaltic, rust-inhibiting primer complying with MPI#79 and compatible with topcoat.
- D. Galvanizing Repair Paint: ASTM A 780.

2.4 GROUT

- A. Nonmetallic, Shrinkage-Resistant Grout: ASTM C 1107, factory-packaged, nonmetallic aggregate grout, noncorrosive and nonstaining, mixed with water to consistency suitable for application and a 30-minute working time, capable of developing a minimum compressive strength of 5,000 psi at 28 days.

2.5 FABRICATION

- A. Structural Steel: Fabricate and assemble in shop to greatest extent possible. Fabricate according to AISC's "Code of Standard Practice for Steel Buildings and Bridges" and AISC 360.
 1. Camber: Provide camber to structural-steel members where indicated. Specified camber applies to steel member prior to erection at jobsite, lying flat so that member weight has no effect. Take necessary precautions to prevent or compensate for camber loss during shipment. Measured camber in members up to 50'-0" long shall be within a tolerance of minus 1/2" to plus zero from the amount specified. For members greater than 50'-0" long, both the positive and negative tolerance may increase 1/8" for every 10'-0" of length in excess of 50'-0". Members with field measured camber outside of the specified tolerance shall be returned to the shop.
 2. Fabricate beams with rolling camber up.
 3. Identify high-strength structural steel according to ASTM A 6/A 6M and maintain markings until structural steel has been erected.
 4. Mark and match-mark materials for field assembly.
 5. Complete structural-steel assemblies, including welding of units, before starting shop-priming operations.
- B. Thermal Cutting: Perform thermal cutting by machine to greatest extent possible.
 1. Plane thermally cut edges to be welded to comply with requirements in AWS D1.1/D1.1M.
- C. Bolt Holes: Cut, drill, or punch standard bolt holes perpendicular to metal surfaces. Mechanical thermal cutting is not allowed without approval by Engineer.

- D. Finishing: Accurately finish ends of columns and other members transmitting bearing loads.
- E. Cleaning: Clean and prepare steel surfaces that are to remain unpainted according to SSPC-SP 1 "Solvent Cleaning or SSPC-SP 2, "Hand Tool Cleaning."
- F. Shear Connectors: Prepare steel surfaces as recommended by manufacturer of shear connectors. Use automatic end welding of headed-stud shear connectors according to AWS D1.1/D1.1M and manufacturer's written instructions.
- G. Steel Wall-Opening Framing: Select true and straight members for fabricating steel wall-opening framing to be attached to structural steel. Straighten as required to provide uniform, square, and true members in completed wall framing.
- H. Welded Door Frames: Build up welded door frames attached to structural steel. Weld exposed joints continuously and grind smooth. Plug-weld fixed steel bar stops to frames. Secure removable stops to frames with countersunk machine screws, uniformly spaced not more than 10 inches o.c. unless otherwise indicated.
- I. Holes: Provide holes required for securing other work to structural steel and for other work to pass through steel framing members.
 - 1. Cut, drill, or punch holes perpendicular to steel surfaces. Do not thermally cut bolt holes or enlarge holes by burning.
 - 2. Baseplate Holes: Cut, drill, mechanically thermal cut, or punch holes perpendicular to steel surfaces.
 - 3. Weld threaded nuts to framing and other specialty items indicated to receive other work.

2.6 SHOP CONNECTIONS

- A. High-Strength Bolts: Shop install high-strength bolts according to RCSC's "Specification for Structural Joints Using ASTM A 325 or A 490 Bolts" for type of bolt and type of joint specified.
 - 1. Joint Type: Snug tightened unless noted or approved otherwise.
 - 2. Provide ASTM F436 washer over all short slotted holes in an outer ply.
 - 3. Provide 5/16" thick structural grade plate washer over all long slotted holes in an outer ply.
- B. Weld Connections: Comply with AWS D1.1/D1.1M for tolerances, appearances, welding procedure specifications, weld quality, and methods used in correcting welding work.
 - 1. Assemble and weld built-up sections by methods that will maintain true alignment of axes without exceeding tolerances in AISC 303 for mill material.

2.7 SHOP PRIMING

- A. Shop prime steel surfaces except the following:
 - 1. Surfaces embedded in concrete or mortar. Extend priming of partially embedded members to a depth of 2 inches.
 - 2. Surfaces to be field welded.
 - 3. Surfaces to be high-strength bolted with slip-critical connections.

4. Surfaces to receive sprayed fire-resistive materials (applied fireproofing).
 5. Galvanized surfaces.
 6. Surfaces of high strength, low alloy steel members (weathering steel).
 7. Top surfaces of beams which support composite metal floor deck.
 8. Headed shear studs, although overspray is acceptable.
- B. Surface Preparation: Clean surfaces to be painted. Remove loose rust and mill scale and spatter, slag, or flux deposits. Prepare surfaces according to the following specifications and standards:
1. SSPC-SP 2, "Hand Tool Cleaning."
 2. SSPC-SP 3, "Power Tool Cleaning."
 3. SSPC-SP 7/NACE No. 4, "Brush-Off Blast Cleaning."
 4. SSPC-SP 11, "Power Tool Cleaning to Bare Metal."
 5. SSPC-SP 14/NACE No. 8, "Industrial Blast Cleaning."
 6. SSPC-SP 6/NACE No. 3, "Commercial Blast Cleaning."
 7. SSPC-SP 10/NACE No. 2, "Near-White Blast Cleaning."
 8. SSPC-SP 5/NACE No. 1, "White Metal Blast Cleaning."
 9. SSPC-SP 8, "Pickling."
- C. Priming: Immediately after surface preparation, apply primer according to manufacturer's written instructions and at rate recommended by SSPC to provide a minimum dry film thickness of 1.5 mils. Use priming methods that result in full coverage of joints, corners, edges, and exposed surfaces.
1. Stripe paint corners, crevices, bolts, welds, and sharp edges.
 2. Apply two coats of shop paint to surfaces that are inaccessible after assembly or erection. Change color of second coat to distinguish it from first.
- D. Painting: Prepare steel and apply a one-coat, nonasphaltic primer complying with SSPC-PS Guide 7.00, "Painting System Guide 7.00: Guide for Selecting One-Coat Shop Painting Systems," to provide a dry film thickness of not less than 1.5 mils.
- E. Painting: Remove any visible rust that forms on blast cleaned surfaces prior to coating application by reblasting visibly rusted areas in conformance with SSPC SP-6. Immediately after surface preparation, apply structural steel primer paint in accordance with manufacturer's instructions and at a rate to provide a uniform dry film thickness of not less than 2.5 dry mils.

2.8 GALVANIZING

- A. Hot-Dip Galvanized Finish: Apply zinc coating by the hot-dip process to structural steel according to ASTM A 123/A 123M.
1. Fill vent and drain holes that will be exposed in the finished Work unless they will function as weep holes, by plugging with zinc solder and filing off smooth.
 2. Hot-Dip galvanize lintels and shelf angles attached to structural-steel frame and located in exterior walls along with all associated fasteners.

2.9 SOURCE QUALITY CONTROL

- A. Testing Agency: Owner will engage an independent testing and inspecting agency to perform shop tests and inspections and prepare test reports.
 - 1. Provide testing agency with access to places where structural-steel work is being fabricated or produced to perform tests and inspections.
- B. Correct deficiencies in Work that test reports and inspections indicate does not comply with the Contract Documents.
- C. Bolted Connections: Shop-bolted connections will be inspected according to RCSC's "Specification for Structural Joints Using ASTM A 325 or A 490 Bolts."
- D. Welded Connections: In addition to visual inspection, shop-welded connections will be tested and inspected according to AWS D1.1/D1.1M and the following inspection procedures, at testing agency's option:
 - 1. Liquid Penetrant Inspection: ASTM E 165.
 - 2. Magnetic Particle Inspection: ASTM E 709; performed on root pass and on finished weld. Cracks or zones of incomplete fusion or penetration will not be accepted.
 - 3. Ultrasonic Inspection: ASTM E 164.
 - 4. Radiographic Inspection: ASTM E 94.
- E. In addition to visual inspection, shop-welded shear connectors will be tested and inspected according to requirements in AWS D1.1/D1.1M for stud welding and as follows:
 - 1. Bend tests will be performed if visual inspections reveal either a less-than-continuous 360-degree flash or welding repairs to any shear connector.
 - 2. Tests will be conducted on additional shear connectors if weld fracture occurs on shear connectors already tested, according to requirements in AWS D1.1/D1.1M.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Verify, with steel Erector present, elevations of concrete- and masonry-bearing surfaces and locations of anchor rods, bearing plates, and other embedments for compliance with requirements.
 - 1. Prepare a certified survey of bearing surfaces, anchor rods, bearing plates, and other embedments showing dimensions, locations, angles, and elevations.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

- A. Provide temporary shores, guys, braces, and other supports during erection to keep structural steel secure, plumb, and in alignment against temporary construction loads and loads equal in

intensity to design loads. Remove temporary supports when permanent structural steel, connections, and bracing are in place unless otherwise indicated.

1. Do not remove temporary shoring supporting composite deck construction until cast-in-place concrete has attained its design compressive strength.

3.3 ERECTION

- A. Set structural steel accurately in locations and to elevations indicated and according to AISC 303 and AISC 360.
- B. Base Bearing and Leveling Plates: Clean concrete- and masonry-bearing surfaces of bond-reducing materials, and roughen surfaces prior to setting plates. Clean bottom surface of plates.
 1. Set plates for structural members on wedges, shims, or setting nuts as required.
 2. Weld plate washers to top of baseplate.
 3. Snug-tighten anchor rods after supported members have been positioned and plumbed. Do not remove wedges or shims but, if protruding, cut off flush with edge of plate before packing with grout.
 4. Promptly pack grout solidly between bearing surfaces and plates so no voids remain. Neatly finish exposed surfaces; protect grout and allow to cure. Comply with manufacturer's written installation instructions for shrinkage-resistant grouts.
- C. Maintain erection tolerances of structural steel within AISC's "Code of Standard Practice for Steel Buildings and Bridges."
- D. Align and adjust various members that form part of complete frame or structure before permanently fastening. Before assembly, clean bearing surfaces and other surfaces that will be in permanent contact with members. Perform necessary adjustments to compensate for discrepancies in elevations and alignment.
 1. Level and plumb individual members of structure.
 2. Make allowances for difference between temperature at time of erection and mean temperature when structure is completed and in service.
- E. Splice members only where indicated.
- F. Do not field cut or alter structural members without approval by Architect/Engineer.
- G. Do not use thermal cutting during erection unless approved by Architect/Engineer. Where allowed, finish thermally cut sections within smoothness limits in AWS D1.1/D1.1M.
- H. Do not enlarge unfair holes in members by burning or using drift pins. Ream holes that must be enlarged to admit bolts.
- I. Shear Connectors: Prepare steel surfaces as recommended by manufacturer of shear connectors. Use automatic end welding of headed-stud shear connectors according to AWS D1.1/D1.1M and manufacturer's written instructions.

- J. Slide Bearings: Slide bearing plates shall be permanently affixed to the member and support by welding. Member faces shall be aligned and leveled so as to maintain contact between surfaces before installing bearing plates.

3.4 FIELD CONNECTIONS

- A. High-Strength Bolts: Install high-strength bolts according to RCSC's "Specification for Structural Joints Using ASTM A 325 or A 490 Bolts" for type of bolt and type of joint specified.
 - 1. Joint Type: Snug tightened.
 - 2. A307 bolts and high-strength (A325 and A490) bolts noted to be "snug-tight" shall be tightened using a few impacts of an impact wrench or the full effort of a man using an ordinary spud wrench, bringing the plies into contact.
 - 3. High-strength bolts which are not specifically designated to be "snug-tight" shall be tightened to provide at least the minimum tension shown in Table 4 of the "Specification for Structural Joints using ASTM A325 and A490 Bolts." Tightening shall be done by the turn-of-the-nut method, with direct tension indicators, or by properly calibrated wrenches.
 - 4. Faying surfaces of "slip-critical" connections, as defined in the "Specification for Structural Joints" and indicated on the Drawings shall have all paint removed by blast cleaning.
 - 5. Bolts tightened with a calibrated wrench or by torque control shall have a hardened washer under the element (nut or bolt head) turned in tightening.
 - 6. Hardened washers shall be placed over slotted holes in an outer ply. Hardened beveled washers shall be used where the outer face of the bolted parts has a slope greater than 1:20 with respect to the bolt axis.
- B. Weld Connections: Comply with AWS D1.1/D1.1M for tolerances, appearances, welding procedure specifications, weld quality, and methods used in correcting welding work.
 - 1. Comply with AISC 303 and AISC 360 for bearing, alignment, adequacy of temporary connections, and removal of paint on surfaces adjacent to field welds.
 - 2. Remove backing bars or runoff tabs at all permanently exposed connections, back gouge, and grind steel smooth.
 - 3. Assemble and weld built-up sections by methods that will maintain true alignment of axes without exceeding tolerances in AISC's "Code of Standard Practice for Steel Buildings and Bridges" for mill material.

3.5 FIELD QUALITY CONTROL

- A. Testing Agency: Owner will engage a qualified independent testing and inspecting agency to inspect field welds and high-strength bolted connections.
- B. Bolted Connections: Bolted connections will be inspected according to RCSC's "Specification for Structural Joints Using ASTM A 325 or A 490 Bolts."
- C. Welded Connections: Field welds will be visually inspected according to AWS D1.1/D1.1M.
 - 1. In addition to visual inspection, field welds will be tested and inspected according to AWS D1.1/D1.1M and the following inspection procedures, at testing agency's option:
 - a. Liquid Penetrant Inspection: ASTM E 165.

- b. Magnetic Particle Inspection: ASTM E 709; performed on root pass and on finished weld. Cracks or zones of incomplete fusion or penetration will not be accepted.
 - c. Ultrasonic Inspection: ASTM E 164.
 - d. Radiographic Inspection: ASTM E 94.
- D. In addition to visual inspection, test and inspect field-welded shear connectors according to requirements in AWS D1.1/D1.1M for stud welding and as follows:
- 1. Perform bend tests if visual inspections reveal either a less-than-continuous 360-degree flash or welding repairs to any shear connector.
 - 2. Conduct tests on additional shear connectors if weld fracture occurs on shear connectors already tested, according to requirements in AWS D1.1/D1.1M.
- E. Correct deficiencies in Work that test reports and inspections indicate does not comply with the Contract Documents.

3.6 REPAIRS AND PROTECTION

- A. Galvanized Surfaces: Clean areas where galvanizing is damaged or missing and repair galvanizing to comply with ASTM A 780.
- B. Touchup Painting: Immediately after erection, clean exposed areas where primer is damaged or missing and paint with the same material as used for shop painting to comply with SSPC-PA 1 for touching up shop-painted surfaces.
- 1. Clean and prepare surfaces by SSPC-SP 2 hand-tool cleaning or SSPC-SP 3 power-tool cleaning.
 - 2. Apply a compatible primer of same type as shop primer used on adjacent surfaces.
- C. Touchup Painting: Cleaning and touchup painting are specified in Division 9 Painting Sections.

END OF SECTION 051200

SECTION 052100 - STEEL JOIST FRAMING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section Includes:

1. K-series steel joists.
2. KCS-type K-series steel joists.
3. K-series steel joist substitutes.
4. LH- and DLH-series long-span steel joists.
5. CJ-series composite steel joists.
6. Joist girders.
7. Joist accessories.

- B. Related Requirements:

1. Division 1 Section "Sustainable Project Design Requirements" for LEED standards and project requirements.
2. Division 3 Section "Cast-in-Place Concrete" for installing bearing plates in concrete.
3. Division 4 Section "Unit Masonry" for installing bearing plates in unit masonry.
4. Division 5 Section "Structural Steel Framing" for field-welded shear connectors.

1.3 DEFINITIONS

- A. SJI's "Specifications": Steel Joist Institute's "Standard Specifications, Load Tables and Weight Tables for Steel Joists and Joist Girders."
- B. Special Joists: Steel joists or joist girders requiring modification by manufacturer to support nonuniform, unequal, or special loading conditions that invalidate load tables in SJI's "Specifications."

1.4 ACTION SUBMITTALS FOR REVIEW

- A. Product Data: For each type of joist, accessory, and product.

- B. Shop Drawings:

1. Include layout, designation, number, type, location, and spacing of joists.
2. Include joining and anchorage details, bracing, bridging, and joist accessories; splice and connection locations and details; and attachments to other construction.

3. Indicate locations and details of bearing plates to be embedded in other construction.

1.5 INFORMATIONAL SUBMITTALS

A. LEED Submittals:

1. Product Data for Credit MR 4: For products having recycled content, documentation indicating percentages by weight of postconsumer and preconsumer recycled content. Include statement indicating cost for each product having recycled content.
2. Laboratory Test Reports for Credit EQ 4: For primers, documentation indicating that products comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

B. Qualification Data: For manufacturer.

C. Welding certificates.

D. Manufacturer certificates.

E. Mill Certificates: For each type of bolt.

F. Comprehensive engineering analysis of special joists signed and sealed by the qualified professional engineer responsible for its preparation.

1.6 QUALITY ASSURANCE

A. Manufacturer Qualifications: A manufacturer certified by SJI to manufacture joists complying with applicable standard specifications and load tables in SJI's "Specifications."

1. Manufacturer's responsibilities include providing professional engineering services for designing special joists to comply with performance requirements.

B. Welding Qualifications: Qualify field-welding procedures and personnel according to AWS D1.1/D1.1M, "Structural Welding Code - Steel."

1.7 DELIVERY, STORAGE, AND HANDLING

A. Deliver, store, and handle joists as recommended in SJI's "Specifications."

B. Protect joists from corrosion, deformation, and other damage during delivery, storage, and handling.

1.8 SEQUENCING

A. Deliver steel bearing plates to be built into cast-in-place concrete construction.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

- A. Structural Performance: Provide special joists and connections capable of withstanding design loads indicated.
 - 1. Use ASD; data are given at service-load level.
 - 2. Design special joists to withstand design loads with live-load deflections no greater than the following:
 - a. Roof Joists: Vertical deflection of 1/240 of the span.
- B. Recycled Content of Steel Products: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 25 percent.
- C. Domestic Steel: All steel shall be domestically manufactured, unless foreign sources are specifically accepted by the Owner.

2.2 K-SERIES STEEL JOISTS

- A. Manufacture steel joists of type indicated according to "Standard Specifications for Open Web Steel Joists, K-Series" in SJI's "Specifications," with steel-angle top- and bottom-chord members, underslung ends, and parallel top chord.
 - 1. Joist Type: KCS-type and K-series steel joists as noted on the drawings.
- B. Steel Joist Substitutes: Manufacture according to "Standard Specifications for Open Web Steel Joists, K-Series" in SJI's "Specifications," with steel-angle or -channel members.
- C. Provide holes in chord members for connecting and securing other construction to joists.
- D. Top-Chord Extensions: Extend top chords of joists with SJI's Type S top-chord extensions where indicated, complying with SJI's "Specifications."
- E. Extended Ends: Extend bearing ends of joists with SJI's Type R extended ends where indicated, complying with SJI's "Specifications."
- F. Camber K-series joists according to SJI's "Specifications".
- G. Equip bearing ends of joists with manufacturer's standard beveled ends or sloped shoes if joist slope exceeds 1/4 inch per 12 inches.
- H. Unless noted otherwise on plan, joist seat shall be designed for a minimum rollover capacity of 3.5 kips. When minimum rollover capacity cannot be provided, joist engineer shall coordinate an alternative solution with the Engineer of Record.

2.3 LONG-SPAN STEEL JOISTS (LH and DLH Series)

- A. Manufacture steel joists according to "Standard Specifications for Longspan Steel Joists, LH-Series and Deep Longspan Steel Joists, DLH-Series" in SJI's "Specifications," with steel-angle top- and bottom-chord members; of joist type and end and top-chord arrangements as follows:
 - 1. Joist Type: LH-series steel joists and DLH-series steel joists as indicated.
 - 2. End Arrangement: Underslung.
 - 3. Top-Chord Arrangement: Parallel.
- B. Provide holes in chord members for connecting and securing other construction to joists.
- C. Camber long-span steel joists according to SJI's "Specifications."
 - 1. Where long-span joists are adjacent to hard points, such as columns, CMU bearing walls, or concrete walls, camber and deflection shall be limited to one-half the deflection and one-half the camber of the interior roof joists unless noted otherwise on the drawings.
- D. Equip bearing ends of joists with manufacturer's standard beveled ends or sloped shoes if joist slope exceeds 1/4 inch per 12 inches.
- E. Unless noted otherwise on plan, joist seat shall be designed for a minimum rollover capacity of 8 kips. When minimum rollover capacity cannot be provided, joist engineer shall coordinate an alternative solution with the Engineer of Record.

2.4 PRIMERS

- A. Low-Emitting Materials: Paints and coatings shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."
- B. Primer: SSPC-Paint 15, or manufacturer's standard shop primer complying with performance requirements in SSPC-Paint 15.
- C. Primer: Provide shop primer that complies with Section 099113 "Exterior Painting" and Section 099123 "Interior Painting."

2.5 JOIST ACCESSORIES

- A. Bridging: Provide bridging anchors and number of rows of horizontal or diagonal bridging of material, size, and type required by SJI's "Specifications" for type of joist, chord size, spacing, and span. Furnish additional erection bridging if required for stability.
- B. Bridging: Schematically indicated. Detail and fabricate according to SJI's "Specifications." Furnish additional erection bridging if required for stability.
- C. Bridging: Fabricate as indicated and according to SJI's "Specifications." Furnish additional erection bridging if required for stability.

- D. Fabricate steel bearing plates from ASTM A 36/A 36M steel with integral anchorages of sizes and thicknesses indicated. Shop prime paint.
- E. Steel bearing plates with integral anchorages are specified in Section 055000 "Metal Fabrications."
- F. Furnish ceiling extensions, either extended bottom-chord elements or a separate extension unit of enough strength to support ceiling construction. Extend ends to within 1/2 inch of finished wall surface unless otherwise indicated.
- G. Carbon-Steel Bolts and Threaded Fasteners: ASTM A 307, Grade A, carbon-steel, hex-head bolts and threaded fasteners; carbon-steel nuts; and flat, unhardened steel washers.
 - 1. Finish: Plain, uncoated.
- H. High-Strength Bolts, Nuts, and Washers: ASTM A 325, Type 1, heavy hex steel structural bolts; ASTM A 563 heavy hex carbon-steel nuts; and ASTM F 436 hardened carbon-steel washers.
 - 1. Finish: Plain.
- I. Welding Electrodes: Comply with AWS standards.
- J. Galvanizing Repair Paint: ASTM A 780.
- K. Furnish miscellaneous accessories including splice plates and bolts required by joist manufacturer to complete joist assembly.

2.6 CLEANING AND SHOP PAINTING

- A. Clean and remove loose scale, heavy rust, and other foreign materials from fabricated joists and accessories by hand-tool cleaning, SSPC-SP 2 or power-tool cleaning, SSPC-SP 3.
- B. Do not prime paint joists and accessories to receive sprayed fire-resistive materials.
- C. Apply one coat of shop primer to joists and joist accessories to be primed to provide a continuous, dry paint film not less than 1 mil thick.
- D. Shop priming of joists and joist accessories is specified in Section 099113 "Exterior Painting" and Section 099123 "Interior Painting."

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine supporting substrates, embedded bearing plates, and abutting structural framing for compliance with requirements for installation tolerances and other conditions affecting performance.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

- A. Do not install joists until supporting construction is in place and secured.
- B. Install joists and accessories plumb, square, and true to line; securely fasten to supporting construction according to SJ's "Specifications," joist manufacturer's written recommendations, and requirements in this Section.
 - 1. Before installation, splice joists delivered to Project site in more than one piece.
 - 2. Space, adjust, and align joists accurately in location before permanently fastening.
 - 3. Install temporary bracing and erection bridging, connections, and anchors to ensure that joists are stabilized during construction.
 - 4. Delay rigidly connecting bottom-chord extensions to columns or supports until dead loads are applied.
- C. Field weld joists to supporting steel bearing plates and framework. Coordinate welding sequence and procedure with placement of joists. Comply with AWS requirements and procedures for welding, appearance and quality of welds, and methods used in correcting welding work.
- D. Bolt joists to supporting steel framework using carbon-steel bolts.
- E. Bolt joists to supporting steel framework using high-strength structural bolts. Comply with Research Council on Structural Connection's "Specification for Structural Joints Using ASTM A 325 or ASTM A 490 Bolts" for high-strength structural bolt installation and tightening requirements.
- F. Install and connect bridging concurrently with joist erection, before construction loads are applied. Anchor ends of bridging lines at top and bottom chords if terminating at walls or beams.

3.3 FIELD QUALITY CONTROL

- A. Testing Agency: Owner will engage a qualified independent testing and inspecting agency to inspect field welds and bolted connections and to perform field tests and inspections and prepare test and inspection reports.
- B. Visually inspect field welds according to AWS D1.1/D1.1M.
 - 1. In addition to visual inspection, test field welds according to AWS D1.1/D1.1M and the following procedures, as applicable:
 - a. Liquid Penetrant Inspection: ASTM E 165.
 - b. Magnetic Particle Inspection: ASTM E 709.
 - c. Ultrasonic Testing: ASTM E 164.
 - d. Radiographic Testing: ASTM E 94.
- C. Visually inspect bolted connections.
- D. Correct deficiencies in Work that test and inspection reports have indicated are not in compliance with specified requirements.

- E. Perform additional testing to determine compliance of corrected Work with specified requirements.

3.4 PROTECTION

- A. Repair damaged galvanized coatings on galvanized items with galvanized repair paint according to ASTM A 780 and manufacturer's written instructions.
- B. Touchup Painting: After installation, promptly clean, prepare, and prime or reprime field connections, rust spots, and abraded surfaces of prime-painted joists, bearing plates, abutting structural steel, and accessories.
 - 1. Clean and prepare surfaces by hand-tool cleaning according to SSPC-SP 2, or power-tool cleaning according to SSPC-SP 3.
 - 2. Apply a compatible primer of same type as primer used on adjacent surfaces.
- C. Touchup Painting: Cleaning and touchup painting are specified in Section 099113 "Exterior Painting" and Section 099123 "Interior Painting."
- D. Provide final protection and maintain conditions, in a manner acceptable to manufacturer and Installer, that ensure that joists and accessories are without damage or deterioration at time of Substantial Completion.

END OF SECTION 052100

SECTION 053100 - STEEL DECKING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

- A. Section Includes:

1. Roof deck.
2. Acoustical roof deck.
3. Cellular roof deck.
4. Acoustical cellular roof deck.
5. Composite floor deck.
6. Electrified cellular floor deck.
7. Noncomposite form deck.
8. Noncomposite vented form deck.

- B. Related Requirements:

1. Section 033000 "Cast-in-Place Concrete" for normal-weight and lightweight structural concrete fill over steel deck.
2. Section 035216 "Lightweight Insulating Concrete" for lightweight insulating concrete fill over steel deck.
3. Section 051200 "Structural Steel Framing" for shop- and field-welded shear connectors.
4. Section 055000 "Metal Fabrications" for framing deck openings with miscellaneous steel shapes.
5. Section 099113 "Exterior Painting" for repair painting of primed deck and finish painting of deck.
6. Section 099123 "Interior Painting" for repair painting of primed deck and finish painting of deck.

1.3 ACTION SUBMITTALS

- A. Product Data: For each type of deck, accessory, and product indicated.

- B. Shop Drawings:

1. Include layout and types of deck panels, anchorage details, reinforcing channels, pans, cut deck openings, special jointing, accessories, and attachments to other construction.

1.4 INFORMATIONAL SUBMITTALS

- A. Welding certificates.
- B. Product Certificates: For each type of steel deck.
- C. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, indicating that each of the following complies with requirements:
 - 1. Power-actuated mechanical fasteners.
 - 2. Acoustical roof deck.
- D. Evaluation Reports: For steel deck.
- E. Field quality-control reports.

1.5 QUALITY ASSURANCE

- A. Testing Agency Qualifications: Qualified according to ASTM E 329 for testing indicated.
- B. Welding Qualifications: Qualify procedures and personnel according to AWS D1.3, "Structural Welding Code - Sheet Steel."
- C. Electrical Raceway Units: Provide UL-labeled cellular floor-deck units complying with UL 209 and listed in UL's "Electrical Construction Equipment Directory" for use with standard header ducts and outlets for electrical distribution systems.
- D. FM Global Listing: Provide steel roof deck evaluated by FM Global and listed in its "Approval Guide, Building Materials" for Class 1 fire rating and Class 1-90 windstorm ratings.

1.6 DELIVERY, STORAGE, AND HANDLING

- A. Protect steel deck from corrosion, deformation, and other damage during delivery, storage, and handling.
- B. Stack steel deck on platforms or pallets and slope to provide drainage. Protect with a waterproof covering and ventilate to avoid condensation.
 - 1. Protect and ventilate acoustical cellular roof deck with factory-installed insulation to maintain insulation free of moisture.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

- A. AISI Specifications: Comply with calculated structural characteristics of steel deck according to AISI's "North American Specification for the Design of Cold-Formed Steel Structural Members."

- B. Fire-Resistance Ratings: Comply with ASTM E 119; testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.
 - 1. Indicate design designations from UL's "Fire Resistance Directory" or from the listings of another qualified testing agency.
- C. Recycled Content of Steel Products: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 25 percent.
- D. Low-Emitting Materials: Paints and coatings shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

2.2 ROOF DECK

- A. **Manufacturers:** Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
 - 1. [ASC Profiles, Inc.; a Blue Scope Steel company.](#)
 - 2. [Canam United States; Canam Group Inc.](#)
 - 3. [CMC Joist & Deck.](#)
 - 4. [Consolidated Systems, Inc.; Metal Dek Group.](#)
 - 5. [Cordeck.](#)
 - 6. [DACS, Inc.](#)
 - 7. [Epic Metals Corporation.](#)
 - 8. [Marlyn Steel Decks, Inc.](#)
 - 9. [New Millennium Building Systems, LLC.](#)
 - 10. [Nucor Corp.; Vulcraft Group.](#)
 - 11. [Roof Deck, Inc.](#)
 - 12. [Valley Joist; Subsidiary of EBSCO Industries, Inc.](#)
 - 13. [Verco Manufacturing Co.](#)
 - 14. [Wheeling Corrugating Company; Div. of Wheeling-Pittsburgh Steel Corporation.](#)
- B. Roof Deck: Fabricate panels, without top-flange stiffening grooves, to comply with "SDI Specifications and Commentary for Steel Roof Deck," in SDI Publication No. 31, and with the following:
 - 1. Prime-Painted Steel Sheet: ASTM A 1008/A 1008M, Structural Steel (SS), Grade 33 minimum, shop primed with manufacturer's standard baked-on, rust-inhibitive primer.
 - a. Color: Manufacturer's standard.
 - 2. Galvanized-Steel Sheet: ASTM A 653/A 653M, Structural Steel (SS), Grade 33, G60 zinc coating.
 - 3. Galvanized and Shop-Primed Steel Sheet: ASTM A 653/A 653M, Structural Steel (SS), Grade 33, G60 zinc coating; cleaned, pretreated, and primed with manufacturer's standard baked-on, rust-inhibitive primer.
 - a. Color: Manufacturer's standard.

4. Aluminum-Zinc-Alloy-Coated Steel Sheet: ASTM A 792/A 792M, Structural Steel (SS), Grade 33 minimum, AZ50 aluminum-zinc-alloy coating.
5. Deck Profile: As indicated.
6. Cellular Deck Profile: As indicated, with bottom plate.
7. Profile Depth: As indicated.
8. Design Uncoated-Steel Thickness: As indicated.
9. Design Uncoated-Steel Thicknesses; Deck Unit/Bottom Plate: As indicated.
10. Span Condition: As indicated.
11. Side Laps: Overlapped.

2.3 ACCESSORIES

- A. General: Provide manufacturer's standard accessory materials for deck that comply with requirements indicated.
- B. Mechanical Fasteners: Corrosion-resistant, low-velocity, power-actuated or pneumatically driven carbon-steel fasteners; or self-drilling, self-threading screws.
- C. Side-Lap Fasteners: Corrosion-resistant, hexagonal washer head; self-drilling, carbon-steel screws, No. 10 minimum diameter.
- D. Flexible Closure Strips: Vulcanized, closed-cell, synthetic rubber.
- E. Miscellaneous Sheet Metal Deck Accessories: Steel sheet, minimum yield strength of 33,000 psi, not less than 0.0359-inch design uncoated thickness, of same material and finish as deck; of profile indicated or required for application.
- F. Pour Stops and Girder Fillers: Steel sheet, minimum yield strength of 33,000 psi, of same material and finish as deck, and of thickness and profile indicated.
- G. Column Closures, End Closures, Z-Closures, and Cover Plates: Steel sheet, of same material, finish, and thickness as deck unless otherwise indicated.
- H. Piercing Hanger Tabs: Piercing steel sheet hanger attachment devices for use with floor deck.
- I. Weld Washers: Uncoated steel sheet, shaped to fit deck rib, 0.0598 inch thick, with factory-punched hole of 3/8-inch minimum diameter.
- J. Flat Sump Plates: Single-piece steel sheet, 0.0747 inch thick, of same material and finish as deck. For drains, cut holes in the field.
- K. Recessed Sump Pans: Single-piece steel sheet, 0.0747 inch thick, of same material and finish as deck, with 3-inch- wide flanges and sloped recessed pans of 1-1/2-inch minimum depth. For drains, cut holes in the field.
- L. Galvanizing Repair Paint: ASTM A 780.
- M. Repair Paint: Manufacturer's standard rust-inhibitive primer of same color as primer.

PART 3 - EXECUTION

3.1 EXAMINATION

- A. Examine supporting frame and field conditions for compliance with requirements for installation tolerances and other conditions affecting performance.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION, GENERAL

- A. Install deck panels and accessories according to applicable specifications and commentary in SDI Publication No. 31, manufacturer's written instructions, and requirements in this Section.
- B. Install temporary shoring before placing deck panels if required to meet deflection limitations.
- C. Locate deck bundles to prevent overloading of supporting members.
- D. Place deck panels on supporting frame and adjust to final position with ends accurately aligned and bearing on supporting frame before being permanently fastened. Do not stretch or contract side-lap interlocks.
 - 1. Align cellular deck panels over full length of cell runs and align cells at ends of abutting panels.
- E. Place deck panels flat and square and fasten to supporting frame without warp or deflection.
- F. Cut and neatly fit deck panels and accessories around openings and other work projecting through or adjacent to deck.
- G. Provide additional reinforcement and closure pieces at openings as required for strength, continuity of deck, and support of other work.
- H. Comply with AWS requirements and procedures for manual shielded metal arc welding, appearance and quality of welds, and methods used for correcting welding work.
- I. Mechanical fasteners may be used in lieu of welding to fasten deck. Locate mechanical fasteners and install according to deck manufacturer's written instructions.

3.3 ROOF-DECK INSTALLATION

- A. Fasten roof-deck panels to steel supporting members by arc spot (puddle) welds of the surface diameter indicated or arc seam welds with an equal perimeter that is not less than 1-1/2 inches long, and as follows:
 - 1. Weld Diameter: As indicated.
 - 2. Weld Spacing: Weld edge and interior ribs of deck units with a minimum of two welds per deck unit at each support. Space welds as indicated.
 - 3. Weld Washers: Install weld washers at each weld location.

- B. Side-Lap and Perimeter Edge Fastening: Fasten side laps and perimeter edges of panels between supports, at intervals as indicated, and as follows:
 - 1. Mechanically fasten with self-drilling, No. 10 diameter or larger, carbon-steel screws.
 - 2. Fasten with a minimum of 1-1/2-inch- long welds.
- C. End Bearing: Install deck ends over supporting frame with a minimum end bearing of 1-1/2 inches, with end joints as follows:
 - 1. End Joints: Lapped 2 inches minimum.
- D. Roof Sump Pans and Sump Plates: Install over openings provided in roof deck and mechanically fasten flanges to top of deck. Space mechanical fasteners not more than 12 inches apart with at least one fastener at each corner.
 - 1. Install reinforcing channels or zees in ribs to span between supports and mechanically fasten.
- E. Miscellaneous Roof-Deck Accessories: Install ridge and valley plates, finish strips, end closures, and reinforcing channels according to deck manufacturer's written instructions. Weld or mechanically fasten to substrate to provide a complete deck installation.
 - 1. Weld cover plates at changes in direction of roof-deck panels unless otherwise indicated.
- F. Flexible Closure Strips: Install flexible closure strips over partitions, walls, and where indicated. Install with adhesive according to manufacturer's written instructions to ensure complete closure.
- G. Sound-Absorbing Insulation: Installation into topside ribs of deck as specified.

3.4 FIELD QUALITY CONTROL

- A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.
- B. Field welds will be subject to inspection.
- C. Testing agency will report inspection results promptly and in writing to Contractor and Architect.
- D. Remove and replace work that does not comply with specified requirements.
- E. Additional inspecting, at Contractor's expense, will be performed to determine compliance of corrected work with specified requirements.

3.5 PROTECTION

- A. Galvanizing Repairs: Prepare and repair damaged galvanized coatings on both surfaces of deck with galvanized repair paint according to ASTM A 780 and manufacturer's written instructions.
- B. Repair Painting: Wire brush and clean rust spots, welds, and abraded areas on both surfaces of prime-painted deck immediately after installation, and apply repair paint.

1. Apply repair paint, of same color as adjacent shop-primed deck, to bottom surfaces of deck exposed to view.
 2. Wire brushing, cleaning, and repair painting of bottom deck surfaces are included in Section 099113 "Exterior Painting" and Section 099123 "Interior Painting."
- C. Repair Painting: Wire brushing, cleaning, and repair painting of rust spots, welds, and abraded areas of both deck surfaces are included in Section 099113 "Exterior Painting" and Section 099123 "Interior Painting."
- D. Provide final protection and maintain conditions to ensure that steel deck is without damage or deterioration at time of Substantial Completion.

END OF SECTION 053100

SECTION 05 40 00 – COLD-FORMED METAL FRAMING

PART 1 GENERAL

1.01 WORK INCLUDED

- A. Exterior non-axial load-bearing steel stud curtain wall, designed to resist positive and negative wind loads.
- B. Exterior soffit framing for metal soffits.
- C. Structural engineering services provided by cold-formed metal framing fabricator for exterior non-axial load-bearing steel stud curtain wall.
- D. Accessories.

1.02 RELATED SECTIONS

- A. Section 01 33 00 – Submittal Procedures.
- B. Section 01 60 00 – Product Requirements: Product substitution procedures.
- C. Section 04 20 19 – Veneer Unit Masonry: Securing veneer anchors to exterior steel studs.
- D. Section 04 43 13 – Mortar Placed Stone Veneer: Securing veneer anchors to exterior steel studs.
- E. Section 06 10 53 – Miscellaneous Carpentry: Securing wood blocking to steel studs.
- F. Section 06 16 43 – Gypsum Sheathing: Securing gypsum sheathing to exterior steel studs.
- G. Section 07 21 16 – Blanket Insulation: Insulation within framing members of studs.
- H. Section 07 40 00 – Cladding Support System: Securing cladding support framing to exterior steel studs.
- I. Section 07 42 13 – Metal Wall and Soffit Panels: Securing metal wall and soffit panels to exterior steel studs.
- J. Section 09 21 16 – Gypsum Board Assemblies: Securing gypsum wall board to framing.
- K. Section 10 28 00 – Toilet, Bath and Laundry Accessories: Supporting toilet accessories off steel stud framing.

1.03 REFERENCES

- A. ASTM A123 – Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products.
- B. ASTM A653 – Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-

Iron Alloy-Coated (Galvannealed) by Hot Dip Process.

- C. ASTM A780 – Standard Practice for Repair of Damaged and Uncoated Areas of Hot-Dip Galvanized Coatings.
 - D. ASTM A1003 – Standard Specification for Steel Sheet, Carbon Metallic and Non-Metallic-Coated for Cold-Formed Framing Members.
 - E. ASTM C645 – Standard Specification for Non-Structural Steel Framing Members.
 - F. ASTM C754 – Standard Specification for Installation of Steel Framing Members to Receive Screw-Attached Gypsum Panel Products.
 - G. ASTM C955 – Standard Specification for Load-Bearing (Transverse and Axial) Steel Studs, Runners (Tracks), and Bracing or Bridging for Screw Application of Gypsum Panel Products and Metal Plaster Bases.
 - H. ASTM C1002 – Standard Specification for Steel Drill Screws for Application of Gypsum Panel Products on Metal Plaster Bases.

 - L. Steel Stud Manufacturers Association:
 - 1. SSMA – Product Technical Information.
 - M. AISI – (American Iron and Steel Institute) “North American Specification for the Design of Cold-Formed Steel Structural Members,” Current Edition.
 - N. FS TT-P-645 – Primer, Paint, Zinc-2 Chromate, Alkyd Type.
- 1.04 PERFORMANCE REQUIREMENTS – EXTERIOR NON-AXIAL LOAD-BEARING STEEL STUD CURTAIN WALL
- A. AISI “Specifications”: Calculate structural characteristics of cold-formed metal framing according to AISI’s “North American Specification for the Design of Cold-Formed Steel Structural Members”.
 - B. Structural Performance: Engineer, fabricate and erect cold-formed metal framing to withstand design loads within limits and under conditions required.

1. Design framing systems to withstand design loads as indicated on the Structural Drawings and the following deflection criteria:
 - a. Deflection of L/600 of the wall height for masonry veneer.
 - b. Deflection of L/600 of the wall height for stone veneer.
 - c. Deflection of L/180 for metal wall panels and soffit panels.
 2. Design framing systems to provide for movement of framing members without damage or overstressing, sheathing failure, connection failure, undue strain on fasteners and anchors, or other detrimental effects when subject to a maximum ambient temperature change (range) of 120 degrees F.
 3. Design framing system to accommodate deflection of primary building structure and construction tolerances, and to maintain clearances at openings.
 - a. Vertical Deflection: Minimum 1 ½ inches, ¾ inches up and ¾ inches down.
- C. Design exterior non-axial load-bearing curtain wall framing to accommodate lateral deflection without regard to contribution of sheathing materials.
- D. Headers: Design according to AISI's "North American Standard for Cold-Formed Steel Framing" header design.
- E. Engineering Responsibility: Engage a fabricator who assumes undivided responsibility for engineering cold-formed metal framing by employing a qualified professional engineer, licensed in the state in which project is constructed, to prepare and sign and seal design calculations, Shop Drawings, and other structural data.
- 1.05 SUBMITTALS – EXTERIOR STEEL STUD NON-AXIAL LOAD-BEARING CURTAIN WALL FRAMING
- A. Section 01 33 00 – Submittal Procedures: Submittal requirements.
 - B. Submit structural calculations prepared by licensed engineer for review. Calculations shall include, but are not limited to:
 1. Description of design criteria.
 2. Engineering analysis depicting stress and deflection (stiffness) requirements for each framing application.
 3. Selection of framing components.
 4. Verification of attachments to structure and/or adjacent framing components.
 - C. Product data for each type of cold-formed metal framing, accessory and product specified.
 - D. Shop Drawings showing layout, spacings, sizes, thicknesses and types of cold-formed metal framing, fabrication, fastening and anchorage details including mechanical fasteners. Show reinforcing channels, opening framing, supplemental framing, strapping, bracing, bridging, splices, accessories, connection details, and attachments to other units

of Work.

1. For cold-formed metal framing indicated to comply with certain design loadings, include structural analysis data sealed and signed by the qualified professional engineer who was responsible for its preparation.
- E. Mill certificates signed by manufacturers of cold-formed metal framing certifying that their products comply with requirements, including uncoated steel thickness, yield strength, tensile strength, total elongation, and galvanized-coating thickness.

1.06 QUALITY ASSURANCE – EXTERIOR STEEL STUD CURTAIN WALL FRAMING

- A. Installer Qualifications: Engage an experienced Installer who has completed cold-formed metal framing similar in material, design and extent to that indicated for this Project and with a record of successful in-service performance.
- B. Engineering Responsibilities: Preparation of Shop Drawings, design calculations and other structural data.
- C. Professional Engineer Qualifications: A professional engineer legally authorized to practice in the jurisdiction where Project is located and experienced in providing engineering services of the kind indicted that have resulted in the installation of cold-formed metal framing similar to this Project in material, design and extent and that have a record of successful in-service performance.
- D. Calculate structural properties of framing members in accordance with AISI SG-973 Specification for Design of Cold-Formed Steel Structural Members.
 1. Furnish framing materials in accordance with SSMA – Product Technical Information.
- E. Pre-Installation Conference: Conduct conference at project site four weeks prior to the installation of framing to comply with requirements of Section 01 30 00 – Administrative Requirements: Pre-installation.
- F. Manufacturer: Company specializing in manufacturing products specified in this Section.
 1. Current member of Steel Stud Manufacturers Association.

1.07 DELIVERY, STORAGE AND HANDLING

- A. Protect metal framing from corrosion, deformation and other damage during delivery, storage and handling.
- B. Store metal framing, protect with a waterproof covering and ventilate to avoid condensation.

PART 2 PRODUCTS

2.01 MANUFACTURERS

- A. Manufacturers for Exterior Curtain Wall Studs: Subject to compliance with requirements, provide metal framing by one of the following:
 - 1. ClarkDietrich Building Systems.
 - 2. Craco Metal Manufacturing, LLC
 - 3. Marino/Ware – A Division of Ware Industries
- B. Basis-of-Design Product: The design for connecting devices for exterior curtainwall framing is based on The Steel Network, Inc.

Subject to compliance with requirements, provide named product or a comparable product by:
 - 1. ClarkDietrich Building Systems.
- C. Products shall comply with ASTM C955.

2.02 EXTERIOR CURTAIN WALL FRAMING

- A. Steel Sheet: ASTM A1003, structural grade, Type H, metallic coated, of grade and weight as follows:
 - 1. Grade: ST33H for 43 mil studs.
 - 2. Grade: ST50H for 54, 68 and 97 mil studs.
 - 3. Coating: G60.
- B. Steel sheet for vertical deflection clips, bridging and clips: ASTM A653, structural steel, zinc coated, of grade and coating as follows:
 - 1. Grade: 50, Class 1 or 2.
 - 2. Coating: G90.
- C. Wall Framing:
 - 1. Steel Studs: Manufacturer's standard C-shaped steel studs of web depths indicated, with lipped flanges and complying with the following:
 - a. Studs: C shaped structural studs, complying with SSMA.
 - b. Design Uncoated Steel Thickness: Stud gauge to be determined based on design criteria and stud span. But in no case shall the stud mils be less than 43.
 - c. Flange Width: Minimum 1-5/8 inch.
 - d. Web: Punched unless otherwise noted. Studs used as joists and headers shall be un-punched.
 - e. Stud Width: 2-1/2 inches, 3-5/8 inches, and 6 inches.
 - f. Stud Spacing: Maximum 16 inches o.c.
 - g. Metal soffit framing:
 - 1) Provide stud size as shown on drawings.

- 2) Space metal soffit framing in accordance with metal soffit manufacturer's requirements. Refer to Section 07 42 13 – Metal Wall and Soffit Panels.
 - 3 Secure framing to structural steel.
 2. Steel Track: Manufacturer's standard U-shaped steel track, unpunched of web depths to match width of studs with 1-1/4 inch straight flanges and as follows:
 - a. Track: Design uncoated steel thickness, match gauge of studs as a minimum, unless otherwise scheduled.
 3. Box Headers: Unless otherwise noted, all openings wider than stud spacing shall be framed with two-unpunched stud joists, with continuous metal tracks installed on the top and bottom sides of header and as follows:
 - a. Minimum Flange Width of Stud Joist: 1-5/8 inch.
 - b. Minimum Deflection: L/360.
 - c. Design Loads: Uniform load (lb/ft) shall be based on information shown on contract documents.
 - d. Depth and Mil Thickness: To be designed based on span and uniform load.
 4. Jamb Studs: Unless otherwise noted, as a minimum, install two studs and one track nested within stud at each side of all openings. Depth of stud and track along with flange width of the stud shall match wall studs. Flange width of track shall be minimum 1-1/4 inches. Support header at each end with header clips StiffClip HE by The Steel Network, Inc. or approved equal. Where clips are not used to support headers, provide additional stud and track to support box header. Studs and track shall extend the full height of the wall. The mil thickness of the studs and track along with the type and spacing of the fasteners shall be designed by the engineer based on:
 - a. Structural performance
 - b. Size of opening
 - c. Alternate Jamb Stud: In lieu of built-up multiple jamb studs provide JamStud by The Steel Network, Inc. Depth of stud to match wall studs.

The mil thickness of the stud shall be designed by the engineer based on:

 - 1) Structural performance
 - 2) Size of opening
 5. Bridging: 1-1/2 inch cold-rolled channels, 16- gauge, black finish or BridgeBar BB150 by The Steel Network Inc or approved equal.
- D. Framing Accessories:
 1. Fabricate steel-framing accessories of the same material and finish used for framing members, with a minimum yield strength of 33,000 psi for 43 mil material and 50,000 psi for 54, 68 and 97 mil thickness material.
 2. Bridging Clip: ASTM A653, 0.0346- inch design thickness, Grade 50, Class 1, 50

ksi yield strength, 65 ksi minimum tensile strength, G90 hot-dip galvanized coating BridgeClip as manufactured by The Steel Network, Inc. (TSN).

3. Vertical Deflection Clips: VertiClip as manufactured by The Steel Network, Inc. (TSN) ASTM A653, 68 mil thickness, 1-1/2 inches by 3-inch clips, Grade 50, Class 1, 50 ksi yield strength, 65 ksi minimum tensile strength, G90 hot dip galvanized coating. Provide clips with manufacturer's step bushings and load rated screw fasteners. Use only deflection connection products that comply with ICC Acceptance Criteria AC261 such as Report No. ESR-1903 (or equivalent). Field fabricated clips are not permitted. Provide the following clips where shown on Drawings:
 - a. Top of Wall (Head Condition): VertiClip SL: Length of clip to match width of studs.
 - 1) At roof slopes shown on Drawings, bend the horizontal leg as required to match roof slope. Vertical slots shall be cut plumb to allow for vertical movement.
 - 2) Framing system shall be installed to provide for a vertical deflection of 1-1/2 inches (3/4 inch up and 3/4- inch downstep bushings).
 - 3) Provide clips with two slots, two screws and two step bushings. Based on loads, provide clips with three slots, three screws and three step bushings.
4. Header Clips: ASTM A653, Grade 50, Class 1, 50 ksi minimum yield strength, 65 ksi minimum yield tensile strength, G-90 hot-dipped galvanized coating, StiffClip HE as manufactured by The Steel Network, Inc. or approved equal. The gauge of the clip and number of fasteners shall be based on the design loads.
5. Provide accessories of manufacturer's standard thickness and configuration, unless otherwise indicated, as follows:
 - a. Supplementary framing.
 - b. Bracing, bridging and solid blocking.
 - c. Web stiffeners.
 - d. Stud kickers and girts.
 - e. Reinforcement plates.
6. Flat Steel Plate: Steel sheet complying with ASTM A653 or ASTM A568 with minimum base metal thickness as follows:
 - a. Thickness:
 - 1) 54 mils (16 gauge) ,33 ksi steel.
 - b. Width: 6 inches.
 - c. Length: 10 feet.

2.03 ANCHORS, CLIPS AND FASTENERS

- A. Steel Shapes and Clips: ASTM A36, zinc coated by the hot-dip process according to ASTM A123.

- B. Powder-Actuated Anchors: Federal Specification FF-P-395b. Manufactured from AISI 1062 or 1065 steel, austempered to a minimum core hardness of 50 to 54 HRC and zinc plated in accordance with ASTM B633. Provide fasteners listed or approved by one or more of the following and of type, diameter and length as required by structural design calculations:
 - 1. Underwriters Laboratory.
 - 2. Factory Mutual.
 - 3. International Code Council (ICC).
- C. Mechanical Fasteners: Corrosion-resistant coated, self-drilling, self-threading steel drill screws. Provide screw type and size as required by structural design calculations for the specific condition and thickness of materials being joined.
 - 1. Head Type: Low profile head beneath sheathing, manufacturer's standard elsewhere.

2.04 MISCELLANEOUS MATERIALS

- A. Galvanizing Repair Paint: SSPC-Paint 20 or DOD-P-21035, with dry film containing a minimum of 94 percent zinc dust by weight.

2.05 FABRICATION

- A. Fabricate metal framing and accessories plumb, square, true to line, and with connections securely fastened, according to manufacturer's recommendations and the requirements of this Section.
 - 1. Fabricate framing assemblies in jig templates.
 - 2. Cut framing members by sawing or shearing; do not torch cut.
 - 3. Fasten metal framing members by screw fastening as standard with fabricator. Wire tying of framing members is not permitted.
 - a. Locate mechanical fasteners and install according to metal framing manufacturer's instructions with screw penetrating jointed members by not less than 3 exposed screw threads.
 - 4. Fasten other materials to metal framing by bolting, or screw fastening according to manufacturer's recommendations.
- B. Reinforce, stiffen, and brace framing assemblies to withstand handling, delivery, and erection stresses. Lift fabricated assemblies to prevent damage or distortion.
- C. Fabrication Tolerances: Fabricate assemblies to a maximum allowable tolerance variation from plumb, level, and true to line of 1/8 inch in 10 feet and as follows:
 - 1. Spacing: Space individual framing members no more than plus or minus 1/8 inch from plan location. Cumulative error shall not exceed minimum fastening requirements of sheathing or other finishing materials.

2. Squareness: Fabricate each metal framing assembly to a maximum out-of-square tolerance of 1/8 inch.

PART 3 EXECUTION

3.01 INSPECTION

- A. Verify that building framing components are ready to receive work.
- B. Beginning of installation means acceptance of existing conditions.

3.02 INSTALLATION – GENERAL

- A. Install metal framing and accessories plumb, square, true to line and with connections securely fastened, according to manufacturer's recommendations and the requirements of this Section.
 1. Cut framing members by sawing or shearing; do not torch cut.
 2. Fasten metal framing members by screw fastening, as standard with fabricator. Wire tying of framing members is not permitted.
 - a. Locate mechanical fasteners and install according to metal framing manufacturer's instructions with screw penetrating joined members by not less than 3 exposed screw threads.
- D. Install framing members in one-piece lengths, unless splice connections are indicated for track or tension members.
- E. Provide temporary bracing and leave in place until framing is permanently stabilized.
- F. Fasten reinforcement plate over web penetrations that exceed size of manufacturer's standard punched openings.
- G. At all locations where multiple studs and tracks occur, fasten studs and tracks together at maximum 24 inches on center.

3.03 EXTERIOR NON-AXIAL LOAD-BEARING CURTAIN WALL INSTALLATION

- A. Install cold-formed metal framing according to AISI's "Standard for Cold-Formed Steel Framing – General Provisions" and to manufacturer's written instructions unless more stringent requirements are indicated.
- B. Install continuous tracks sized to match studs. Align tracks accurately and securely anchor to supporting structure as indicated, and at spacings as determined by structural design calculations for power driven fasteners.
- C. Install jack studs and braces below window sills, above window headers and elsewhere to provide structural support and bracing.
- D. Provide minimum 3 studs at corners.

- E. Install horizontal bridging in stud system spaced at mid-height for walls up to 10'-0" in height. For walls over 10'-0", install bridging at 48 inches on center.
 - 1. Bridging: Continuous 16-gauge cold-rolled steel channel, with bridging clip secured to each stud web by inseting tabs through web slots and fastened to stud with 2-#10 diameter screws provided by the clip manufacturer. Secure cold-rolled channel to clip with 1-#10 screw provided by clip manufacturer. In lieu of cold-rolled channel provide BridgeBar 150 as manufactured by The Steel Network or approved equal. Secure BridgeBar to BridgeClip.
- F. Install headers over wall openings wider than the stud spacing. Fabricate headers of compound shapes indicated, complete with clip-angle connectors, web stiffeners or gusset plates.
 - 1. Frame wall openings with not less than a double stud and track nested within stud at each jamb of frame as required by manufacturer.
 - 2. Where header clips are not used, install jack studs or cripples below window sills and above window heads.
 - 3. Install intermediate studs above and below openings to align with wall stud spacing.
- G. Install miscellaneous framing and connections, including stud kickers, web stiffeners, clip angles, continuous angles, anchors, fasteners, and stud girts, to provide a complete and stable curtain wall framing system.
- H. At ends of studs provide a minimum of 10 inches of unpunched steel. Where field cuts reduce this minimum 10-inch unpunched steel, install web stiffening in accordance with manufacturers' requirements.
- I. Isolate steel framing from building structure at locations indicated to prevent transfer of vertical loads while providing lateral support.
 - 1. Install deflection clips as shown on Drawings.
 - a. Secure clips to primary structure.
 - b. Position slotted holes of clip vertically. Secure clips to each stud using fasteners provided by the manufacturer through the center of each step, bushing. Verify step bushing is fully seated inside each slot. Do not remove tape until screws have been installed through each brushing.

3.05 TOLERANCES

- A. Maximum Variation from Plumb, Level and True Position: 1/8 inch in 10 feet.

END OF SECTION

SECTION 05 50 00 – METAL FABRICATIONS

PART 1 GENERAL

1.01 SUMMARY

- A. Section includes shop-fabricated metal items.
 - 1. Bollards.
 - 2. Ladders
 - a. Aluminum.
- B. Related Sections:
 - 1. Section 05 12 00 – Structural Steel Framing: Steel lintels.
 - 2. Section 07 72 33-Roof Hatches: Coordinating roof hatch with roof access ladders.
 - 3. Section 09 90 00 – Painting and Coating: Field-applied paint finish.

1.02 REFERENCES

- A. Aluminum Association:
 - 1. AA DAF-45 – Designation System for Aluminum Finishes.
- B. American National Standards Institute:
 - 1. ANSI A14.3 – American National Standard (ASC) for Ladders – Fixed – Safety Requirements.
- C. ASTM International:
 - 1. ASTM A53/A53M – Standard Specification for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated, Welded and Seamless.
 - 2. ASTM A123/A123M – Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products.
 - 3. ASTM A153/A153M – Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware.
 - 4. ASTM A325 – Standard Specification for Structural Bolts, Steel, Heat Treated, 120/105 ksi Minimum Tensile Strength.
 - 5. ASTM A563 – Standard Specification for Carbon and Alloy Steel Nuts.
 - 6. ASTM A653 – Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.

- 7. ASTM B221 – Standard Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes.
 - 8. ASTM F436 – Standard Specification for Hardened Steel Washers.
 - D. OSHA, Occupational Safety and Health Administration.
 - 1. 29 CFR 1910.23 Ladders.
- 1.03 SUBMITTALS
- A. Section 01 33 00 – Submittal Procedures: Submittal requirements.
 - B. Shop Drawings: Indicate profiles, sizes, connection attachments, anchorage, size and type of fasteners, and accessories. Include elevations, and details where applicable.
- 1.04 QUALITY ASSURANCE
- A. All ladders shall comply with ANSI A14.3 and OSHA 29 CFR 1910.23 Fixed Ladders and local building codes.
- 1.05 DELIVERY, STORAGE AND HANDLING
- A. Section 01 60 00 – Product Requirements: Product Storage and Handling Requirements.
 - B. Accept metal fabrications on site in labeled shipments. Inspect for damage.
 - C. Protect metal fabrications from damage by exposure to weather.
- 1.06 FIELD MEASUREMENTS
- A. Verify field measurements are as indicated on Shop Drawings or as instructed by manufacturer.

PART 2 PRODUCTS

2.01 MATERIALS – STEEL

- A. Steel Pipe: ASTM A53/A53M, Grade B, Schedule 40.
- B. Bolts: ASTM A325; Type 1
 - 1. Finish: Unfinished unless otherwise noted. Provide hot-dipped galvanized finish as required by ladder manufacturer.
- C. Nuts: ASTM A563 heavy hex type.
 - 1. Finish: Unfinished unless otherwise noted. Provide hot-dipped galvanized as required by ladder manufacturer.
- D. Washers: ASTM F436; Type 1.
 - 1. Finish: Unfinished unless otherwise noted. Provide hot-dipped galvanized as

required by ladder manufacturer.

2.02 MATERIALS – ALUMINUM

- A. Extruded Aluminum: ASTM B221, Alloy 6063, Temper T5.

2.03 BOLLARDS

- A. Bollards: ASTM A53/A53M, Grade B, Schedule 40 steel pipe, concrete filled, crowned cap, diameter and length as indicated on Drawings; ASTM A123, hot dipped galvanized.
- B. Concrete Fill: 3,000 psi as specified in Section 03 30 00.

2.04 ALUMINUM HATCH ACCESS LADDERS

- A. Manufacturer – Basis of Design

- 1. Royalite Manufacturing, Inc.
- 2. Ladders shall comply with ANSI A14.3 and OSHA Standards.

- B. Approved manufacturers offering equal products:

- 1. O’Keeffe’s Inc.
- 2. Precision Ladders.

- C. Hatch Access Ladder

- 1. Royalite “Sure-Step” Hatch Ladder, Model (HL) with “Lift Up Rail Extensions.”
- 2. All ladders shall be submitted and approved prior to fabrication showing full dimensions, wall and floor attachments, materials, construction and finish. All ladders must comply with all safety orders pertinent to the installation. Materials shall be electrolysis and maintenance free aluminum or #302 stainless steel. Side rails shall lift up and lock 42 inches above the top step of the ladder for safe egress and ingress and retract into the ladder frame when the roof hatch is in the closed position.
- 3. Steps shall be 2-inch by 1-inch in section by 24 inches long, extruded from 6063-T5 aluminum, serrated on the top surface, smooth rounded on the sides and bottom. Steps shall carry a 1200 lb. load without failing. Spacing shall be 12 inches vertically.
- 4. Heavy-duty side rails shall be extruded from 6063-T5 aluminum, no less than .125-inch wall thickness by 4 inches wide mounted so that centerline of tread is minimum of 7 inches from face of wall. Rails shall be rounded on the corners and protected on the exterior to prevent tampering or vandalism of the step fasteners. Side rails shall be constructed using 302 stainless steel self-locking fasteners, full penetration inert gas heliarc welds, ground smooth and burr free.
 - a. Wall brackets: Bent aluminum plate, 2 inches wide by 3/16 inch thick.
 - b. Base brackets: Aluminum angle floor bracket, 2 inches by 2 inches by 2 inches by 1/8 inch.

5. Lift-up side rails shall be made of 6063-T5 extruded aluminum, extended and lock 42 inches about the top step, then retract into the heavy-duty rails by releasing the latch mechanism located near the top of the side rails.
6. Finish shall be Mill finish.
7. Anchor Bolts: Hot-dipped galvanized or stainless steel bolts. Diameter as specified by the ladder manufacturer. Fastener length as required to provide adequate anchorage to substrate provided by project contractor as determined by the project engineer.

2.05 FABRICATION

- A. Fit and shop assemble items in largest practical sections, for delivery to site.
- B. Fabricate items with joints tightly fitted and secured.
- C. Exposed Mechanical Fastenings: Flush countersunk screws or bolts; unobtrusively located; consistent with design of component, except where specifically noted otherwise.
- D. Supply components required for anchorage of fabrications. Fabricate anchors and related components of same material and finish as fabrication, except where specifically noted otherwise.

2.06 FACTORY-APPLIED FINISHES – STEEL

- A. Galvanizing: ASTM A123/A123M; minimum 2.0 oz/sq. ft. coating thickness; galvanize after fabrication.
- B. Galvanizing for Fasteners, Connectors and Anchors:
 1. Hot-Dipped Galvanizing: ASTM A153/A153M.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Section 01 30 00 – Administrative Requirements: Coordination and project conditions.
- B. Verify field conditions are acceptable and are ready to receive Work.

3.02 INSTALLATION

- A. Install items plumb and level, accurately fitted, free from distortion or defects.
- B. Obtain approval of Architect/Engineer prior to site cutting or making adjustments not scheduled.
- C. Install manufactured ladders in accordance with manufacturer's instructions.
 1. Anchor securely using fasteners specified by manufacturer or others of equivalent or greater strength and corrosion resistance.

END OF SECTION

SECTION 05 52 00 – HANDRAILS AND RAILINGS

PART 1 GENERAL

1.01 SUMMARY

- A. Section includes steel pipe railings, guardrails, balusters, fittings, handrails and wire mesh.
 - 1. Provide mechanical fasteners at connections and structural adhesive for splices.
- B. Related Sections:
 - 1. Section 03 30 00 – Cast-In-Place Concrete: Execution requirements for placement of anchors specified in this section in concrete.
 - 2. Section 09 90 00 – Painting and Coating: Paint finish work.

1.02 REFERENCES

- A. ASTM International:
 - 1. ASTM A53/A53M – Standard Specification for Pipe, Steel, Black and Hot Dipped, Zinc-Coated, Welded and Seamless.
 - 2. ASTM A123/A123M – Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products.
 - 3. ASTM E894 (Reapproved 2004) – Test Method for Anchorage of Permanent Metal Railing Systems and Rails for Buildings.
 - 4. ASTM E935 – Standard Test Methods for Performance of Permanent Metal Railing Systems and Rails for Buildings.
 - 5. ASTM E985 – Standard Specification for Permanent Metal Railing Systems and Rails for Buildings.
- B. National Ornamental & Miscellaneous Metals Association:
 - 1. NOMMA Guideline 1 – Joint Finishes.
- C. SSPC: The Society for Protective Coatings:
 - 1. SSPC – Steel Structures Painting Manual.
 - 2. SSPC Paint 15 – Steel Joist Shop Primer/Metal Building Primer.
 - 3. SSPC Paint 20 – Zinc-Rich Coating, Type I – Inorganic and Type II – Organic.

1.03 DESIGN REQUIREMENTS

- A. Structural Performance: Engineer, fabricate and install handrails, guardrails and railing systems to withstand, when tested per ASTM E985, for structural performance based on

the following:

1. Testing performed according to ASTM E894 and E935.
- B. Structural Performance: Engineer, fabricate and install handrails and railing systems to withstand the following structural loads without exceeding the allowable design working stress of the materials involved, including anchors and connections. Apply each load to produce the maximum stress in each of the respective components of each metal fabrication.
 1. Guards: Capable of withstanding the following loads applied as indicated.
 - a. Concentrated Load: Single concentrated load of 200 lbs applied in any direction at any point along the top, and have attachment devices and supporting structure to transfer this loading to appropriate structural elements of the building.
 - b. Uniform load of 50 lbs per linear foot applied in any direction at the top and to transfer this load through the supports to the structure.
 - c. Concentrated and uniform loads above need not be assumed to act concurrently.
 2. Handrails: Capable of withstanding the following loads applied as indicated.
 - a. Concentrated Load: Single concentrated load of 200 lbs applied in any direction at any point along the top, and have attachment devices and supporting structure to transfer this loading to appropriate structural elements of the building.
 - b. Uniform load of 50 lbs per linear foot applied in any direction at the top and to transfer this load through the support to the structure.
 - c. Concentrated and uniform loads above need not be assumed to act concurrently.
 3. Components: Intermediate rails (all those except the handrail), balusters and panel fillers shall be designed to withstand a horizontal applied normal load of 50 pounds on an area equal to one square foot, including openings and space between rails.
 - a. Reactions due to this loading are not required to be superimposed with those of either B1 or B2 above.

1.04 SUBMITTALS

- A. Section 01 33 00 – Submittal Procedures: Submittal requirements.
- B. Shop Drawings: Indicate profiles, sizes, connection attachments, anchorage, size and type of fasteners and accessories.
 1. Shop Drawings shall be signed and sealed by a licensed engineer in the State of Texas.

1.05 QUALITY ASSURANCE

- A. Finish joints in accordance with NOMMA Guideline 1.

1.06 FIELD MEASUREMENTS

- A. Verify field measurements prior to fabrication.

PART 2 PRODUCTS

2.01 STEEL RAILING SYSTEM COMPONENTS

- A. Pipe: ASTM A53, Grade B, Standard Weight (Schedule 40)
 - 1. Size: 1 1/4 inches iron pipe size, outside diameter 1.66 inches, unless otherwise noted on the Drawings.
- B. Fittings: Wall brackets, cast steel.
 - 1. Wall Brackets: Universal steel wall brackets #1929-3 with 4579 filler 5/8" deep for use at metal stud / metal wall furring and gypsum wall board walls as manufactured by R & B Wagner Inc. or equal.
 - a. At masonry and concrete walls provide 1929.PL Universal steel wall brackets as manufactured by R & B Wagner Inc. or equal.
- C. Exposed Fasteners: Flush countersunk screws or bolts; consistent with design of railing.
- D. Splice Connectors: Steel concealed spigots.
- E. Galvanizing: All exterior handrails, guardrails and railings shall be hot-dip galvanized per ASTM A123/A123M; galvanize after fabrication.
- F. Shop Primer: SSPC Paint 15, Type 1 Red Oxide.
- G. Non-Shrink, Non-Metallic Grouts:
 - 1. Euco N-S Grout; Euclid Chemical Co.
 - 2. Crystex; L & M Construction Chemicals, Inc.
 - 3. 588 Grout; W.R. Meadows, Inc.
 - 4. SonogROUT 10K; Sonneborn Building Products – ChemRex, Inc.
- H. Erosion-Resistant Anchoring Cement:
 - 1. Commercial Anchor Cement; W.R. Bonsal Co.
 - 2. Super Por-Rok;CGM Incorporated.
 - 3. Thorogrip; Thoro Systems Products.
- I. Touch-Up Primer: Match shop primer.
- J. Rust Preventative/Anti-Corrosive Touch-Up Primer/Coating for Galvanized Surfaces: SSPC Paint 20, Type II Organic zinc rich.

1. ZRC Zero VOC Water-Based Galvanizing Compound as manufactured by ZRC Worldwide.
 2. VOC: 0 g/L
- K. Mounting brackets for removable handrails/guardrails:
1. Manufacturer: Safety Rail Company.
 2. Products:
 - a. Face Mount End, single post 400563.
 - b. Face Mount, two posts 400564.

2.02 FABRICATION

- A. Fit and shop assemble components in largest practical sizes for delivery to site.
- B. Fabricate components with joints tightly fitted and secured. Furnish spigots and sleeves to accommodate site assembly and installation.
- C. Exposed Mechanical Fastenings: Flush countersunk screws or bolts; unobtrusively located; consistent with design of component, except where specifically noted otherwise.
- D. Supply components required for anchorage of fabrications. Fabricate anchors and related components of same material and finish as fabrication, except where specifically noted otherwise.
- E. Exterior Components: Continuously seal joined pieces by continuous welds. Drill condensate drainage holes at bottom of members at locations not encouraging water intrusion.
- F. Interior Components: Continuously seal joined pieces by continuous welds.
- G. Exposed Welded Joints: NOMMA Guideline 1 Joint Finish 1.
- H. Accurately form components to suit stairs, ramps and landings, to each other and to building structure.
- I. Accommodate for expansion and contraction of members and building movement without damage to connections or members.
- J. Provide inserts and other anchorage devices to connect handrails and railing systems to concrete or masonry work. Fabricate anchorage devices capable of withstanding loads imposed by handrails and railing systems. Coordinate anchorage devices with supporting structure.
- K. For railing posts set in concrete, provide preset sleeves of steel, not less than 6 inches long with inside dimensions not less than 1/2 inch greater than outside dimensions of post, and steel plate forming bottom closure.
 1. In lieu of setting railing posts in preset sleeves, contractor may core drill concrete, minimum 6 inches deep with inside dimensions of not less than 1/2 inch greater than outside dimensions of post.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Section 01 30 00 – Administrative Requirements: Coordination and Project Conditions.
- B. Verify field conditions are acceptable and are ready to receive work.
- C. Verify concealed blocking and reinforcement is installed and correctly located to receive wall mounted handrails.

3.02 PREPARATION

- A. Supply items required to be cast into concrete with setting templates, to appropriate sections.

3.03 INSTALLATION

- A. Install components plumb and level, accurately fitted, free from distortion or defects.
- B. Anchor railings to structure with anchors, plates or angles.
- C. Field weld anchors as indicated on Drawings. Touch up welds with primer. Grind welds smooth.
- D. Conceal bolts and screws whenever possible. Where not concealed, use flush countersunk fastenings.
- E. Assemble with spigots and sleeves to accommodate tight joints and secure installation.
- F. Unless otherwise noted on the Drawings, install wall brackets at maximum 5'-0" on center.
- G. Anchor posts in concrete by forming or core-drilling holes not less than 6 inches deep and 1/2 inch greater than outside diameter of post. Set the centerline of the posts a minimum of 4 inches away from the vertical edge of concrete walks, ramps or steps. Clean holes of all loose material, insert posts, and fill annular space between post and concrete with the following anchoring material, mixed and placed to comply with anchoring material manufacturer's directions.
 - 1. Non-shrink, non-metallic grout or anchoring cement.
- H. Removable guardrails/handrails:
 - 1. For single posts provide face mount end brackets weld to steel.
 - 2. For two posts provide face mount brackets, weld to steel.

3.04 ERECTION TOLERANCES

- A. Section 01 40 00 – Quality Requirements: Tolerances.
- B. Maximum Offset from Alignment: 1/4 inch.

- C. Maximum Out-of-Position: 1/4 inch.

END OF SECTION

SECTION 06 10 53 – MISCELLANEOUS CARPENTRY

PART 1 GENERAL

1.01 WORK INCLUDED

- A. Roof curbs, cants and perimeter and miscellaneous nailers and exterior plywood sheathing.
- B. Blocking in wall and roof openings.
- C. Concealed wood blocking for support of wall-hung equipment, fixtures, accessories and where shown on Drawings.
- D. Telephone, electrical and technology panel backboards.
- E. Wood treatment.
- F. Separation sheet.
- G. Rigid wall backing plates.

1.02 RELATED SECTIONS

- A. Section 04 20 19 – Veneer Unit Masonry: Fasteners used to secure through-wall flashing to treated wood nailers.
- B. Section 04 43 13 – Mortar-Placed Stone Veneer: Fasteners used to secure through-wall flashing to treated wood nailers.
- C. Section 04 72 00 – Cast Stone Masonry: Fasteners used to secure through-wall flashing to treated wood nailers.
- D. Section 07 27 26 – Fluid-Applied Membrane Air Barriers: Covering preservative-treated materials with transition membranes.
- E. Section 07 54 23 – Thermoplastic Polyolefin Roofing: Covering preservative-treated materials with roof membrane and size and spacing of fasteners per FM requirements.
- F. Section 07 62 00 – Sheet Metal Flashings and Trim: Fasteners used to secure sheet metal flashing to treated wood nailers, blocking, curbs and cants.
- G. Section 07 72 33 – Roof Hatches.

1. DOC PS1 – Construction and Industrial Plywood.

2. DOC PS2 – Performance Standard for Wood-Based Structural-Use Panels.
 3. DOC PS 20 – American Softwood Lumber Standard.
- I. Wood Blocking at Grab Bars, Shower Seats and Bench Seats:
1. Grab bars, shower seats and dressing room bench seats shall be designed to resist a single concentrated load of 250 pounds applied in any direction at any point.

1.04 QUALITY ASSURANCE

- A. Lumber Grading Agency: Certified by DOC PS 20.
- B. Plywood Grading Agency: Certified by APA/EWA.
- C. Pressure-Treated Wood Treatment Facility: Provide treated materials that have been produced under an ALSC recognized quality assurance program.
- D. Wood Treatment Plant Qualifications: Wood treatment plant experienced in performing work of this section which has specialized in the treatment of wood similar to that required for this project and a plant licensed by treatment manufacturer.
- E. Apply label from agency approved by authority having jurisdiction to identify each fire retardant treated material.
- F. Treated Material: All preservative-treated wood members shall bear an end tag or permanent ink stamp indicating the following:
 1. Identification of the inspection agency.
 2. Identification of the standard to which the material was treated.
 3. Identification of the treating facility.
 4. Identification of the preservative and retention.
 5. Identification of the end use for which the product is suitable.
- G. Test Report for Fire Retardant Treatment: Certified test report showing compliance with specified performance characteristics and physical properties. Include in test report certification that fire retardant solution does not contain ammonium phosphate.
 1. Evaluation Report: National Evaluation Report ESR-1626 or ICBO ER-5755 indicating flame spread, strength, corrosion and hygroscopic properties.

1.05 SUBMITTALS

- A. Submit product data under provisions of Section 01 30 00.
- B. Wood treatment data as follows, including chemical treatment manufacturer's instruction for handling, storing, installing and finishing treated materials:

1. For fire-retardant-treated wood products, include certification by treating plant that treated materials comply with specified standard and other requirements as well as data relative to bending strength, stiffness and fastener-holding capacities of treated material.
 2. For preservative-treated materials, provide manufacturer's test results based on AWPA E12-94 Standard Test Method of Determining Corrosion of Metal In Contact With Treated Wood.
- C. Warranty of chemical treatment manufacturer for each type of treatment.
1. Fire Retardant Treatment: Provide manufacturer's 40-year preservative warranty covering fire-retardant-treated materials commencing on date of substantial completion.
- D. Fasteners: Provide manufacturer's recommendations for types of fasteners to be used with treated materials.

1.06 DELIVERY, STORAGE AND HANDLING

- A. Keep materials under cover and dry. Protect from weather and contact with damp or wet surface. Stack lumber, plywood and other panels. Provide for air circulation within and around stacks and temporary coverings. Store materials off the ground
- B. Allow materials exposed to incidental moisture to dry thoroughly prior to covering with vapor- or moisture-retarding finish materials.

PART 2 PRODUCTS

2.01 MATERIALS

- A. Lumber in accordance with DOC PS 20 and as follows:
 1. Softwood Lumber: Southern Pine species, #2 grade.
 - a. Where nominal sizes are indicated, provide actual sizes required by DOC PS 20 for moisture content specified.
 - b. Provide dressed lumber S4S, surfaced four sides.
 - c. Moisture content: Kiln dried to 19 percent maximum moisture content at time of dressing for lumber not to receive wood preservative or fire retardant treatment.
- B. Plywood in accordance with DOC PS 1 and as follows:
 1. Exterior
 - a. Not Exposed: APA rated all veneer plywood sheathing, exterior, Group 1 minimum 5 plies, of thickness shown on Drawings.
 - b. Moisture content of panels at time of shipment shall not exceed 18 percent.
 2. Interior

- a. Not Exposed: APA rated all veneer plywood sheathing, exposure 1, Group 1, minimum 5 plies, of thickness indicated on Drawings.
 - b. Moisture content of panels at time of shipment shall not exceed 18 percent.
- C. Plywood Backing Panels: For mounting electrical, telephone equipment, or technology equipment, APA rated all veneer plywood sheathing, Grade C-D plugged, exposure 1, minimum 5 plies, minimum 3/4 inch thick unless otherwise indicated.
1. Products shall contain no added formaldehyde resins.
- D. Separation Sheet: Provide only membranes with the ability to withstand temperatures over 240 degrees F.
1. Grace Construction Products/Grace Ice & Water Shield HT.
 2. Carlisle Coatings and Waterproofing/WIP 300 HT.
 3. Mid-States Asphalt Quik-Stick HT Pro.
- E. Wood blocking at grab bars, shower seats, bench seats, floor-mounted cabinets and wall-hung cabinets:
1. Provide a rigid wall backing system; Backit as manufactured by The Steel Network.
 2. Substitutions Permitted: Provide test reports verifying system will resist the following loads in accordance with the International Building Code:
 - a. Resist a minimum of 200 lbs. of concentrated load or 50 lbs. per linear foot in any direction.
 - b. Resist a concentrated load of 250 lbs.
 3. Material: ASTM A653, Grade 33, 33 ksi minimum yield strength, 45 ksi minimum tensile strength, G-60 hot-dipped galvanized coating. Material thickness 20 gauge, 33 mil.

2.02 ANCHORAGE AND FASTENING MATERIALS

- A. Select proper type, size, material and finish for each application. Comply with the following:
1. Nails and Staples: ASTM F 1667.
 2. Wood Screws: FS FF-S-111D(1).
 3. Bolts and Studs: FS FF-B-575D.
 4. Nuts: FS FF-N-836E.
 5. Washers: FS FF-W-92B(1).
 6. Lag Screws or Lag Bolts: ANSI-B18.2.1.
 7. Masonry Anchoring Devices: For expansion shields, nails and drive screws comply

with A-A-1922A.

8. Toggle Bolts.
 9. Bar or Strap Anchors: ASTM A575 carbon steel bars.
- B. Fasteners and Anchors: All fasteners and anchors used in contact with pressure-treated wood and in high humidity locations (lumber and plywood) shall be labeled as appropriate for use with the specified wood treatments and shall be:
1. Screws, nails and small bolts: Stainless steel Type 304 or 316, size and type to suit condition.
 2. 1/4-inch diameter and larger bolts: Hot-dipped galvanized per ASTM A153.
 3. Fasteners with proprietary anti-corrosion coatings may be submitted for use with treated wood, size and type to suit location. When submitted, the fastener manufacturer shall furnish specific information regarding the performance of their products in the specified treated wood and any precautions or special instructions that may be applicable.
 4. Anchors: Expansion shield and lag bolt type for anchorage to concrete and hollow masonry. Bolts or ballistic fasteners for anchorages to steel and concrete.
 5. At all non-treated and fire-retardant-treated locations, provide hot-dipped galvanized per ASTM A153 unless noted otherwise in Article 3.02, size and type to suit location.

2.03 FIRE-RETARDANT-TREATED MATERIALS

- A. General: Comply with AWWPA Standard U1. Identify fire-retardant-treated wood with appropriate classification marking of UL; U.S. Testing; Timber Products Inspection, Inc.; or another testing and inspecting agency acceptable to authorities having jurisdiction.
1. Manufacturer: Arch Wood Protection, Inc.
 2. Treatment Type: Interior Type A.
 3. Product: Dricon FRT.
- B. Inspect each piece of treated lumber or plywood after drying and discard damaged or defective pieces.
- C. Fire retardant chemicals shall be free of halogens, sulfates and ammonium phosphate, and must comply with FR-1 of AWWPA standard P17.
- D. All fire retardant treated wood shall be kiln dried after treatment to a moisture content of 19 percent for lumber and 15 percent for plywood
- E. The fire protection chemical shall provide protection against termites and fungal decay and must be registered for use as a wood preservative by the U.S. Environmental Protection Agency.

- F. Testing on the fire performance, strength and corrosive properties of the fire retardant treated wood shall be recognized by issuance of a National Evaluation Services Report.
- G. Carbon steel, galvanized steel, aluminum, copper and red brass in contact with the fire-retardant-treated wood must exhibit corrosion rates less than one mil per year when tested in accordance with Federal Specification MIL-L-19140, paragraph 4.6.5.2.
- H. All fire-retardant wood must have a listed flame spread of less than 25 and show no evidence of significant progressive combustion when the test is continued for an additional 20-minute period. Additionally, the flame front shall not progress more than 10 1/2 feet beyond the centerline of the burners at any time during the test. Test in accordance with ASTM E84 or UL 723.

2.04 PRESERVATIVE-TREATED MATERIALS

- A. Water-Borne Preservative: Ca-C, copper azole Type C.
- B. Lumber shall be Southern Pine treated with copper azole, Type C, in accordance with AWWA Standard U1, Commodity Specification A, to the requirements of Use Category 3B.
- C. Plywood shall be treated with copper azole, Type C, in accordance with AWWA Standard U1, Commodity Specification F, to the requirements of Use Category 3B.
- D. Moisture Content: Drying after treatment as follows:
 - 1. Lumber: 19 percent maximum.
 - 2. Plywood: 18 percent maximum.

PART 3 EXECUTION

3.01 FRAMING

- A. Set members level and plumb, in correct position.
- B. Place horizontal members crown side up.
- C. DO NOT rip or mill fire retardant lumber unless the material carries a ULI approved milling after treatment label. If lumber does not carry a ULI approved label, only end cuts, drilling holes and joining cuts are permitted. All cuts on plywood are considered end cuts. Where lumber is detailed with a bevel edge, cut lumber prior to treatment or provide treated red oak or yellow poplar.
- D. Securely attach carpentry work. Use fasteners of appropriate type and length. Coordinate with applicable specification section for size and spacing of fasteners.
- E. Separate all surfaces of preservative-treated wood in contact with the following materials using the sheet materials specified in Article 2.01. The separations sheet shall be installed continuously. Separation sheet materials which are not self-adhesive shall be fastened to the treated wood/plywood using stainless steel nails.
 - 1. Structural and non-structural steel (galvanized and ferrous).

2. Metal flashings and metal trim.

3.02 NAILERS

- A. Install nailers at all open eaves and edges, where wood cants are installed, where wood curbs are installed and where shown on Drawings. Nailers shall be treated wood blocks the same thickness as the roof insulation and shall be a minimum of 5-1/2 inches wide, unless otherwise noted on the Drawings.
- B. Secure wood nailers to roof structure in accordance with the current edition of ANSI/SPRI ES-1.
 1. Bottom nailers: Where the nailers are secured to the metal roof deck, install the bottom nailer to the metal deck with two rows of No. 10 steel screws spaced at 12 inches on center. Place a 5/8 inch outside diameter steel washer under the head of each screw. At corner regions, space screws at 6 inches on center. Each wood nailer shall have at least two fasteners. A fastener shall be located approximately 4 inches but not less than 3 inches from each end.
 - a. Screws and washers installed in preservative-treated wood shall be:
 - 1) Stainless steel type 304 or 316;
 - 2) Proprietary anti-corrosion coatings which have been recommended by manufacturer for use with preservative-treated materials.
 2. Bottom nailers: Where the nailers are secured to steel angles/plates, install the bottom nailer to the steel angle/plate with hot-dipped galvanized steel bolts or hot – dipped galvanized threaded studs welded to angle/plate, hot-dip galvanize per ASTM A153. Bolts/studs shall be 1/2 inch diameter with nuts and washers spaced at 48 inches on center. At corner regions, place bolts/studs at 24 inches on center. Each bolt shall have two washers, one under each bolt head and one under each nut. Each stud shall have one washer under each nut. For wood nailers wider than 5-1/2 inches, bolts/studs shall be staggered. Each wood nailer shall have at least two bolts/studs. A bolt/stud shall be located 4 inches from each end of wood nailer.
 3. Top nailers: Secure top nailers to bottom nailer with annular ring shank nails. Nails shall be long enough to penetrate 1-1/4 inches into the bottom nailer and each additional nailer layer. Provide two rows staggered spaced at 12 inches on center. maximum. Spacing shall not exceed 6 inches, at corner regions. Withdrawal resistance should be 200 lb per nail.
 - a. Nails installed in preservative-treated wood shall be:
 - 1) Stainless steel type 304 or 316;
 - 2) Proprietary anti-corrosion coatings which have been recommended by manufacturer for use with preservative-treated materials.
 - C. Secure wood nailers around the perimeter of openings in the exterior wall of metal stud construction with the following fasteners:
 1. At window openings secure the 2 x wood nailers plus two layers of 5/8 inch plywood, unless otherwise noted on the drawings (preservative treated/fire-retardant treated) through the 1/2 inch sheathing to the metal stud framing using Rodenhouse Inc., #10 Grip Deck Ceramic Coated self-drilling screws. Pre drill wood.

- a. At 3 ½ inch wide material provide two fasteners centered as shown, spaced at maximum 16 inches on center. Ensure fasteners engage metal stud framing minimum 4 pitches of thread.
- b. At 5 ½ inch wide material provide two vertical rows of fasteners, spaced as shown at maximum 16 inches on center. Ensure fasteners engage metal stud framing minimum 4 pitches of thread.

3.03 SCHEDULING

- A. Roof cant, roof nailers, roof blocking, roof curbing:
 1. Southern pine species for lumber, preservative treated.
 2. Group 1, exterior grade for veneer core plywood, preservative treated.
- B. Blocking/nailers in exterior cavity wall openings:
 1. Southern pine species for lumber, preservative treated.
 2. Group 1, exterior grade for veneer core plywood, preservative treated.
- C. Blocking/nailers in exterior wall openings:
 1. Southern pine species for lumber, preservative treated.
 2. Group 1, exterior grade for veneer core plywood, preservative treated.
- D. Wood blocking at window heads:
 1. Southern pine species for lumber, fire-retardant treated.
 2. Group 1, exterior grade for veneer core plywood, fire-retardant treated.
- E. Concealed wood blocking in interior metal stud partitions for supporting washroom accessories, door stops, toilet partitions, wall-hung equipment, markerboards, tackboards, projection screens, acoustic wall panels, steel support brackets, etc:
 1. Southern pine species for lumber, untreated. Wood blocking or nailers on metal stud framing shall be bolted to framing.
- F. Concealed wood blocking in interior metal stud partitions for supporting grab bars, shower seats, bench seats, floor-mounted cabinets and wall-hung cabinets.
 1. 2 by 6 Southern pine, untreated, installed with Backit rigid wall backing. Provide an approved hot-dipped galvanized screw fastener in each guide hole in the rigid wall backing plate.
- G. Telephone, electrical and technology panel boards:
 1. Fire-retardant-treated veneer core plywood panel. Paint panel black.

END OF SECTION

SECTION 06 16 43 – GYPSUM SHEATHING

PART 1 GENERAL

1.01 WORK INCLUDED

- A. Glass-Faced Wall Sheathing.
- B. Roof Board.

1.02 RELATED SECTIONS

- A. Section 01 60 00 – Product Requirements: Substitutions.
- B. Section 05 40 00 – Cold-Formed Metal Framing.
- C. Section 06 10 53 – Miscellaneous Carpentry.
- D. Section 07 27 26 – Fluid-Applied Membrane Air Barriers: Sealing joints in glass-faced sheathing.
- E. Section 07 54 23 – Thermoplastic Polyolefin Roofing: Securing roof membrane to roof board.

1.03 REFERENCES

- A. ASTM C473 – Standard Test Methods for Physical Testing of Gypsum Panel Products.
- B. ASTM C518 – Standard Test Method for Steady-State Thermal Transmission Properties by Means of Heat Flow Meter Apparatus.
- C. ASTM C954 – Standard Specification for Drill Screws for the Application of Gypsum Board or Metal Plaster Bases to Steel Studs from 0.033 in. to 0.112 in. in thickness.
- D. ASTM C1002 – Standard Specification for Steel Self-Piercing Tapping Screws for the Application of Gypsum Panel Products or Metal Plaster Bases to Wood Studs or Steel Studs.
- E. ASTM C1177 – Standard Specification for Glass Mat Gypsum Substrate for Use as Sheathing.
- F. ASTM C1280 – Standard Specification for Application of Gypsum Sheathing.
- G. ASTM D3273 – Standard Test Method for Resistance to Growth of Mold on the Surface of Interior Coatings in an Environment Chamber.
- H. ASTM E72 – Standard Test Methods of Conducting Strength Tests of Panels for Building Construction.
- I. ASTM E84 – Standard Test Method for Surface Burning Characteristics of Building Materials.
- J. ASTM E96 – Standard Test Methods for Water Vapor Transmission of Materials.

- K. ASTM E119 – Standard Test Methods for Fire Tests of Building Construction and Materials.
- L. ASTM E136 – Standard Test Method for Behavior of Materials in a Vertical Tube Furnace at 750 degrees C.

1.04 SUBMITTALS

- A. Section 01 33 00 – Submittal Procedures.
- B. Product Data: Submit technical data on sheathing and roof board.
- C. Manufacturer's Certificate: Certify products meet or exceed specified requirements.
 - 1. Roof board manufacturer shall verify in writing, that the material is compatible with roof membrane system.

1.05 QUALITY ASSURANCE

- A. Mold Resistance:
 - 1. Wall sheathing and roof boards shall receive a score of 10 indicating no mold growth detected in the category of mold and mildew resistance when tested in accordance with ASTM D3273.
- B. Standards:
 - 1. Wall sheathing and roof board shall meet or exceed ASTM C1177.
- C. Fire Performance, Wall Sheathing and Roof Board:
 - 1. Maximum flame spread – 10, maximum smoke developed – 0, when tested in accordance with ASTM E84.
 - 2. Non-combustible when tested in accordance with ASTM E136.
- D. Warranties:
 - 1. Wall Sheathing:
 - a. Wall sheathing shall have a 12-month exposure warranty.
 - b. Wall sheathing shall have a 5-year warranty against manufacturing defects.
- E. Compatibility:
 - 1. Wall sheathing and roof boards shall be compatible with materials specified in Division 7 which are to be installed directly to the sheathing and roof boards.

1.06 DELIVERY, STORAGE AND HANDLING

- A. Store and protect products under provisions on Section 01 60 00 – Product Requirements: Product storage and handling requirements.

- B. Delivery: Deliver materials to the job site in manufacturer's original packaging, containers and bundles with manufacturer's brand name and identification intact and legible.
- C. Store materials protected against damage from weather, direct sunlight, surface contamination, construction traffic or other causes. Stack sheathing and roof boards flat on leveled supports off the ground, under cover and fully protected from weather.
 - 1. Store and support sheathing and roof board in flat stacks to prevent sagging.
 - 2. Protect materials to keep them dry. Do not permit the entrapment of moisture or condensation.
 - 3. Protect gypsum board panels to prevent damage to edges, ends and surfaces.

PART 2 PRODUCTS

2.01 GLASS-FACED GYPSUM WALL SHEATHING

- A. Glass-Faced Sheathing: Composition, gypsum sheathing board core in accordance with ASTM C1177 with glass mats both sides and long edges.
 - 1. Products/Manufacturers:
 - a. DensGlass exterior sheathing/Georgia Pacific.
 - b. GlasRoc sheathing with EGRG technology/CertainTeed Gypsum, Inc. Securock glass-mat sheathing/USG.
 - c. eXP/National Gypsum.
 - d. Substitutions permitted: Product shall comply with ASTM C1177 and shall have been tested in accordance with ASTM D3273 and receive a value of 10, and requirements of this section.
 - 2. Thickness: 1/2 inch
 - 3. Size: 4'-0" by 8'-0"

2.02 ROOF BOARD

- A. Roof Board:
 - 1. Product/Manufacturer:
 - a. Georgia-Pacific DensDeck Prime with Eonic Technology: Verify in writing product is compatible with specified roofing membrane.
 - b. Substitutions permitted: Product shall comply with ASTM C1177 and shall have been tested in accordance with ASTM D3273 and receive a value of 10 and requirements of this section. Verify in writing product is compatible with specified roofing membrane.
 - 2. Thickness: 1/2 inch.
 - 3. Edges: Square.
 - 4. Size: 4'-0" by 8'-0"

2.03 ACCESSORIES

- A. Steel drill screws complying with ASTM C1002 for the following locations:
 - 1. Fastening glass-faced sheathing and roof board to steel members less than 0.033 inch thick.
 - 2. Fastening glass-faced sheathing and roof board to wood members using 1 ¼ inch bugle head coarse thread sharp point screw.
- B. Steel drill screws complying with ASTM C954 for fastening glass-faced sheathing and roof board to steel members from 0.033 to 0.112 inch thick.
- C. All fasteners shall be corrosion resistant. All fasteners and anchors used in contact with treated wood and in high humidity locations (lumber and plywood) shall be labeled as appropriate for use with the specified wood treatments and shall be:
 - 1. Stainless steel Type 304 or 316.
 - 2. Fasteners with proprietary anti-corrosion coatings may be submitted for use with treated wood. When submitted, the fastener manufacturer shall furnish specific information regarding the performance of their products in the specified treated wood and any precautions or special instructions that may be applicable.
 - 3. At non-preservative-treated and fire-retardant-treated locations, provide hot-dipped galvanized fasteners per ASTM A153, unless otherwise noted.

PART 3 EXECUTION

3.01 GLASS-FACED SHEATHING

- A. Glass-Faced Sheathing (Exterior Wall Sheathing)
 - 1. General: Provide glass-faced board sheathing in the cavity behind the stone/masonry veneer, behind metal wall and soffit panels, and where noted on the Drawings. Fasten to exterior heavy gauge stud framing using 1 1/4 inches, type S-12 bugle head self-tapping corrosion-resistant fine thread screw fasteners for 1/2 inch and 5/8 inch thick sheathing. For light gauge metal framing use 1 1/4 inches, Type S bugle head, corrosion-resistant sharp point, fine thread screws for 1/2 inch and 5/8 inch thick sheathing. Attach sheathing perpendicular (horizontal) to framing, with end joints staggered not less than one stud spacing. Abut ends of boards over centers of stud flanges. Keep perimeter fasteners 3/8 inch from edges and ends of board units. Fit boards tightly against each other and around openings.
 - 2. Install sheathing in accordance with manufacturer's instructions and applicable instructions in GA-253. Apply DensGlass gold side, side labeled USG Securock, CertainTeed GlasRoc or National Gypsum logo side out. Center end joints over supports and stagger in each course. Attach with screws to each support in accordance with manufacturer's recommended spacing, but provide not more than 8 inches o.c. at perimeter and 8 inches o.c. in the field. Drive fasteners to bear tight against and flush with surface of sheathing. Do not counter sink.

3.02 ROOF DECK BOARD

A. Roof Board

1. General: Provide roof deck board on the roof side of the parapets where the roof membrane is adhered to the roof board and locations noted on the Drawings. Install DensDeck Prime with green side out. Space fasteners a maximum of 8 inches o.c. around the perimeter and 8 inches o.c. in the field of the panel. Fasteners shall be approved by the board manufacturer. Panels shall be kept dry before, during and after installation. Install only as much roof board as can be covered by roof membrane system in the same day.

END OF SECTION

SECTION 06 41 16 – PLASTIC-LAMINATE-CLAD ARCHITECTURAL CABINETS

PART 1 GENERAL

1.01 SUMMARY

- A. Base and wall cabinets, laminated, factory finished.
- B. Countertops.
- C. Cabinet hardware.
- D. Preparation for installing utilities.
- E. Shelving.
- F. Definitions of Casework Items:
 - 1. Exposed Surfaces:
 - a. Exposed exterior surfaces, defined as all exterior surfaces exposed to view, include:
 - 1) All surfaces visible when doors and drawers are closed, including knee spaces.
 - 2) Underside of cabinet bottoms over 42 inches above the finished floor, including cabinet bottoms behind light valances and the bottom edge of light valances.
 - 3) Cabinet tops under 80 inches above the finished floor.
 - 4) Front edges of stretchers, ends, divisions, tops, and bottoms.
 - 5) Sloping tops of cabinets that are visible.
 - b. Exposed interior surfaces, defined as all interior surfaces exposed to view in open casework or behind transparent doors, include:
 - 1) Shelves, including edgebanding.
 - 2) Divisions and partitions (Front edge is an exposed surface).
 - 3) Interior face of ends (sides), backs and bottoms (including pull-outs). Also included are the interior surfaces of cabinet top members 36 inches or more above the finished floor.
 - 4) Interior face of door and applied drawer fronts.
 - c. Semi-exposed surfaces, defined as those interior surfaces only exposed to view when doors or drawers are opened, include:
 - 1) Tops and bottoms of shelves, including front edge banding (Front edge is an exposed surface).
 - 2) Divisions and partitions (Front edge is an exposed surface).
 - 3) Interior face of ends (sides), backs and bottoms (including a bank of drawers). Also included are the interior surfaces of cabinet top members 36 inches or more above the finished floor.
 - 4) Drawer sides, sub-fronts, backs and bottoms.
 - 5) The underside of cabinet bottoms between 24 inches and 42

- 6) inches above the finished floor.
- 6) Security and dust panels or drawer stretchers.
- d. Concealed surfaces, defined as those exterior or interior surfaces that are covered or not normally exposed to view include:
 - 1) Toe space unless otherwise specified.
 - 2) Sleepers, stretchers and solid sub-tops.
 - 3) The underside of cabinet bottoms less than 24 inches above the finished floor.
 - 4) The flat tops of cabinets 80 inches or more above the finished floor.
 - 5) The three non-visible edges of adjustable shelves.
 - 6) The underside of countertops, knee spaces and drawer aprons.
 - 7) The faces of cabinet ends of adjoining units that butt together.
- G. Cabinet Construction:
 - 1. Frameless construction where the front edge of the cabinet body components are edgebanded.
- H. Cabinet and door/drawer:
 - 1. Flush overlay, Figure 10-057 of the Architectural Woodwork Standards, 2nd Edition.

1.02 RELATED SECTIONS

- A. Section 06 10 53 – Miscellaneous Carpentry: Securing wall and floor mounted cabinets to wood blocking.
- B. Section 06 61 16 – Solid-Surfacing Fabrications.
- C. Section 09 90 00 – Painting and Coating: Field painting work station brackets.

1.03 REFERENCES

- A. American National Standards Institute:

1.04 SUBMITTALS

- A. Section 01 33 00 – Submittal Procedures.
- B. Submit product data for each type of product specified in this section and incorporated into items of casework.
- C. Shop Drawings: Indicate materials, component profiles and elevations, assembly methods, joint details, fastening methods, accessory listings, hardware location, and schedule of finishes.
 1. Show locations and sizes of furring, blocking and hanging strips specified in Section 06 10 53.
- D. Samples: Submit two 8-inch by 10-inch size samples, illustrating each cabinet finish specified.

1.05 QUALITY ASSURANCE

- A. Perform work in accordance with AWI Custom quality, as the minimum standard unless a higher standard of construction is specified throughout this specification.

1.06 DELIVERY, STORAGE AND HANDLING

- A. Deliver, store and handle products to site under provisions of Section 01 60 00 – Product Requirements and AWI Section 2 – Care and Storage.

- B. Protect units from moisture damage.
- C. Environmental Conditions: Obtain and comply with woodwork manufacturer's and installer's coordinated advice for optimum temperature and humidity conditions for woodwork during its storage and installation. Do not install woodwork until these conditions have been attained and stabilized from date of installation through remainder of construction period.

1.07 FIELD MEASUREMENTS

- A. Verify that field measurements are as indicated on Shop Drawings.

PART 2 PRODUCTS

2.01 HARDWOOD LUMBER

- A. Graded in accordance with AWI: Average moisture content of 6-8 percent, species yellow poplar, plain sawn.
- B. Graded in accordance with AWI: Average moisture content 6-8 percent, species yellow birch natural, plain sawn.

2.02 SHEET MATERIALS

- A. Medium-Density Fiberboard (MDF) Panels

- 1. Material:
 - a. Wood Fiber: 100 percent pre-consumer recycled wood residuals
 - b. Binder: Formaldehyde-free adhesive system.
- 2. Conformance: ANSI A208.2, industrial-grade MDF.
- 3. Panel Thickness: 3/4-inch.
- 4. Moisture Resistant: ASTM D1037, 6-cycle accelerated aging test.
- 5. Physical Properties:
 - a. Density: 48 pounds per cubic foot.
 - b. Internal Bond: 200 psi.
 - c. Modulus of Rupture: 6,000 psi.
 - d. Modulus of Elasticity: 600,000 psi.
 - e. Screw Holding: Required to pull 1-inch #10 sheet metal screw.
 - 1) Face: 350 lbs.
 - 2) Edge: 275 lbs.
 - f. Water Absorption: 5 percent average, 24-hour soak.
 - g. Thickness Swell: 3 percent average, 24-hour soak.
 - h. Linear Expansion: 0.30 percent, dimensional change in length and width due to humidity change.
 - i. Flame Spread: ASTM E84; Class C

- j. Moisture Content: 4 to 6 percent average, oven dry.
- k. Formaldehyde Emissions: 0.01 ppm

6. Manufacturer/Product:

- a. Sierra Pine/Medex complying with ANSI A208.2-2009 Grade 155, MR50 or approved equal per Section 01 60 00.

7. Use: Countertops and backsplash.

B. Medium-Density Fiberboard (MDF) Panels:

1. Material:

- a. Wood Fiber: 100 percent pre-consumer recycled wood residuals.
- b. Binder: Formaldehyde-free adhesive system

2. Conformance: ANSI A208.2 industrial-grade MDF.

3. Panel Thickness: 3/8-inch, 1/2-inch, 3/4-inch and 1 inch.

4. Physical properties, based on 3/4-inch thickness:

- a. Density: 48 pounds per cubic foot.
- b. Internal Bond: 150 psi.
- c. Modulus of Rupture: 5,500 psi.
- d. Modulus of Elasticity: 550,000 psi.
- e. Modulus of Hardness, Janka Ball: 1,150 pounds.
- f. Screw Holding: Required to pull 1 inch #10 sheet metal screw.

- 1) Face: 350 lbs.
- 2) Edge: 275 lbs.

- g. Water Absorption: 6.5 percent average, 24-hour soak.
- h. Thickness Swell: 3.5 percent average, 24-hour soak.
- i. Linear Expansion: 0.27 percent dimensional change in length and width due to humidity change.
- j. Flame Spread Rating: ASTM E84; Class C.
- k. Moisture Content: 6 percent average, oven dry basis
- l. Formaldehyde Emissions: 0.01 ppm.

5. Manufacturer/Product:

- a. Sierra Pine/Medite II complying with ANSI A208.2-2009 Grade 155 or approved equal per Section 01 60 00.

2.03 LUMBER

- A. Lumber Base: Preservative-treated lumber or preservative-treated 5-ply veneer core plywood.

2.04 MANUFACTURERS – PLASTIC LAMINATE

- A. Refer to finish schedule for manufacturer.

2.05 LAMINATE MATERIALS

- A. Plastic Laminate: High Pressure Decorative Laminate, NEMA LD3, Current Edition, for type; color, pattern, and finish indicated.
 - 1. General Purpose, Horizontal and High Usage Exposure: NEMA Standard HGS, nominal thickness 0.048 inches.
 - 2. General Purpose, Vertical and Medium Usage Exposure: NEMA Standard VGS, nominal thickness 0.028 inches.
 - 3. Cabinet Liner: NEMA Standard CLS, nominal thickness 0.020 inches.
 - 4. Unfinished Backing Sheet: NEMA Standard BKL, nominal thickness 0.020 inches.
- B. Thermoset Decorative Overlay: Decorative surfaces of thermally fused polyester or melamine impregnated web, pre-laminated to specified substrate and complying with Composite Panel Association.
 - 1. Substrate: Medium-density fiberboard.
 - 2. Interior Finish Color:
 - a. White.

2.06 ACCESSORIES

- A. Contact Adhesive and Sealants: As recommended by fabricator.
- B. MDF water proof edge sealer:
 - 1. Two- part epoxy system as manufactured by The West System.
 - a. Part A, West System 105 Epoxy Resin.
 - b. Part B, West System 206 Slow Hardener.
- C. Edging: High-pressure laminate and 3mm PVC, as noted.
- D. Cable Grommet with 90-Degree Rotating Top: Hafele 60 mm diameter opening, Cat. No. 631.26.301, color black.
- E. Fasteners: Size and type to suit application.
 - 1. To secure base cabinets to preservative treated wood, use hot-dipped galvanized fasteners complying with ASTM A153 or Type 304 or 316 stainless-steel fasteners.
- F. Bolts, Nuts, Washers, Lags, Pins and Screws: Of size and type to suit application; finish in exposed locations. Shall match finish of hardware. **Note:** The use of drywall screws is not permitted. Use heavy shank steel screws.
- G. Concealed Joint Fasteners: Threaded steel.
- H. Dowels: Minimum 5/16 inch by 1 3/16 inches.

I. Dowel Screw: Minimum 9/32 inch by 2 inches.

J. Biscuits: #30.

2.07 HARDWARE

A. Hardware: Shall conform to ANSI/BHMA A156.9, "American National Standard for Cabinet Hardware" and BIFMA, "Business and Institutional Furniture Manufacturers' Association," Current Edition.

B. Shelf Supports for 5mm Hole: Knappe and Vogt #345 NP.

1. Shelf support shall meet ANSI/BHMA A156.9 Grade 1 requirements and test standard.

C. Wire Drawer and Door Pulls: Stanley #4484-US26D, 4 inch.

D. Hinges: European style conforming to ANSI/BHMA A156.9 Grade 1 performance and permanent set test requirements and as follows:

1. 170-degree opening.

2. Self-closing

3. All metal construction.

4. Use two per door for doors up to 36 inches high, three per door for doors up to 60 inches high, four per door for doors up to 80 inches high.

5. Provide screws as recommended by hinge manufacturer appropriate to specified panel product.

E. Cabinet Locks: Olympus Lock, Inc., Deadbolt Locks.

1. Cabinet door lock:

a. Olympus 721DR (door) Cabinet locks: Locks to accept 6 or 7 pin small format interchangeable core cylinders as supplied by Best, Arrow, Falcon, KSP or equivalent. Verify with District. All locks to be field reversible and to provide dedicated door functions in order to maintain keyway verticality when installed. Include strikes and spacers as required for flush fit with outside face of casework material. Locks will provide disassembly/reassembly features to facilitate on-the-job maintenance. Unless noted otherwise provide one lock at each cabinet door and drawer.

b. Function: Key removable in locked or unlocked position.

c. Cylinder length: 1 3/8 inches.

d. Finish: US26D.

e. Keying: Keyed to room in which locking cabinet is located, unless otherwise noted.

- 1) Verify with District.
2. Cabinet drawer lock:
 - a. Olympus 721DW (drawer) Cabinet locks: Locks to accept 6 or 7 pin small format interchangeable core cylinders as supplied by Best, Arrow, Falcon, KSP or equivalent. Verify with District. All locks to be field reversible and to provide dedicated door and drawer functions in order to maintain keyway verticality when installed. Include strikes and spacers as required for flush fit with outside face of casework material. Locks will provide disassembly/reassembly features to facilitate on-the-job maintenance.
 - b. Function: Key removable in locked or unlocked position.
 - c. Cylinder length: 1 3/8 inches.
 - d. Finish: US26D.
 - e. Keying: Keyed to room in which locking cabinet is located, unless otherwise noted.
 - 1) Verify with District.
 3. Unless noted otherwise provide one lock at each cabinet door and drawer.
- F. Spring-Loaded Elbow Catch: H'A'FELE #245.74.200. Provide one catch on the inactive leaf of each pair of doors noted to be locked.
- G. Drawer Slides:
1. All drawer slides shall be tested in accordance with ANSI/BHMA A156.9 and in accordance with BIFMA standards.
 2. Box and File Drawers: Accuride 7432, 100 lb. load rating, side mounting, steel ball bearing, full extension, for drawer widths up to 24 inches wide and drawer depths deeper than 6 inches.
 - a. Finish: Clear zinc (ROHS compliant)
 3. Large Storage, Lateral Files: Accuride 3640, 200 lb. load rating, side mounting, steel ball bearing, over travel, for drawer widths 24 inches to 42 inches.
 - a. Finish: Clear zinc (ROHS compliant)
- H. Magnetic Catch: Knape & Vogt 918 ALUM.
- I. Door and Drawer Bumpers: Clear plastic bumpers.
- J. Surface Bolts: Provide two on the inactive leaf of the 3'-0" by 7'-0" casework units.
- M. Concealed Flat Brackets: A&M Hardware, Inc.
1. Extended Concealed Flat Brackets:

- a. ½ inch steel.
 - b. 26 inches by 26 inches, 2.0 ECFLAT24
 - c. Load to deformation (lbf): 1,700 per pair.
Color: Black.
Maximum spacing: 36 inches on center.
2. Concealed Flat Brackets:
- a. ½ inch steel.
 - b. 26 inches by 18 inches, 2.0 CFLAT24
 - c. Load to deformation (lbf): 1,150 per pair.
 - d. Color: Black.
 - e. Maximum spacing: 36 inches on center.

2.08 FABRICATION

- A. Casework, Laminate: Shall conform to the design and details shown of the Drawings, and shall meet the requirements for casework as defined in the Architectural Woodwork Standards current edition, Section 10 – Casework, for Custom Grade woodwork for laminate finish.
1. Construction Style:
 - a. Flush Overlay Style: Provide base, wall and full height units with drawer fronts, doors and fixed panels (if any) overlaying and concealing frames and sides of cabinet bodies, Architectural Woodwork Standards, Construction Frameless – Flush Overlay.
 2. Cabinet Construction:
 - a. Laminate Cabinets: Laminate facings conforming to Architectural Woodwork Standards, Section 10 – Casework.
 - 1) Exposed exterior surfaces finish: High-pressure decorative laminate as specified.
 - 2) Exposed interior surfaces finish: High-pressure decorative laminate as specified, matching color of exposed exterior laminate unless noted otherwise.
 - 3) At inside face of door and drawer fronts: Same material and thickness as the face.
 - 4) Semi-exposed surfaces finish:
 - a) Thermally fused melamine
 - 5) Drawer sides, back and sub-fronts:
 - a) Minimum thickness: 1/2-inch.
 - b) Material: Single-species solid lumber.
 - b. Joinery and Fastening of Case Body Members. Refer to Architectural Woodwork Standards, Section 10. Case body members shall be joined in accordance with Architectural Woodwork custom grade standards as listed below:

- 1) Exposed Ends (finished ends on casework shall be integral, not applied secondarily): Rabbeted or plowed to receive backs. Horizontal members, excluding countertops shall not extend beyond the exposed ends.
- 2) Concealed Ends: Rabbeted or plowed to receive backs.
- 3) Cabinet Backs: Where non-plowed/dadoed in housed shall be screwed to the case body, divisions and/or fixed shelves at a maximum of 4 inches on center.
- 4) Cabinet Backs: Where plowed-in with a minimum shoulder of 3/8 inch shall be securely nailed or stapled to the case body at a maximum of 4 inches on center.
- 5) No nails, screws or other fastenings may be visible on exposed or semi-exposed surfaces.
- 6) Rails or top panels must be provided where case will have a separate top, in order to permit concealed fastening of the separate top through such rails.
- 7) Anchor Strips: Minimum 1/2-inch-thick lumber or panel product, minimum 2-1/2-inches width; securely glued and mechanically attached to cabinet body members at 4 inches on center on the wall side of the cabinet back-top and bottom for wall hung and floor mounted standing cabinets. Cabinet heights over 60 inches require an intermediate anchor strip.

c. Component Construction: Wall and base cabinet.

- 1) Doors: 3/4-inch thick MDF with VGS high-pressure plastic laminate on both sides. At tall cabinets provide 1-inch MDF with VGS high-pressure plastic laminate on both sides. **Note:** Laminate face side and thermoset decorative overlay back side not permitted on doors. Apply laminate to both faces in the same machine direction.
 - a) Edging: 3 mm PVC.
 - b) No cabinet door shall be more than 24 inches wide and 84 inches high.
 - c) Stop silencers to be installed at the top and bottom of all hinged doors on the closing edge.
 - d) Doors shall stop, as applicable, against the cabinet body at the bottom, sides and top stretcher. At paired doors below a drawer, a rail, stretcher or partition shall be provided.
 - e) Locking pairs:
 - i. Provide an elbow catch on the inactive leaf and a stop block. The stop block shall be adequate to prevent the latch of the elbow catch/latch from being defeated by applying pressure on the door.
 - ii. Full height doors with a fixed mid-height shelf shall have an elbow catch/latch on the inactive leaf of the fixed shelf.
 - iii. Full height doors without fixed shelf shall have a surface-mounted slide bolt.

- 2) Drawer Fronts: 3/4-inch thick MDF with VGS high-pressure plastic laminate on both sides. **Note:** Laminate face side and thermoset decorative overlay back side not permitted on drawers.
 - a) Edging: 3 mm PVC.
 - b) Secure to drawer box sub-front with pan/binder head, countersunk flathead or oval head screws with a minimum of two screws at each end a maximum of 1 1/2-inches from inside corners of the drawer box and a maximum of 12 inches on center.
 - c) False fronts shall be securely attached to the cabinet body.
- 3) Exposed End Panels: 3/4-inch thick MDF thermally fused melamine panel with VGS high-pressure laminate on exposed face. Where exposed end panel surfaces are exposed to view (interior and exterior), provide VGS high-pressure laminate on both surfaces.
 - a) Edging: VGS high-pressure laminate on exposed edge.
- 4) Concealed end panels (Faces of cabinet ends of adjoining units that butt together): 3/4-inch thick MDF thermally fused melamine panels at semi-exposed side. At exposed end, provide VGS high-pressure plastic laminate.
 - a) Edging: 3 mm PVC on exposed surfaces.
- 5) Division Panels: 3/4-inch thick MDF.
 - a) At semi-exposed surfaces provide thermally fused melamine on both faces.
 - b) At exposed surfaces provide VGS high-pressure laminate on both sides.
 - c) Edging: 3 mm PVC on exposed edges.
- 6) Base Cabinet Bottoms: 3/4-inch thick MDF thermally fused melamine panels at semi-exposed panels. At exposed panels provide HGS high-pressure laminate.
 - a) Edging: 3 mm PVC on exposed surfaces.
- 7) Tops of Wall-Hung Cabinets and Tall Cabinets: 3/4-inch thick MDF thermally fused melamine panels at semi-exposed panels. At exposed panels provide VGS high-pressure laminate.
 - a) Edging: 3 mm PVC on exposed edges.
- 8) Bottoms of Wall-Hung Cabinets: 3/4-inch thick MDF thermally fused melamine panels at semi-exposed panels. At exposed panels provide HGS high-pressure laminate.
 - a) Edging: 3 mm PVC on exposed edges.
 - b) When unsupported do not exceed 48 inches in length. Over 48 inches provide center support.

- 9) Security and Dust Panels: 1/2-inch thick MDF.
 - a) Furnish above locked doors and drawers, only if each drawer or door is keyed differently.
 - b) Where front and rear stretchers are provided, the panel may be 1/4-inch thick and let into the stretchers.

- 10) Stretchers (Only Required to Base Cabinets with Separate Countertops) Coordinate with Section 06 61 16 – Solid Surfacing Fabrications for countertop supports:
 - a) Solid stock: 3/4-inch thick by 2 inches wide.
 - b) MDF: 3/4-inch thick by 5 inches wide, reinforced as necessary to support the countertop.
 - c) Provide stretchers at both the front and back of the cabinet body except at sink compartments, which may run front to back.
 - d) In lieu of stretchers a panel member of 3/4-inch MDF specified for use in counters or 3/4 inch, minimum 5 ply veneer core plywood with Type I adhesive which runs the full length and depth of the cabinet opening may be used.
 - e) At drawer banks where the total drawer opening height exceeds 30 inches provide an intermediate front stretcher.

- 11) Drawer Boxes (Sides, Backs, Sub-Fronts): 1/2-inch thick, single-species solid hardwood lumber with a hardness rating of medium or better per Appendix B, Section 3 – Lumber of the standards, factory finished with minimum one seal coat and one top coat, sides, backs and sub-fronts. Joints to be doweled and glued under pressure. Provide a minimum of two per joint. Dowels shall be spaced a maximum 1 1/4-inches on center for joints up to 4 inches in length and 2 1/2-inches on center for joints over 4 inches in length. Optional fastening methods include multiple-dovetailed or biscuit-joined under pressure. Biscuits shall be spaced a maximum of 3 inches on center, minimum two per biscuits per joint. All joints shall be securely glued.

- 12) Drawer Bottom: Minimum 1/4-inch thick MDF thermally fused melamine panels, balanced.
Note: Where drawer exceeds 30 inches in width, or bottom-mount hardware is required, the drawer bottom shall be a minimum of 1/2-inch thick MDF thermally fused melamine panels, balanced. The drawer bottom shall be plowed into drawer sides, back and sub-fronts 1/4-inch, and securely glued to form a rigid unit. Provide a minimum 3/8-inch standing shoulder on sides, back and sub-front.

- 13) Drawer Hardware, Locks:
 - a) Drawer slides to operate smoothly.
 - b) Provide closing stops at the rear of both drawer sides, unless such is built into the slides to prevent the drawer from impacting the cabinet body.
 - c) Spring-loaded tip-down stop to be provided (design permitting) to prevent the drawer from pulling out of the cabinet, unless such is built into the drawer slides.

- d) At locked banks of drawers where each drawer is keyed differently provide security or dust panels. Coordinate with locks specified in the hardware section of this specification.
 - e) At file drawers, provide clear inside height sufficient for hanging file folder tabs. Provide either a system stand or rails. At legal-sized drawers with hanging file suspension bars provide both legal- and letter-sized files.
- 14) Base and Wall Cabinet Back: 1/4-inch thick MDF. At exposed surfaces provide VGS high-pressure laminate, panels balanced. At semi-exposed surfaces provide thermally fused melamine panels.
- 15) Aprons: 3/4-inch thick MDF with VGS high-pressure plastic laminate on both sides.
- a) Edging at bottom: 3 mm PVC.
- 16) Fixed Shelves: 3/4-inch thick MDF thermally fused melamine panels at semi-exposed surfaces. At exposed surfaces provide MDF with HGS high-pressure laminate.
- a) Edging: 3 mm PVC.
 - b) Shelves shall be fixed to ends, dividers and backs.
 - c) Shelves over 30 inches in length shall have a center support.
- 17) Adjustable Shelves: 3/4-inch thick MDF for spans up to 31 inches, 1-inch thick MDF for spans up to 39 inches. At semi-exposed shelves provide HGS high-pressure laminate. At exposed surfaces provide HGS high-pressure laminate.

NOTE: Thickness and span of shelves are based on the following:
Load: 50 lbs. per sq. ft.
Maximum load of 200 lbs applied uniformly on any shelf.
Maximum deflection: 1/4 inch.
MOE of material with vertical grade HPDL on both sides:
Minimum 550,000.

- a) Edging: 3 mm PVC.
- b) Width of shelf, maximum 1/8 inch less than inside cabinet width except where shelf-support clips require notching. Ends may exceed 1/8 inch provided both ends are banded and the total clearance between shelf clips is a maximum of 1/8 inch.
- c) Shelves shall be supported on cleanly bored holes at a maximum of 2 inches on center with shelf rests.
 - i. Centerline of rests shall not exceed a minimum of 1 inch to a maximum of 4 inches from the front and back of cabinet body.
 - ii. Support placement shall not conflict with hinge placement.
 - iii. Dimension between the centerline of the rest shall not be less than 60

- iv. percent of the shelf depth.
Shelves over 29 3/4-inches deep provide 3 supports at each end.
- v. Bored shelf hole support systems shall extend vertically to within 6 inches of the interior top or bottom of the cabinet.

18) Toe Kick: 3/4-inch-thick preservative-treated plywood.

d. Countertops (Plastic Laminate):

- 1) Exposed surfacing material: HGS high-pressure laminate.
- 2) Substrate: 3/4 MDF. Refer to 2.02, A, for product. Seal all edges of MDF at sink cutout with two-part epoxy water-proof sealer. Sand MDF with an 80-grit sandpaper prior to applying sealer. Apply water-proof sealer in three coats.
- 3) Nominal thickness at edge 1 1/2-inches.
- 4) Provide standard unfinished backing sheet BKL.

a) Front edge: 3 mm PVC.

e. Backsplash and Sidesplash (Plastic Laminate):

- 1) Exposed surfacing material: HGS high pressure laminate.
- 2) Substrate: 3/4-inch thick MDF. Refer to 2.02, A, for product.
- 3) Exposed Ends: HGS high-pressure laminate.
- 4) Backside of all splashes shall have a backing sheet.
- 5) Assembly 1, wall mount, jobsite assembled.
- 6) Seal all surfaces not covered with plastic laminate with water proof sealer in three coats. Sand MDF with an 80 grit sandpaper prior to applying sealer.

- B. Shop assemble casework for delivery to site in units easily handled and to permit passage through building openings.
- C. Install edging as specified in one piece for full length of component.
- D. When necessary to cut and fit on site, provide materials with ample allowance for cutting. Provide trim for scribing and site cutting.
- E. Apply plastic laminate finish in full uninterrupted sheets. Fit corners and joints hairline; securing with glue and concealed bolt type fasteners. Locate counter butt joints minimum 2 feet from edge of sink cutouts.
- F. Cutouts in plastic laminate countertops shall have a minimum 1/4-inch radius at all inside corners.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verify adequacy of backing and support framing.

3.02 INSTALLATION

- A. Install casework plumb, level, true and straight with no distortions. Shim as required using concealed shims. Install to a tolerance of 1/8 inch to 8 feet 0 inches for plumb and level (including tops); and with no variations in flushness of adjoining surfaces.
- B. Scribe and cut casework to fit adjoining work and refinish cut surfaces or repair damaged finish at cuts.
- C. Anchor casework to anchors or blocking built in or directly attached to substrates. Secure to grounds, stripping and blocking with countersunk, concealed fasteners and blind nailing as required for a complete installation. Attach countertops securely to base units.
 - 1. Casework Wall Anchorage:
 - a. Continuous Blocking or Backing: Provide minimum 2-inch by 6-inch nominal wood or 6-inch by 16-gauge metal track notched at each stud at locations shown on the casework Shop Drawings. Coordinate with Section 06 10 53 for plate used with 2 by 6.
 - b. Anchorage fasteners shall be neatly installed through the back and anchor strip, at the top and bottom of each cabinet body (wall hung and base cabinets) and at intermediate height of cabinets over 60 inches tall.
 - c. Fastener to be a minimum 3-1/2-inch by #10 diameter screw with a surface-bearing head. Achieve a minimum of 1-1/2-inch penetration into the wall studs, blocking or masonry. The use of drywall or bugle-head screws is prohibited.
 - d. Exposed interior surfaces require screws capable of being recessed and covered with matching cover caps.
 - e. Each cabinet unit (wall and base unit) or undivided span shall have a minimum of four anchorage fasteners, two at the top and two at the bottom subject to:
 - 1) A maximum spacing of 16 inches on center, except wall cabinet units over 48 inches in height shall be 12 inches on center.
 - 2) Install fasteners vertically within 2 inches of the outside top and bottom of the cabinet and within 2 inches horizontally of the outside end.
 - 2. Adjoining cabinets: Adjacent cabinets shall be fastened together at the front with a minimum of two #8 by 1-1/4-inch flat, oval or pan-head screws a maximum of 30 inches on center and at exposed interior surfaces, fasteners shall be countersunk and covered to match the surface.
- D. Install casework without distortion so that doors and drawers fit openings properly and are accurately aligned. Adjust hardware to center doors and drawers in openings and to provide unencumbered operation. Complete installation of hardware and accessory items as indicated.
- E. Grommets shall be provided at all locations designated by the Owner. Do not install grommets until the Owner has approved the location.
- F. Provide cutouts for plumbing fixtures, and appliances as indicated. Smooth cut edges and coat with waterproof coating or adhesive.
- G. Apply a continuous bead of silicone sealant to the joint between the countertop and splash.
- H. Provide all brackets as shown on Drawings.

- I. Adjustable Shelf Supports: Two vertical rows of 5 mm diameter holes spaced at 2 inches on center.
- J. Countertop overhangs shall be consistent with a minimum of 1/2-inch and a maximum of 1-1/4-inch of cabinet face and/or finish end.
- K. Unsupported countertop spans shall not exceed 36 inches and shall be reinforced to prevent deflection in excess of 1/4-inch under a 50 lb. per square foot load.
- L. Laminations to countertops shall be made securely with Type II adhesive.
- M. Built-up members for plastic laminate countertops shall be MDF material.
- N. Backsplashes require end splashes at walls.
- O. At Assembly 1, wall mount backsplash and end-splash:
 - 1. Top edge to be banded.
 - 2. Front edge of end-splash to be banded.
 - 3. All splash components shall be securely adhered to the wall, butt-joined to the countertop and shall be caulked with a clear waterproof caulking so as to leave a visual bead not exceeding 1/8 inch between the bottom of the splash and the countertop.
- P. Base cabinets not installed on a wood base: Seal any portion of the MDF core in contact with the floor using the water proof sealer specified in this section.

3.03 ADJUSTING

- A. Adjust work under provisions of Section 01 70 00 – Execution and Closeout Requirements: Testing, adjusting and balancing.
- B. Adjust moving or operating parts to function smoothly and correctly.

3.04 CLEANING

- A. Clean work under provisions of Section 01 70 00 – Execution and Closeout Requirements: Final cleaning.
- B. Clean casework, counters, shelves, hardware, fittings and fixtures.
- C. Protect surfaces from damage. Repair or replace damaged work that cannot be repaired to Architect's satisfaction.

3.05 PLASTIC LAMINATE SCHEDULE

- A. Refer to Drawings for location, color and manufacturer of plastic laminate.

END OF SECTION

SECTION 06 60 00 – SOLID POLYMER FABRICATIONS

PART 1 GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 1 specification sections, apply to this section.

1.02 SUMMARY

- A. This Section Includes the Following:
 - 1. Solid polymer fabrications in vertical applications.
- B. This Section Includes the Following:
 - 1. Partitions
- C. The extent of solid polymer fabrications is shown on the Drawings.

1.03 SUBMITTALS

- A. Product Data: Indicate product description, fabrication information and compliance with specified performance requirements.
- B. Shop Drawings: Include plans, elevations, sections, details and attachments to other work.
- C. Samples for Initial Selection:
 - 1. Submit minimum 4 inch by 4 inch samples. Indicate full color and pattern variation.
- D. Samples for Verification:
 - 1. Submit minimum 6 inch by 6 inch sample for each type, texture, pattern and color of solid polymer.
- E. Maintenance Data: Submit manufacturer's care and maintenance data, including care, repair and cleaning instructions. Include in Project closeout documents.

1.04 QUALITY ASSURANCE

- A. Fire-Test-Response Characteristics: Provide original fire test reports to ensure compliance with the following requirements:
 - 1. Rate of Burning:
 - a. ASTM D635 Class: CC1 for a nominal thickness of 1.5 mm (0.060 in.)
 - 2. Self-Ignition Temperature:

- a. ASTM D1929: greater than 650 degrees F
3. Density of Smoke:
 - a. ASTM D2843: Less than 75%
4. Flammability Classification:
 - a. ASTM E84: Smoke less than 450, Flame spread less than 75.
- B. Impact Resistance: Provide Solid Polymer Fabrications that comply with the following requirements:
 1. Impact Strength, Un-notched (23 degrees), ASTM D4812: No breakage.
 2. Impact Strength, Notched (23 degrees), ASTM D526: 88J/m (1/16).
- C. Allowable Tolerances:
 1. Maximum deflection: 1/16 inch over 12 inches.

1.05 DELIVERY, STORAGE AND HANDLING

- A. Do not deliver solid polymer fabrications, system components and accessories to Project site until areas are ready for installation
- B. Handle materials to prevent damage to finished surfaces. Provide protective coverings to prevent damage or staining following installation for duration of project.
- C. Before installing solid polymer fabrications, permit them to reach room temperature.

1.06 PROJECT CONDITIONS

- A. Environmental Limitations: Do not install solid polymer fabrications until spaces are enclosed and weatherproof, and ambient temperatures and humidity conditions are maintained at the levels indicated for Project when occupied for its intended use.

1.07 WARRANTY

- A. Manufacturer's Special Warranty on Solid Polymer Fabrications: Manufacturer's standard form agreeing to repair or replace units that fail in material or workmanship within the specified warranty period.
- B. Warranty Period: 1 year after the date of substantial completion.
- C. The warranty shall not deprive the owner of other rights or remedies the Owner may have under other provisions of the Contract Documents, and is in addition to and runs concurrent with other warranties made by the Contractor under the requirements of the Contract Documents.

PART 2 PRODUCTS

2.01 MANUFACTURERS

- A. Basis of Design Product: The design of solid polymer fabrications is based on Varia™ as provided by 3-Form, Inc. Products from other manufacturers must be approved by the Architect prior to bidding in accordance with the Instructions to Bidders and Section 01 60 00 – Product Requirements.
 - 1. Fire-test-response characteristics noted in Part 1 must be substantiated with original test results for manufacturers' products. Generic tests, which do not specifically refer to manufacturer, will not be accepted.
- B. Provide products specified in each solid polymer fabrication product data sheet at end of this Section.

2.02 MATERIALS

- A. EcoResin™ Resin Sheet
 - 1. Engineered polyester resin, Glycol modified.
 - 2. Sheet Size: Maximum 4 feet by 10 feet.
 - 3. Thickness: Minimum 1/16 inch.
- B. Interlayer Materials: Compatible with polyester and bonding process to create a monolithic sheet of material when complete.

2.03 FABRICATION

- A. General: Fabricate solid polymer fabrications to designs, sizes and thicknesses indicated and to comply with indicated standards. Sizes, profiles and other characteristics are indicated on the Drawings.
- B. Comply with manufacturer's written recommendations for fabrication.
- C. Machining: Acceptable means of machining are listed below. Ensure that material is not chipped or warped by machining operations.
 - 1. Sawing: Select equipment and blades suitable for type of cut required.
 - 2. Drilling: Drills specifically designed for use with plastic products.
 - 3. Milling: Climb cut where possible.
 - 4. Routing.
 - 5. Tapping.
 - 6. Shearing and Punching: Acceptable only on 1/16-inch material.
 - 7. Die Cutting: Acceptable only on material 1/8 inch or less.
- D. Forming: Form products to shapes indicated using the appropriate method listed below.

Comply with manufacturer's written instructions.

1. Cold bending.
 2. Hot bending.
 3. Thermoforming: Acceptable only on uncoated material.
 4. Drape forming.
 5. Matched mold forming.
 6. Mechanical forming.
- E. Laminating: Laminate to substrates indicated using adhesives and techniques recommended by manufacturer.

2.04 MISCELLANEOUS MATERIALS

- A. General: Provide products of material, size and shape required for application indicated, and with a proven record of compatibility with surfaces contacted in installation.
- B. Cleaner: Type recommended by manufacturer.
- C. Fasteners: Use screws designed specifically for plastics. Self-threading screws are acceptable for permanent installations.
- D. Bonding Cements: Solvent or adhesives, suitable for use with product and application.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Examine substrates, areas and conditions where installation of solid polymer fabrications will occur, with installer present, for compliance with manufacturer's requirements. Verify that substrates and conditions are satisfactory for installation and comply with requirements specified.

3.02 INSTALLATION

- A. General: Comply with manufacturer's written instructions for the installation of solid polymer fabrications.
- B. Shop fabricates items to the greatest degree possible.
- C. Utilize fasteners, adhesives and bonding agents recommended by manufacturer for type of installation indicated. Material that is chipped, warped, hazed or discolored as a result of installation or fabrication methods will be rejected.
- D. Install components plumb, level and rigid, scribed to adjacent finishes, in accordance with approved Shop Drawings and product data.

- E. Form field joints using manufacturer's recommended procedures. Locate seams in panels so that they are not directly in line with seams in substrates.

3.03 CLEANING AND PROTECTION

- A. Protect surfaces from damage until date of substantial completion. Repair work or replace damaged work, which cannot be repaired to Architect's satisfaction.

END OF SECTION

PRODUCT DATA SHEET 1 – Solid Polymer Fabrication #1 (SPF-1)

Product: [Replace with Collection and product name]

Color: [Replace with color name]

Gauge: [1/16 inch] [1/8 inch] [3/16 inch] [1/4 inch] [3/8 inch] [1/2 inch] [3/4 inch] [1 inch] [As indicated on Drawings] [As required to meet deflection requirements]

Surface Finish: [Patent] [Patent and Hardcoat] [Patina] [Pixel] [Sandstone] [SFX Frost] [Stucco] [Supermatte]

UV Protection: [required] [not required]

Expansion/Contraction Allowance:

Edge Seal: [not required] [required]

Orientation: [Horizontal] [Vertical]

SECTION 06 61 16 – SOLID SURFACING FABRICATIONS

PART 1 GENERAL

1.01 SUMMARY

- A. Section includes cast plastic fabrications as shown in the List of Finishes and shown on the drawings.
- B. Related Sections:
 - 1. Section 06 41 16 – Plastic-Laminate-Clad Architectural Cabinets. At counters build up the thickness using core panel members specified in this section below the solid surface counter.
 - 2. Section 22 40 00 - Plumbing Fixtures: Plumbing drains and fixture trim.

1.02 REFERENCES

- A. ASTM International:
 - 1. ASTM E84 - Standard Test Method for Surface Burning Characteristics of Building Materials.
- B. National Electrical Manufacturers Association:
 - 1. NEMA MG 1 - Motors and Generators.
- C. Underwriters Laboratories Inc.:
 - 1. UL - Fire Resistance Directory.

1.03 SUBMITTALS

- A. Section 01 33 00 - Submittal Procedures.
- B. Shop Drawings: Indicate dimensions, thicknesses, required clearances, tolerances, materials, colors, finishes, fabrication details, field jointing, adjacent construction, methods of support, integration of plumbing components, and anchorages.
- C. Product Data: Submit data on specified component products, electrical characteristics and connection requirements.
- D. Samples: If colors are indicated on Drawings, submit an 8-inch-square sample of each selected color. If colors are not indicated on Drawings, submit manufacturer's standard color book showing colors of actual material in 2-inch by 2-inch size.
- E. Manufacturer's Instructions: Submit complete manufacturer's fabrication and installation instructions.
- F. Maintenance Instructions: Upon completion, furnish the Owner one set of manufacturer's recommended cleaning procedures.

1.04 CLOSEOUT SUBMITTALS

- A. Section 01 70 00 - Execution and Closeout Requirements: Closeout procedures.
- B. Operation and Maintenance Data: Submit list of approved cleaning materials and procedures required; list of substances harmful to component materials. Include instructions for stain removal and surface and gloss restoration.

1.05 QUALITY ASSURANCE

- A. Surface Burning Characteristics: Maximum 25/450 flame spread/smoke developed index when tested in accordance with ASTM E84.

1.06 QUALIFICATIONS

- A. Manufacturer: Company specializing in manufacturing products specified in this section with minimum three years of documented experience.
- B. Installer Qualifications: Installation of solid surfacing materials shall be by a firm that is authorized by solid surfacing manufacturer to fabricate and install solid surfacing materials, and that can demonstrate successful experience in installing finished carpentry items similar in type and quality to those required for this project.

1.07 FIELD MEASUREMENTS

- A. Verify field measurements prior to fabrication.
- B. Verify field measurements are as indicated on Shop Drawings.

1.08 SEQUENCING

- A. Sequence Work to permit installation of adjacent affected construction, plumbing rough-in.

1.09 WARRANTY

- A. Section 01 70 00 - Execution and Closeout Requirements: Product warranties and product bonds.
- B. Furnish ten-year manufacturer warranty for each type of unit.

1.10 DELIVERY, STORAGE AND HANDLING

- A. Transport and handle sheets and fabricated items by methods that will prevent damage and defacing.
- B. Storage: If units are not installed immediately upon delivery to site, store in covered location, off the ground or floor, and cover with moisture- and stain-resistant paper or plastic.

1.11 ENVIRONMENTAL CONDITIONS

- A. Obtain and comply with solid surfacing manufacturer's recommendation for optimum temperature and humidity conditions for solid surfacing material during its storage and

installation.

1.12 MAINTENANCE

- A. Section 01 70 00 - Execution and Closeout Requirements: Spare parts and maintenance products.
- B. Furnish two containers of 16 ounces of polishing cream.

PART 2 PRODUCTS

2.01 MATERIAL

- A. General: Solid surfacing material shall be non-porous, homogenous blend of polyester or acrylic alloys and fire fillers to create a material that cuts like wood. The color and pattern shall extend throughout the material. The material shall be in 1/4-inch, 1/2 inch or 3/4 inch thickness as indicated, in one piece wherever possible.

2.02 MANUFACTURER/COLOR

- A. Refer to Finish Schedule for manufacturer and color.
 - 1. Finish:
 - a. Satin.

2.03 FABRICATION AND INSTALLATION MATERIALS

- A. Joint Adhesive: Type recommended by manufacturer, in color to match solid surface material.
- B. Mildew-Resistant Silicone Sealant: FDA/UL sealant as recommended by manufacturer, in colors matching components.
- C. Contact Adhesive: Type recommended by manufacturer for adhering solid surface to base cabinets and counters.
- D. Concealed Flat Brackets: A&M Hardware, Inc.
 - 1. Extended Concealed Brackets:
 - a. 1/2 inch steel.
 - b. 26 inches by 26 inches, 2.0 ECFLAT24
 - c. Load to deformation (lbf): 1,700 per pair.
 - d. Color: Black.
 - e. Maximum spacing: 36 inches on center.
 - 2. Concealed Brackets:
 - a. 1/2 inch steel.
 - b. 26 inches by 18 inches, 2.0 CFLAT24

- c. Load to deformation (lbf): 1,150 per pair.
- d. Color: Black.
- e. Maximum spacing: 36 inches on center.

2.04 FABRICATION

- A. Solid surface materials shall be fabricated by an authorized solid surface fabricator.
- B. Solid surface countertops shall be the thickness indicated, one piece wherever possible, and with flush joints sealed with joint adhesive where required. Solid surface manufacturer shall guarantee color match within the crate. Follow solid surface manufacturer's standard "Color Matching" procedures when joining sheets from outside the crate. Shop shall fabricate in the largest sections possible for transporting and building access.
- C. Ease top and front edges and corners only if shown on drawings.
- D. Solid surface materials shall be fabricated to field measurements. Seams shall be located where shown on approved Shop Drawings. Provide seam blocks under all seams where necessary in accordance with manufacturer's recommendations.
- E. Edge detail shall be as selected by Architect.
- F. Backsplash height shall be according to detail provided.
- G. Backsplashes shall be field-installed, with tight, sealed joints, unless otherwise noted.
 - 1. Coves: Provide shop-fabricated integrally molded coves at back and ends where against walls or other vertical surfaces, with 3/8-inch radius between top and splash only if shown on drawings.
 - 2. Finish of exposed surfaces shall be (satin) according to the methods prescribed by the manufacturer.
- H. Sinks shall be selected from manufacturer's standard sink designs and colors and shall be formed integrally into countertops.
- I. Cutouts for sinks furnished by others shall be smooth and uniform without saw marks. The top and bottom of sink openings shall be finished smooth. Corners of sink cutouts must be a minimum of 1/4-inch radius.
- J. Full underlayment: At wall hung counters, base cabinets with or without sinks provide the following core material for solid surface counters:
 - 1. 3/4 inch exterior grade veneer core plywood with waterproof adhesive, minimum 5 ply, fir or poplar.
 - 2. Provide full underlayment only at locations where cooking does not take place.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verify that counters and supports are suitable for installation in accordance with Shop

Drawings.

3.02 INSTALLATION

- A. Install tops in locations indicated, conforming to manufacturer's recommended installation procedures. Set tops on supports and anchor using fasteners shown on approved submittals.
- B. Use silicone sealant for attaching backsplashes and reveal edges. Seal all joints with sealant.
- C. Field joints shall be hard-seamed unless otherwise specified.

3.03 CLEANING

- A. At completion of work, remove all excess material, dirt, dust, trash and other materials resulting from the installation. Clean surfaces of solid surface materials, remove all labels and leave the area clean.

3.04 PROTECTION

- A. Provide suitable protection on counter, to protect the installation from damage until final acceptance. Place temporary covers over sinks to preclude their use for construction purposes.

3.05 SCHEDULE

- A. Refer to "List of Finishes" and drawings for location of solid surface materials indicated by SS.

END OF SECTION

SECTION 07 11 13 – BITUMINOUS DAMPPROOFING

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Cold-applied, water-based asphalt emulsion damp-proofing for planter walls.

1.02 RELATED SECTIONS

- A. Section 03 30 00 – Cast-in-Place Concrete.

1.03 REFERENCES

- A. ASTM

1. ASTM D1187 – Standard Specification for Asphalt-Base Emulsions for Use as Protective Coatings for Metal.
2. ASTM D1227 – Standard Specification for Emulsified Asphalt Used as a Protective Coating for Roofing.

1.04 SYSTEM DESCRIPTION

- A. Performance Requirements: Provide material complying with the following requirements:

1. Nonflammable.
2. VOC Content:
 - a. 0.25 pounds per gallon (30g/L) less water and exempt solvents.
3. Service Temperature Range:
 - a. Minus 40 degrees F (minus 40 degrees C) to 150 degrees F (66 degrees C).
4. Compliance:
 - a. Trowel-applied long fiber reinforced complying with ASTM D1227, Type 2, Class I and ASTM D1187, Type 1.

1.05 SUBMITTALS

- A. Submit Under Provisions of Section 01 33 00.
- B. Product Data: Provide properties of primer, bitumen, mastics, technical bulletins and MSDS on each product.
- C. Manufacturer's Installation Instructions: Indicate special procedures and perimeter conditions requiring special attention.

1.06 QUALITY ASSURANCE

- A. Perform work in accordance with NRCA Waterproofing Manual.

1.07 QUALIFICATIONS

- A. Applicator: Company specializing in performing the work of this section with minimum 3 years of documented experience.

1.08 DELIVERY, STORAGE AND HANDLING

- A. Comply with Section 01 60 00.
- B. Comply with manufacturer's ordering instructions and lead-time requirements to avoid construction delays.
- C. Deliver materials in manufacturer's original, unopened, undamaged containers with identification labels intact.
- D. Store tightly sealed materials off ground and away from moisture, direct sunlight, extreme heat and freezing temperatures.

1.09 PROJECT CONDITIONS

- A. Environmental Requirements:
 - 1. Keep from freezing in the container.
 - 2. Do not apply at temperatures below 40 degrees F (4 degrees C) or when temperatures are expected to fall to 40 degrees F (4 degrees C) within 24 hours.
 - 3. Protect from rain until coating has set.
 - 4. Application shall be protected or covered within 7 days of application.
 - 5. Do not expose to long-term UV.

PART 2 PRODUCTS

2.01 MANUFACTURERS – BITUMINOUS DAMPPROOFING

- A. Karnak Chemical Co., #920 AF Fibrated Coating.
- B. BASF Building Systems, Masterseal 614.
- C. Substitutions: Under provisions of Section 01 60 00.

2.02 COLD ASPHALTIC MATERIALS – BITUMINOUS DAMPPROOFING

- A. Asphalt Emulsion: Asphalt-and-water-emulsion coating, compounded to penetrate substrate and build to moisture-resistant coating. Coating shall be fibered asphalt emulsion, non-asbestos compound, complying with ASTM D1227, Type II, Class I, and ASTM D1187, Type I.

1. Manufacturers/Products: Provide and install one of the products listed in 2.01 manufacturers.
- B. Protection Board:
 1. Manufacturers/Products:
 - a. Dow Chemical Company/Protection Board III
 - b. Owens Corning/Fanfold DWB Dampproofing Waterproofing Board

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verify substrate surfaces are durable, free of matter detrimental to adhesion or application of dampproofing system.
- B. Verify items which penetrate surfaces to receive dampproofing are securely installed.

3.02 PREPARATION

- A. Protect adjacent surfaces not designated to receive dampproofing.
- B. Clean and prepare surfaces to receive dampproofing and waterproofing in accordance with manufacturer's instructions.
- C. Do not apply dampproofing to surfaces unacceptable to manufacturer.
- D. Apply mastic to seal penetrations, small cracks, or minor honeycomb in substrate.

3.03 APPLICATION

- A. Interior Vertical Surfaces of Planter Walls:
 1. Apply long fiber fibrated material in 1 coat by trowel.
 2. Fill in crevices and grooves, providing continuous coating and free from breaks and pinholes. Carry coating over exposed top and outside edge of footing. Spread around joints, grooves and slots, and into chases, corners, reveals and soffits. Bring coating to finished grade.
 3. Install protection board directly to tacky surface of damp-proofing membrane.
 4. Place backfill at least 24 to 48 hours after application, but within 7 days.

3.04 PROTECTION

- A. Protect application from damage during construction.

END OF SECTION

SECTION 07 21 00 – CONTINUOUS THERMAL INSULATION

PART 1 GENERAL

1.01 SUMMARY

- A. Section includes fire-resistant, rigid board insulation consisting of a polyisocyanurate foam core laminated to aluminum foil facers installed at the following locations:
 - 1. Masonry cavity wall construction
 - 2. Behind metal wall panels.
- B. Related Sections:
 - 1. Section 04 20 19 – Veneer Unit Masonry: Board insulation installed in cavity wall.
 - a. Coordinate with masonry veneer anchors.
 - 2. Section 04 43 13 – Mortar-Placed Stone Veneer: Board insulation installed in cavity wall.
 - a. Coordinate with stone veneer anchors.
 - 3. Section 07 27 26 – Fluid-Applied Membrane Air Barriers: Board insulation installed over air barrier.
 - a. Board insulation and adhesive shall be compatible with the air barrier system.
 - b. Board insulation shall have been tested and passed NFPA 285 fire test with the specified fluid-applied membrane air barriers specified in Section 07 27 26.
 - 4. Section 07 40 00 – Cladding-Support-System: Metal Z furring and J track with thermal tape for use with board insulation specified in this Section behind:
 - a. Metal wall panels.
 - 5. Section 07 42 13-Metal Wall and Soffit Panels.
 - a. Installing board insulation between metal zee furring for metal wall panels.

1.02 REFERENCES

- A. American Society for Testing and Materials:
 - 1. ASTM C203 - Test Method for Breaking Load and Flexural Properties of Block-Type Thermal Insulation.
 - 2. ASTM C518 – Standard Test Method for Steady-State Thermal Transmission Properties by Means of the Heat Flow Meter Apparatus.
 - 3. ASTM 1289 - Standard Specification for Faced Rigid Cellular Cellular Polyisocy-

anurate Thermal Insulation.

4. ASTM D1621 - Test Method for Compressive Properties of Rigid Cellular Plastics.
 5. ASTM D1622 - Test Method for Apparent Density of Rigid Cellular Plastics.
 6. ASTM D2126 - Test Method for Response of Rigid Cellular Plastics to Thermal and Humid Aging.
 7. ASTM E84 – Standard Test Method for Surface Burning Characteristics of Building Materials.
 8. ASTM E96/E96M - Test Method for Water Vapor Transmission of Materials.
- B. National Fire Protection Agency:
1. NFPA 285-12 for the 2015 IBC: Standard Method of Test for the Evaluation of Flammability Characteristics of Exterior Non-Load-Bearing Wall Assemblies Containing Combustible Construction.

1.03 SYSTEM DESCRIPTION

- A. Materials of This Section: Provide thermal protection to air and seal materials at building enclosure elements in conjunction with air barrier materials in Section 07 27 26.

1.04 SUBMITTALS

- A. Section 01 33 00 – Submittal Procedures
- B. Product Data: Submit data on product characteristics, performance criteria, limitations and adhesives.
- C. Submit documentation that the board insulation has been tested and passed NFPA 285 wall assembly using air barrier membranes specified in Section 07 27 26.
- D. Submit Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for each product verifying qualities of insulation components meet or exceed specified requirements.
- E. Submit Field Inspection and Field-Testing Reports in accordance with Field Quality Control requirements.
- F. Manufacturers printed installation instructions for each type of material to be used.
1. Certify adhesive used to bond insulation to air barrier membrane is compatible with specified air barrier membrane.
- G. Submit Material Safety Data Sheets (MSDS) for each type of insulation to be used.
- H. Research/Evaluation Reports: For foam-plastic insulation, from ICC-ES
- I. Provide written certification from the manufacturer of the board insulation stating that the

board insulation is compatible with the fluid applied membrane air barrier system specified in Section 07 27 26.

- J. Warranty: Provide manufacturer's minimum 15-year thermal performance warranty.

1.05 ENVIRONMENTAL REQUIREMENTS

- A. Section 01 60 00 – Product Requirements.
- B. Do not install adhesives when temperature or weather conditions are detrimental to successful installation.

1.06 SEQUENCING

- A. Sequence Work to ensure air barrier materials are in place before beginning work of this section.

1.07 COORDINATION

- A. Section 01 30 00 – Administrative Requirements: Coordination and project conditions.
- B. Coordinate Work with Section 07 27 26 for air barrier materials. Board adhesive shall be compatible with air barrier materials.

1.08 QUALITY ASSURANCE

- A. Source Limitations: Provide each type of building insulation and related accessories from one single manufacturer.
- B. Installer Qualifications:
 - 1. Contractor shall provide evidence of having completed 3 projects of similar size and scope in the past 3 years.
 - 2. Contractor shall provide evidence of certification by the rigid insulation manufacturer as having been properly trained in the proper installation of the submitted products.
- C. Surface-Burning Characteristics: As determined by testing identical products according to ASTM E84 by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.
- D. Assembly Fire Propagation Characteristics: Provide results of tests performed on wall assemblies tested by manufacturer in accordance with NFPA 285.

1.09 PRE-INSTALLATION MEETING

- A. Prior to start of insulation installation review and document insulation installation methods and procedures including:
 - 1. Participants
 - 2. Substrate conditions

3. Manufacturer's installation guidelines
4. Construction schedule
5. Governing regulatory requirements and requirements for insurance
6. Review field quality control procedures

1.10 DELIVERY, STORAGE, AND HANDLING

- A. Protect insulation materials from physical damage and from deterioration due to moisture, soiling, and other sources. Store inside and in a dry location. Comply with manufacturer's written instructions for handling, storing, and protecting during installation.
- B. Protect foam-plastic board insulation as follows:
 1. Do not expose to sunlight except to necessary extent for period of installation and concealment.
 2. Protect against ignition at all times. Do not deliver foam-plastic board materials to Project Site before installation time.
 3. Quickly complete installation and concealment of foam-plastic board insulation in each area of construction.

1.11 WARRANTY

- A. Minimum warranty period is 15 years from the date insulation is installed.

PART 2 PRODUCTS

1.01 MATERIALS

- A. **Foil-Faced, Polyisocyanurate Board Insulation per ASTM C1289:** Type 1 - Faced with aluminum foil on both major surfaces of the core, Class 1- non-reinforced core foam or Class 2 – glass-fiber reinforced core foam, Grade 3 - 25 psi.
- B. Foam Surface Burning Characteristics per ASTM E84:
 1. Maximum flame spread: Equal to or less than 25.
 2. Maximum smoke-developed index: Equal to or less than 450.
- C. Compressive Strength per ASTM C1621: Minimum 25 psi.
- D. Flexural Strength per ASTM C203: Equal to or greater than 40 psi.
- E. Water Vapor Transmission per ASTM E96: Equal to or less than 0.03 perms per inch.
- F. Water Absorption per ASTM C209: Maximum $\leq 1\%$ by volume.
- G. Density per ASTM D1622: 2.0 pcf.
- H. Thermal Resistance per ASTM C518: R-value per thickness:

1. 2.0 inches: R-13.
 - I. Faces: 12 mil thick aluminum foil facer, both sides.
 - J. Board Thickness:
 1. 2 inches.
 - K. Board Size: 48 inches by 120 inches. NOTE: Board shall be scored on both sides to fit between spacing of masonry anchors.
 - L. Board edges: Square.
 - M. Acceptable Manufacturer's and Products: Subject to compliance with requirements of Contract Documents, provide products by one of manufacturer's named below. If not named, submit as a substitution according to Conditions of the Contract and appropriate Division 01 Sections.
 1. Atlas: EnergyShield Pro.
 - a. In accordance with NFPA 285, the following fluid-applied membrane air barriers as specified in Section 07 27 26 are approved for use in conjunction with the above referenced board insulation as part of the wall system.
 - 1) Kemper Systems America, Inc.: FW 100A.
 - 2) W.R. Meadows: Air-Shield LMP (Gray)
 2. Hunter: Xci Foil (Class A).
 - a. In accordance with NFPA 285, the following fluid-applied membrane air barrier as specified in Section 07 27 26 are approved for use in conjunction with the above referenced board insulation as part of the wall system.
 - 1) Kemper Systems America, Inc: FW100A.
 - 2) W.R. Meadows: Air-Shield LMP (Gray).
 3. Rmax: ECOMAXci FR.
 - a. In accordance with NFPA 285, the following fluid-applied membrane air barriers as specified in Section 07 27 26 are approved for use in conjunction with the above referenced board insulation as part of the wall system.
 - 1) Sika: Sikagard 535.
 - 2) W.R. Meadows: Air-Shield LMP (Gray).
 - N. Recycled Content: Pre-consumer recycled content not less than 3.4%

1.02 ACCESSORIES

- A. Sealant/Adhesive for Bonding Insulation to specified air barrier membrane:
 - 1. Sealant/adhesive with demonstrated capability to bond insulation securely to substrates without damaging insulation and substrates and as recommended by insulation manufacturer.
 - a. Adhesive used to bond insulation to air barrier membrane shall be compatible with specified air barrier membrane in Section 07 27 26.

PART 3 EXECUTION

3.01 PREPARATION

- A. Clean substrates of substances that are harmful to insulation including removing projections capable of puncturing foil facer, or that interfere with insulation attachment.
- B. Ensure products are dry prior to installation. Replace damaged products.

3.02 INSTALLATION, GENERAL

- A. Install insulation with the long edge vertical behind unit masonry veneer and horizontal behind mortar placed stone veneer and metal wall panels, printed side to the exterior.
- B. Install in as large of pieces as possible to minimize joints.
- C. Abut wall insulation tightly together both horizontally and vertically, and at all openings.
- D. Comply with insulation manufacturer's written installation instructions.
- E. Install insulation that is undamaged, dry, and unsoiled and that has not been left exposed to ice, rain, or snow at any time.
- F. Extend insulation to envelop entire area to be insulated. Cut and fit tightly around obstructions and fill voids with insulation. Remove projections that interfere with placement.
- G. Provide sizes to fit applications indicated and selected from manufacturer's standard thicknesses, widths, and lengths.
- H. Apply single layer of insulation units to produce thickness indicated unless multiple layers are otherwise shown or required to make up total thickness.
 - 1. Stagger successive layers a minimum of 16" both vertically and horizontally so joints in successive layers do not align.

3.03 INSTALLATION OF INSULATION FOR FRAMED CONSTRUCTION

- A. Adhesive Installation:
 - 1. Install pads of adhesive spaced approximately 24 inches o.c. both ways on inside face, and as recommended by adhesive manufacturer.

2. Fit courses of insulation between wall ties, metal zee furring and other obstructions, with edges butted tightly in both directions. Press units firmly against inside substrates.

3.04 PROTECTION

- A. Protect installed insulation from damage due to harmful weather exposures, physical abuse, and other causes. Provide temporary coverings or enclosures where insulation is subject to abuse and cannot be concealed and protected by permanent construction immediately after installation.
- B. Do not leave continuous insulation uncovered and exposed to UV for longer than an aggregate of 60 days between storage and uncovered installation.
- C. At the end of each work day seal exposed edges to be weathertight.

3.05 PROJECT CLEAN UP

- A. Removal all packaging and properly recycle.
- B. Remove all scrap materials and properly dispose of offsite.

END OF SECTION

SECTION 07 21 16 – BLANKET INSULATION

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Thermal Batt Insulation.
- B. Stone Wool Batt Insulation.

1.02 RELATED SECTIONS

- A. Section 05 40 00 – Cold Formed Metal Framing: Installing thermal batt insulation between metal studs.
- B. Section 07 72 10 – Roof Curbs: Installing stone wool batt insulation within roof curb framing.
- C. Section 09 21 16 – Gypsum Board Assemblies: Acoustic insulation.
- D. Section 09 22 16 – Non-Structural Metal Framing: Installing acoustic insulation and thermal batt insulation between metal studs.
- E. Division 23: Installing stone wool batt insulation within rooftop mechanical curbs.

1.03 REFERENCES

- A. American Society for Testing Materials:
 - 1. ASTM C612 – Standard Specification for Mineral Fiber Block and Board Thermal Insulation.
 - 2. ASTM C665 – Standard Specification for Mineral-Fiber Blanket Thermal Insulation for Light Frame Construction and Manufactured Housing.
 - 3. ASTM E84 – Standard Test Method for Surface Burning Characteristics of Building Materials.
 - 4. ASTM E96 – Standard Test Methods for Water Vapor Transmission of Materials.
 - 5. ASTM E136 – Standard Test Method for Behavior of Materials in a Vertical Tube Furnace at 750 degrees C.
 - 6. ASTM E970 – Standard Test Method for Critical Radiant Flux of Exposed Attic Floor Insulation Using a Radiant Heat Energy Source.

1.04 SUBMITTALS

- A. Submit under provisions of Section 01 33 00 – Submittal Procedures.
- B. Product Data: Provide data on product characteristics, performance criteria, and limitations.
- C. Manufacturer's Certificate: Certify that products meet or exceed specified requirements.

1.05 COORDINATION

- A. Section 01 30 00 – Administrative Requirements: Coordination and project location.

PART 2 PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS – THERMAL AND ACOUSTICAL INSULATION MATERIALS

- A. Certainteed Corporation
 - 1. Unfaced sustainable insulation CertaPro AcoustaTherm Batts.
- B. Johns Manville
 - 1. Unfaced formaldehyde-free batt insulation
- C. Owens Corning
 - 1. EcoTouch Pink Fiberglas Insulation
- D. Rockwool Inc.
 - 1. Comfortbatt (Stone wool)
- E. Substitutions per Section 01 60 00.

2.02 MATERIALS

- A. Thermal Batt Insulation: ASTM C665; pre-formed glass fiber or glass mineral wool batt; friction fit, between metal studs, conforming to the following:
 - 1. Thermal Resistance:
 - a. Exterior Walls:
 - 1) At 6- inch metal studs install R19.
 - 2) At 3-5/8 and 2 ½ inch metal stud walls install R13.
 - b. Facing: Unfaced.
 - c. Flame/Smoke Properties: 25/450 in accordance with ASTM E84.
 - d. Material shall be formaldehyde free.
- B. Stone wool batt insulation: Non-combustible, lightweight, water repellent, semi-rigid wool batt insulation, ASTM C665, Type 1
 - 1. Thermal Resistance:
 - a. Exterior Walls:
 - 1) At 6 inch metal studs install 6 inch, R24 insulation.

- 2) At 3-5/8 inch metal stud walls install 3 ½ inch, R15 insulation.
 - 3) At 2 ½ inch metal stud walls install 2 1/2" inch, R10 insulation.
- b. Curbs:
- 1) At equipment curbs install 3 ½ inch, R15 insulation.
 - 2) At rooftop mechanical curbs install 6 inch, R24 insulation.
- c. Acceptable material: Rockwool Inc., Comfortbatt, 16 inch by 48 inch.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Section 01 30 00 – Administrative Requirements: Coordination and project conditions.
- B. Verify that substrate, adjacent materials, and insulation are dry and ready to receive insulation.

3.02 INSTALLATION

- A. Install insulation in accordance with insulation manufacturer's instructions.
- B. Install thermal batts in exterior walls as shown on the Drawings without gaps or voids. Do not compress insulation.
- C. Trim insulation neatly to fit spaces. Insulate miscellaneous gaps and voids.
- D. Fit insulation tight in spaces and tight to exterior side of mechanical and electrical services within the plane of insulation.
- E. Install rock mineral wool insulation between exterior metal stud framing where the insulation will be exposed to the elements before the exterior wall sheathing can be applied and sealed and at other locations noted.
- F. At built-up metal stud headers installed at exterior walls, fill header with stone wool batt insulation using 6 inch R24 insulation.
- G. At built up jamb studs fill cavity with stone wool batt insulation.
- H. At roof curbs install 3 ½ inch R 15 stone wool batt insulation.
- I. At rooftop mechanical curbs install 6 inch R24 stone wool batt insulation.

END OF SECTION

SECTION 07 26 13 – MOISTURE CONTROL SYSTEM

PART 1 GENERAL

1.01 SUMMARY

- A. This Section includes the furnishing and application of moisture control systems and self-leveling underlayment for the reduction of moisture vapor transmission and alkalinity control for interior concrete slabs requiring the installation of following materials:

1. Resilient Tile Flooring.
2. Carpet.
3. Ceramic floor tile: Water proofing membrane, crack isolation membranes.

1.02 RELATED SECTIONS

- A. Section 01 20 00 – Prices and Payment Procedures: Unit price for performing Work specified in this Section.
- B. Section 01 40 00 – Quality Requirements.
- C. Section 01 45 23 – Concrete In-Situ Relative Humidity and pH Testing: Testing requirements.
- D. Section 03 30 00 – Cast-In-Place Concrete: Installation and curing requirements.
- E. Section 09 30 00-Tile: Installation of water proofing membranes and/or crack isolation membranes.
- F. Section 09 65 00 – Resilient Flooring: Resilient flooring installation requirements.
- G. Section 09 68 13 – Tile Carpeting: Carpet installation requirements.
- H. Section 12 48 13 – Entrance Floor Mats and Frames.

1.03 REFERENCES

- A. American Society of Testing Materials:
1. ASTM D7234 – Test Method for Pull-Off Adhesion Strength of Coatings on Concrete Using Portable Pull-Off Adhesion Testers.
 2. ASTM E96 – Standard Test Methods for Water Vapor Transmission of Materials.
 3. ASTM F2170 – Standard Test Method for Determining Relative Humidity in Concrete Floor Slabs Using In Situ Probes.
 4. ASTM F3010 – Standard Practice for Two-Component Resin Based Membrane Flooring Moisture Mitigation Systems for Use Under Resilient Floor Coverings.

- B. ICRI, International Concrete Repair Institute.

1.04 TESTING

- A. Before installation of the finish floor materials over the concrete slabs, in-situ relative humidity testing per ASTM F2170 and pH testing shall be performed by the Owner's Testing Lab to determine the level of water vapor transmission in the slab and the type of moisture reduction system required. Refer to Section 01 45 23 for testing procedures.
- B. The Owner's Testing Lab shall coordinate the test with the General Contractor's project scheduling to allow sufficient time to test, submit their findings and install the moisture control system before the installation of the finish flooring materials.

1.05 SUBMITTALS

- A. General: Submit in accordance with Section 01 33 00 – Submittal Procedures.
- B. Product Data: Provide product data for each type of product and process specified which shall include the following:
 - 1. Manufacturer's specifications.
 - 2. Manufacturer's installation instructions.
 - 3. Independent test data.
 - 4. Certification requirements.
 - 5. Warranty information.
- C. The installer of the moisture control system shall submit the following tests obtained from the General Contractor:
 - 1. Test results from the in-situ relative humidity testing according to ASTM F2170.
 - 2. Test results from the pH test.

1.06 QUALITY ASSURANCE

- A. Installer Qualifications:
 - 1. Installation of the Moisture Control System shall be by a manufacturer-approved installer with experience in surface preparation and application of the materials specified.
 - 2. Approved installer shall have not less than five (5) years of experience installing the moisture control system specified.
- B. Manufacturer's Qualifications:
 - 1. The manufacturer shall have not less than three (3) years of experience in manufacturing the same moisture control system. The moisture control system shall be specifically formulated and marketed internationally for moisture control

and alkalinity control without change of formulation or system design for a minimum period of three (3) years.

2. Manufacturer shall provide the Owner with their standard 15-year warranty at no additional cost.
3. Manufacturer shall provide Independent lab test reports documenting performance per the following:
 - a. ASTM E96 – Water Vapor Transmission (dry and wet methods). Performance shall be documented at a minimum 90 percent water vapor transmission reduction compared to untreated durable concrete.
- C. The Moisture Control System shall be installed only over concrete surfaces that have been properly mechanically prepared to a minimum surface profile of ICRI CSP #3 and which have an RH value of 100 percent or less when measured in accordance with ASTM F2170.
- D. The moisture control system shall comply with ASTM F3010 – Standard Practice for Two-Component Resin Based Membrane Flooring Moisture Mitigation Systems for Use Under Resilient Floor Coverings.

1.07 DELIVERY, STORAGE AND HANDLING

- A. Deliver products to the job site in their original unopened containers, clearly labeled with the manufacturer's name and brand designation.
- B. Store products in an approved ventilated dry area, protect from moisture, freezing and direct sunlight.

1.08 WARRANTY

- A. Manufacturer's Warranty: Warrant vapor emission control treatment against manufacturing defects and improper installations for a period of 15 years.
 1. Cover costs of treatment materials, cementitious compounds and labor costs of application and preparation.
 2. Extend warranty to flooring material, adhesive and installation labor for same period against moisture vapor emission and alkalinity-related failure.
 3. Provide warranty underwritten by product liability insurance carrier having a minimum "A" rating from Best or equivalent rating system in the amount of \$5,000,000 per occurrence and naming Owner, Architect and Contractor as co-insured.
 4. Warranty may not exclude concrete slabs containing silica or silicate compounds.

1.09 SITE CONDITIONS

- A. Do not apply moisture control system to unprotected surfaces or surfaces with standing water.
- B. Do not apply moisture control system below 50 degrees F surface temperature or where

the temperature is expected to fall below 50 degrees F within 24 hours from time of application.

- C. Allow for continuous ventilation and indirect air movement at all times during application and curing process.

PART 2 PRODUCTS

2.01 MANUFACTURERS/PRODUCTS

- A. Moisture control systems which may be incorporated in the Work shall be the product of a single manufacturer:

1. Manufacturer: Allied Construction Technologies, Inc.

a. Products

- 1) Moisture control system: AC Tech 2170, two component, fluid applied 100 solids epoxy based moisture control system.
 - a) VOC content: 0 g/L < 100 g/L.
- 2) Underlayment primer: AC Tech 2170 SLP self-leveling primer.
 - a) VOC content: 0 g/L < 100 g/L.
- 3) Portland-cement-based underlayment system: Self-leveling underlayment concrete system recommended by AC Tech.
 - a) VOC content: 0 g/L < 100 g/L.

2. Manufacturer: Ardex Engineered Cements

a. Products

- 1) Moisture control system: Ardex MC Plus, two-coat moisture control system consisting of a primer and sealer.
 - b) VOC content: 0 g/L < 100 g/L.
- 2) Underlayment primer: Ardex P82 Ultra primer.
 - c) VOC content: 0 g/L < 100 g/L.
- 3) Portland-cement-based underlayment system: Ardex K15 Premium self-leveling underlayment concrete.
 - d) VOC content: 0 g/L < 100 g/L.

3. Manufacturer: Koster American Corporation.

a. Products:

- 1) Moisture control system: Koster VAP 1 2000 Zero (Zero VOC's) System.
 - a) VOC content: 0 g/L < 100 g/L.
 - 2) Underlayment primer: VAP 1 06 primer.
 - a) VOC content: 0 g/L < 100 g/L.
 - 3) Portland-cement-based underlayment system: Koster SL Standard or SL Premium self-leveling underlayment.
 - a) VOC content: 0 g/L < 100 g/L.
- B. Materials: Provide all required materials necessary for a complete installation over the concrete surface where the vapor emissions, the relative humidity and pH levels of the concrete are in conformance with the flooring manufacturer's requirements and the concrete surface is suitable to receive the finish floor materials.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Pre-Installation Moisture Testing: Conduct pre-installation concrete relative humidity and alkalinity testing on all interior slab areas to receive finish flooring.
- B. Examine concrete substrates with Installer present for compliance with requirements for installation of concrete moisture-vapor and alkalinity control system. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION

- A. Inspect all surfaces with regard to their suitability to receive the moisture control system with the manufacturer's representative.
- B. The concrete shall be clean, and free of all oil, grease, dirt, curing compounds and any substance that might act as a bond breaker.
 1. Verify surfaces to be treated with the moisture control system have not been previously treated with other materials such as underlayments, screeds or penetrating sealers. Notify manufacturer's representative of these conditions prior to application of the moisture control system.
- C. Shotblast all floors to a concrete surface profile of #3 or #4 and clean surfaces to remove all residue off the concrete. Fibers used to reinforce the concrete shall be burned off, scraped and vacuumed. Remove all fibers, after shotblasting, leaving no fibers on the concrete surface. Acid etching and the use of sweeping compounds and solvents are not permitted as means of preparing the substrate.
 1. Shotblast a small area and verify with the specific floor applicator that the surfaces are fit to receive the specified flooring system without application of an underlayment.

- D. Repair concrete prior to moisture vapor reduction system installation using materials recommended by moisture system control manufacturer.
- E. Joint and Crack Preparation:
 - 1. Moving Joints: Do not bridge moving joints with the moisture control system.
 - 2. Saw Cuts, Control Joints and Non-Moving Cracks: Fill all non-moving joints and cracks with material recommended by manufacturer of the moisture control system.

3.03 APPLICATION

- A. Mix and apply moisture control system following the printed instructions from the manufacturer.
- B. Apply self-leveling cementitious underlayment and primer to a smooth and level surface, after installation of the moisture control system. Install to a thickness of minimum 1/8 inch.

3.04 PROTECTION

- A. Protect each coat during the required cure time from any kind of traffic, water and contaminants.

END OF SECTION

SECTION 07 26 16 – UNDER-SLAB VAPOR BARRIER

PART 1 GENERAL

1.01 SUMMARY

A. Products Supplied Under This Section:

1. Vapor barrier, seam tape, mastic, pipe boots, detail strip for installation under concrete slabs.

B. Related Sections:

1. Section 03 30 00 – Cast-in-Place Structural Concrete.

1.02 REFERENCES

A. American Society for Testing and Materials (ASTM)

1. ASTM D1709: Test Methods for Impact Resistance of Plastic Film by the Free-Falling Dart.
2. ASTM E96: Standard Test Methods for Water Vapor Transmission of Materials.
3. ASTM E154: Standard Test Methods for Water Vapor Retarders Used in Contact with Earth Under Concrete Slabs on Walls or as Ground Cover.
4. ASTM E1643: Standard Practice for Selection, Design, Installation and Inspection of Water Vapor Retarders Used in Contact with Earth or Granular Fill Under Concrete Slabs.
5. ASTM E1745: Standard Specification for Water Vapor Retarders Used in Contact with Soil or Granular Fill Under Concrete Slabs.
6. ASTM F1249: Standard Test Method for Water Vapor Transmission Rate Through Plastic Film and Sheeting Using a Modulated Infrared Sensor.

B. American Concrete Institute (ACI)

1. ACI 302.2R-06: Guide for Concrete Slabs that Receive Moisture-Sensitive Materials.
 - a. Vapor barriers not protected by fill shall be 15 mils or thicker.
 - b. Vapor barriers shall have a perm rating **BELOW** 0.01 US perms (grains/ft² * hr * in. Hg) or less.

1.03 SUBMITTALS

A. Quality Assurance:

1. Independent laboratory test results showing compliance with ASTM E1745 Class A and Perm rating of 0.01 grains/ft² * hr * in. Hg or less, per ASTM E96 or ASTM F1249. The water vapor permeance shall only be expressed in the perm unit

grains/ft² * hr * in. Hg.

2. Independent laboratory test results showing compliance with ASTM E154, maintaining permeance of less than 0.01 perms (grains/ft² * hr * in. Hg) after mandatory conditioning test per sections 8, 11, 12 and 13 of ASTM E154.
 3. Manufacturer's samples, literature.
 4. Manufacturer's installation instructions for placement, seaming and pipe boot installation.
- B. Pre-Installation Conference:
1. Section 01 30 00 – Administrative Requirements: Pre-installation meeting.
 2. Convene minimum four weeks prior to commencing work of this section at the project site. Participants include Contractor, concrete subcontractor and under-slab vapor barrier manufacturer. Advise the Architect of the scheduled meeting date.

PART 2 PRODUCTS

2.01 MATERIALS

A. Vapor Barrier:

1. Vapor Barrier membrane must have the following properties:
 - a. Manufactured from prime virgin resins
Products made from the following materials are not acceptable:
 - 1) Woven products.
 - 2) Recycled plastics.
 - 3) Laminated materials
 - b. Water Vapor Barrier: ASTM E1745; meets or exceeds Class A.
 - c. Water Vapor Permeance Rating: ASTM E96 or ASTM F1249: Less than 0.01 US perms (grains/ft² * hr * in. Hg).
 - 1) Maintain permeance of less than 0.01 perms (grains/ft² * hr * in. Hg) after mandatory conditioning tests per ASTM E154, Sections 8, 11, 12 and 13.
 - d. Thickness: 15 mil.
 - e. Puncture Resistance: 2326 grams.
 - f. Basis of Design: Contract Documents are based on manufacturer and products named below. Other acceptable manufacturer's with products having equivalent characteristics may be provided.
 - 1) Basis of Design: Stego Wrap 15-mil vapor barrier by Stego Industries.
 - 2) Acceptable Manufacturer's and Products:

- i. Fortifiber Building Systems Group, Moistop Ultra 15.
- ii. W.R. Meadows, Perminator.

- 3) Substitutions: Permitted in accordance with the Contract Documents.

2.02 ACCESSORIES

A. Seams

- 1. Tape by Stego Industries. Tape shall have the following qualities:
 - a. A 3 ¾ inches wide tape composed of polyethylene film and an acrylic, pressure-sensitive adhesive.
 - b. Water Vapor Transmission Rate: ASTM E96; 0.3 perms or lower.

B. Sealing penetrations in the vapor barrier

- 1. Use one or both of the following materials:
 - a. Stego Mastic by Stego Industries.
 - 1) Mastic must have the following qualities:
 - 2) Water Vapor Transmission Rate: ASTM E96; 0.3 perms or lower.
 - b. Stego Tape by Stego Industries.

C. Perimeter/edge seal

- 1. StegoTack Tape by Stego Industries: A 2-inch-wide double-sided adhesive strip.

D. Pre-Cut Pipe Boots

- 1. Stego Pre-Cut Pipe Boots, constructed from vapor barrier material, pressure sensitive tape and/or mastic per manufacturer's instructions.

PART 3 EXECUTION

3.01 PREPARATION

- A. Ensure that subsoil is approved by Architect or geotechnical firm.
- B. Level and tamp or roll aggregate, sand or tamped earth base.

3.02 INSTALLATION

A. Install Vapor Barrier:

- 1. Installation shall be in accordance with manufacturer's instructions and ASTM E1643.
 - a. Unroll Vapor Barrier with the longest dimension parallel with the direction of the pour.

- 1) Face laps away from direction of placement of concrete.
- b. Overlap joints 6 inches and seal laps using the following tape:
 - 1) At slab-on-grade seal joints using Stego 3 ¾ inch wide seam tape.
- c. Seal vapor barrier to perimeter of slab using Stego 2-inch-wide double-sided tape.
- d. Seal all penetrations (including pipes) per manufacturer's instructions.
- e. No penetration of the Vapor Barrier is allowed except for reinforcing steel and permanent utilities.
- f. Repair damaged areas by cutting patches of vapor barrier, overlapping damaged area 6 inches and taping all four sides with tape.

END OF SECTION

SECTION 07 27 26 – FLUID-APPLIED MEMBRANE AIR BARRIERS

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Materials and installation methods supplementing a one-component vapor permeable, liquid applied, elastic air, and water barrier.
- B. Materials and installation to bridge and seal the following air leakage pathways and gaps:
 - 1. Connections of the walls to the roof air barrier.
 - 2. Connections of the walls to the foundations.
 - 3. Expansion joints.
 - 4. Openings and penetrations of storefront.
 - 5. Door frames.
 - 6. Piping, conduit, duct and similar penetrations.
 - 7. Masonry ties, screws, bolts and similar penetrations.
 - 8. All other air leakage pathways in the building envelope.

1.02 RELATED SECTIONS

- A. Section 04 20 00 – Unit Masonry: Sealing masonry ties to air barrier membrane.
- B. Section 04 20 19 – Veneer Unit Masonry: Sealing masonry ties to air barrier membrane.
- C. Section 04 43 13- Mortar-Placed Stone Veneer: Sealing masonry ties to air barrier membrane.
- D. Section 06 10 53 – Miscellaneous Carpentry: Covering preservative-treated materials with self-adhering membranes.
- E. Section 06 16 43 – Gypsum Sheathing: Installing air barrier membrane over glass-faced gypsum sheathing and roof board.
- F. Section 07 21 00 – Continuous Thermal Insulation: Compliance with NFPA 285 Fire Test with insulation products.
- G. Section 07 40 00 – Cladding Support System: Securing metal Z tracks and J tracks to air barrier membrane.
- H. Section 07 54 23-Thermoplastic Polyolefin Roofing. Attaching air barrier membrane tape and fluid applied membrane to TPO roof membrane.

1. Verify compatibility of materials specified in this section with TPO roofing membrane.
- I. Section 07 62 00 – Sheet Metal Flashing and Trim: Coordination of TPO base flashing with at copings with air barrier membrane.
 1. Verify compatibility of TPO base flashing with air barrier membrane.
- J. Section 07 65 10 – Flexible Flashing: Coordination of flexible flashing with fluid-applied membrane air barriers.
- K. Section 07 90 00-Joint Protection: Sealants in contact with fluid-applied membrane air barrier system shall be compatible with system.

 7. ASTM E96-00e1: Standard Test Methods for Water Vapor Transmission of Materials.
- D. International Energy Conservation Code
 1. IECC 2015, Chapter 4, Commercial Energy Efficiency, Section C402.5 Air Leakage - Thermal Envelope (mandatory):
 - a. A continuous air barrier shall be provided in all climate zones except 2B.

- E. International Code Council – Evaluation Service:
 - 1. ICC-ES-AC212 – Acceptance Criteria for Water-Resistive Coatings Used as Water-Resistive Barriers Over Sheathing.
- F. National Fire Protection Agency
 - 1. NFPA 285-12 for 2015 IBC: Standard Method of Test for the Evaluation of Flammability Characteristics of Exterior Non-Load-Bearing Wall Assemblies Containing Combustible Construction.

1.04 PERFORMANCE REQUIREMENTS

- A. Provide an air barrier system constructed to perform as a continuous elastic air barrier, and as a liquid water drainage plane flashed to discharge to the exterior any incidental condensation or water penetration. Membrane shall accommodate movements of building materials by providing expansion and control joints as required, with accessory air seal materials at such locations, changes in substrate and perimeter conditions.
 - 1. The air barrier shall have the following characteristics:
 - a. It must be continuous, with all joints made air-tight.
 - b. It shall be capable of withstanding positive and negative combined design wind, fan and stack pressures on the envelope without damage or displacement, and shall transfer the load to the structure. It shall not displace adjacent materials under full load. The air barrier shall be joined in an airtight and flexible manner to the air barrier material of adjacent systems, allowing for the relative movement of systems due to thermal and moisture variations and creep. Connection shall be made between:
 - 1) Foundation and walls.
 - 2) Walls and windows or doors.
 - 3) Different wall systems.
 - 4) Wall and roof.
 - 5) Wall and roof over unconditioned space.
 - 6) Walls, floor and roof across construction, control and expansion joints.
 - 7) Walls, floors and roof to utility, pipe and duct penetrations.
 - 8) Flashing to wall surface.
 - 2. All penetrations of the air barrier and paths of air infiltration/exfiltration shall be made air-tight.
- B. Accredited Laboratory:
 - 1. The testing laboratory shall be accredited to perform the test protocol for each test method listed in Article 1.04 of this section.
 - 2. The accreditation organizations for laboratories shall be one of the following:
 - a. IAS (International Accreditation Service, Inc.)
 - b. A2LA (American Association for Laboratory Accreditation)
 - c. SCC (Standard Council of Canada)

C. Testing Methods:

1. All testing performed in accordance with all the test methods listed shall be conducted with the liquid-applied material within the minimum/maximum range listed. The specific thickness of the liquid-applied material which was used when conducting the following tests shall be recorded on the test report and shall be the site-installed thickness.
2. Air Leakage:
 - a. Assemblies of materials and components shall have an air leakage not to exceed 0.04 cfm/ft² under a pressure differential of 0.3 in. water (1.57 psf) (0.2 L/s•m² @ 75 Pa) when tested in accordance with ASTM E2357-05 Standard Test Method for Determining Air Leakage of Air Barrier Assemblies.
 - 1) This procedure measures the air leakage of representative air barrier assembly before and after exposure to specific conditioning cycles and then assigns a rating dependent upon the results.
 - 2) The results will include the air permeance of the material (the amount of air that passes through the material) the air permeance of the components (the amount of air that passes through the material) and the air leakage that results from joining all the pieces together.
 - b. Test specimens: Test shall be performed on three specimens constructed of frame construction.
 - 1) Specimen 1: Opaque wall min. size 2400 mm (7.87 feet) by 2400 mm (7.87 feet) per ASTM E2357, Annex A1, Figure A1.1.
 - 2) Specimen 2: Penetrations, terminations and connections per ASTM E2357, Annex A1, Figure A1.2.
 - 3) Specimen 3: Roof/foundation interface and opaque wall. Size 2400 mm (7.87 feet) x 2500 mm (8.20 feet) with 300 mm (.98 feet) high concrete beam, per ASTM E2357 Annex A1, Figure A1.3.
 - c. After the initial leakage testing the specimens shall be exposed to the following loads:
 - 1) Sustained positive and negative load of 600 Pa (12.53 psf) for one hour
 - 2) Cyclic positive and negative load of 800 Pa (16.70 psf) for 3 seconds for 2,000 cycles with positive load and 2,000 cycles with negative load
 - 3) Gust wind load positive and negative for 3 seconds at 1,200 Pa (25.06 psf)
 - 4) Refer to ASTM E2357 Annex A3, Figure A3.1 Structural (Wind) Loading Schedule.
 - d. The maximum deflection of the air barrier material shall be recorded at the following wind pressure loading: $D_{0.60}$ @ 1440 Pa (30.08 psf). The

wind loading pressure shall be maintained for a period of 10 seconds and the maximum deflection at any point on the specimens, from the supporting member of the air barrier assembly shall be determined for both positive and negative pressures.

3. Air Permeance of Materials:
 - a. Materials used for the air barrier system in the opaque envelope shall have an air permeance not to exceed 0.004 cfm/ft² under a pressure differential of 0.3 in. water (1.57 psf) (0.02 L/s.m² @ 75 Pa) when tested in accordance with ASTM E2178-03.
 4. Water vapor transmission of the liquid membrane
 - a. Declare the water vapor permeance (water and desiccant method) at the applied thickness in accordance with ASTM E96-00e1.
 5. Water resistance of the liquid membrane
 - a. The water resistance of the liquid membrane when tested in accordance with AATCC 127-03 at a hydrostatic pressure test for five hours shall be a minimum of 55 cm.
 6. Fastener sealability of the liquid membrane
 - a. The sealability of the liquid membrane in accordance with ASTM D1970-01, Section 7.9 Nail Sealability, shall have passed the test.
 7. Pull adhesion of the liquid membrane
 - a. The minimum requirement for the pull adhesion of the liquid membrane in accordance with ASTM D4541-05 shall be 100 kPa or report force at substrate failure. Specify substrates or surface preparation for glass-faced gypsum sheathing and concrete block.
 8. Crack bridging of the liquid membrane
 - a. The liquid membrane when tested in accordance with ICC ES-AC212 or ASTM C1305 shall have passed either test method.
- D. Fire Testing:
1. The air barrier as a component of a wall assembly which includes foam plastic insulation shall have been tested and passed NFPA 285.

1.05 SUBMITTALS

- A. Section 01 33 00 – Submittal Procedures.
- B. Product Data: Submit manufacturer's product data, installation instructions, and manufacturer's printed instructions for evaluating, preparing and treating substrate, temperature and other limitations of installation conditions, technical data, and tested

physical and performance properties.

1. Submit data on all products used in the wall assembly tested in accordance with ASTM E2357, Specimen 2.
 - a. Provide data on how all penetrations in the membrane of the test specimen were sealed including materials used to seal the penetrations which include pipe and duct penetrations, masonry tie fasteners, window openings, junction boxes, joints in the sheathing and concrete block.
 2. Provide data on specific thickness of materials tested per Article 1.04.
 3. Submit letter from primary materials manufacturer indicating approval of products not manufactured by primary manufacturer.
 4. Include statement that materials are compatible with adjacent materials proposed for use.
 5. Submit reports indicating that field peel-adhesion test on all materials to which sealants are adhered have been performed and the changes made, if required, to other approved materials, in order to achieve successful adhesion.
- C. Prior to commencing work, provide test data from an approved independent testing laboratory certifying the air leakage rates of the air barrier assembly, including primary membrane, primer and sealants have been tested to meet ASTM E2357 on a framed wall and the air leakage requirements identified in Article 1.04.
1. Provide data on all materials used to construct each specimen wall.
 2. Provide copies of the report per ASTM E2357, 11.
- D. Prior to commencing work, provide documentation from an approved independent testing laboratory certifying the air leakage rates of the air barrier membrane, including transition membranes in accordance with ASTM E2178 and the air permeance requirements identified in Article 1.04.
- E. Prior to commencing work, the air barrier manufacturer shall submit all other test reports identified in Article 1.04 of this section.
- F. Prior to commencing work, submit documentation that the air barrier membrane has been tested and passed NFPA 285 wall assembly using the board insulation products specified in Section 07 21 00.
- G. Prior to commencing the Work, submit references clearly indicating that the materials proposed have been installed for not less than three years on projects of similar scope and nature. Submit references for a minimum of five projects.
- H. Shop Drawings: Prior to commencing the Work, submit project specific Shop Drawings showing locations and extent of air and vapor barrier assemblies and details of all typical conditions, intersections with other envelope assemblies and materials, membrane counterflashings, and details showing how gaps in the construction will be bridged, how inside and outside corners are negotiated, how materials that cover the air and vapor barrier are secured with airtight condition maintained, and how miscellaneous penetrations such as conduits, pipes, electric boxes and similar items are sealed. The

manufacturer's representative shall review the Contract Drawings and note any modifications required to make the system air and water tight.

- I. Certification of compatibility by air barrier manufacturer, listing all materials on the project that it connects to or that come in contact with it.

1.06 QUALITY ASSURANCE

- A. Air barrier assemblies shall be evaluated both as a material in accordance with ASTM E2178 and as an assembly in accordance with ASTM E2357 by the Air Barrier Association of America as well as passed all other evaluations by the Air Barrier Association of America.
- B. The air barrier assembly shall have been tested and passed NFPA 285 Fire Test as part of the tested wall assembly which included closed-cell polyisocyanurate foam laminated to foil facers.
- C. Manufacturer's Qualifications: Provide primary products, including each component of the air barrier membrane system, which has been commercially available for a minimum of 3 years.
- D. Submit in writing, a document stating that the applicator of the primary air barrier membrane specified in this section is recognized by the manufacturer as suitable for the execution of the Work.
- E. Perform Work in accordance with the printed requirements of the air barrier manufacturer and this specification.
- F. Maintain one copy of manufacturer instructions on site.
- G. At the beginning of the Work and at all times during the execution of the Work, allow access to Work site by the air barrier membrane manufacturer's representative.
- H. Components used in this section shall be sourced from one manufacturer, including sheet membrane, air barrier sealants, primers, mastics and adhesives.

1.07 MOCK-UP

- A. Construct mock-up in accordance with Section 01 40 00 – Quality Requirements: Requirements for a mock-up.
- B. Provide mock-up of air barrier materials under provisions of Section 04 20 19 – Veneer Unit Masonry.
- C. Provide mock-up of air barrier materials under provisions of Section 04 43 13 – Mortar-Placed Stone Veneer.
- D. Items to be incorporated in mock-up include:
 1. Where directed by Architect, construct typical exterior wall panel, size as indicated on drawings, incorporating masonry veneer system, through wall flexible flashing, glass-faced gypsum sheathing, wall ties, board insulation, metal

studs, aluminum storefront frame, showing air barrier membrane application details and transition membranes.

2. Where directed by Architect, construct typical exterior wall panel, size as indicated on drawings, incorporating metal wall panels, metal furring per Section 07 40 00, board insulation, metal stud framing, glass faced gypsum sheathing, aluminum storefront frame, showing air barrier membrane application details and transition membranes.

1.08 PRE-INSTALLATION CONFERENCE

- A. Convene four weeks prior to commencing work of this section, under provisions of Section 01 30 00 – Administrative Requirements: Pre-installation meeting. Attendance by the manufacturer's representative along with the installer is **mandatory**.

DO NOT PROCEED WITH THE INSTALLATION OF THE AIR BARRIER MEMBRANE AND THE THROUGH WALL FLASHING MEMBRANE PRIOR TO THE PRE-INSTALLATION CONFERENCE.

DO NOT PROCEED WITH THE PRE-INSTALLATION CONFERENCE IF ANY ONE OF THE FOLLOWING PARTIES IS NOT IN ATTENDANCE:

**MANUFACTURER'S REPRESENTATIVE
INSTALLER
OWNER'S REPRESENTATIVE (IF APPLICABLE)
ARCHITECT
GENERAL CONTRACTOR**

1.09 DELIVERY, STORAGE AND HANDLING

- A. Deliver materials to the job site in undamaged and original packaging indicating the name of the manufacturer and product.
- B. Store roll materials on end in original packaging.
- C. Store water-borne products, adhesives and primers at temperatures of 40 degrees F (5 degrees C) and above to facilitate handling. Do not allow product to freeze.
- D. Keep solvent away from open flame or excessive heat.
- E. Protect rolls from direct sunlight until ready for use.

1.10 COORDINATION

- A. Ensure continuity of the air seal throughout the scope of this section.

PART 2 PRODUCTS

2.01 MANUFACTURERS AND PRODUCTS

- A. Basis of Design: Contract Documents are based on manufacturer and products named below to establish a Standard of Quality. Other acceptable manufacturers with products,

listed in Paragraph B below, having equivalent characteristics may be submitted.

1. Basis of Design Product Selections:

- a. Manufacturer: Kemper Systems America, Inc.
- b. Product: Wall Guardian FW-100A, acrylic based.
 - 1) Refer to Section 07 21 00-Continuous Thermal Insulation for list of approved products tested in compliance with NFPA 285 with this membrane.
- c. Air leakage of building assembly in accordance with ASTM E2357, Specimen 2: 0.0004 cfm/ft² @ 1.57 psf @ 20 mils dry.
- d. Air permeance in accordance with ASTM E2178: 0.0001 cfm/ft² @1.57 psf @ 20 mils dry.
- e. Water vapor permeance in accordance with ASTM E96 – Water Method: 11.5 perms @ 22 mils dry.
- f. Water vapor permeance in accordance with ASTM E96, Dessicant Method: 0.96 perms @ 22 mils dry.
- g. Water resistance in accordance with AATCC 127-03: Pass.
- h. Fastener sealability in accordance with ASTM D1970-01: Pass.
- i. VOC content: 50 g/L.
- j. Pull adhesion in accordance with ASTM D4541-05: ≥ 110 kPa.
- k. Crack bridging in accordance with ICC ES AC212: Pass.
- l. Fire test in accordance with NFPA 285: Passed.
- m. Exposure: 6 months.
- n. In service temperature: Zero sag at 180 Degrees F.
- o. Self-adhering membrane for transition, joint treatment, inside and outside corners, window and door openings, closure between air barrier membrane and storefront, and door frames and at other locations noted shall be UT-40 universal tape, 40 mil thick polyester-backed synthetic butyl rubber-based adhesive membrane.

Note: Verify compatibility of self-adhering membrane with roof membrane, and any other material system membrane is secured to.

- 1) Tensile strength: 150 psi.
 - 2) Elongation: 500 percent min.
 - 3) Permeance: 0.13 perms.
 - 4) Pliability: Pass.
 - 5) In-service temperature: -30 degrees F to 250 degrees F.
 - 6) Roll size widths: Provide roll size widths as required from 4 inches up to 36 inches.
- p. Primer:
 - 1) Primer for self-adhering membrane for application below 32 degrees F, gypsum sheathing, concrete or masonry surfaces, AP-42 primer, 0 g/L.
 - q. Sealants:
 - 1) Sealants shall be compatible with air barrier systems and shall be approved by the air barrier manufacturer.

- 2) Liquid Tape Sealant:
 - a) Kemper Systems America, Inc. GreatSeal LT100 Liquid Tape: Polyether-based, moisture curing, elastomeric vertical seam sealer. VOC content: 15.7 g/L < 250 g/L.
 - b) Primers as recommended by sealant manufacturer for surfaces to be sealed.
 - c) Backer rods: As recommended by sealant manufacturer.
 - 3) Sealant:
 - a) Kemper Systems America, Inc GreatSeal PE-150: Polyether-based sealant. VOC content 18.26 g/L < 250 g/L.
 - b) Primers as recommended by sealant manufacturer for surfaces to be sealed.
 - c) Backer rods: As recommended by sealant manufacturer.
- B. Acceptable Manufacturers and Products: Subject to compliance with requirements of Contract Documents, provide product by one of the manufacturers listed below:
1. Manufacturer: W.R. Meadows, Inc.
 - a. Product: Air-Shield LMP (Gray) Low Version VOC.
 - 1) Refer to Section 07 21 00-Continuous Thermal Insulation for list of approved products tested in compliance with NFPA 285 with this membrane.
 - b. Air leakage of building assembly in accordance with ASTM E2357, Specimen 2: 0.00052 cfm/ft² @ 1.57 psf @ 45 mils dry.
 - c. NOTE: Provide all materials used in the wall assembly tested in accordance with ASTM E2357, Specimen 2.
 - d. Air permeance in accordance with ASTM E2178: <0.00022 cfm/ft² @ 1.57 psf @ 20 mils dry.
 - e. Water vapor permeance in accordance with ASTM E96 – Water Method: 10.47 perms @ 47.6 mils dry.
 - f. Fire test in accordance with NFPA 285: Pass.
 - g. Fastener sealability in accordance with ASTM D1970-01: Pass.
 - h. Pull adhesion in accordance with ASTM D4541-05.
 - i. VOC content: 40 g/L.
 - j. Exposure: 6 months.
 - k. In service temperature: Zero sag at 175 Degrees F.
 - l. Self-adhering membrane for transition, joint treatment, window and door openings, inside and outside corners and where noted shall be a high temperature membrane 40 mil thick polyester-backed synthetic butyl rubber-based adhesive membrane. Note: Verify compatibility of self-adhering membrane with roof membrane, and any other material system membrane is secured to.
 2. Manufacturer: Sika Corp.
 - a. Product: Sikagard 535.

- 1) Refer to Section 07 21 00-Continuous Thermal Insulation for list of approved products tested in compliance with NFPA 285 with this membrane.
 - b. Air leakage of building assembly in accordance with ASTM E2357, Specimen 2: 0.0026 cfm/ft² @ 1.57 psf @ 20mils dry
 - c. NOTE: Provide all materials used in the wall assembly tested in accordance with ASTM E2357, Specimen 2.
 - d. Air permeance in accordance with ASTM E2178: <0.00018 cfm/ft² @ 1.57 psf @ 10 mils dry.
 - e. Water vapor permeance in accordance with ASTM E96 – Water Method: 6 perms @ 20 mil dry.
 - f. Fire test in accordance with NFPA 285: Pass.
 - g. Fastener sealability in accordance with ASTM D1970-01: Pass.
 - h. Pull adhesion in accordance with ASTM D4541-05: Pass
 - i. VOC content: 80 g/L.
 - j. Exposure: 6 months.
 - k. Self-adhering membrane for transition, joint treatment, window and door openings, inside and outside corners and where noted shall be SikaMultiSeal 515 membrane 40 mil thick polyester-backed synthetic butyl rubber-based adhesive membrane. Note: Verify compatibility of self-adhering membrane with roof membrane, and any other material system membrane is secured to.
- C. Substitutions per Section 01 60 00.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verify that surfaces and conditions are ready to accept the Work of this section. Notify Architect in writing of any discrepancies. Commencement of the work or any parts thereof shall mean acceptance of the prepared substrate.

3.02 PREPARATION

- A. All surfaces must be sound, dry, clean and free of oil, grease, dirt, excess mortar or other contaminants. Fill spalled areas in substrates to provide an even plane.
- B. Mortar joints in concrete block and form tie holes/voids in poured concrete shall be filled flush and smooth and allowed to be cured for a minimum of 24 hours.
- C. All joints between gypsum sheathing, masonry and concrete and other substrate joints up to ¼- inch wide shall be treated with GreatSeal LT-100 Liquid Tape.
 1. Use a quality caulking gun to ensure ease of application.
 2. Application shall occur only when temperatures are above 40 degrees F and inclement weather is not predicted.
 3. Cut the plastic nozzle at a 45- degree angle or use special nozzle.

4. Begin gunning the material filling the joint from the bottom to the surface ensuring there are no voids or air pockets in the joint.
 5. Applied in a 1/4 -inch bead.
 6. Tool to 3/4 inch by 1/16 -inch cap seal that becomes tack free in 20 minutes.
 7. It cures to a firm rubber seal in one hour.
 8. For best finishing performance, do not allow un-tooled beads to stand for more than 10 minutes.
- D. At joints (change in plane, change in substrate, control joints, loose fitting penetrations) between gypsum sheathing, masonry and concrete and other substrates wider than 1/4 inch shall be sealed with:
1. UT 40 Tape, overlapping each side of joint a minimum of 4 inches installed over LT-100 liquid tape and backer rod.
- E. At building expansion joints install UT-40 Tape overlapping each side joint a minimum of 4 inches. Leave the release paper on the tape only for the width of the expansion joint.
- F. At joints between air barrier membrane and storefront frames, door frames where transition membrane is lapped onto the frame, install a continuous fillet bead of GreatSeal PE-150 sealant and backer rod behind the transition membrane.
1. Where transition membrane is not lapped onto storefront frames, door frames seal joint between frames and air barrier membrane/transition membrane with GreatSeal PE 150 sealant and backer rod as secondary sealant and interior sealant.
 - a. Sealant shall be compatible with air barrier/transition membrane.

3.03 PRIMER FOR TRANSITION MEMBRANE (SELF-ADHERING TYPE ONLY)

- A. Apply primer for self-adhering membranes at rate recommended by manufacturer.
- B. Apply primer to all areas to receive transition sheet membrane as indicated in Drawings by roller or spray and allow minimum 30-minute open time. Primed surfaces not covered by transition membrane during the same working day must be re-primed.

3.04 TRANSITION MEMBRANE (SELF-ADHERING TYPE)

- A. Align and position self-adhering transition membrane, remove protective film and press firmly into place. Center tape over area to be sealed. Ensure minimum 4- inch overlap at all end and side laps unless otherwise noted. Cover horizontal joints first then vertical joints.
 1. Transition membrane shall extend a minimum of 3 inches onto primed surface of sheathing, concrete block, or concrete. Seal edges of transition membrane with a continuous bead of GreatSeal LT-100 prior to the application of the air barrier membrane.

- B. Tie in to roofing system and at the interface of dissimilar materials as indicated in Drawings.
 - 1. Verify compatibility of all materials that membrane comes in contact with.
- C. Promptly roll all laps and membrane with a counter top roller to affect seal.
- D. Ensure all preparatory work is complete prior to applying liquid membrane.
- E. Seal storefront frames (window and door frames), and steel door frames using UT 40 tape installed behind air barrier. Install a continuous fillet bead of GreatSeal PE-150 sealant and backer rod behind the tape at storefront frames (window and door frames). At steel door frames, install a fillet bead of GreatSeal PE-150 behind the tape. Lap tape over storefront frames (window and door frames), and steel door frames as detailed. Extend tape behind air barrier minimum 4 inches. Provide GreatSeal PE-150 sealant and backer rod around the perimeter of the storefront frames (window and door frames), on the interior side of the frames.
 - 1. Where sealant comes in contact with any surface or edge of the UT 40 tape provide Great Seal PE-150 sealant.
 - 2. Where transition membrane is not lapped onto any of the frames noted above, seal joint between frames and air barrier membrane/transition membrane with GreatSeal PE 150 sealant and backer rod as secondary sealant and interior sealant.
- F. At all inside corners, apply a fillet shaped bead of GreatSeal PE-150 sealant directly behind the transition membrane.

3.05 PRIMARY AIR BARRIER

- A. Apply by spray, a complete and continuous unbroken film at a temperature of 40 degrees F and rising with less than a 30 percent chance of rain in the next 24 hours:

Select either paragraph 1 or 2 below or both based on project requirements

- 1. Exterior Gypsum Sheathing: Note applied mil thickness shall match ABAA system evaluation per ASTM E2357.
 - a. Kemper Systems America, Inc., FW-100A at the minimum rate of 40 mils wet, 20 mils dry
 - b. W.R. Meadows, Inc. Air-Shield LMP (gray) at the minimum rate of 90 mils wet, 45 mils dry.
 - c. Sika Corp, Sikagard 535 at the minimum rate of 40 mils wet, 20 mils dry.
 - d. Spray around all projections, including masonry veneer anchors, ensuring a complete and continuous air seal.
- 2. Concrete Masonry Unit (CMU), Concrete: Note: Applied mil thickness shall match ABAA system evaluation per ASTM E2357.
 - a. Kemper Systems America, Inc., FW-100A at the minimum rate of 40 mils wet, 20 mils dry.
 - b. W.R. Meadows, Inc., Air-Shield LMP (gray) at the minimum rate of 90

mils wet, 45 mils dry.

- c. Sika Corp, Sikagard 535 at the minimum rate of 40 mils wet, 20 mils dry.
- d. Spray around all projections including masonry veneer anchors ensuring a complete and continuous air seal.

3.06 INSPECTION

- A. Notify Architect when sections of work are complete so as to allow for review prior to installing continuous insulation. The manufacturer's representative shall be on site to review the installation along with the Architect.

3.07 PROTECTION OF FINISHED WORK

- A. Liquid membranes are not designed for permanent exposure. Cover the liquid membrane, as recommended by the manufacturer, within the following time frames. Contractor shall verify the number of calendar days with the air barrier manufacturer:
 - 1. Cover the Kemper Systems America, Inc. FW-100A material within 180 calendar days after installation.
 - 2. Cover W.R. Meadows, Inc. Air-Shield LMP (gray) within 180 calendar days after installation.
 - 3. Cover Sika Corp, Sikagard 535 within 180 calendar days after installation.
 - 4. Transition membranes shall be covered within 180 days after installation
- B. Prepare, treat and seal vertical and horizontal surfaces at terminations and penetrations through the air barrier and at protrusions according to air barrier manufacturer's written instructions.

3.08 SCHEDULE

- A. Install liquid membrane system over the entire surface of the glass-faced sheathing in the following area. Seal any masonry anchor penetrations air tight by coating the back of the anchor plate with sealant compatible with fluid applied air barrier membrane.
 - 1. In the masonry cavity wall.
- B. Install liquid membrane system over the entire surface of the outer surface of the inner wythe of masonry. Seal any masonry anchor penetrations air tight.
 - 1. Seal any masonry anchor penetrations air tight by coating the back of the anchor plate with sealant compatible with fluid applied air barrier membrane. Seal all pre-drilled holes prior to installing masonry expansion anchors used to secure masonry anchors to concrete block.
- C. Install liquid membrane system over the entire surface of the glass-faced gypsum sheathing in the following area:
 - 1. Behind the metal wall and soffit panels.

- a. Where metal furring is installed seal head of all fasteners used to secure framing to the wall.

- D. Hollow Metal Door Frames: Seal door frame to wall surface with transition membrane and sealant.

- E. Wall and Roof Junction: Seal wall to roof with transition membrane.

- F. Seal the top of sheathing to the underside of the roof systems with sealant.

- G. Openings: Seal around the perimeter of all openings with transition membrane.

- H. Perimeter wood nailers at wall openings: Cover all exposed surfaces of wood nailers with transition membrane. Extend membrane over sheathing, masonry and metal framing as shown. Prime surface.

- I. Aluminum storefront frames: Seal frames to the wall surface with transition membrane, sealant and backer rod.
 - 1. Verify air barrier sealants that are not compatible with sealants used to install storefront framing do not come in contact with sealants used to seal the storefront framing.

 - 2. Where transition membrane is not lapped onto storefront frame noted above, seal joint between frames and air barrier membrane/transition membrane with GreatSeal PE 150 sealant and backer rod as secondary sealant and interior sealant.

END OF SECTION

SECTION 07 40 00 – CLADDING SUPPORT SYSTEM

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Cladding support system consisting of zee furring, J-tracks and corner angles for securing:
 - 1. Metal wall panels to walls that require continuous rigid insulation.
- B. Substrate:
 - 1. Exterior sheathing over metal stud framing.
- C. Structural engineering services provided by cladding support metal framing fabricator.

1.02 RELATED SECTIONS

- A. Section 05 40 00 - Cold-Formed Metal Framing: Securing cladding support system to exterior steel stud curtain wall framing.
- B. Section 06 16 43 – Gypsum Sheathing: Fastening cladding support system through exterior gypsum sheathing.
- C. Section 07 21 00 – Continuous Thermal Insulation: Cladding support framing members sized to match thickness of continuous insulation.
- D. Section 07 27 26 – Fluid-Applied Membrane Air Barrier: Compatibility of thermal tape to fluid-applied air barrier membrane including any sealants provided by the cladding support manufacturer.
- E. Section 07 42 13 – Metal Wall and Soffit Panels: Wall cladding system.
 - 1. Securing horizontal metal wall panels to horizontal framing specified in this section.

1.03 REFERENCES

- A. 2015, IECC International Energy Conservation Code.
- B. ASHRAE STANDARD 90.1 Energy Standard for Buildings Except Low-Rise Residential Buildings. Edition as referenced in the applicable IECC.
- C. ASTM Standards:
 - 1. ASTM C518 Standard Test Method for Steady-State Thermal Transmission Properties by Means of the Heat Flow Meter Apparatus.
 - 2. ASTM C1363 Standard Test Method for Thermal Performance of Building Materials and Envelope Assemblies by Means of a Hot Box Apparatus.
 - 3. ASTM D1667 Standard Specification for Flexible Cellular Materials-Poly (Vinyl

Chloride) Foam (Closed Cell).

1.04 DESIGN REQUIREMENTS

- A. Cladding support fabricator is responsible for designing system, including anchorage to the following substrates and required modifications to meet specified requirements and maintain visual design concepts.
 - 1. Steel stud framing.
- B. Cladding support fabricator shall employ a professional engineer, licensed to practice engineering in jurisdiction where Project is located to engineer each cladding support system and attachment to substrate including:
 - 1. Frequency and spacing of horizontal cladding support framing.
- C. Structural Design: Cladding support system shall be designed to withstand effects of load and stresses from dead loads, wind loads, (snow and ice loads where applicable) as indicated on Structural General Notes and the following deflection criteria:
 - 1. Deflection of L/180 for metal wall panels.
- D. Attachment System:
 - 1. No framing component shall penetrate the layer of continuous exterior insulation.
- E. Performance Requirements:
 - 1. Attachment System Performance: Constructed system shall comply with applicable ANSI/ASHRAE 90.1 definition of continuous insulation.
 - 2. No thermal bridges other than fasteners and service openings.
 - 3. Thermal Performance:
 - a. Provide thermal performance data R and U values for exterior wall assembly as shown on the contract documents using thermal modelling software as recommended by cladding support manufacturer based on the following standards:
 - 1) Applicable climate zone where the project is located.
 - 2) Applicable IECC.
 - 3) Applicable ASHRAE 90.1.
- F. Engineering Responsibility: Engage a fabricator who assumes undivided responsibility for engineering cladding support system by employing a qualified professional engineer, licensed in the state in which project is located to prepare and sign and seal design calculations, Shop Drawings and other structural data.

1.05 SUBMITTALS

- A. Product Data: For each type of product.

1. Provide documentation that cladding support system complies with the referenced IECC code and relevant ASTM Standards. Verify mechanical properties, coatings, dimensions, and labeling are checked. Installation instructions shall be included.
- B. Provide engineered design and drawings for gage and spacing of cladding support system including fastener type and spacing required to secure cladding support system to the following substrates:
 1. Exterior sheathing over metal stud framing.
- C. Structural Calculations:
 1. Submit comprehensive analysis of design loads, including dead loads, live loads and wind loads and attachment to wall signed and sealed by a licensed engineer in the applicable State the project is located in.
- D. Manufacturer's Certification: Submit manufacturer's certification of product compliance with codes and standards along with product literature and data sheets for specified products.
- E. Provide written certification that thermal tape and any sealants required by the installation of the cladding support system are compatible with fluid applied membrane air barrier specified in Section 07 27 26.

1.06 QUALITY ASSURANCE

- A. Manufacturer Qualifications: Company specializing in manufacturing products specified in this section with at least two years of documented experience.
- B. Installer Qualifications: Engage an experienced Installer who has completed cladding support metal framing similar in material, design and extent to that indicated for this Project and with a record of successful in-service performance.
 1. Install system in strict compliance with manufacturer's installation instructions.
 2. Have not less than three years of documented experience.
- C. Professional Engineer Qualifications: A professional engineer legally authorized to practice in the jurisdiction where Project is located and experienced in providing engineering services of the kind indicated that have resulted in the installation of cladding support framing similar to this Project in material, design and extent and that have a record of successful in-service performance.
- D. Engineering Responsibilities: Preparation of Shop Drawings, design calculations and other structural data.
- E. Pre-Installation Meeting:
 1. Participants: Authorized representatives of the General Contractor, Owner, Architect, Manufacturer's technical representative for each product specified, installation subcontractors for continuous thermal insulation, cladding support system

and:

a. Metal wall panels.

2. Meeting Timing: Minimum 4 weeks prior to beginning work of this Section and related work that may affect work of this Section.
3. Review metal wall framing assemblies for potential interference and conflicts and coordinate layout and support provisions for interfacing work.
4. Review and document methods, procedures and manufacturer's installation guidelines and safety procedures for insulation, flashings, support framing, attachment system, finish panels, and penetration and gap sealant.
5. Review construction schedule and confirm availability of products, applicator/installer personnel, equipment and facilities.
6. Review governing regulatory requirements and requirements for insurance and certificates.
7. Review field quality control procedures.

F. Mock-Ups:

1. Mock-up complete system at location as directed by Architect.
2. Coordinate mock-up with the following Section:
 - a. Section 07 27 26 Fluid-Applied Membrane Air Barrier mock up requirements.
3. Mock-up shall demonstrate prepared substrate, support/attachment framing, insulation, façade finish, outside corner, inside corner, penetrations, exterior finishes and aesthetic appearance.
4. Verify mock-up as conforming to manufacturer's instructions and provisions of Contract Documents.
5. Do not begin work of this Section until façade mock-up has been inspected and approved by manufacturer's representative on site and Architect's acceptance of mock-up is given in writing.
6. Protect and maintain accepted mock-up as standard of quality for work of this Section.

1.07 DELIVERY, STORAGE, AND HANDLING

- A. Deliver materials to site in manufacturer's original unopened containers and packaging with labels clearly identifying product name and manufacturer.
- B. Deliver components and other manufactured items or accessories without damage or deformation.
- C. Storage: Store materials in clean, dry, and level interior areas or outdoor areas for limited

duration in accordance with manufacturer's written instructions.

- D. Protect components and auxiliary accessories during transportation, handling, and installation from moisture, excessive temperatures and other construction operations in accordance with manufacturer's written instructions.
- E. Handle components in strict compliance with manufacturer's written instructions and recommendations, and in a manner to prevent bending, warping, twisting, and surface, edge or corner damage.

1.08 SITE CONDITIONS

- A. Weather Limitations: Proceed with installation only when existing and forecasted weather conditions permit assembly of this Work in accordance with manufacturer's written installation instructions and warranty requirements.

1.09 SEQUENCING

- A. Coordinate construction to ensure that assemblies fit properly to supporting and adjoining construction; coordinate schedule with construction in progress to avoid delaying work.

PART 2 PRODUCTS

2.01 MANUFACTURER AND PRODUCTS

- A. Basis of Design: Contract Documents are based on manufacturer and products named below to establish a standard of quality. Other Manufacturer's offering equivalent systems may submit as a substitution request in accordance with General Conditions and Division 01 requirements provided deviations are minor and does not change the concept as expressed in Contract Documents as judged by Architect.

- 1. Manufacturer: The Steel Network, Inc.
- 2. Products: ThermaFast Cladding Support System. A pre-engineered system designed to support rigid insulation, cladding material and resist wind loads. System is made from structural grade steel slotted to minimize thermal conductivity with a 1- inch thermal tape preinstalled on each piece for an integral continuous thermal break.

- a. Components:

- 1) ThermaFast J-Track.
- 2) ThermaFast Z-Track.
- 3) ThermaFast Corner Angle.

2.02 CLADDING SUPPORT SYSTEM

- A. Steel material and coating: ASTM A1003/A1003M Structural Grade 50 Type H, ST50H 50ksi minimum yield strength, 65ksi minimum tensile strength, with ASTM A653/A653M G90 hot dipped galvanized coating.
 - 1. Thickness: 54 mil minimum thickness (16-gauge, 0.0566- inch design thickness).

2. Depth of Z-track and J-Track based on depth of insulation specified.
 - a. 2 inches.
- B. Thermal Tape:
 1. Size: 1/16- inch thick by 1 inch wide.
 2. Density per ASTM D1667: 15 lbs/ft³.
 3. Thermal conductivity, k factor per ASTM C518: 0.3.
- C. Fasteners: Hot dipped galvanized gasketed fasteners.
 1. Metal stud framing: Self-drilling, size and gauge based on design requirements.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Examine areas and substrates, with Installer present, for compliance with requirements and other conditions affecting performance of the work. Do not begin installation until substrates have been properly prepared.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 PREPARATION

- A. Clean and prepare surfaces using the methods recommended by the manufacturer before installation.

3.03 INSTALLATION

- A. Install in J-track, Z-track and Corner angles in accordance with manufacturer's instructions and approved submittals, and in proper relationship with adjacent construction.
 1. Coordinate installation of Z- track and J- track with board insulation specified in Section 07 21 00.
 - a. Attach cladding support system to steel stud backup with minimum (1) #10-16 self-drilling gasketed screws to each stud. (2) screws may be required for high design wind pressures per manufacturer's recommendations.
- B. Install wall panels in accordance with Section 07 42 13.

3.04 PROTECTION

- A. Protect installed products until completion of project. repair or replace damaged products before Substantial Completion.

END OF SECTION

SECTION 07 42 13 - METAL WALL AND SOFFIT PANELS

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Concealed fastener metal wall and soffit panels.
- B. Subgirts installed behind wall panels.

1.02 RELATED SECTIONS

- A. Section 05 40 00 – Cold Formed Metal Framing: Installing metal wall panels over metal stud framing.
 - 1. Installing metal soffit panels to metal framing support system as detailed.
- B. Section 07 21 00 – Continuous Thermal Insulation: Installing metal wall panels over board insulation.
- C. Section 07 40 00 – Cladding Support System: Installing metal wall panels to metal Z and J tracks.
- D. Section 07 62 00 – Sheet Metal Flashings and Trim: Sheet metal copings, and flashings.
- E. Section 07 90 00 – Joint Protection: Field-applied joint sealants.

1.03 REFERENCES

- A. American Architectural Manufacturer's Association (AAMA):
 - 1. AAMA 621 - Voluntary Specification for High Performance Organic Coatings on Coil Coated Architectural Hot Dipped Galvanized (HDG) and Zinc-Aluminum Coated Steel Substrates.
- B. American Society of Civil Engineers (ASCE):
 - 1. ASCE 7 - Minimum Design Loads for Buildings and Other Structures.
- C. ASTM International (ASTM):
 - 1. ASTM A755/A755M - Specification for Steel Sheet, Metallic Coated by the Hot-Dip Process and Pre-painted by the Coil-Coating Process for Exterior Exposed Building Products.
 - 2. ASTM A792/A792M – Standard Specification for Steel Sheet, 55 percent Aluminum-Zinc Alloy-Coated by the Hot-Dip Process.
 - 3. ASTM C920 - Specification for Elastomeric Joint Sealants.
 - 4. ASTM E72 - Standard Test Methods of Conducting Strength Tests of Panels for Building Construction.

- D. Sheet Metal and Air Conditioning Contractors National Association, Inc. (SMACNA):
 - 1. Architectural Sheet Metal Manual.

1.04 PERFORMANCE REQUIREMENTS

- A. General: Provide metal wall and soffit panel assemblies meeting performance requirements as determined by application of specified tests by a qualified testing agency on manufacturer's standard assemblies.
- B. Design Requirements:
 - 1. Manufacturer is responsible for designing system, including anchorage to cladding support system and necessary modifications to meet specified requirements and maintain visual design concepts.
 - 2. Manufacturer shall employ a professional engineer, licensed to practice engineering in jurisdiction where Project is located, to engineer each component of metal wall and soffit panel system:
 - a. Where noted engineer the metal subgirt framing and the metal subgirt spacing behind wall panels.
 - 3. Structural Performance: Provide metal wall and soffit panel assemblies capable of withstanding the effects of indicated loads and stresses within limits and under conditions indicated, per ASTM E72:
 - a. Wind Loads: Refer to Structural Drawings for wind loads.
 - b. Limits of Deflection: Metal wall panel and soffit panel assembly shall withstand scheduled wind pressure with the following allowable deflection:
 - 1) Maximum allowable deflection limited to L/180 deflection of panel perimeter normal to plane of wall and soffit with no evidence of failure.
 - c. Coordinate with Section 07 40 00-Cladding Support System for spacing of framing system based on wind loads.
 - 4. Thermal Movements: Allow for thermal movements from variations in both ambient and internal temperatures. Accommodate movement of support structure caused by thermal expansion and contraction.
 - 5. Vertical deflection of back up wall assembly: Accommodate for vertical deflection of back up wall system with in metal wall panels.
 - 6. Wall systems that incorporate foam plastic insulation must be tested by the foam plastic supplier in accordance with NFPA-285.

1.05 QUALITY ASSURANCE

- A. Manufacturer/Source: Provide metal wall panel and panel accessories from a single manufacturer.
- B. Installer Qualifications: Experienced Installer with minimum of 5 years experience with

successfully completed projects of a similar nature and scope.

1.06 PREINSTALLATION MEETING

- A. Convene four weeks prior to commencing work of this section, under provisions of Section 01 33 00 – Administrative Requirements: Pre-installation meeting. Attendance by the manufacturer's representative along with the installer is mandatory including other trade contractors.
 - 1. Coordinate cladding support system in relation to metal wall and soffit panel assembly.
 - 2. Coordinate installation of building air and water barrier behind metal wall and soffit panel assembly.
 - 3. Coordinate window, door and other openings and penetrations of metal wall panel assembly.

1.07 SUBMITTALS

- A. Product Data: Manufacturer's data sheets, for specified products.
 - 1. Include data indicating compliance with performance requirements.
- B. Shop Drawings: Provide shop drawings prepared by manufacturer or manufacturer's authorized Installer. Include full elevations showing openings and penetrations. Include details of each condition of installation and attachment. Provide details at a minimum scale of 1-1/2-inch per foot (1:8) of all required trim and extrusions needed for a complete installation.
 - 1. Indicate points of supporting structure that must coordinate with metal wall and soffit panel assembly installation.
 - 2. Indicate details of fastening, including clip spacing, supported by load span tables that include an evaluation of clip and panel side joint interaction.
 - 3. Indicate details where wall panels span over deflection joints in back up wall assembly, provide appropriate trim, fasteners and clips as required to allow back up wall to move (deflect) without damaging wall panels.
- C. Structural Calculations:
 - 1. Submit Panel manufacturer's comprehensive analysis of design loads, including dead loads, live loads, wind loads and thermal movement.
 - 2. Submit façade attachment/support framing system including manufacturer's comprehensive analysis of design loads, including dead loads, live loads, wind loads and thermal movement, signed and sealed by a licensed engineer in the applicable State.
- D. Samples for Initial Selection: For each product specified. Provide representative color charts of manufacturer's full range of colors.
- E. Samples for Verification: Provide 12-inch section of panel(s) showing finishes. Provide

12-inch long pieces of trim pieces and other exposed components.

1.08 INFORMATIONAL SUBMITTALS

- A. Product Test Reports: Indicating compliance of products with requirements, from a qualified independent testing agency.
- B. Qualification Information: For Installer firm.
- C. Manufacturer's Warranty: Submit sample warranty.

1.09 CLOSEOUT SUBMITTALS

- A. Maintenance data.

1.10 DELIVERY, STORAGE AND HANDLING

- A. Protect metal wall and soffit panel products during shipping, handling, and storage to prevent staining, denting, deterioration of components or other damage.
 - 1. Deliver, unload, store and erect metal wall and soffit panel products and accessory items without misshaping panels or exposing panels to surface damage from weather or construction operations.

1.11 WARRANTY

- A. Special Manufacturer's Warranty: On manufacturer's standard form, in which manufacturer agrees to repair or replace components of metal wall and soffit panel assemblies that fail in materials and workmanship within two years from date of Substantial Completion.
- B. Special Panel Finish Warranty: On manufacturer's standard form, in which manufacturer agrees to repair or replace metal wall and soffit panels that evidence deterioration of finish within the following periods from the date of substantial completion:
 - 1. Warranty Period: 20 years.

PART 2 PRODUCTS

2.01 MANUFACTURERS AND PRODUCTS

- A. Basis of Design: Contract Documents are based on manufacturer and product named below to establish a standard of quality. Other manufacturers with products having equivalent characteristics may be submitted in accordance with Conditions of the Contract and appropriate Division 1 sections.
 - 1. Manufacturer: PAC-CLAD.

2.02 METAL PANEL MATERIALS

- A. Metallic-Coated Steel Face Sheet: Coil-coated, ASTM A755/A755M.

1. Aluminum-zinc alloy-coated Steel Sheet: ASTM A 792/A 792 M, Class AZ50 Grade 50 (Class AZM150, Grade 275), structural steel quality.
2. Face Sheet: Minimum 22 gauge nominal uncoated thickness.
3. Surface: Smooth.

2.03 CONCEALED FASTENER METAL WALL PANELS

- A. Metal Wall Panels – General: Factory-formed, concealed fastener panels with interconnecting side joints, fastened to supports with concealed fasteners, with factory-applied sealant in side laps when required to meet performance requirements.
- B. Flush-joint profile raised flat pan MWP# 1
 1. Basis of Design Product: PAC-CLAD, Flush Solid Panel
 - a. Acceptable Manufacturers/Products: CENTRIA IW-10A.
 - 1) Panel Coverage: 12 inches
 - 2) Panel Height: 1.50 inches.
 2. Panel Coverage: 12 inches.
 3. Panel Height: 1 inch.

2.04 CONCEALED FASTENER METAL SOFFIT PANELS

- A. Metal Soffit Panels – General: Factory-formed, concealed fastener panels with interconnecting side joints, fastened to supports with concealed fasteners, with factory-applied sealant in side laps when required to meet performance requirements.
 1. Flush-joint profile raised flat pan MSP# 1:
 - a. Basis of Design Product: PAC-CLAD Flush Solid Panel.
 - b. Panel Coverage: 12 inches.
 - c. Panel Height: 1 inches.
 2. Acceptable Manufacturers/Products:
 - a. CENTRIA IW-10A.
 - 1) Panel coverage: 12 inches.
 - 2) Panel height: 1.5 inches.

2.05 METAL PANEL ACCESSORIES

- A. Metal Panel Accessories – General: Provide complete metal wall and soffit panel assembly incorporating trim, soffits, sills, inside and outside corners, expansion joint covers and miscellaneous flashings. Provide manufacturer's factory-formed clips, shims, flashings, gaskets, lap tapes, closure strips, and caps for a complete installation. Fabricate and in-

stall accessories in accordance with SMACNA Manual.

- B. Mitered Corners: Structurally-bonded horizontal interior and exterior trimless corners matching metal wall panel material, profile, and factory-applied finish, fabricated and finished by metal wall panel manufacturer.
 - 1. Welded, riveted, fastened or field-fabricated corners do not meet the requirements of this specification.
- C. Formed Flashing and Trim: Match material, thickness, and color of metal wall and soffit panel face sheets.
- D. Sealants: Type recommended by metal wall and soffit panel manufacturer for application, meeting requirements of Section 07 90 00 – Joint Protection.
- E. Flashing Tape: 4-inch wide self-adhering butyl flashing tape.
- F. Fasteners – General: Self-tapping gasketed screws, bolts, nuts, and other acceptable fasteners recommended by panel manufacturer. Where exposed fasteners cannot be avoided for miscellaneous applications, supply corrosion-resistant fasteners with heads matching color of metal wall panels by means factory-applied coating.
- G. Concealed Clips: Galvanized steel, 0.051 inch/16 ga. thick, designed to allow unimpeded thermal movement of panel.

2.06 METAL SOFFIT PANEL ACCESSORIES

- A. Formed Flashing and Trim: Match material, thickness, and color of metal wall panel face sheets.
- B. Sealants: Type recommended by metal wall panel manufacturer for application, meeting requirements of Section 07 90 00 – Joint Protection.
- C. Flashing Tape: 4-inch wide self-adhering butyl flashing tape.
- D. Fasteners – General: Self-tapping gasketed screws, bolts, nuts, and other acceptable fasteners recommended by panel manufacturer. Where exposed fasteners cannot be avoided for miscellaneous applications, supply corrosion-resistant fasteners with heads matching color of metal wall panels by means factory-applied coating.

2.07 SECONDARY SUBGIRT FRAMING

- A. Refer to Section 07 40 00 – Cladding Support System.
 - 1. Z and J tracks.
- B. Metal Subgirt Framing
 - 1. Wall panels installed over metal stud framing.
 - a. Where wall panels are installed horizontally over metal stud framing provide the following:

- 1) Horizontal Z and J tracks: Refer to Section 07 40 00 Cladding Support System.
- 2) Vertical subgirts: Minimum 16 gauge G90 galvanized 3/4 inch deep subgirts.
 - a) Spacing of subgirts to be determined by metal wall panel engineer.
 - b. Where soffit panels are installed vertically over metal stud fanning provide the following:
 - 1) Horizontal metal framing as detailed.

2.08 METAL WALL AND SOFFIT PANEL FINISHES

A. Exposed Coil-Coated Finish System:

1. Fluoropolymer Two-Coat System: 0.2 mil primer with 0.8 mil 70 percent PVDF fluoropolymer color coat, AAMA 621.
2. Color:
 - a. Exterior Surface: Slate gray.
 - 1) Panel: Color as selected by Architect.
 - 2) Interior Surface: Manufacturer's standard primer color.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Examine metal wall and soffit panel substrate with Installer present. Inspect for erection tolerances and other conditions that would adversely affect installation of metal wall and soffit panels.
- B. Wall and Soffit Substrate: Confirm that wall and soffit substrate is within tolerances acceptable to metal wall and soffit panel system manufacturer.
 1. Maximum substrate and framing deviations from flat plane acceptable:
 - a. 1/4 inch in 20 feet vertically or horizontally.
 - b. 1/2 inch across building elevation.
 - c. 1/8 inch in 5 feet.
- C. Metal Z and J tracks framing: Inspect metal Z and J track framing that will support metal wall and soffit panels to determine if support components are installed as indicated on approved shop drawings. Confirm presence of acceptable framing members at recommended spacing to match installation requirements of metal wall and soffit panels.
- D. Install secondary subgirt framing over metal Z and J tracks as specified..

- E. Air/Moisture Barriers: Confirm that work has been completed, inspected, and tested as required.
- F. Openings: Verify that penetrations match layout on Shop Drawings.
- G. Installer shall notify the General Contractor in writing of out-of-tolerance work and other deficient conditions prior to proceeding with metal wall and soffit panel installation.
- H. Correct out-of-tolerance work and other deficient conditions prior to proceeding with metal wall panel system installation.

3.02 METAL WALL AND SOFFIT PANEL INSTALLATION

- A. General: Install metal wall and soffit panels in accordance with approved shop drawings and manufacturer's recommendations. Install metal wall and soffit panels in orientation, sizes, and locations indicated. Anchor metal wall and soffit panels and other components securely in place. Provide for thermal and structural movement
- B. Attach panels to framing using recommended clips, screws, fasteners, sealants, and adhesives indicated on approved shop drawings.
 - 1. Fasteners for Steel Wall and Soffit Panels: Stainless-steel for exterior locations and locations exposed to moisture; carbon steel for interior use only.
 - 2. Fasten metal wall panels to supports with concealed clips at each joint at location, spacing and with fasteners recommended by manufacturer. Install clips to supports with self-tapping fasteners.
 - 3. Provide weatherproof escutcheons for pipe and conduit penetrating exterior walls.
 - 4. Dissimilar Materials: Where elements of metal wall panel system will come into contact with dissimilar materials, treat faces and edges in contact with dissimilar materials as recommended by manufacturer.
- C. Joint Sealers: Install joint sealants where indicated on approved Shop Drawings.

3.03 ACCESSORY INSTALLATION

- A. General: Install metal wall and soffit panel accessories with positive anchorage to building and provide for thermal expansion. Coordinate installation with flashings and other components.
 - 1. Install related flashings and sheet metal trim per requirements of Section 07 62 00 – Sheet Metal Flashing and Trim.
 - 2. Install components required for a complete metal wall and soffit panel assembly, including trim, corners, lap strips, flashings, sealants, fillers, closure strips, and similar items.
 - 3. Comply with performance requirements and manufacturer's written installation instructions.

4. Provide concealed fasteners except where noted on approved Shop Drawings.
5. Set units true to line and level as indicated.
6. Where wall panels span over deflection joints in back up wall assembly, provide appropriate trim, fasteners and clips as required to allow back up wall to move (deflect) without damaging wall panels.

3.04 FIELD QUALITY CONTROL

- A. Manufacturer's Field Service: Engage a service representative authorized by metal wall panel manufacturer to inspect completed installation. Submit written report.
- B. Correct deficiencies noted in manufacturer's report.

3.05 CLEANING AND PROTECTION

- A. Remove temporary protective films. Clean finished surfaces as recommended by metal wall panel manufacturer. Clear weep holes and drainage channels of obstructions, dirt, and sealant. Maintain in a clean condition during construction.
- B. Replace damaged panels and accessories that cannot be repaired by finish touch-up or minor repair.

END OF SECTION

SECTION 07 54 23 – THERMOPLASTIC-POLYOLEFIN ROOFING

PART 1 GENERAL

1.01 SUMMARY

- A. The project consists of installing a thermoplastic-polyolefin adhered roofing system as outlined below:
 - 1. Fully adhered 80 mil single-ply thermoplastic-polyolefin roof membrane.
 - 2. Coverboard.
 - 3. Roof insulation.
 - 4. Membrane flashings and accessories.

1.02 RELATED SECTIONS

- A. Section 05 31 23 – Steel Roof Decking: Steel roof deck..
- B. Section 06 10 53 - Miscellaneous Carpentry: Wood nailers, curbs, and treatment process.
 - 1. Coordinate corrosion-resistant requirements for fasteners with type of wood preservative treatment.
- C. Section 07 27 26 – Fluid-Applied Membrane Air Barrier: Verify compatibility of air barrier materials that come in contact with roof membrane.
- D. Section 07 62 00 – Sheet Metal Flashings and Trim.
- E. Section 07 72 33 - Roof Hatches.
- F. Section 22 14 00 – Facility Storm Drainage: Roof drains.
- G. Division 23 for Roof-Mounted Equipment: Flashing equipment curbs.

- H. IECC: 2015.

1.04 EXTENT OF WORK

- A. Provide all labor, material, tools, equipment and supervision necessary to complete the installation of a 80-mil thick white reinforced TPO (Thermoplastic Polyolefin) reinforced membrane Adhered Roofing System including flashings, insulation and coverboard as specified herein and as indicated on the Drawings in accordance with the manufacturer's most current specifications and details.
- B. The roofing contractor shall be fully knowledgeable of all requirements of the contract documents and shall make themselves aware of all job site conditions that will affect their work.
- C. The roofing contractor shall confirm all given information and advise the building owner, prior to bid, of any conflicts that will affect their cost proposal.

1.05 SUBMITTALS

- A. Prior to starting work, the roofing contractor must submit the following:
 - 1. Shop Drawings showing layout, details of construction and identification of materials for the following work:
 - a. Provide field, perimeter and corner fastening pattern for roof insulation in accordance with Quality Assurance Article..
 - b. Base flashings.
 - c. Crickets, saddles and tapered edge strips, including slopes.
 - A. Show valley slope on crickets. Refer to Article 3.04, E, 3.
 - d. Liquid flashing.
 - 2. Product Data: For each type of roofing product specified. Include data substantiating that materials comply with requirements.
 - a. Fasteners:
 - 1) Coordinate selection of corrosion resistant coating with Section 06 10 53. Coatings shall be compatible with preservative wood treatment and metal surfaces being secured to. Coatings shall be selected to prevent galvanic corrosion between fastener and metal surfaces.
 - 2) Manufacturer's of proprietary anti-corrosion coatings shall submit data regarding the specific performance of their products in the treated wood and any precautions or special instructions that may be applicable.
 - 3. A sample of the manufacturer's Membrane System Warranty.

4. Submit a letter of certification from the manufacturer which certifies the roofing contractor is authorized to install the manufacturer's roofing system and lists foremen who have received training from the manufacturer along with the dates training was received.
 5. Certification from the membrane manufacturer indicating the membrane thickness over the reinforcing scrim (top ply membrane thickness) is nominal 0.034 inches or thicker per ASTM D7635.
 6. Certification of the manufacturer's warranty reserve.
 7. Intent to warrant assembly letter:
 - a. The roofing manufacturer shall provide an intent to warrant assembly letter outlining in detail the assembly of the entire roof system including base flashings for the project. The assembly letter shall be on the roof system manufacturer's letterhead and signed and dated by an approved representative of the roof manufacturer. Include the project name, Architect's name and roofing installer's name on the letter.
 8. Wind-Uplift Certification; Submit data which substantiates roof system meets specified uplift requirements, along with fastening pattern for field, perimeter and corner areas.
 9. Maintenance Data: For roofing system to include in the maintenance manuals specified in Division 1.
- B. Upon completion of the installed work, submit copies of the manufacturer's final inspection to the specifier prior to the issuance of the manufacturer's warranty.

1.06 PRODUCT DELIVERY, STORAGE AND HANDLING

- A. Deliver materials to the job site in the manufacturer's original, unopened containers or wrappings with the manufacturer's name, brand name and installation instructions intact and legible. Deliver in sufficient quantity to permit work to continue without interruption.
- B. Comply with the manufacturer's written instructions for proper material storage.
1. Store roof membrane in the original undisturbed plastic wrap in a cool, shaded area. Roof membrane that has been exposed to the elements for approximately 7 days must be prepared in accordance with roof membrane manufacturer's written instructions prior to hot air welding.
 2. Store curable materials (adhesives and sealants) between 60 degrees F and 80 degrees F in dry areas protected from water and direct sunlight. If exposed to lower temperature, restore to 60 degrees F minimum temperature before using.
 3. Store materials containing solvents in dry, well ventilated spaces with proper fire and safety precautions. Keep lids on tight. Use before expiration of their shelf life.
- C. Insulation storage.

1. Short term: Where short term outdoor storage, 2 weeks or less, is necessary whether at grade or on the roof deck, the following precautions shall be observed unless otherwise directed by the polyisocyanurate insulation manufacturer:
 - a. Place the package on raised pallets or platforms, minimum 3 inches above ground and store flat. Do not place pallets on dirt or grass.
 - b. Cut the factory packaging taking care not to cut the insulation in order to prevent condensation from occurring and cover the package and pallet with a waterproof, breathable cover such as a canvas tarpaulin that is secured in place.
 2. Where polyisocyanurate insulation is to be stored for periods longer than 2 weeks, prior to installation store insulation indoors in a dry, well ventilated warehouse.
 3. Exercise care during handling of the polyisocyanurate insulation to prevent braking or crushing of the square edges and surfaces. Remove the insulation bundles from the trucks with proper equipment. Other means of mishandling, such as pushing pallets off the truck or rolling the pallet across the roof deck is not acceptable.
- D. Any materials which are found to be damaged shall be removed and replaced at the applicator's expense.

1.07 WORK SEQUENCE

- A. Schedule and execute work to prevent leaks and excessive traffic on completed roof sections. Care should be exercised to provide protection for the interior of the building and to ensure water does not flow beneath any completed sections of the membrane system.
- B. Do not disrupt activities in occupied spaces.

1.08 USE OF THE PREMISES

- A. Before beginning work, the roofing contractor must secure approval from the General Contractor and/or the building Owner's Representative for the following:
 1. Areas permitted for personnel parking.
 2. Access to the site.
 3. Areas permitted for storage of materials and debris.
 4. Areas permitted for the location of cranes, hoists and chutes for loading and unloading materials to and from the roof.

1.09 PRE-INSTALLATION MEETINGS

- A. Pre-Installation Conference: Before installing roofing system, conduct conference at Project site to comply with requirements of Section 01 30 00 – Administrative Requirements: Pre-installation meetings. Notify participants at least 5 working days before conference.

1. Meet with Owner; Architect; Owner's insurer, if applicable; testing and inspecting agency representative; roofing Installer; roofing system manufacturer's representative; deck Installer; air barrier installer and installers whose work interfaces with or affects roofing, including installers of roof accessories and roof-mounted equipment.
2. Review and finalize construction schedule and verify availability of materials, installers' personnel, equipment and facilities needed to make progress and avoid delays.
3. Review methods and procedures related to roofing installation, including manufacturer's written instructions.
4. Examine deck substrate conditions and finishes for compliance with requirements, including flatness and attachment to structural members.
5. Review roof slope.
 - a. Verify roofing system will provide the roof assembly fire classification as specified for the roof slope indicated.
6. Review loading limitations of deck during and after roofing.
7. Review flashings, special roofing details, roof drainage, roof penetrations, equipment curbs, and condition of other construction that will affect roofing.
8. Review governing regulations and requirements for insurance, certifications, and inspection and testing, if applicable.
9. Review temporary protection requirements for roofing system during and after installation.
10. Review roof observation and repair procedures after roofing installation.
11. Document proceedings, including corrective measures or actions required, and furnish copy of record to each participant.
12. Review transition from wall air barrier to roof membrane and base flashing.
 - a. Review compatibility of all materials specified in Section 07 27 26 – Fluid-Applied Membrane Air Barrier that come in contact with roof membrane.

1.10 JOB SITE PROTECTION

- A. Do not overload any portion of the building, by either use of or placement of equipment, storage of debris or storage of materials.
- B. Protect against fire and flame spread. Maintain proper and adequate fire extinguishers.
- C. Take precautions to prevent drains from clogging during the roofing application. Remove debris at the completion of each day's work and clean drains, if required. At completion, test drains to ensure the system is free running and drains are watertight. Remove

strainers and plug drains in areas where work is in progress. Install flags or other telltales on plugs. Remove plugs each night and screen drain.

- D. Store moisture susceptible materials above ground and protect with waterproof coverings.
- E. Remove all traces of piled bulk material and return the job site to its original condition upon completion of the work.

1.11 SAFETY

- A. The roofing contractor shall be responsible for all means and methods as they relate to safety and shall comply with all applicable local, state and federal requirements that are safety related. Safety shall be the responsibility of the roofing contractor. All related personnel shall be instructed daily to be mindful of the full time requirement to maintain a safe environment for the facility's occupants including staff, visitors, customers and the occurrence of the general public on or near the site.

1.12 WORKMANSHIP

- A. Applicators installing new roof, flashing and related work shall be factory trained and approved by the manufacturer they are representing.
- B. All work shall be of highest quality and in strict accordance with the manufacturer's published specifications and to the building owner's satisfaction.
- C. There shall be a supervisor on the job site at all times while work is in progress.

1.13 QUALITY ASSURANCE

- A. The thermoplastic-polyolefin membrane roofing system shall achieve a UL Class A.
- B. FM Listing: Provide single ply membrane, base flashings, and component materials that meet requirements of FM 4450 and FM 4470 as part of a roofing system and that are listed in FM's "Approval Guide" for Class 1 or noncombustible construction, as applicable. Identify materials with FM markings.
 - 1. Roofing system shall be installed to meet the wind uplift load requirements based on the current ASCE/SEI 7 and design loads as shown on structural drawings.
 - a. For design pressures in the field, perimeter and corner regions multiply ultimate pressures by a factor of 2.
- C. The membrane must be manufactured by the roof membrane manufacturer. Manufacturer's supplying membrane made by others are not acceptable.
- D. Unless otherwise noted in this specification, the roofing contractor must strictly comply with the manufacturer's current specifications and details.
- E. The roofing system must be installed by an applicator authorized and trained by the manufacturer in compliance with shop drawings as approved by the manufacturer. The roofing applicator shall be thoroughly experienced and upon request be able to provide

evidence of having at least five (5) years successful experience installing single-ply TPO roofing systems and having installed at least one (1) roofing application or several similar systems of equal or greater size within one year.

- F. Provide adequate number of experienced workmen regularly engaged in this type of work who are skilled in the application techniques of the materials specified. Provide at least one thoroughly trained and experienced superintendent on the job at all times roofing work is in progress.
- G. There shall be no deviations made from this specification or the approved shop drawings without the prior written approval of the specifier. Any deviation from the manufacturer's installation procedures must be supported by a written certification on the manufacturer's letterhead and presented for the specifier's consideration.
- H. Upon completion of the installation, the applicator shall arrange for an inspection to be made by a non-sales technical representative of the membrane manufacturer in order to determine whether or not corrective work will be required before the warranty will be issued. Notify the building owner seventy-two (72) hours prior to the manufacturer's final inspection.
- I. The average thickness over scrim for the membrane must meet or exceed 0.034 inches or more for 80 mil membrane.
- J. Membrane shall meet or exceed ASTM D573, 32 weeks @ 240 degrees F.
- K. Membrane must exceed ASTM D573 of 32 weeks at no less than 52 weeks.
- L. Membrane shall exceed ASTM D6878-Xenon Arc of 10,080 kJ/m² at nm at no less than 50,000 kJ/m² at 340 nm.
- M. Minimum Roof Reflectance and Emittance based on one of the following rating systems or energy codes:
 - 1. 2015 International Energy Conservation Code (IECC), Section C402.3 Roof solar reflectance and thermal emittance:
 - a. Roofs in climate zones 1, 2 and 3 shall comply with either subparagraph 1) or 2) below:
 - 1) Three-year- aged solar reflectance of 0.55 and three-year aged thermal emittance of 0.75. Calculation of the aged SRI and aged thermal emittance shall be based on aged tested values of solar reflectance and thermal emittance as rated by the Cool Roof Rating Council (CRRC).
 - 2) Three-year-aged solar reflectance index of 64 as determined in accordance with ASTM E 1980 using a convection coefficient of 2.1 Btu/h per square foot per degree F. Calculation of the aged SRI shall be based on aged tested values of solar reflectance as rated by the Cool Roof Rating Council (CRRC).
- N. Chemical resistance:

1. The following chemical shall have a negligible effect on the roof membrane:
 - a. Animal Fat/Grease
 - b. Vegetable oils.
 - c. Soap Solutions.
 - d. Silicone oil.
 2. The following chemicals shall have limited absorption or effect on the membrane:
 - a. Mineral oils.
 3. The membrane shall not be exposed continuously to the following chemicals:
 - a. Mineral spirits
- O. Nailers: The basic attachment of the nailer shall be sufficient to carry the design wind uplift load as calculated per ASCE/SEI 7. At outside building corner regions, the nailer securement shall be designed to carry a load two times the basic nailer attachment design

1.14 JOB CONDITIONS, CAUTIONS AND WARNINGS

- A. Material Safety Data Sheets (MSDS) must be on location at all times during the transportation, storage and application of materials.
- B. When positioning membrane sheets, exercise care to locate all field splices away from low spots and out of drain sumps. All field splices should be shingled to prevent bucking of water.
- C. When loading materials onto the roof, the roofing contractor must comply with the requirements of the building owner to prevent overloading and possible disturbance to the building structure.
- D. Proceed with roofing work only when weather conditions are in compliance with the manufacturer's recommended limitations, and when conditions will permit the work to proceed in accordance with the manufacturer's requirements and recommendations.
- E. Proceed with work so new roofing materials are not subject to construction traffic. When necessary, new roof sections shall be protected and inspected upon completion for possible damage.
- F. Provide protection, 3/4 inch thick plywood adhered to a one inch layer of polyisocyanurate insulation, for all roof areas exposed to traffic during construction. Plywood must be smooth and free fasteners and splinters.
- G. The surface on which the insulation or roofing membrane is to be applied shall be clean, smooth, dry, and free of projections or contaminants that would prevent proper application of or be incompatible with the new installation, such as fins, sharp edges, foreign materials, oil and grease.
- H. New roofing shall be complete and weather tight at the end of the work day.
- I. Contaminants such as grease, fats and oils shall not be allowed to come in direct contact

with the roofing membrane.

1.15 WARRANTY

- A. Provide manufacturer's 20-year, Total System Warranty covering both labor and material with no dollar limitation. The maximum wind speed coverage shall be peak gusts of 72 mph measured at 10 meters above ground level. Certification is required with bid submittal indicating the manufacturer has reviewed and agreed to such wind coverage.
 - 1. Warranty shall cover 2 inch hail and 16 hours of accidental puncture per year.
- B. Pro-rated system warranties shall not be accepted.
- C. Evidence of the manufacturer's warranty reserve shall be included as part of the project submittals for the specifier's approval.

PART 2 PRODUCTS

2.01 MANUFACTURERS AND PRODUCTS

- A. Basis of Design: Contract Documents are based on manufacturer and product named. Other manufacturers with products having equivalent characteristics may be submitted as substitutions according to Conditions of the Contract and appropriate Division 1 sections, provided deviations are minor and does not change concept as expressed in Contract Documents as judged by Architect.
 - 1. Manufacturer: Carlisle SynTec.
 - 2. Product: Sure-Weld fully adhered 80 mil thermoplastic-polyolefin roof membrane.
 - a. All components of the specified roofing system shall be products of Carlisle SynTec or accepted by Carlisle SynTec as compatible.
 - b. All products (including insulation, fasteners, fastening plates, prefabricated accessories and edgings) must be manufactured and/or supplied by the roofing system manufacturer and covered by the warranty.

2.02 MEMBRANE

- A. Furnish Sure-Weld 80-mil thick white reinforced TPO (thermoplastic polyolefin) membrane as needed to complete the roofing system. Membrane thickness over the reinforcing scrim (top-ply thickness) shall be nominal 0.034 inches thick or greater. Membrane sheets in rolls 12 feet, 10 feet or 8 feet wide by 100 feet long.

TPO membrane shall meet or exceed the following properties and characteristics per ASTM D6878:

Physical Property	Test Method	80 mil TPO
Tolerance on nominal thickness, percentage	ASTM D751	+10 % to -10 %

Thickness of TPO membrane over scrim, inches on weathering side	ASTM D7635 optical method, average of 3 areas	0.034 inches
Total thickness of membrane,		80 mils
Weight of 80 mil sheet, lb/sq. ft.		0.40 lbs/sq. ft.
Breaking strength, minimum, lbf	ASTM D751 Grab Method	350 lbf. min 425 lbf. typical
Elongation at break of reinforcement, Percentage	ASTM D751 Grab Method	15 % min 25 % typical
Tearing strength, minimum, lbf	ASTM D751 procedure B Tongue Tear	55 lbf. min 130 lbf. typical
Puncture resistance, lbf	FTM 101C, Method 2031	400 lbf. min 450 lbf. typical
Brittleness point, maximum, degree F	ASTM D2137, Method B	-40 degrees F. max. -50 degrees F typical
Linear dimensional change, percentage	ASTM D1204, 6 hours at 158 degrees F	+/- 1 % max -0.2 % typical
Field seam strength, lbf/in.	ASTM D1876 tested in peel	40 lbf/in. min 70 lbf/in typical
Water vapor permeance, perms	ASTM E96, Procedure B	0.10 max perms 0.05 perms typical
Properties after heat aging Breaking strength: Elongation reinf.: Tearing strength: Weight change, percentage	ASTM D573 32 weeks at 240 degrees F.	315 minimum 13.5 minimum 33 minimum 1.0 % maximum
Properties after heat aging	ASTM D573 52 weeks at 240 degrees F.	Membrane shall remain flexible and not cracking under 10X magnification while wrapped around a 3 inch diameter mandrel.
Ozone resistance, no cracks 7X 100 pphm, 168 hours	ASTM D1149	No cracks
Resistance to water absorption after 7 days immersion at 158 degrees F, change in mass, maximum percentage one side, +/- 3.0 % max	ASTM D471	0.90 %
Radiant exposure kJ/ sq. meter at 340nm		27,720 kJ/ sq. meter at 340 nm
CRRC Solar Reflectance: Initial 3 years		0.79 0.70
CRRC Thermal Emittance: Initial 3 years		0.90 0.86
SRI:		

Initial		99
3 years		85

1. Base Flashing and Parapet Flashing to be 60-mil.

2.03 INSULATION MATERIALS

A. **Polyisocyanurate Board Insulation:** Rigid, cellular polyisocyanurate thermal insulation with core formed by using hydrocarbon blowing agents which are Montreal Protocol compliant, complying with ASTM C 1289, Type II, Class 2 in-organic facers, Grade 2 (20 psi), classified by facer type as follows:

1. Facer Type: Faced with coated polymer-bonded in-organic glass fiber mat facers on both major surfaces of the core foam. Facers shall be compatible with foam adhesive.
2. **Thickness: 4.4 inches. Install in two layers, each layer 2.2 inches thick to achieve a minimum LTTR R- value of 25.**
3. Positioning: This is the top layer with the metal deck below.
4. Board Size:
 - a. Maximum 4 foot by 8 foot where boards are mechanically attached.
 - b. Maximum 4 foot by 4 foot where boards are adhered to substrate.
5. Codes and Compliances: Provide polyisocyanurate insulating materials that comply with the following testing standards:
 - a. FM Standard 4450/4470 approval for Class 1 insulated steel, wood, concrete and gypsum roof deck construction.
 - b. UL Standard 1256 Classification, insulated metal deck construction assemblies; Construction #120 & 123.
 - c. UL Standard 790 Classification, Class A with most roof membrane system.
6. Product: **Carlisle Syntec SecurShield Polyisocyanurate Insulation.**

B. **Tapered Polyisocyanurate Board Insulation:** Rigid, cellular polyisocyanurate thermal insulation with core formed by using hydrocarbon blowing agents which are Montreal Protocol compliant, complying with ASTM C 1289, Type II, Class 2 in-organic facers, Grade 2 (20 psi):

1. Thickness: As required to provide positive slope to drains. Tapered insulation shall be installed at a minimum slope of 2 times the slope of the roof where the roof structure slopes, unless otherwise noted on the drawings. Where the roof structure is set flat, provide tapered insulation at a minimum slope of 1/4 inch per foot, unless otherwise noted on the Drawings.
2. Positioning: Position this above the ISO
3. Codes and Compliances: Provide polyisocyanurate insulating materials that comply with the following testing standards:

- a. FM Standard 4450/4470 approval for Class 1 insulated steel, wood, concrete and gypsum roof deck construction.
 - b. UL Standard 1256 Classification, insulated metal deck construction assemblies; Construction #120 & 123.
 - c. UL Standard 790 Classification, Class A with most roof membrane system.
4. Product: Product: Carlisle Syntec SecurShield Polyisocyanurate Insulation.
- C. Roof Drain Sump Insulation:
1. First layer 4 foot x 4 foot, 2.9 inches thick polyisocyanurate filler insulation complying with Article 2.03.
 2. Second layer: Tapered 1/2 inches to 1 1/2 inches, (1/2" per foot) 24 inches wide 48 inches long polyisocyanurate insulation complying with Article 2.03. Furnish four pieces at each roof drain. Miter ends of each board at 45 degrees to form a 48 inch by 48 inch square sump.
- D. Insulation Accessories:
1. General: Furnish roofing insulation accessories as recommended by insulation and roof membrane manufacturer for intended use and compatible with sheet roofing material.
 2. Insulation Fasteners: Provide fasteners as described below for each specific deck type and to comply with Factory Mutual recommendations for specified wind uplift resistance. All fasteners shall comply with the corrosion resistance requirements of Factory Mutual Standard 4470. Fasteners shall utilize metal stress distribution plates, with screws of sufficient length to penetrate each type of roof deck the minimum required by Factory Mutual.
 - a. Steel Decks: InsulFast #12 roofing fasteners as provided by Carlisle Syntec. Minimum deck penetration is 3/4 inch for steel decks.
 - b. Fastener Plates: Shall be galvalume-coated steel insulation plates, as provided by Carlisle Syntec, with a diameter of 3 inches, 0.20 nominal thickness and a galvalume finish.
 3. Insulation Adhesive: A two-component, spray applied or extruded low rise foam adhesive designed to adhere insulation to insulation.
 - a. Manufacturer/Product: Carlisle Syntec Flexible FAST Adhesive or product recommended by insulation and roof membrane manufacturer.
 - 1) VOC Content: 0 g/L.
 - b. Provide appropriate adhesive catalyst where temperatures are below 50 degrees F as recommended by roof membrane manufacturer.

2.04 COVERBOARD

- A. Minimum 1/2 inch DensDeck Prime with Eonic Technology Roof Board, 4 feet by 4 feet

sheets, as manufactured by Georgia-Pacific.

1. Water Absorption per ASTM C473: Less than 5 percent of weight.
 2. Surface Water Absorption per ASTM C473: Nominal 1.0 grams.
- B. Coverboard Adhesive: A two-component, spray applied or extruded low rise foam adhesive designed to adhere coverboard to insulation.
1. Manufacturer/Product: Carlisle Syntec Flexible FAST Adhesive or product recommended by insulation manufacturer, coverboard manufacturer and roof membrane manufacturer.
 - a. Provide appropriate adhesive catalyst where temperatures are below 50 degrees F as recommended by roofing manufacturer.
 - b. VOC Content: 0 g/L.

2.05 FLASHINGS

A. TPO (Sure-Weld) Related Products

1. Sure-Weld non-reinforced flashing: 0.060 TPO flashing to be used for inside/outside corners and field fabricated pipe flashings where the use of pre-molded or pre-fabricated accessories is not feasible.
 - a. Size: 12 inch and 24 inch wide by 50 foot long rolls.
 - b. Color: Match roof membrane.
2. Sure-Weld reinforced flashing: Provide 0.060 by 9" wide by 50' long Sure-Weld reinforced membrane for overlaying fasteners and fastening plates.
3. Sure-Weld Pressure-Sensitive Cover Strip: A nominal 40-mil thick non-reinforced TPO membrane laminated to nominal 35-mil thick cured synthetic rubber pressure-sensitive adhesive used in conjunction with TPO Primer to strip in flat metal flanges (i.e., drip edges or rows of fasteners and plates).
 - a. Size: 6 inch wide by 100 foot long.
 - b. Color: Match roof membrane.
4. Sure-Weld TPO T-Joint Covers: A 60-mil thick injection molded TPO flashing formed into a 4.5 inch diameter circle used to seal step-offs at splice intersections.
 - a. Installation: Mandatory.
 - b. Color: Match roof membrane.
5. Pre-Molded Accessories:
 - a. Inside Corners: A pre-molded 60-mil thick corner flashing for inside corners. Color to match roof membrane.
 - b. Outside Corners: A one-piece 60-mil thick injection molded corner flashing used for flashing outside corners. Color to match roof membrane.

- c. TPO Curb Wrap Corners: Fabricated flashings made of 60-mil thick reinforced Sure-Weld membrane.
 - 1) Size: Each corner shall be fabricated with a 6 inch wide base flange and a 12 inch overall height. Size as required to fit curb. Each curb requires four corners.
 - d. Pipe Flashings: A pre-molded pipe flashing used for pipe penetrations. Color to match roof membrane.
 - 1) Sizes: As required to fit ¾ inch to 8 inch diameter pipes. Provide stainless steel clamping ring.
 - e. Split Pipe Seals: A prefabricated flashing consisting of 60-mil thick reinforced Sure-Weld Membrane for pipes 1 inch to 6 inch in diameter. A split (cut) and overlapped tab are incorporated to allow the pipe seal to be opened and wrapped around the pipe when it is not possible to pull a standard pipe flashing over a round penetration.
 - f. TPO Square Tubing Wraps: Fabricated flashings made of 60-mil thick reinforced Sure-Weld membrane for square tubing. A split (cut) and overlap tab are incorporated into these parts to allow the seals to be opened and wrapped around a square penetration.
 - 1) Sizes to fit: 3 inch, 4 inch, 5 inch and 6 inch square tubing.
 - g. Molded TPO Sealant Pocket: A pre-fabricated, interlocking, 2-piece, injection molded, flexible pocket with a rigid polypropylene vertical wall and pre-formed deck flanges. Pockets can be adjusted from 11.5 inches to 7.5 inches in length by 6 inches in width. Used in conjunction with White One-Part Pourable Sealer. Color, white.
 - h. Pre-fabricated Sealant Pocket: A two-piece, pre-fabricated sealant pocket made of reinforced 60-mil TPO membrane and coated metal to form a rigid, oversized sealant pocket with a weldable horizontal deck flange.
 - i. Sealant Pocket Extension Legs: Designed for use with the TPO Molded Sealant Pocket and the Pre-Fabricated Sealant Pocket to extend the length in increments of 10 inches. Fabricated from 60-mil thick reinforced TPO membrane and TPO coated metal. Color, white.
- B. Liquid Flashing: Manufacturers standard liquid flashing resin a two-component polyurethane-based resin used with liquid flashing fleece that is compatible with TPO roof membrane.

- 1. VOC Content: 2 g/L.

2.06 ADHESIVES AND CLEANERS

- A. Low-VOC Bonding Adhesive: A high-strength, solvent-based contact adhesive for bonding Sure-Weld membrane to various surfaces. The adhesive is applied to both the membrane and the substrate at a coverage rate of approximately 60 square feet per gallon per finished surface (includes coverage on both surfaces).
 - 1. VOC Less than 250 g/L. Complies with Max VOC allowed 250 g/L.
- B. Low-VOC Cut-Edge Sealant: A clear colored sealant used to seal cut edges of reinforced

Sure-Weld membrane. A coverage rate of approximately 225 - 275 linear feet per squeeze bottle can be achieved when a 1/8" diameter bead is applied.

1. VOC Content 235 g/L. Complies with Max VOC allowed 450 g/L.
- C. Water Cut-Off Mastic: Used as a mastic to prevent moisture migration at drains, compression terminations and beneath conventional metal edging (at a coverage rate of approximately 10' per tube or 100' per gallon).
1. VOC Content 250 g/L. Complies with Max VOC allowed 250 g/L.
- D. Universal Single-Ply Sealant: A 100% solids, solvent free, voc free, one part polyether sealant that provides a weather tight seal to a variety of building materials. It is white in color and is used for general caulking such as above termination bars and metal counter flashings and at scuppers.
1. VOC Content 22 g/L. Complies with Max VOC allowed 450 g/L.
- E. Thermoplastic One-Part Pourable Sealer: A one-part, moisture curing, elastomeric polyether sealant used to fill TPO Molded Pourable Sealant Pockets. Packaged in 4, 2-liter foil pouches inside a reusable plastic bucket. 1 pouch will fill 2 TPO Molded Pourable Sealant Pockets.
1. VOC Content less than 25 g/L. Complies with Max VOC allowed 450 g/L.
- F. Weathered Membrane Cleaner: Used to prepare membrane for heat welding that has been exposed to the elements or to remove general construction dirt at an approximate coverage rate of 400 square feet per gallon (one surface).
- G. TPO Low VOC Primer:: A solvent-based, low solids primer used to prepare the surface of Sure-Weld Membrane prior to application of Pressure-Sensitive Coverstrip and TPO Pressure-Sensitive RUSS. This low VOC product is ideal for use in states where environmental issues are a concern.
1. VOC Content less than 250 g/L. Complies with Max VOC allowed for all other sealant primers 750 g/L.

2.07 FASTENERS AND PLATES

- A. HP-X Fasteners: A heavy-duty #15 threaded fastener with a #3 Phillips drive used for membrane or insulation securement into steel, wood plank or minimum 15/32 inch thick plywood when increased pullout resistance is desired.
- B. HP-Xtra Fastener: An oversized diameter (.315) steel threaded fastener with a #3 Phillips drive used in conjunction with Piranha Xtra Plates for membrane securement into steel or wood decks.
- C. Pre-Assembled ASAP Fasteners: A pre-assembled 3-inch diameter Plastic Plate and # 12 threaded fastener with a #3 drive used for insulation attachment into steel or wood decks. Installed using OMG Fastening Tools.
- D. InsulFast Fasteners: A threaded #12 fastener with #3 Phillips drive used for insulation

attachment into steel or wood decks.

- E. HP Term Bar Nail-Ins: A 1-1/4 inch long expansion anchor with a zinc-plated steel drive pin used for fastening the Carlisle Termination Bar or Seam Fastening Plates to concrete, brick, or block walls.
- F. Piranha Plates: A 2-3/8 inch diameter metal barbed fastening plate used with Carlisle HP-X or HP-14-10 Fasteners for membrane securement. This plate can be used for insulation securement.
- G. Piranha Xtra Plates: A 2-3/8" diameter metal barbed fastening plate with an oversized hole for use with Carlisle HP-Xtra Fasteners for membrane securement.
- H. Insulation Fastening Plates: a nominal 3 inch diameter plastic or metal plate used for insulation attachment.
- I. Sure-Weld Pressure-Sensitive RUSS (Reinforced Universal Securement Strip): A 6-inch wide, nominal 60-mil thick reinforced TPO membrane with 3-inch wide Pressure Sensitive Tape laminated along one edge. The 6-inch wide Pressure-Sensitive RUSS is used horizontally at the base of walls, curbs, etc., in conjunction with 2-inch diameter Seam Fastening Plates below the TPO deck membrane for additional membrane securement.
 - 1. 6-inch wide Pressure-Sensitive RUSS is used horizontally or vertically at the base of walls, curbs, etc., in conjunction with PiranhaFastening Plates below the TPO deck membrane for additional membrane securement.
 - 2. 10-inch wide Pressure-Sensitive RUSS is for perimeter membrane securement.

2.08 WALKWAYS

- A. Protective surfacing for roof traffic shall be Sure-Weld TPO Walkway Rolls installed per manufacturer's requirements.

2.09 METAL ACCESSORIES

- A. Coated metal: 24 gauge galvanized sheet coated with a layer of 40 mil non-reinforced flashing. Sheet cut to size shown on drawings.
 - 1. Use: Separation flashing where single ply roof membrane ties into fluid applied membrane air barrier system.

PART 3 EXECUTION

3.01 GENERAL

- A. Comply with the manufacturer's published instructions for the installation of the membrane roofing system as required to meet warranty and wind storm classification requirements including proper substrate preparation, job site considerations and weather restrictions.
- B. Position sheets to accommodate contours of the roof deck and shingle splices to avoid bucking water.

3.02 EXAMINATION

- A. Section 01 30 00 – Administrative Requirements: Coordination and Project Conditions.
- B. Examine substrates, areas, and conditions under which roofing will be applied, with Installer present, for compliance with requirements.
- C. Verify that roof openings and penetrations are in place and set and braced and that roof drains are properly clamped into position.
- D. Verify that wood blocking, curbs, and nailers are securely anchored to roof deck at roof penetrations and terminations and match the thicknesses of insulation required.
- E. Verify that flatness and fastening of metal roof decks comply with installation tolerances specified in Section 05 31 23 – Steel Roof Decking.
- F. Verify that deck is securely fastened with no projecting fasteners and with no adjacent units in excess of 1/16 inch (1.5 mm) out of plane.
- G. Do not proceed with installation until unsatisfactory conditions have been corrected.

3.03 INSULATION STOPS/NAILERS

- A. Install insulation stops/nailers at all open eaves and edges, where wood curbs are installed and where shown on Drawings.
 - 1. Insulation stops/nailers shall be treated wood blocks the same thickness as the roof insulation and shall be a minimum of 5 1/2 inches wide, unless otherwise noted on the Drawings.
- B. Secure wood nailers to roof structure in accordance with the current edition of ANSI/SPRI ES-1 and FM 1-49.
 - 1. Bottom nailers: Where the nailers are secured to the metal roof deck, install the bottom nailer to the metal deck with two rows of No. 10 steel screws spaced at 12 inches o.c. Place a 5/8 inch outside diameter steel washer under the head of each screw. At corner regions, space screws at 6 inches o.c. Each wood nailer shall have at least two fasteners. A fastener shall be located approximately 4 inches but not less than 3 inches from each end.
 - a. Screws and washers installed in preservative treated wood shall be:
 - 1) Stainless steel type 304 or 316;
 - 2) Proprietary anti-corrosion coatings which have been recommended by manufacturer for use with preservative-treated materials.
 - 2. Bottom nailers: Where the nailers are secured to steel angles/plates, install the bottom nailer to the steel angle/plate with hot-dipped galvanized steel bolts or hot-dipped galvanized threaded studs welded to angle/plate hot dip galvanized per ASTM A513. Bolts/studs shall be 1/2 inch diameter with nuts and washers spaced at 48 inches o.c. At corner regions, place bolts/studs at 24 inches o.c. Each bolt shall have two washers, one under each bolt head and one under each nut. Each

stud shall have one washer under each nut. For wood nailers wider than 5 1/2 inches, bolts/studs shall be staggered. Each wood nailer shall have at least two bolts/studs. A bolt/stud shall be located 4 inches from each end of wood nailer.

3. Top nailers: Secure top nailers to bottom nailer with annular ring shank nails. Nails shall be long enough to penetrate 1 1/4 inches into the bottom nailer and each additional nailer layer. Provide two rows staggered spaced at 12 inches o.c. maximum. Spacing shall not exceed 6 inches, at corner regions. Withdrawal resistance should be 200 lb per nail.
 - a. Nails installed in preservative treated wood shall be:
 - 1) Stainless steel type 304 or 316;
 - 2) Proprietary anti-corrosion coatings which have been recommended by manufacturer for use with preservative-treated materials.

3.04 INSULATION

- A. Coordinate installing roofing system components so insulation is not exposed to precipitation or left exposed at the end of the workday.
- B. Comply with roofing system manufacturer's written instructions for installing roofing insulation.
- C. First Layer Insulation Application:
 1. Position 2.2 inch thick boards to ensure board edges bear on top flange of metal deck, minimum 1 inch. Cut and realign boards which do not bear sufficiently on top flange of metal deck.
 2. Install insulation with long joints of insulation in continuous straight lines with end joints staggered between rows, abutting edges and ends between boards. Fill gaps exceeding 1/4 inch (6 mm) with insulation.
 - a. Cut and fit insulation within 1/4 inch (6 mm) of nailers, projections, and penetrations.
 3. Fasten first layer of insulation with screw and plates to metal deck. Ensure fasteners engage top of deck flute and penetrate deck a minimum of 3/4 inches.
 4. Ensure field fastening pattern complies with the wind uplift loads per ASCE/SEI 7 requirements, and the design pressures per Quality Assurance Article and the insulation and roofing system manufacturer's written instructions.
 5. Increase number of fasteners at corners, roof perimeters, and penetrations to meet the wind uplift requirements based on ASCE/SEI 7 and the design pressures per Quality Assurance Article.
 6. Ensure screws engage deck properly. Remove unengaged screws and reposition new screws to engage deck.
- D. Second Layer Insulation Application:

1. Set 2.2 inch thick second layer in two-component low rise-rise polyurethane foam adhesive.
 - a. Low-rise foam pattern shall be in accordance with specified wind uplift requirements.
 2. Stagger joints, minimum 6 inches, in both directions from first layer insulation. Remove and replace insulation with improper staggering of joints.
 3. Set loose, cut boards at overnight tie-ins to provide uninterrupted staggering of insulation joints, upon resumption of work.
- E. Tapered Installation: Install tapered insulation under area of roofing to conform to slopes indicated and to Shop Drawings so as to provide uniform positive drainage. The tapered insulation shall be mechanically fastened with screws and plates to metal deck using materials approved by the manufacturer, meeting the wind rating requirements specified.
1. Install cricket installation at edge of drain sumps.
 2. Establish straight, uniform cricket valley position over second layer roof insulation.
 3. Cricket valley slopes shall be a minimum of 3:1.
 4. Cricket surface slopes shall be a minimum of twice the slope of the roof.

3.05 COVERBOARD

- A. Install coverboard in accordance with manufacturer's instructions.
- B. Install coverboard over the entire surface of roof insulation. Only apply as much coverboard that can be covered in the same day by the roof membrane.
 1. Coverboard panels shall be kept dry before, during and after installation.
- C. Secure coverboard to insulation with two-component low- rise polyurethane foam adhesive in accordance with manufacturer's instructions and wind-uplift requirements.

3.06 MEMBRANE PLACEMENT AND ATTACHMENT

- A. Position Sure-Weld membrane over the acceptable substrate. Fold membrane sheet back onto itself so half the underside of the membrane is exposed.
- B. Apply Bonding Adhesive in accordance with the manufacturer's published instructions, to the exposed underside of the membrane and the corresponding substrate area. Do not apply Bonding Adhesive along the splice edge of the membrane to be hot air welded over the adjoining sheet. Allow the adhesive to dry until it is tacky but will not string or stick to a dry finger touch.
 1. Roll the coated membrane into the coated substrate while avoiding wrinkles. Brush down the bonded section of the membrane sheet immediately after rolling the membrane into the adhesive with a soft bristle push broom to achieve maximum contact.

2. Fold back the unbonded half of the sheet and repeat the bonding procedures.
- C. Position adjoining sheets to allow a minimum overlap of 2 inches to provide a minimum 1-1/2 inch hot air weld.
- D. Continue to install adjoining membrane sheets in the same manner, overlapping edges a minimum of 2 inches and complete the bonding procedures as stated previously.

3.07 MEMBRANE HOT AIR WELDING PROCEDURES

- A. Hot air weld the Sure-Weld membrane using an Automatic Hot Air Welding Machine or Hot Air Hand Welder in accordance with the manufacturer's specifications. At all splice intersections, roll the seam with a silicone roller immediately after welder crossed the membrane step-off to ensure a continuous hot air welded seam.
 1. Note: All splice intersections shall be overlaid with Sure-Weld T-joint covers or non-reinforced flashing.
- B. Probe all seams once the hot air welds have thoroughly cooled (approximately 30 minutes).
- C. Repair all seam deficiencies the same day they are discovered.
- D. Apply Cut Edge Sealant on all cut edges of reinforced membrane (where the scrim reinforcement is exposed) after seam probing is complete. Cut Edge Sealant is not required on vertical splices.

3.08 FLASHING

- A. Flashing of parapets, curbs, expansion joints and other parts of the roof must be performed using Sure-Weld reinforced membrane. Sure-Weld non-reinforced membrane can be used for flashing pipe penetrations, Sealant Pockets, and scuppers, as well as inside and outside corners, when the use of prefabricated accessories is not feasible.
- B. Follow manufacturer's typical flashing procedures for all wall, curb, and penetration flashing including metal edging/coping and roof drain applications.
- C. Liquid flashing: Use liquid flashing to flash oddly shaped penetrations.

3.09 SEPARATION FLASHING

- A. Install coated metal flashing where single ply roof membrane is tied into the fluid applied air barrier membrane.

3.10 WALKWAYS

- A. Install walkways at all traffic concentration points (such as roof access doors, rooftop ladders, etc.) and all locations as identified on the specifier's drawing.
- B. Hot air weld walkway material to the membrane.

3.11 PROTECTION AROUND GREASE FANS and HVAC EQUIPMENT

- A. Around the perimeter of roof mounted grease fans install an additional layer of 80 mil TPO for a horizontal distance of ten feet around each grease fan.
- B. Around the perimeter of roof mounted HVAC units install an additional layer of 80 mil TPO for a horizontal distance of ten feet around each HVAC unit.

3.12 DAILY SEAL

- A. On phased roofing, when the completion of flashings and terminations is not achieved by the end of the work day, a daily seal must be performed to temporarily close the membrane to prevent water infiltration.
- B. Complete an acceptable membrane seal in accordance with the manufacturer's requirements.

3.13 CLEAN-UP

- A. Perform daily clean up to collect all wrappings, empty containers, paper, and other debris from the project site. Upon completion, all debris must be disposed of in a legally acceptable manner.
- B. Prior to the manufacturer's inspection for warranty, the applicator must perform a pre-inspection to review all work and to verify all flashing has been completed as well as the application of all caulking.

END OF SECTION

SECTION 07 62 00 – SHEET METAL FLASHINGS AND TRIM

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Scuppers
- B. Exposed Trim
- C. Gravel-Stop Fascia
- D. Copings
- E. Flashing
 - 1. Receivers
 - 2. Counterflashing

1.02 RELATED WORK

- A. Section 04 20 00 – Unit Masonry: Through Wall Flashing in Masonry.
- B. Section 04 20 19 – Veneer Unit Masonry: Through Wall Flashing in Masonry.
- C. Section 04 43 13 – Mortar Placed Stone Veneer: Through Wall Flashing in Masonry.
- D. Section 06 10 53 – Miscellaneous Carpentry: Securing metal flashings to preservative treated lumber/plywood.
- E. Section 07 27 26 – Fluid-Applied Membrane Air Barriers: Sealing materials with transition membrane
- F. Section 07 54 23 – Thermoplastic Polyolefin Roofing: Sheet metal and underlayment materials.
- G. Section 07 72 33 – Roof Hatches: Metal Curbs.
- H. Section 23 05 29 – Hangers and Supports for HVAC Piping and Equipment: Roof Curbs for Mechanical Equipment.
- I. Section 26 05 29 – Hangers and Supports for Electrical Systems: Roof Curbs for Electrical Equipment.

1.03 REFERENCES

- A. SMACNA – Architectural Sheet Metal Manual, Current Edition.

1.04 SUBMITTALS

- A. Section 01 33 00 – Submittal Procedures.
- B. Shop Drawings: Indicate material profile, jointing pattern, jointing details, fastening methods, flashings, terminations, and installation details.
- C. Submit four samples, 4 inches x 4 inches, illustrating metal finish color prior to fabrication and installation.
- D. Product Data: Submit data on manufactured components metal types, finishes and characteristics.
- E. Test Results:
 - 1. Provide pull-off test results for edge flashings in accordance with current edition of ANSI/SPRI ES-1, SPRI test method RE-2.
 - a. Test results shall meet or exceed design wind pressures as calculated to RE-2.
 - 2. Provide pull-off test results for copings in accordance with current edition of ANSI/SPRI ES-1, SPRI test method RE-3.
 - a. Test results shall meet or exceed horizontal and vertical design wind pressures as calculated according to RE-3.
- F. Submit sample workmanship and material warranties.
- G. Submit sealant literature.
- H. Sealants

1. The General Contractor shall provide to sealant manufacturers, samples of all substrates which are in contact with sealant, regardless of whether adhesion must be achieved.
 2. For substrates which must support adhesion, submit to the Architect, for record only, sealant manufacturer's reports of adhesion tests conducted in accordance with ASTM C794.
- I. Submit fasteners.
 - J. Provide certification that sheet metal fabricator is an authorized fabricator in accordance with NRCA's ITS Certification. Provide evidence that the sheet metal edge flashings and copings have been approved and listed by NRCA and Intertek Testing Services (ITS).

1.05 DESIGN REQUIREMENTS

- A. Design and size edge systems and copings in accordance with current edition of ANSI/SPRI ES-1.
 1. Wind Speed: As indicated on Structural Drawings.
 2. Exposure: As indicated on Structural Drawings.
 3. Importance Factor: As indicated on Structural Drawings.

1.06 QUALIFICATIONS

- A. Fabricator and Installer: Company specializing in sheet metal work with minimum five years of documented experience.
- B. The sheet metal edge flashings and copings shall be listed by NRCA and tested by Intertek Testing Services (ITS). Sheet metal fabricator shall be NRCA ITS Certified.
 1. The metal edge securement including the coping, except gutter, shall be installed as tested in accordance with the most current version of the ANSI/SPRI ES-1, American National Standard for Edge Systems Used with Low-Slope Roofing Systems.
 2. Copings: Copings shall be tested per the current edition of ANSI/SPRI ES-1, Test RE-3 for Copings. The coping system shall be tested simultaneously on horizontal and vertical surfaces and shall exceed horizontal and vertical design wind pressure as calculated in accord with the ANSI/SPRI ES-1 current edition, Test RE-3.
 3. Edge Metal: The vertical face of edge metal flashing shall be tested per the current edition of ANSI/SPRI ES-1, Test RE-2 for edge metal. Test results shall meet or exceed design wind pressures as calculated in accord with ANSI/SPRI ES-1 current edition, RE-2.
 4. Refer to Structural Drawing for design loads.

1.07 WARRANTY

- A. Provide a two-year workmanship warranty.

- B. Steel Warranty:
 - 1. Galvalume material shall have a 20-year guarantee against failure due to corrosion, rupture or perforation.
- C. Finish Warranty:
 - 1. Furnish manufacturer's standard 20-year warranty stating architectural fluoropolymer finish will perform as follows:
 - a. Weathering Tests (Florida Exposure, 10 years):
 - 1) Color Retention: Free of fading or color change in excess of 5 delta E Units (Hunter) of color change as calculated in accordance with ASTM D2244.
 - 2) Chalk Resistance: Chalking shall be no more than that represented by a No. 8 rating based on ASTM D4214, test method A, after test site exposure.
 - 3) Gloss Retention: Not less than 50% loss of gloss after exposure test.
 - 4) Resistance to Erosion: Less than 10% film loss after the exposure test.
 - b. Flexibility: No evidence of cracking when viewed with the unaided eye, and no loss of adhesion to the point of metal rupture, using a 180-degree bend on a 1/8-inch mandrel per ASTM D522.
 - c. T Bend: Perform to a grade "1T" per ASTM D4145.
 - d. Film Adhesion:
 - 1) No removal of film under the tape within or outside of the cross-hatched area or blistering anywhere on the test specimen, test in accordance with NCCA 4.2.10.
 - 2) No coating removed by scotch tape on tested area per ASTM D3359.
 - e. Reverse and Direct Impact Resistance:
 - 1) Hot-Dipped Galvanized (HDG), ASTM A525, G90, Minimum Steel or Zinc-Aluminum Coated Steel Such as Galvalume: No cracking, no removal of film from substrate, using 3x metal thickness in inch lbs. and 5/8-inch ball indenter (Gardner Impact Test) when tested in accordance with ASTM D2749.

1.08 DELIVERY, STORAGE AND HANDLING

- A. Section 01 60 00 – Product Requirements: Product storage and handling requirements.
- B. Deliver, store, and protect products according to manufacturer's recommendations.
- C. Stack pre-formed metal to prevent twisting, bending or abrasion and to provide ventilation.
- D. Slope metal sheets to ensure drainage.

- E. Prevent contact with materials during storage which may cause discoloration or staining.
- F. Do not install material which becomes damaged during storage and handling.

1.09 COORDINATION

- A. Section 01 30 00 – Administrative Requirements: Coordination and project.
- B. Coordinate with related Work and ensure timely installation of Work of this Section.

1.10 PRE-INSTALLATION MEETING

- A. Section 01 30 00 – Administrative Requirements: Pre-installation meeting.
- B. Convene 4 weeks prior to commencing work of this Section.
- C. Review installation procedures and coordination required with related Work.

PART 2 PRODUCTS

2.01 SHEET MATERIALS

- A. Stainless Steel: ASTM A240; Type 302/304, dead soft fully annealed, 26 gauge, smooth, milled rolled, Number 2D finish.
- B. Galvanized Sheet Metal: ASTM A653, G90 zinc coating, structural sheet steel, various gauges.
- C. Pre-Finished Galvalume: ASTM A792-AZ50, Grade 40, structural quality, various gauges.
 - 1. Finish: Minimum two-coat fluoropolymer coating with minimum 70% polyvinylidene fluoride resin (Kynar 500, Kynar 500 VLD or Hylar 5000) by weight.
 - a. Primer: 0.25 to 0.35 mils thick.
 - b. Color top coat: 0.7 to 0.9 mils thick.
 - 2. Manufacturer: The Valspar Corporation.
 - 3. Color: As selected from manufacturer's standard color.

2.02 ACCESSORIES

- A. Fasteners: **NOTE:** All fasteners shall be corrosion resistant. All fasteners used to connect materials to preservative treated lumber and plywood shall be as appropriate for use with the specified wood treatments and with the roof/sheet metal materials being fastened. Select appropriate fasteners as required to prevent galvanic corrosion with other materials.
 - 1. Roofing Nails: Threaded, or ring-shank, minimum 3/8-inch head, in lengths to match application.
 - a. Finish:

- 1) Stainless steel Type 304 or 316.
 - 2) Fasteners with proprietary anti-corrosion coatings may be submitted for use with treated wood. When submitted, the fastener manufacturer shall furnish specific information regarding the performance of their products in the specified treated wood and any precautions or special instructions that may be applicable.
2. Wood Screws: #14 hex head or pan head, with integral, steel washer and minimum 5/8-inch neoprene or EPDM washer; prefinished heads and washers where exposed to view.
- a. Finish:
- 1) Stainless steel Type 304 or 316.
 - 2) Fasteners with proprietary anti-corrosion coatings may be submitted for use with treated wood. When submitted, the fastener manufacturer shall furnish specific information regarding the performance of their products in the specified treated wood and any precautions or special instructions that may be applicable.
3. Sheet Metal Screws: #14; round or pan head, prefinished heads and rubber, neoprene or EPDM washers. Provide stainless steel for use with stainless steel flashing.
- a. Finish:
- 1) Hot-dipped galvanized per ASTM A153.
 - 2) Stainless steel Type 304 or 316.
 - 3) Fasteners with proprietary anti-corrosion coatings may be submitted for use with treated wood. When submitted, the fastener manufacturer shall furnish specific information regarding the performance of their products in the specified treated wood and any precautions or special instructions that may be applicable.
4. Fastener lengths as required to penetrate:
- a. Minimum 1 1/4 inch, or through wood receiving members.
 - b. 1/2 inch through sheet metal and steel receiving members.
- B. Solder: ASTM B32 – 50/50 type.
- C. Flux: FS 0-F-506.
- D. Primer: As recommended by single ply (TPO) roof manufacturer.
- E. Sealant/Tape:
1. Acceptable Manufacturers and Products: Subject to compliance with requirements of Contract Documents, provide product by one of the manufacturers named below. NOTE: Sealants in contact with single ply (TPO)

membrane and metal flashing shall be compatible with single ply (TPO) membrane. Refer to Section 07 54 23 Thermoplastic Polyolefin Roofing for approved sealants.

- a. BASF Building Systems; MasterSeal NP 150.
 - 1) VOC Content: 14 g/L.
 - b. Kemper System: GreatSeal PE-150 multipurpose sealant.
 - 1) VOC Content: 18.26 g/L.
 - c. Substitutions: Comply with the requirements of this section and Division 1 requirements and the following:
 - 1) Sealant shall comply with ASTM C920, Type S, Grade NS, Class 25 or higher. Use NT, T, M, G, A and O.
2. Primers: Prime the following surfaces with primer recommended by joint sealant manufacturer:
 - a. Fluorocarbon (Kynar) coatings.
 - b. Galvanized steel.
 - c. Stainless steel.
 3. Verify adhesion of sealant to each metal and coating specified in accordance with ASTM C794.
 4. Sealant Tape: 100 percent solids, high grade, butyl, size to fit application.
 5. Coordinate sealants and sealant tapes with roof membrane specified in:
 - a. Section 07 54 23 – Thermoplastic Polyolefin Roofing for compatibility.

2.03 FABRICATION

- A. Sheet Metal Fabrication Standard: Fabricate sheet metal flashing and trim to comply with recommendations of SMACNA's "Architectural Sheet Metal Manual" or NRCA Construction Details that apply to the design, dimensions, metal and other characteristics of the item indicated.
- B. Comply with details shown to fabricate sheet metal flashing and trim that fit substrates and result in waterproof and weather-resistant performance once installed. Verify shapes and dimensions of surfaces to be covered before fabricating sheet metal.
- C. Form exposed sheet metal Work that is without oil canning, buckling, tool marks and defects, and that is true to line and levels indicated, true to shape, accurate in size, square with exposed edges folded back to form hems.
- D. Fabricate concealed cleats from same material as sheet metal component being anchored or from compatible, noncorrosive metal recommended by sheet metal manufacturer.
 1. Size: As recommended by NRCA for application.

2. Cleat gauge shall be one gauge heavier than material being fastened.
 3. All cleats shall be continuous with lengths not to exceed 12 feet. Allow a 1/4-inch gap between pieces. Joints in cleats shall not coincide with joints in metal.
- E. Form pieces in 10-foot sections.
- F. Hem exposed edges on underside 1/2 inch; miter and seam corners.
- G. Fabricate corners, intersections and terminations of "running" flashing as fixed components, separate from other lengths of flashing. Fabricate such components with maximum 18-inch legs.
- H. Form joints in running flashings to accommodate thermal movement equally throughout all joints.
- I. Form material with standing seams, flat lock seams, except where otherwise indicated.
- J. Movement Joints:
1. At moving joints, use sealed lapped, or bayonet-type joints. Where lapped or bayonet-type joint provision in work cannot be used or will not be weatherproof and waterproof, form moving joints of interlocking hooked seams, not less than 1 inch deep, filled with sealant (concealed within joint).
- K. Fabricate vertical faces with bottom edge formed outward 3/4 inch, maximum 30-degree brake, and hemmed to form a drip.
- L. Fabricate accessories in profile and size to suit gutters and downspouts.
1. Anchorage Devices: In accordance with SMACNA requirements.
- M. Obtain approval to adjust dimensions and configurations of sheet metal flashings, within acceptable limits, to allow more effective yield of material or to facilitate fabrication in sheet metal brake. Ensure adjustments comply with design intent.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verify that related Work has progressed to the appropriate stage.
- B. Verify suitability of receiving surfaces.

3.02 PREPARATION

- A. Field-measure site conditions prior to fabricating work. Note variances; adjust dimensions to accommodate site conditions.
- B. Pre-prime top and bottom surfaces of metal flanges which are built into single ply (TPO) membrane roof, except where field soldered.

- C. Separate metal from noncompatible metal, corrosive substrates or preservative-treated materials by permanent separation material as recommended by single ply (TPO_ roofing manufacturer.
- D. Metal Flashings
 - 1. Remove scale, rust, loose or inappropriate coatings, oils and protective films from metal a bright surface.
 - 2. Prime the following surfaces with a primer recommended by joint manufacturer:
 - a. Fluorocarbon (Kynar) coatings.
 - b. Galvanized, galvalume steel.
 - c. Stainless steel.
- E. Penetrations within manufactured roof penetrations
 - 1. Thoroughly clean and remove all loose roof cement, mastics, coatings, scaled rust and caulking from the penetration.
- F. Priming
 - 1. Where priming metal flashings is required for proper adhesion, comply with the following:
 - a. Apply primer at full strength by wiping or brushing. Apply primer to a light, uniform coating. Do not apply or allow primer onto exposed face of substrate.
 - b. Prime all joints in gutters.
 - c. Allow primer to dry in accordance with manufacturer's instructions.
 - d. Primer shall be compatible with single ply roof membrane specified in:
 - 1) Section 07 54 23 Thermoplastic Polyolefin Roofing.

3.03 SOLDERING

- A. Solder only fixed components such as corners, intersections, termination, skirts, collars and one-piece flashings made of galvanized sheet steel and stainless steel.
- B. Pre-tin both sides of edges to be soldered using flux and solder to full-anticipated width of joint.
- C. Join sub-components together before soldering. For flat seams, and whenever possible, form flat-lock seams binding sheets tightly. Where flat-lock seams are impractical, provide tabs, partially interlocked if possible, and join with pop-rivets at 1 inch on center.
- D. Do not solder over nail heads.
- E. Apply flux to surface of joint, and solder slowly with well-heated irons. Heat sheets as necessary to sweat solder to full width of seam, or minimum 3/4 inch. Ensure an even flow of solder without excess build-up.
- F. Solder joints in a horizontal position whenever possible. When soldering on slopes steeper than 45 degrees, apply a second bead, neatly laced.

- G. Neutralize flux from surfaces immediately after soldering, use cloth saturated with 10% solution of soda and water, and wipe using separate cloth and clean water.

3.04 JOINTING

- A. Form joints in running flashings to accommodate thermal movement equally throughout all joints.
- B. Provide "slip"-type joints each side of soldered or joined components, except where total length of intersecting lengths is less than 5 feet.
- C. Provide joints aligned with expansion or control joints in walls. Overlap, notch and loosely interlock adjoining sections at lower hem. Fasten only one side of joint to wall.
- D. Form rigid, fixed joints only when constructing fixed components. Provide minimum 3/4-inch tabs, interlocked where possible. Join sections with tabs concealed.
- E. Solder fixed joints in galvanized and stainless-steel metal. Seal laps and rivet 2 inches on center fixed joints in prefinished metal.
- F. Flashing Receivers:
 - 1. Form butt joint, leaving 1/2-inch space.
 - 2. Set 4-inch cover plate in double, side-by-side bead of sealant each side of joint (4 beads total). Hook lower edge of plate minimum 1/2 inch into pocket.
 - 3. Fasten plate only at center without engaging either flashing length. Provide slight kick-down all sides of plate.
 - 4. Tab inside and outside corners, seal between tabs with sealant, and rivet 1 inch on center.
- G. Counterflashing:
 - 1. Form minimum 4-inch lap joint. Apply single bead of sealant concealed inside lap. Notch and interlock lower hem allowing for 1/4-inch movement. Do not fasten through lap.
 - 2. Tab inside and outside corners, seal between tabs with sealant (or solder corner) and pop-rivet 1 inch on center.
 - 3. Install counterflashing so that a minimum of 4 inches of the roof membrane base flashing is covered. The lower edge of the counterflashing shall be 1 inch minimum above the cant.
- H. Concealed Cleats: Maximum length 12 feet. Leave 1/4-inch space between lengths. Joints in cleat shall not coincide with joints in fascia metal.
- I. Membrane Roofing, Embedded Edge Metal Flashing (Gravel Stop):
 - 1. Form butt joint with 12-inch backer plate and 6-inch cover plate. Backer plate and cover plate shall be formed to the profile of the gravel stop.

2. Set continuous cleat on top of roofing membrane.
3. Set backer plate on top of the roofing membrane hooked over cleat.
4. Roof flange width shall be minimum 3 3/4 inches to 4 1/4 inches maximum, recessed 1/2 inch behind nailer edge.
5. Set each length of edge metal flange onto backer plate and hooked over cleat and embedded into single ply sealant. Leave 1/4-inch clearance between end butts. The edge metal roof flange shall be set on top of the roofing membrane. Fasten the flange to the wood nailers with annular ring or barbed shank 1 1/4 inches long roofing nails spaced at 3 inches o.c. in staggered pattern; rows to be 3/4 inch from the edges of the roof flange.
6. Apply single ply sealant over joint, extending to top of stop and along each length of gravel stop flange approximately 3 3/4 inches.
7. Pre-drill cover plate to receive nails to prevent distortion of metal.
8. On the face, install two beads of single ply sealant from the drip edge to the top of the stop.
9. Hook cover plate at face and embed into single ply sealant.
10. Nail through the opening between the gravel stop sections with two nails.
11. Do not over drive nails, causing displacement of single ply sealant or deformation of plate. Ensure that single ply sealant oozes slightly beyond sides of plate and remove excess.
12. Delay nailing of joint components and edge metal flange until both sides of the joint are sealed and positioned.
13. Corners shall be mitered, lapped, sealed and riveted 1-inch o.c.

J. Copings:

1. Copings shall be formed as detailed.
2. Copings shall slope to the roof side a minimum of 1/4 inch per foot.
3. A layer of single ply (TPO) roof membrane shall be installed over the top and vertical edges of the wood nailer.
 - a. Where membrane comes in contact with fluid-applied membrane air barrier, Section 07 27 26 Fluid-Applied Membrane Air Barrier, verify membrane is compatible with air barrier.
4. Form coping cap with a minimum 1-inch-high double-lock standing seam. Lap coping fascia a minimum of 2 inches at each standing seam. Seal lap with a continuous bead of sealant.
5. Copings less than or equal to 12 inches in width: The coping shall be secured to the wood nailer with a continuous cleat on the side away from the roof. On the roof side, fasten the coping to the wood nailer or metal wall panels with screws

and watertight washers, through elongated holes.

6. Copings greater than 12 inches but less than or equal to 24 inches in width: The coping shall be secured to the wood nailer with a continuous cleat on both sides.
7. All seams and joints shall be sealed.
8. Outside and inside corners shall be formed watertight, welded or mitered, seamed and sealed.

3.05 INSTALLATION

- A. General: Unless otherwise indicated, install sheet metal flashing and trim to comply with performance requirements, manufacturer's installation instructions, and SMACNA's "Architectural Sheet Metal Manual." Anchor units of Work securely in place by methods indicated, providing for thermal expansion of metal units; conceal fasteners where possible, and set units true to line and level as indicated. Install Work with laps, joints, and seams that will be permanently watertight and weatherproof.
 1. The edge metal securement including copings, shall be installed as tested in accordance with the most current version of the ANSI/SPRI ES-1, American National Standard for Edge Systems Used with Low-Slope Roofing Systems.
- B. Provide uniform, symmetrical layout of flashing sections, seams, joints, and fasteners.
- C. Roughen surface of prefinished metal flanges which are stripped-in. Ensure single ply strip-in ply bonds to surface.
- D. Ensure proper fit and positioning of flashings. Make adjustments necessary to accommodate variances and imperfections in receiving surfaces.
- E. Install flashings free of warp or distortion, and without stress on fixed components.
- F. Stagger joints between components.
- G. Counterflashings: Coordinate installation of counterflashings with installation of assemblies to be protected by counterflashing. Install counterflashings in reglets or receivers. Secure in a waterproof manner.
- H. Roof-Penetration Flashing: Coordinate roof-penetration flashing installation with Section 07 54 23 Thermoplastic Polyolefin Roofing and installation of items penetrating roof.

3.06 SCHEDULE

- A. Membrane Roofing, Embedded Edge Metal Flashing (Gravel-Stop) – Note: The metal gauge, fasteners, fastener spacings and installation shall be based on Test RE-2 of the ANSI/SPRI ES-1.
 1. Material: Galvalume Steel
 2. Finish:

- a. Pre-finished.
3. Minimum metal thickness for flatness, exposed face:
 - a. Up to 8 inches: 24 gauge.
 - b. >8 inches to 10 inches: 22 gauge.
 - c. >10 inches to 16 inches: 20 gauge.
4. Fasteners:
 - a. Corrosion resistant, barbed, annular ring or screw shank nail
 - b. Spacing: Staggered 3 inches o.c.
 - c. Length: Minimum 1-1/4 inches penetration into nailer
5. Cleat:
 - a. Material: Galvanized steel with metal flange extension.
 - b. Thickness: Cleat gauge to be one gauge heavier than metal thickness of embedded edge metal flashing.
 - c. Fasteners:
 - 1) Corrosion resistant, barbed, annular ring or screw shank nail.
 - 2) Spacing: 6 inches o.c.
 - 3) Minimum 1 1/4 inches penetration into nailer.
 - 4) Locate fastener near the lower brake.
6. Roof Edge Cover Plate:
 - a. Material: Galvalume steel.
 - b. Finish:
 - 1) Pre-finished..
 - c. Thickness: Match gauge of embedded edge metal flashing
 - d. Fasteners:
 - 1) Corrosion resistant, barbed, annular ring or screw shank nail
 - 2) Spacing: 2 fasteners between opening sections
 - 3) Length: Minimum 1-1/4 inches penetration into nailer
7. Roof Edge Backer Plate:
 - a. Material: Galvanized steel.
 - b. Thickness: Match gauge of embedded edge metal flashing.
 - c. Fasteners:
 - 1) Corrosion resistant, barbed, annular ring or screw shank nail
 - 2) Spacing: Staggered 3 inches o.c.
 - 3) Length: Minimum 1 1/4 penetration into nailer
- B. Copings: Note: The metal gauge, fasteners, fastener spacings and installation shall be based on Test RE-3 of the ANSI/SPRI ES-1.

1. Material: Galvalume steel.
 2. Finish:
 - a. Pre-finished.
 3. Thickness: Widths up to 12 inches = 24 gauge. >12 inches to 18 inches = 22 gauge.
 4. Fasteners:
 - a. Copings up to and equal to 12 inches in width: On roof side, corrosion-resistant screw fasteners with neoprene washers spaced 16 inches o.c. On the opposite side, provide a continuous cleat.
 - b. Copings over 12 inches in width but less than 24 inches: Provide continuous cleats on each side.
 5. Cleat:
 - a. Material: Galvanized steel with metal flange extension.
 - b. Thickness: Cleat gauge to be one gauge heavier than metal thickness of coping.
 - c. Fasteners:
 - 1) Corrosion-resistant, barbed, annular ring or screw shank nail
 - 2) Spacing: 6 inches o.c.
 - 3) Length: Minimum 1-1/4 inches penetration into nailer
 - 4) Locate fasteners near the lower brake.
- C. Pocket Receiver (Built into Masonry)
1. Material: Stainless steel.
 2. Thickness: 26 gauge.
 3. Solder all outside and inside corners.
 4. Fasteners
 - a. Stainless steel screw fasteners.
 - b. Spacing: 8 inches o.c.
- D. Pocket Receiver
1. Material: Galvanized steel.
 2. Thickness: 24 gauge.
 3. Fasteners
 - a. Corrosion resistant screw fasteners.
 - b. Spacing: 8 inches o.c.

4. Solder all outside and inside corners.
- E. Counterflashing (Install in Conjunction with Stainless Steel Pocket Receiver)
1. Material: Stainless steel.
 2. Thickness: 26 gauge.
 3. Fasteners:
 - a. Stainless steel screws with neoprene washers.
 - b. Spacing: 12 inches o.c.
 4. Solder all outside and inside corners.
- F. Counterflashing
1. Material: Galvanized steel.
 2. Thickness: 24 gauge.
 3. Fasteners:
 - a. Corrosion resistant screws with neoprene washers.
 - b. Spacing: 12 inches o.c.
 4. Solder all outside and inside corners.
- G. Scupper:
1. Material: Stainless steel.
 2. Thickness: 26 gauge.
 3. Fasteners:
 - a. Corrosion-resistant screws, barbed, annular ring or screw shank nail.
 - b. Spacing: 3 inches o.c.
 - c. Length: Minimum 1-1/4 inches penetration into nailer.
 4. Hem to scupper cover plate
- H. Scupper Face Plate:
1. Material: Galvalume.
 2. Finish:
 - a. Pre-finished.
 3. Thickness: 24 gauge.

4. Hem to scupper and conductor head.
- I. Penetration Flashing:
 1. Coordinate with Section 07 54 23 Thermoplastic Polyolefin Roofing.
 - J. Fascia Cover:
 1. Material: Galvalume.
 2. Finish:
 - a. Pre-finished.
 3. Thickness: 24 gauge.
 4. Fasteners:
 - a. Corrosion-resistant, barbed, annular ring or screw shank nail.
 - b. Spacing: 12 inches o.c.
 - c. Length: Minimum 1-1/4 inches penetration into nailer.

END OF SECTION

SECTION 07 65 10 – FLEXIBLE FLASHING

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Flexible Flashing for use as through wall flashing and accessories.

1.02 RELATED SECTIONS

- A. Section 01 33 00 – Submittal Procedures.
- B. Section 01 60 00 – Product Requirements: Product substitution procedures
- C. Section 04 20 00 – Unit Masonry: Securing through wall flashing to masonry back up.
- D. Section 04 20 19 – Veneer Unit Masonry: Coordination of through wall flashing with masonry veneer.
- E. Section 04 43 13 – Mortar-Placed Stone Veneer: Coordination of through wall flashing with stone veneer.
- F. Section 04 72 00 – Cast Stone Masonry: Coordination of through wall flashing with cast stone.
- G. Section 06 10 53 – Miscellaneous Carpentry: Corrosion-resistant fasteners used to secure through wall flashing to treated wood nailers.
- H. Section 07 27 26 – Fluid-Applied Membrane Air Barriers: Coordination of through wall flashing with fluid-applied air barriers.

1.03 REFERENCES

- A. ASTM International:
 - 1. ASTM A240 – Standard Specification for Chromium and Chromium-Nickel Stainless-steel Plate, Sheet, and Strip for Pressure Vessels and for General Applications.
 - 2. ASTM D412 – Standard Test Methods for Vulcanized Rubber and Thermoplastic Elastomers – Tension.
 - 3. ASTM D3273 – Standard Test Method for Resistance to Growth of Mold on the Surface of Interior Coatings in an Environmental Chamber.
 - 4. ASTM E84 – Test Methods for Surface Burning Characteristics of Building Materials.
 - 5. ASTM E154 – Standard Test Methods for Water Vapor Retarders Used in Contact with Earth Under Concrete Slabs, on Walls, or as Ground Cover.
- B. Brick Institute Association (BIA)

1. BIA Technical Notes on Brick Construction No.7 – Water Penetration Resistance – Design and Detailing: Detailing of through wall flashing.
 2. BIA Technical Notes on Brick Construction No. 28B – Brick Veneer/Steel Stud Walls: Detailing through wall flashing.
- C. International Building Code (IBC)
1. 2015 Edition, Section: 1405.4 Flashing: Requirements for flashing.
- 1.04 QUALITY ASSURANCE
- A. Manufacturer: Provide flashing materials by a single manufacturer.
- 1.05 MOCK-UP
- A. Coordinate with the mock up requirements in the following sections:
1. Section 04 20 19 – Veneer Unit Masonry
 2. Section 04 43 13 – Mortar-Placed Stone Veneer
- B. Do not start work until Architect has accepted sample panel.
- C. Use panel as standard of comparison for all masonry work built of the same material.
- D. Do not destroy or move panel until work is completed and accepted by the Owner.
- 1.06 SUBMITTALS
- A. Submit under provisions of Section 01 33 00 – Submittal Procedures. Obtain written acceptance of submittals prior to the purchase of the materials or methods.
- B. Product Data: Provide data for flashing membranes, drip plate, sealants, gasketed fasteners for metal stud, concrete block or concrete surface and accessories as specified. Provide installation and storage instructions for flexible flashing membrane and drip plates. Provide letter from the flexible membrane flashing manufacturer that the flexible flashing membrane and sealants are compatible with specified fluid applied air barrier membrane.
- C. Samples: Provide two 3 inches by 5-inch sample of flashing material.
1. Provide 6-inch-long strip of drip plate.
- D. Certificates: Submit certificates attesting compliance with applicable specifications for grades, types and classes included in these specifications.
- 1.07 QUALIFICATIONS
- A. Installer: Company specializing in performing work of this section with minimum ten years of documented experience.

1.08 PRE-INSTALLATION CONFERENCE

- A. Section 01 30 00 – Administrative Requirements: Pre-installation meeting.
- B. Coordinate with the following Sections:
 - 1. Section 04 20 00 – Unit Masonry
 - 2. Section 04 20 19 – Veneer Unit Masonry
 - 3. Section 04 43 13 – Mortar Placed Stone Veneer
 - 4. Section 04 72 00 – Cast Stone Masonry

1.09 JOB CONDITIONS

- A. Protection of Flexible Flashing Membrane.
 - 1. Protect flexible flashing membrane from damage. Remove and replace damaged materials prior to installing masonry veneer.

1.10 DELIVERY, STORAGE AND HANDLING

- A. Deliver, store, protect and handle products to site under provisions of Section 01 60 00 – Product Requirements.

1.11 WARRANTY

- A. Warrant flexible flashing/drainage system material for life of the wall.

PART 2 PRODUCTS

2.01 MANUFACTURERS AND PRODUCTS

- A. Definitions:
 - 1. Cavity wall flashing: Same as flexible flashing.
 - 2. Foundation sill flashing: Same as flexible flashing.
 - 3. Head and sill flashing: Same as flexible flashing.
 - 4. Through wall flashing: Same as flexible flashing.
 - 5. Flexible flashing: Waterproof material typically used cavity wall construction to contain and assist in the proper water drainage that may penetrate wall system veneer. Other materials may be required to constitute the system.
- B. Acceptable Manufacturers and Products: Subject to compliance with requirements of Contract Documents, provide product by one of manufacturers named below. If not named, submit as substitution according to Conditions of the Contract and appropriate Division 01 Sections.

1. Manufacturer: Product
 - a. York Manufacturing, Inc.: York Flash-Vent SS.
 - 1) Alternate: York Manufacturing, Inc Flash Vent SA SS. A self-adhered stainless-steel drainage plane flexible flashing with an Engineered system, with high resistant to damage, composite with a stainless-steel with a butyl co-polymer on one stainless-steel and non-woven drainage fabric laminated to opposing face with non-asphalt adhesive.
 - b. STS Coatings, Inc.: Wall Guardian TWF Stainless-steel.
2. Characteristics
 - a. Engineered composite system made up of a stainless-steel sheet metal core with a polymer fabric adhered to one side and a non-woven drainage fabric laminated on the opposite side. Both the polymer fabric and non-woven drainage mat shall be adhered to the stainless-steel sheet metal core using non-asphalt adhesive.
 - b. Tensile strength, stainless-steel: 100,000 psi average.
 - c. Puncture resistance, stainless-steel: 2,500 psi average.
 - d. Mold resistance: ASTM D3273.
 - e. Fire rating: Class A, per ASTM E84.
 - f. Stainless-steel Sheet Metal Core: Type 304 complying with ASTM A240.
 - g. Fabrics:
 - 1) Polymer Fabric: Laminated to back side of stainless-steel core.
 - 2) Non-Woven Drainage Fabric: Laminated to front face of stainless-steel core.
 - h. Recycled content for stainless-steel: Minimum 60 percent recycled content.
 - i. Size: Manufacturers standard width rolls as follows:
 - 1) Widths: 12, 16, 18, 24, and 36 inches
 - 2) Length: 40 feet
3. Inside and outside corners: 26 gage stainless-steel.
4. Mastic as recommended by flashing manufacturer. Provide a letter from the air barrier manufacturer certifying that the mastic material is compatible with the membrane material.
 - a. York Manufacturing UniverSeal US-100.
 - b. STS Coatings GreatSeal LT-100.
5. Sealants:
 - a. York Manufacturing UniverSeal US-100.
 - b. STS Coatings GreatSeal LT-100.

(Note: Sealant shall be compatible with the fluid applied membrane air barrier.)

6. End Dam: Product may be formed in the field or provide 26 gage preformed stainless-steel.
7. Splice Material: Provide one of the following materials.
 - a. York Manufacturing, York 304 self- adhering stainless-steel material.
 - 1) Widths: 4, 6, 9,12,18,24, and 36 -inch.
 - 2) Length: 20 and 50 feet.
 - b. York Manufacturing Multi-Flash SS stainless-steel fabric flashing.
 - 1) Widths: 12,18,24, and 36- inch
 - 2) Length: 60 feet
8. Termination Bar: One inch, 26 gage stainless-steel termination bar with sealant lip and holes spaced at 8 inches on center. NOTE: Plastic termination bars will not be allowed.
9. Fasteners: Stainless-steel type gasketed fasteners 304 or 316.
10. Drip plate: Hohmann & Barnard DP, 26- gauge Stainless steel drip plate Type 316, 3 ½ inches wide.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Section 01 30 00 – Administrative Requirements: Coordination and project conditions.
- B. Verify that field conditions are acceptable and are ready to receive work.
- C. Verify items provided by other sections of work are properly sized and located.
- D. Verify built-in items are in proper location, and ready for roughing into masonry work.

3.02 FLEXIBLE MASONRY FLASHINGS

- A. Install through-wall flashing membrane in accordance with manufacturer's printed instructions. Install flashings after the air barrier membrane has been installed.
- B. Extend flashings horizontally at foundation walls, masonry lugs, above all lintels, heads of openings, at bottom of walls, below sills and were shown on Drawings.
 1. At steel lintel angles installed over openings install a continuous stainless steel drip plate.
- C. Vertical Concrete Block Back-up Masonry Surfaces and Vertical Concrete Surfaces:
 1. Surface apply after air/water barrier membrane is installed. Strike a line for the top edge of flashing material. Extend flashing up the face of the wall a minimum of 8 inches. Apply flashing with non-woven wicking fabric surface to outside lining

up flashing top edge with previously struck line. Secure flashing to masonry/concrete surface using a continuous stainless-steel termination bar with stainless-steel fasteners spaced at 8 inches on center. Seal the back of the flashing membrane to the air/water barrier membrane with a continuous bead of polyether sealant using manufacturer's recommended nozzle. Seal the back of the termination bar to the face of the flashing drainage fabric with a continuous bead of polyether sealant using manufacturer's recommended nozzle. Seal the top of the termination bar to the wall with a continuous bead of polyether sealant. Seal heads of all fasteners used to secure termination bar with polyether sealant.

D. Cavity Wall Flashing:

1. Surface apply after air/water barrier membrane is installed. Flashing shall start flush with the outside face of veneer masonry using the factory cut edge, or shall extend 1.5 inches beyond the face of the veneer, extend through the cavity, rising height required to cross cavity and extend up back wall a minimum of 8 inches, as well as the rising height required to extend above the horizontal leg of the steel lintel a minimum of 8 inches. Secure flashing to sheathing surface using a continuous stainless-steel termination bar with stainless-steel fasteners spaced at 8 inches on center. Seal the back of the flashing membrane to the air/water membrane with a continuous bead of polyether sealant using manufacturer's recommended nozzle. Seal the back of the termination bar to the face of the flashing drainage fabric with a continuous bead of polyether sealant using manufacturer's recommended nozzle. Seal the top of the termination bar to the wall with a continuous bead of polyether sealant. Seal heads of all fasteners used to secure termination bar with polyether sealant. At concrete block and concrete surfaces secure flashing per Vertical Concrete Block Back-up Masonry Surfaces and Vertical Concrete Surfaces Paragraph. The horizontal leg of the flashing for exterior veneer shall be laid in multiple beads of continuous polyether sealant per the Horizontal, Concrete and Steel Surfaces Paragraph and topped with a fresh full bed of mortar. The first sealant bead shall be set near the leading edge of the horizontal surface. Do not allow sealant to run beyond the masonry edge when the flashing is pushed into the sealant. At all terminations, turn ends of flashings up at sides a minimum of 2 inches forming a pan. All corners shall be folded or provide preformed end dams, do not cut. Seal with polyether sealant.
 - a. Where flashing is extended 1.5 inches beyond the face of the veneer, trim the flashing flush with the masonry veneer after inspection by agreed upon parties.
 - b. Where self-adhered flashing is used the horizontal leg of the flashing is not required to be set in a continuous bead of polyether sealant.

E. Head and Sill Flashing:

1. Surface apply after air/water barrier membrane is installed. Flashing shall start flush with the outside of the wall or lintel angle using the factory cut edge or shall extend 1.5 inches beyond wall or lintel angle, then carried through or up the wall as per the "Cavity Wall Flashing" paragraph. Secure flashing to sheathing/wood nailer surface using a continuous stainless-steel termination bar with stainless-steel fasteners spaced at 8 inches on center. Seal the back of the flashing membrane to the air/water membrane with a continuous bead of polyether sealant using manufacturer's recommended nozzle. Seal the back of the termination bar to the face of the flashing drainage fabric with a continuous bead

of polyether sealant using manufacturer's recommended nozzle. Seal the top of the termination bar to the wall with a continuous bead of polyether sealant. Seal heads of all fasteners used to secure termination bar with polyether sealant. At lintels flashing shall extend to the first head joint but not less than 6 inches beyond each side of the opening and be turned up minimum 2 inches at the sides (head joint) forming a pan. Where lintels do not bear on masonry, extend the flashing to the end of the lintel and then turn the flashing up a minimum of 2 inches to form a pan. At sills, extend flashing to ends of openings unless otherwise detailed, and turn up minimum 2 inches at sides forming a pan. All corners shall be folded or use preformed end dams, do not cut. Trim flashing flush with the veneer masonry after inspection. Seal with polyether sealant.

- a. At sill flashings where fasteners used to secure masonry/stone veneer anchors penetrate the vertical surface of the through wall flashing membrane seal all penetrations in flashing as follows:
 - 1) Prior to installing the termination bar and masonry veneer anchors, coat the vertical surface of the through wall flashing non-woven drainage fabric with two coats of fluid applied air barrier membrane specified in Section 07 27 26. Install coating using a roller to the limits shown. Do not coat horizontal surface of the non-woven drainage fabric.
- b. Where flashing is extended 1.5 inches beyond the face of the wall or lintel angle trim the flashing flush with the wall or lintel angle after inspection by agreed upon parties.

F. Horizontal Masonry, Concrete and Steel Surfaces:

1. Flashing shall be laid with the non-woven wicking fabric facing up in three continuous beads of polyether sealant and topped with a full bed of mortar at masonry lugs and at masonry/grout lugs. At loose lintels, and masonry/stone sills lay the non-woven fabric facing up in two continuous beads of polyether sealant and topped with a full bed of mortar. Flashing shall be carried through the wall. Install the factory cut edge flush with exterior masonry or extend flashing 1.5 inches beyond edge of masonry, concrete or steel edge. The first sealant bead shall be installed near the leading edge of the concrete, masonry or steel surface with two additional beads of sealant spaced at 3 inches on center at masonry lugs and masonry/grout lugs and one additional bead spaced two inches on center at loose lintels, and masonry /stone sills. Do not allow sealant to run beyond the concrete/masonry/steel edge when the flashing is pushed into the sealant. At all terminations, turn ends of flashings up at sides a minimum of 2 inches forming a pan. All corners shall be folded or use preformed end dams, do not cut. Seal with polyether sealant.
 - a. Where flashing is extended 1.5 inches beyond the face of the wall or lintel angle trim the flashing flush with the wall or lintel angle after inspection by agreed upon parties.
 - b. Where self-adhered flashing is used the horizontal leg of the flashing is not required to be set in a continuous bead of polyether sealant.

- c. At all steel lintels over openings, prior to installing flashing install a continuous stainless steel drip edge. Set drip plate over horizontal leg of steel lintel in two continuous beads of polyether sealant. Install drip edge so the face of the 30- degree edge is 1 inch from the face of the masonry above the lintel. Cut the drip edge at each jamb. Continue the flat plate the length of the angle that bears on the masonry. The first sealant bead shall be installed near the leading edge of the steel lintel surface with one additional bead spaced two inches on center. Do not allow sealant to run beyond the steel edge when the drip edge is pushed into the sealant. All laps shall be 3 inches with a bead of polyether sealant between laps and with a bead of sealant on the top edges of the overlap. Install flashing membrane on top of drip edge in accordance with the Horizontal Masonry, Concrete and Steel Surface paragraph.

G. Joining Materials:

1. Joints shall be a minimum of 6 inches wide on either side of the joint and made by butting the ends of the through wall flashing together using one of the following methods:
 - a. Splice end joints over 12-inch-wide piece of self-adhering stainless-steel flashing. Install the self-adhering stainless-steel flashing with metal face down, set in multiple beads of polyether sealant per Horizontal, Concrete and Steel Surfaces paragraph. Remove the release liner and imbed the through wall flashing with the non-woven wicking fabric side up in the butyl adhesive. Seal butt seam with polyether sealant.
 - b. Splice end joints over 12-inch-wide piece of Multi-Flash SS stainless-steel fabric flashing. Bond the Multi-Flash to the surface using multiple beads of polyether sealant and bond through wall flashing to the Multi-Flash using multiple beads of polyether sealant per Horizontal, Masonry Concrete Steel Surfaces paragraph. Seal butt seam with polyether sealant.
 - c. Where self-adhered flashing is used splice end joints by butting ends together over 4-inch-wide piece of York 304 self-adhering stainless-steel flashing. The York 304 self-adhered stainless-steel flashing shall be installed metal face up on to the substrate. Seal the butt seams of self-adhered flashing with polyether sealant.

H. End Dams:

1. Openings in the Wall: Where flashing is not continuous, the ends of the flashing shall be extended beyond the jamb lines on both sides and turned up a minimum of 2 inches into the head joint to form an end dam. Seal with polyether sealant. Refer to Head and Sill Flashing paragraph above for flashing that terminate at ends of openings.
2. Bottoms of Door Frames and/or Window Frames: The ends of the flashing on each side of the door and/or window frames shall be turned up a minimum of 4 inches into the head joint to form an end dam. Seal with polyether sealant.

I. Inside and Outside Corners:

1. Make in industry-accepted manner using corner and splice material or utilize preformed corners from manufacturer.
- J. All penetrations in the through wall flashing shall be sealed with a sealant approved by the flashing manufacturer.

END OF SECTION

SECTION 07 72 10 – ROOF CURBS

PART 1 GENERAL

1.01 SUMMARY

- A. Section includes:
 - 1. Manufactured Equipment Curbs.

1.02 RELATED SECTIONS

- A. Section 05 31 23 – Steel Roof Decking.
- B. Section 06 10 53 – Miscellaneous Carpentry: Securing curb to pressure-treated wood.
- C. Section 07 21 16 – Blanket Insulation: Installing stone wool batt insulation inside the equipment curb.
- D. Section 07 54 23 – Thermoplastic Polyolefin Roofing.
- E. Section 07 62 00 – Sheet Metal Flashings and Trim.
- F. Division 23 for roof-mounted equipment and pipe chase housings.

1.03 REFERENCES

- A. National Roofing Contractors Association:
 - 1. NRCA – The NRCA Roofing and Waterproofing Manual.
- B. Sheet Metal and Air Conditioning Contractors:
 - 1. SMACNA – Architectural Sheet Metal Manual.

1.04 SUBMITTALS

- A. Section 01 33 00 – Submittal Procedures.
- B. Shop Drawings: Indicate configuration and dimension of components, adjacent construction, required clearances and tolerances, and other affected work.
- C. Product Data: Submit data on shape of components, materials and finishes, anchor types and locations.
- D. Manufacturer's Installation Instructions: Submit instructions for special procedures and perimeter conditions requiring special attention.

1.05 QUALITY ASSURANCE

- A. Perform Work in accordance with NRCA details.

PART 2 PRODUCTS

2.01 MANUFACTURED EQUIPMENT CURBS

- A. Manufacturers/Products:
 - 1. The Pate Co., es-2.
 - 2. Roof Products, Inc., Model RPES-3.
 - 3. ThyBar, Model TEMS-3.
 - 4. Substitutions: Section 01 60 00 – Product Requirements.
- B. Materials:
 - 1. ASTM A653 G90 – hot-dipped galvanized steel. Minimum 18-gauge or heavier as engineered by manufacturer.
 - 2. Internal bulkhead reinforcement.
 - 3. 18-gauge counterflashing.
 - 4. Wood nailers: Factory installed, pressure treated.
- C. Construct equipment supports to match roof slope with plumb and level top surface for mounting equipment.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Section 01 30 00 – Administrative Requirements: Coordination and project conditions.
- B. Verify deck, wood nailers and other items affecting Work of this section are in place and positioned correctly.

3.02 INSTALLATION

- A. Install curbs in accordance with manufacturer's instructions and as indicated on Drawings.
- B. Isolate flange from pressure-treated wood with a layer of:
 - 1. Where TPO roof membrane is installed use a piece of TPO membrane.
- C. Coordinate installation of components of this section with installation of roofing membrane and base flashings.
- D. Coordinate installation of sealants and roofing cement with Work of this section to ensure water tightness.

- F. At equipment curbs install 3 ½- inch stone wool batt insulation in accordance with Section 07 21 16.

END OF SECTION

SECTION 07 72 33 – ROOF HATCHES

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Prefabricated roof hatch with integral support curbs, operable hardware, counterflashings, and safety railing.

1.02 RELATED SECTIONS

- A. Section 05 50 00 – Metal Fabrications: Ladder for access to roof.
- B. Section 06 10 53 – Miscellaneous Carpentry: Wood nailers.
- C. Section 07 54 23 – Thermoplastic Polyolefin Roofing.
- D. Section 07 62 00 – Sheet Metal Flashings and Trim: Flashing to roof system.

1.03 REFERENCE STANDARDS

- A. ASTM A500/A500M – Standard Specification for Cold-Formed Welded and Seamless Carbon Steel Structural Tubing in Rounds and Shapes; 2007.
- B. Occupational Safety & Health Administration (OSHA): 29 CFR 1910.23 – Fixed Ladders.
- C. Occupational Safety & Health Administration (OSHA): 29 CFR 1910.29 – Guarding Floor and Wall Openings and Holes.

1.04 SUBMITTALS

- A. Submit under provisions of Section 01 33 00 – Submittal Procedures.
- B. Product Data: Provide data on unit construction, sizes, configuration, jointing methods and locations when applicable, and attachment method.
- C. Manufacturer's Installation Instructions: Indicate special installation criteria, interface with adjacent components.
- D. Certificate: Certify that products of this section meet or exceed specified requirements.

PART 2 PRODUCTS

2.01 36-INCH BY 30-INCH ROOF HATCH

- A. Manufacturers/Products
 - 1. Babcock-Davis: Product BRHUG- BG3630
 - 2. Bilco Co.: Product Type S-20
 - 3. DUR-RED: Product LH

4. Substitutions: Section 01 60 00 – Product Requirements.

B. Construction

1. Unit: 36 inches by 30 inches size, single leaf type.
2. Integral Steel Curb: Minimum 14- gauge galvanized steel with a minimum 1 inch rigid glass fiber insulation; integral cap flashing to receive roof flashing; extended flange for mounting; minimum height from top of curb to top of roof membrane surface of 12 inches.
3. Flush Steel Cover: Minimum 14- gauge galvanized steel; minimum 1- inch glass fiber insulation; sandwiched by 22 -gauge steel interior liner; continuous neoprene gasket to provide weatherproof seal.

C. Hardware:

1. Compression spring operator and shock absorbers.
2. Steel manual pull handle for interior and exterior operation.
3. Steel hold open arm with vinyl covered grip handle for easy release.
4. Components, zinc-plated finish.
5. Interior padlock provision.

D. Hinges: Manufacturer's recommended type for specific type of roof hatch.

E. Fabrication

1. Fabricate components free of visual distortion or defects. Weld corners and joints.
2. Provide for removal of condensation occurring within components or assembly.
3. Fit components for weathertight assembly.
4. Sloped Roofs: Fabricate roof hatch curbs tapered to maintain hatch top level.

G. Accessories:

1. Anchorage Devices: Type recommended by manufacturer.
2. Counterflashing: Same metal type and finish as roof hatch frame.
3. Underlayment at Thermoplastic Polyolefin Roofing: Same sheet material specified in Section 07 54 23.

2.02 ROOF HATCH FALL PROTECTION SAFETY RAIL SYSTEM

A. Basis of Design: SafePro L.P., Roof Hatch Fall Protection Safety Rail:

1. Model No. SP-3036L for 30 inches by 36 inches roof hatch.
 2. Substitutions permitted in accordance with this specification and Section 01 60 00.
- B. Description: Steel tube railing system mounted on roof hatch providing an ergonomically correct power grip in a safe upright egress and ingress through roof hatches in addition to protection from accidental falls through roof opening while roof hatch is open. Includes top and mid-rail and wrap-around self-closing gravity gate mounted with heavy-duty hinges acting as a ladder extension.
1. Steel Tubing: 1-1/2 inch cold-rolled electric welded steel tubing, ASTM A500, Grade B, cold formed.
 2. Size: Formed to fit roof hatch size of 36 inches by 30 inches, 30 inches by 54 inches or 30 inches by 96 inches.
 3. Height: 42 inches above roof surface when mounted on standard roof hatch cap flashing.
 4. Mounting System: Integrated stanchions of rail system through bolted to extended cap flashing of roof hatch using 3/8 inch bolts.
 5. Gate System: Gravity self-closing, non-collapsible full wrap-around steel tubing grab hold, welded construction. Heavy-duty hinges with 5/8 inch hinge pin with built-in pinchless gate stop and pull-up full open positioning.
 6. Fasteners: Stainless steel 316 Grade Hex head bolts, 3/8 inch by 2 inch, nylon locking hex nut and flat washers.
 7. Labels: Furnish with manufacturer's standard labels containing safety warning, fall dangers, "No Hoisting" warning and manufacturer identification.
- C. Performance:
1. Safety rails shall meet and exceed OSHA Standard CFR 29 1910.29. No exceptions allowed.
- D. Fabrication: Factory formed and fully welded construction, free of sharp edges and snag points.
- E. Finish: Factory finished with powder coating.
1. Powder Coat Finish: Manufacturer's standard powder coating. Color: Safety Yellow.

PART 3 EXECUTION

3.01 INSTALLATION

- A. Install in accordance with manufacturer's instructions.
- B. Coordinate with installation of roofing system and related flashings for weathertight

installation.

- C. Isolate nailing flange in contact with preservative-treated wood with:
 - 1. At Thermoplastic Polyolefin Roofing, Section 07 54 23, isolate nailing flange in contact with preservative-treated wood with a layer of TPO roofing.
- D. Install safety railing in accordance with manufacturer's instructions at each new roof hatch.
- E. Final installation to be watertight assembly.
- F. Adjust hinge for smooth operation.
- G. If roof curb height is not in itself sufficient to produce the minimum height of 12 inches from the top of curb to surface of roof membrane, add treated wood nailers to achieve the minimum clearance

END OF SECTION

SECTION 07 84 00 – FIRESTOPPING

PART 1 GENERAL

1.01 RELATED SECTIONS

- A. Division 21 – Fire Suppression: Fire protection work requiring firestopping.
- B. Division 23 – Heating, Ventilating and Air Conditioning (HVAC): HVAC work requiring firestopping.
- C. Division 26 – Electrical: Electrical work requiring firestopping.

1.02 GENERAL DESCRIPTION OF THE WORK OF THIS SECTION

- A. Only tested firestop systems shall be used in specific locations as follows:
 - 1. Penetrations for the passage of duct, cable, cable tray, conduit, piping, electrical busways and raceways through fire barriers.
 - 2. Openings around structural members which penetrate walls.
- B. Special Inspections and Tests:
 - 1. A qualified independent testing laboratory and inspection agency, selected and paid by Owner and approved by Architect, will perform special inspection, professional testing and laboratory services specified herein. The Inspector shall meet the requirements of ASTM E2174.
 - 2. Penetration firestops: Field inspection of penetration firestop systems shall be in accordance with ASTM E2174.
 - a. General: The inspector shall verify compliance of the fire penetration firestop system by observing the installation process then taking and recording measurements of the substrates and materials being installed or by destructive examination of completed installations.
 - b. Method of inspection shall be one of the following methods as approved by the authorizing authority (AA) which shall be the designated person, or organization, or their duly authorized representative, charged with the administration and enforcement of the provisions of ASTM E2174 and the authority having jurisdiction (AHJ).
 - 1) Method 1: The inspector shall be on site during during the installation of the penetration firestop system and shall randomly witness a minimum of 10 percent of each type of penetration firestop system, or
 - 2) Method 2: The inspector shall conduct a post installation inspection, which shall require the destructive type verification of the penetration firestop system and the repair of the firestop system. A minimum of 2 percent, but not less than one, of each type of firestop system shall be inspected per floor or for each area of a floor when the floor is larger than 10,000 square feet.

- c. Repair, replacement and re-inspection:
 - 1) Method 1: Any type of firestop system observed during the installation of the penetration firestop system in Method 1 that does not comply with the inspection shall be repaired or replaced plus one full additional inspection of the percentage specified in Method 1 of that type of firestop system that failed inspection shall be performed by the contractor. The cost to repair, replace and re-inspect the non-compliant fire stop system shall be paid for by the contractor, with no additional cost to the Owner. In addition, the cost to provide one full additional inspection as noted shall be paid for by the contractor with no additional cost to the Owner.
 - 2) Method 2: If the post installation method is selected, any type of firestop system that does not comply with the inspection shall be repaired or replaced and re-inspected plus one full additional inspection of the percentage specified in Method 2 of that type of firestop system that failed inspection shall be performed by the contractor. The cost to repair, replace and re-inspect the non-compliant fire stop system shall be paid for by the contractor, with no additional cost to the Owner. In addition, the cost to provide one full additional inspection as noted shall be paid for by the contractor with no additional cost to the Owner.
 - 3) All repairs/replacement of firestop systems shall be conducted according to the manufacturers recommended procedures and methods.
- 3. Fire-resistant joint systems: Field inspection of fire-resistant joint systems shall be in accordance with ASTM E2393.
 - a. General: The inspector shall verify compliance of the fire resistive joint system by observing the installation process then taking and recording measurements of the substrates and materials being installed or by destructive examination or disassembly of completed installations.
 - b. Method of inspection shall be one of the following methods as approved by the authorizing authority (AA) which shall be the designated person, or organization, or their duly authorized representative, charged with the administration and enforcement of the provisions of ASTM E2393 and the authority having jurisdiction (AHJ).
 - 1) Method 1: The inspector shall be on site during installation and randomly witness a minimum of 5 percent of the total linear feet of each type of fire resistive joint system being installed, or
 - 2) Method 2: The inspector shall conduct a post-installation inspection using one of the two options below, in accordance with ASTM E2393, except for mechanical systems, which shall be inspected per Method 1 above.
 - i. Option 1: Destructive type verification of the fire resistive joint system and the repair of the joint system. The destructive inspection shall consist of a minimum of one sampling per type of joint system per 500 linear feet.
 - ii. Option 2: Disassembly and verification of the components and reinstallation of the joint system.

The disassembly inspection shall consist of a minimum of one sampling per type of joint system per 500 linear feet.

- c. Repair, replacement and re-inspection:
- 1) Method 1: Any type of fire resistive joint system observed during the installation of the fire resistive joint system in Method 1 that does not comply with the inspection shall be repaired or replaced plus one full additional inspection of the percentage specified in Method 1 of that type of fire resistive joint system that failed inspection shall be performed by the contractor. The cost to repair, replace and re-inspect the non-compliant fire resistive joint system shall be paid for by the contractor, with no additional cost to the Owner. In addition, the cost to provide one full additional inspection as noted shall be paid for by the contractor with no additional cost to the Owner.
 - 2) Method 2: If the post installation method is selected, Option 1 or 2, any type of fire-resistant joint system that does not comply with the inspection shall be repaired or replaced and re-inspected plus one full additional inspection of the number specified in Method 2, Option 1 or 2, of that type of fire-resistant joint system that failed inspection shall be performed by the contractor. The cost to repair, replace and re-inspect the non-compliant fire resistive joint system shall be paid for by the contractor, with no additional cost to the Owner. In addition, the cost to provide one full additional inspection as noted shall be paid for by the contractor with no additional cost to the Owner.
 - 3) All repairs/replacement of fire resistive joint systems shall be conducted according to the manufacturers recommended procedures and methods.

1.04 SYSTEM PERFORMANCE REQUIREMENTS

- A. General: Provide firestopping systems that are produced and installed to resist the spread of fire, according to requirements indicated and the passage of smoke and other gases.
- B. Through-Penetration Firestop Systems for Fire-Resistance-Rated Walls: Through penetrations shall be protected by an approved penetration firestop system installed as tested in accordance with ASTM E814 or UL 1479, with a minimum positive pressure differential of 0.01 inch of water and shall have an F rating of not less than the required fire-resistance rating of the wall penetrated.
- C. Fire-Resistive Joint Sealants: Provide joint sealants with fire-resistance ratings indicated, as determined per ASTM E119, but not less than that equaling or exceeding the fire resistance rating of the construction in which the joint occurs.
- D. Fire-Resistive Joint Systems: Fire-resistive joint systems shall be tested in accordance with the requirements of either ASTM E1966 or UL 2079.
- E. For firestopping exposed to view, traffic, moisture and physical damage, provide products that do not deteriorate when exposed to these conditions.
 - 1. For piping penetrations for plumbing and wet-pipe sprinkler systems, provide moisture-resistant through-penetration firestop systems.
 - 2. For penetrations involving insulated piping, provide through-penetration firestop systems not requiring removal of insulation.
- F. For firestopping exposed to view, provide products with flame-spread values of less than 25 and smoke-developed values of less than 450, as determined per ASTM E84.

1.05 SUBMITTALS

- A. Product data for each type of product specified.
 - 1. Certification by firestopping manufacturer that products supplied comply with local regulations controlling use of volatile organic compounds (VOCs) and are nontoxic to building occupants.
- B. Shop Drawings detailing materials, installation methods and relationships to adjoining construction for each through-penetration firestop system and each kind of construction condition penetrated and kind of penetrating item. Include firestop design designation of qualified testing and inspecting agency evidencing compliance with requirements for each condition indicated.
 - 1. Submit documentation, including illustrations, from a qualified testing and inspecting agency that is applicable to each through-penetration firestop configuration for construction and penetrating items.
 - 2. Where Project conditions require modification of qualified testing and inspecting agency's illustration to suit a particular through-penetration firestop condition, submit illustration approved by firestopping manufacturer's fire protection engineer with modifications marked.
- C. Product certificates signed by manufacturers of firestopping products certifying that their products comply with specified requirements.
- D. Product test reports from, and based on tests performed by, a qualified testing and inspecting agency evidencing compliance of firestopping with requirements based on comprehensive testing of current products.
- E. Qualification data for firms and persons specified in "Quality Assurance" article to demonstrate their capabilities and experience. Include list of completed projects with project names, addresses, names of Architects and Owners and other information specified.

1.06 QUALITY ASSURANCE

- A. A manufacturer's direct representative (not distributor or agent) to be on-site during initial installation of firestop systems to train appropriate contractor personnel in proper selection and installation procedures. This will be done per manufacturer's written recommendations published in their literature and drawing details.
- B. Fire-Test-Response Characteristics: Provide firestopping that complies with the following requirements and those specified under the "System Performance Requirements" article:
 - 1. Firestopping tests are performed by a qualified testing and inspecting agency. A qualified testing and inspecting agency is UL, Warnock Hersey or another agency, performing testing and follow-up inspection services for firestop systems, that is acceptable to authorities having jurisdiction.
 - 2. Through-penetration firestop systems are identical to those tested per ASTM E814 under conditions where positive furnace pressure differential of at least 0.01-inch of water (2.5 Pa) is maintained at a distance of 0.78-inch (20 mm) below the fill materials surrounding the penetrating items in the test assembly.

Provide rated systems complying with the following requirements:

- a. Through-penetration firestop system products bear classification marking of qualified testing and inspecting agency.
 - b. Through-penetration firestop systems correspond to those indicated by reference to through-penetration firestop system designations listed by UL in their "Fire Resistance Directory," by Warnock Hersey or by another qualified testing and inspecting agency.
3. Fire-resistive joint sealant systems are identical to those tested for fire-response characteristics per ASTM E119 under conditions where the positive furnace pressure differential is at least 0.01-inch of water (2.5 Pa), as measured 0.78-inch (20 mm) from the face exposed to furnace fire. Provide systems complying with the following requirements:
- a. Fire-Resistance Ratings of Joint Sealants: As indicated by reference to design designations listed by UL in their "Fire Resistance Directory" or by another qualified testing and inspecting agency.
 - b. Joint sealants, including backing materials, bear classification marking of qualified testing and inspection agency.
- C. Information on Drawings referring to specific design designations of through-penetration firestop systems is intended to establish requirements for performance based on conditions that are expected to exist during installation. Any changes in conditions and designated systems require the Architect's prior approval. Submit documentation showing that the performance of proposed substitutions equals or exceeds that of the systems they would replace and are acceptable to authorities having jurisdiction.
- D. Installer Qualifications: Engage an experienced installer who is certified, licensed or otherwise qualified by the firestopping manufacturer as having the necessary experience, staff and training to install manufacturer's products per specified requirements. A manufacturer's willingness to sell its firestopping products to the Contractor or to an Installer engaged by the Contractor does not in itself confer qualification on the buyer.
- E. Single-Source Responsibility: Obtain through-penetration firestop and fire-resistant joint systems for each kind of penetration and construction condition indicated from a single manufacturer.
- F. Provide firestopping products containing no detectable asbestos as determined by the method specified in 40 CFR Part 763, Subpart F, Appendix A, Section 1, "Polarized Light Masonry."
- G. Coordinating Work: Coordinate construction of openings and penetrating items to ensure that designated through-penetration firestop systems are installed per specified requirements.
- H. For those firestop applications that exist for which no UL tested system is available through a manufacturer, an engineering judgment derived from similar UL system designs or other tests will be submitted to local authorities having jurisdiction for their review and approval prior to installation. Engineering judgment Drawings must follow requirements set forth by the International Firestop Council.

1.07 DELIVERY, STORAGE AND HANDLING

- A. Deliver firestopping products to Project site in original, unopened containers or packages with intact and legible manufacturers' labels identifying product and manufacturer; date of manufacturer; lot number; shelf life, if applicable; qualified testing and inspecting agency's classification marking applicable to Project; curing time and mixing instructions for multicomponent materials.
- B. Store and handle firestopping materials to prevent their deterioration or damage due to moisture, temperature changes, contaminants or other causes.

1.08 PROJECT CONDITIONS

- A. Environmental Conditions: Do not install firestopping when ambient or substrate temperatures are outside limits permitted by firestopping manufacturers or when substrates are wet due to rain, frost, condensation or other causes.
- B. Ventilation: Ventilate firestopping per firestopping manufacturers' instructions by natural means or, where this is inadequate, forced air circulation.

1.09 SEQUENCING AND SCHEDULING

- A. Do not cover up those firestopping installations that will become concealed behind other construction until the owner's representative and authorities have jurisdiction, if required, have examined each installation.

PART 2 PRODUCTS

2.01 FIRESTOPPING – GENERAL

- A. Basis of Design: Contract Documents are based on manufacturer and product names listed in the firestop schedule below to establish a Standard of Quality. Other acceptable manufacturers with products having equivalent characteristics may be considered, provided deviations are minor and does not change concept as expressed in Contract Documents as judged by Architect.
 - 1. Hilti
 - a. Firestop material used at head wall conditions shall be tested with specified fireproofing.
 - 2. Refer to each test number for:
 - a. Safing insulation.
 - b. Board insulation.
 - c. Pipe insulation.
- B. Acceptable Manufacturers: Subject to compliance with requirements of Contract Documents, provide product by one of the manufacturers named below. If not named, submit as substitution according to Conditions of the Contract and appropriate Division 1 sections.
 - 1. Specified Technologies Inc.

2. Tremco.
 3. USG.
- C. Compatibility: Provide firestopping composed of components that are compatible with each other, the substrates forming openings and the items, if any, penetrating the firestopping under conditions of service and application, as demonstrated by firestopping manufacturer based on testing and field experience.
- D. Accessories: Provide components for each firestopping system that are needed to install fill materials and to comply with "System Performance Requirements" article in Part 1. Use only components specified by the firestopping manufacturer and approved by the qualified testing and inspecting agency for the designated fire-resistance-rated systems. Accessories include, but are not limited to, the following items:
1. Permanent forming/damming/backing materials including the following:
 - a. Semi-refractory fiber (mineral wool) insulation, 4 pcf, and 8 pcf density as required, formaldehyde free.
 - b. Ceramic fiber.
 - c. Sealants used in combination with other forming/damming materials to prevent leakage of fill materials in liquid state.
 - d. Fire-rated formboard.
 - e. Joint fillers for joint sealants.
 2. Temporary forming materials.
 3. Substrate primers.
 4. Collars.
 5. Steel sleeves.
- E. Applications: Provide firestopping systems composed of materials specified in this Section that comply with system performance and other requirements.

2.02 MIXING

- A. For those products requiring mixing prior to application, comply with firestopping manufacturer's directions for accurate proportioning of materials, water (if required), type of mixing equipment, selection of mixer speeds, mixing containers, mixing time and other procedures needed to produce firestopping products of uniform quality with optimum performance characteristics for application indicated.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Examine substrates and conditions, with Installer present, for compliance with requirements for opening configurations, penetrating items, substrates and other conditions affecting performance of firestopping. Do not proceed with installation until unsatisfactory conditions have been corrected.

3.02 PREPARATION

- A. Surface Cleaning: Clean out openings and joints immediately prior to installing firestopping to comply with recommendations of firestopping manufacturer and the following requirements:
 - 1. Remove all foreign materials from surfaces of opening and joint substrates and from penetrating items that could interfere with adhesion of firestopping.
 - 2. Clean opening and joint substrates and penetrating items to produce clean, sound surfaces capable of development optimum bond with firestopping. Remove loose particles remaining from cleaning operation.
 - 3. Remove laitance and form release agents from concrete.
- B. Priming: Prime substrates where recommended by firestopping manufacturer using that manufacturer's recommended products and methods. Confine primers to areas of bond; do not allow spillage and migration onto exposed surfaces.
- C. Masking Tape: Use masking tape to prevent firestopping from contacting adjoining surfaces that will remain exposed upon completion of Work and that would otherwise be permanently stained or damaged by such contact or by cleaning methods used to remove smears from firestopping materials. Remove tape as soon as it is possible to do so without disturbing firestopping's seal with substrates.
- D. Verify sleeves in openings are steel. Remove any plastic sleeves and replace with steel sleeves. Sleeves shall be secured to the masonry walls.

3.03 INSTALLING THROUGH-PENETRATION FIRESTOPS

- A. General: Comply with the "System Performance Requirements" article in Part 1 and the through-penetration firestop manufacturer's installation instructions and Drawings pertaining to products and applications indicated.
- B. Install forming/damming materials and other accessories of types required to support fill materials during their application and in the position needed to produce the cross-sectional shapes and depths required to achieve fire ratings of designated through-penetration firestop systems. After installing fill materials, remove combustible forming materials and other accessories not indicated as permanent components of firestop systems.
- C. Install fill materials for through-penetration firestop systems by proven techniques to produce the following results:
 - 1. Completely fill voids and cavities formed by openings, forming materials, accessories and penetrating items.
 - 2. Apply materials so they contact and adhere to substrates formed by openings and penetrating items.
 - 3. For fill materials that will remain exposed after completing Work, finish to produce smooth, uniform surfaces that are flush with adjoining finishes.

3.04 INSTALLING FIRE-RESISTIVE JOINT SEALANTS

- A. General: Comply with the "System Performance Requirements" article in Part 1, with ASTM C1193 and with the sealant manufacturer's installation instruction and Drawings pertaining to products and applications indicated.
- B. Install joint fillers to provide support of sealants during application and at position required to produce the cross-sectional shapes and depths of installed sealants relative to joint widths that allow optimum sealant movement capability and develop fire-resistance rating required.
- C. Install sealants by proven techniques that result in sealants directly contacting and fully wetting joint substrates, completely filling recesses provided for each joint configuration and providing uniform, cross-sectional shapes and depths relative to joint width that optimum sealant movement capability. Install sealants at the same time joint fillers are installed.
- D. Tool non-sag sealants immediately after sealant application and prior to the time skinning or curing begins. Form smooth, uniform beds of configuration indicated or required to produce fire-resistance rating, as well as to eliminate air pockets and to ensure contact and adhesion of sealants with sides of joint. Remove excess sealant from surfaces adjacent to joint. Do not use tooling agents that discolor sealants or adjacent surfaces or are not approved by sealant manufacturer.

3.05 FIELD QUALITY CONTROL

- A. All penetration firestop systems shall be examined by an appointed code official general contractor and/or inspecting agency employed and paid by Owner. All firestop penetrations shall be examined for complete firestopping to determine, in general, if it is being installed in compliance with requirements.
 - 1. Refer to Article 1.02, Paragraph B for special inspection and testing of firestopping and fire-resistant joint systems.
- B. Inspecting agency will report observations promptly and in writing to Contractor and Architect.
- C. Do not proceed to enclose firestopping with other construction until reports of examinations are issued.
- D. Where deficiencies are found, repair or replace firestopping so that it complies with requirements.

3.06 CLEANING

- A. Clean off excess fill materials and sealants adjacent to openings and joints as work progresses by methods and with cleaning materials approved by manufacturers of firestopping products and of products in which opening and joints occur.
- B. Protect firestopping during and after curing period from contact with contaminating substances or from damage resulting from construction operations or other causes so that they are without deterioration or damage at time of Substantial Completion. If, despite such protection, damage or deterioration occurs, cut out and remove damaged or deteriorated firestopping immediately and install new materials to produce firestopping

complying with specified requirements.

3.07 LOCATIONS

- A. Penetrations through all fire-resistance-rated walls including both empty openings and openings containing cables, pipes, ducts, conduits and other penetrating items.
- B. Sealant joints in fire-resistance-rated construction.

3.08 FIRESTOP SCHEDULE

I. WALLS – GYPSUM WALLBOARD AND METAL STUD CONSTRUCTION

A. Single Metal Pipe/Conduit or Tubing:

1. Pipe Sizes:

- a. Steel Pipe: Nom. 30 inches diameter (or smaller), schedule 10 (or heavier) steel pipe.
- b. Cast Iron Pipe: Nom. 30 inches diameter (or smaller) cast or ductile iron pipe.
- c. Steel Conduit: Nom. 6 inches diameter (or smaller) steel conduit.
- d. Electrical Metal Tubing: Nom. 4 inches diameter (or smaller) electrical metal tubing.
- e. Copper Pipe: Nom. 6 inches diameter (or smaller) regular (or heavier) copper pipe.
- f. Copper Tubing: Nom. 6 inches diameter (or smaller) Type L (or heavier) copper tubing.

2. Rating: F, 1 Hour or 2 Hour.

3. UL Number: WL 1054.

4. Manufacturer/Product: Hilti Construction Chemicals, Inc./FS-One MAX Intumescent Firestop Sealant.

- a. VOC content: 9 g/L.

5. Annular space around penetration: 0 inch minimum to 2-1/4 inches maximum.

6. Firestop System: Construct firestop in accordance with UL Design Number.

B. Multiple Penetrations:

1. Cables, through penetrations.

- a. Steel or aluminum cable tray (maximum 18 inches by 6 inches) bearing UL classification mark.
- b. Cables: Aggregate cross-sectional area of cables in cable tray to be maximum 30% of the cross-sectional area of the cable tray.
 - 1) 7/C No. 12 AWG with PVC insulation and PVC jacket.
 - 2) 100 pair No. 24 AWG cable with PVC insulation and jacket.
 - 3) 1/C, 750 kcmil (or smaller) with PVC insulation and jacket.

- c. Maximum 3 inches diameter PVC schedule 40 solid core PVC pipe (or smaller) for use in closed (process or supply) or vented (drain, waste or vent) piping system.
 - d. Steel pipe: Nominal 6 inches diameter (or smaller), schedule 40 (or heavier) steel pipe.
 - e. Conduit: Nominal 4 inches diameter (or smaller) EMT or 4 inches diameter steel conduit.
 - f. Copper pipe: Nominal 4 inches diameter (or smaller) regular (or heavier) copper pipe.
 - g. Copper tube: Nominal 4 inches diameter (or smaller) Type L (or heavier) copper tube.
 - h. Cable Bundles
 - 1) 7/C No. 12 AWG with PVC insulation and PVC jacket.
 - 2) 25 pair No. 24 AWG cable with PVC insulation and jacket.
 - 3) Type R GU/59 coaxial cable with PVC outer jacket.
 - 4) 24 fiber optic cable with PVC sub unit and outer jacket.
2. Rating: F, 1 Hour or 2 Hour.
 3. UL Number: WL 8013.
 4. Manufacturer/Product: Hilti CFS-BL Fire Block, FS-One MAX Intumescent Firestop sealant.
 - a. VOC content CFS-BL: 5.4 g/L.
 - b. VOC content sealant: 9 g/L.
 5. Firestop System: Construct firestop in accordance with UL Design Number.
- C. Cables (Single or Multiple)
1. Cable Sizes
 - a. Max. 7/C No. 12 AWG with PVC insulation and jacket.
 - b. Max. 25 pair No. 24 AWG phone cables with PVC insulation and jacket.
 - c. Type RG/U coaxial cable with PE insulation and PVC jacket having a max. outside dia. of 1/2 inch.
 - d. Multiple fiber optical communications cable jacketed with PVC and having a max. outside dia. of 5/8 inch.
 - e. Through Penetrating Products: Max. three copper conductor No. 8 AWG. Metal-clad cables.
 - f. Max. 3/C (with ground) (or smaller) No. 8 AWG copper conductor cable with PVC insulation and jacketing.
 - g. Max. 3/4 inch diam. copper ground cable with or without a PVC jacket.
 - h. Fires-resisting cables: Max. 1 1/4 inches dia. single conductor or multi-conductor Type MI cable. A min. 1/8 inch separation shall be maintained between MI cables and any other cable.
 2. Rating: F, 1 hour or 2 hour.
 3. UL Number: WL 3065.

4. Manufacturer/Product: Hilti Construction Chemicals, Inc./FS-One MAX Intumescent Firestop Sealant.
 - a. VOC content: 9 g/L.
 5. Pipe Sleeve: Optional nominal 4 inches diameter (or smaller) steel EMT or Schedule 5 (or heavier) steel pipe or min. 0.016 inch thick galv. steel sleeve. Set sleeve flush with wall.
 6. Annular Space: Minimum 0 inch to maximum 1 inch
 7. Aggregate cross-sectional area of cable in opening to be maximum 45% of the cross-sectional area of the opening. Fill annular space with a minimum 5/8 inch depth of FS-One firestop sealant on each side of opening for one and two hour rating. Construct firestop in accordance with UL Design Number.
- D. Plastic Pipe:
1. Pipe Sizes:
 - a. Polyvinyl Chloride (PVC) Pipe: Nom. 10 inches diam. (or smaller) Schedule 40 solid-core or cellular core PVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping system.
 - b. Chlorinated Polyvinyl Chloride (CPVC) Pipe: Nom. 10 inches diam. (or smaller) SDR 13.5 CPVC pipe for use in closed (process or supply) systems only.
 - c. Acrylonitrile Butadiene Styrene (ABS) Pipe: Nom. 6 inches diam. (or smaller) Schedule 40 solid-core or cellular core ABS pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems.
 - d. Flame Retardant Polypropylene (FRPP) Pipe: Nom. 6 inches diam. (or smaller) Schedule 40 FRPP pipe for use in closed (process or supply) or vented (drain, waste or vent) piping system.
 - e. Polyvinylidene Fluoride (PVDF) Pipe: Nom. 4 inches diam. (or smaller) PVDF pipe for use in closed (process or supply) or vented (drain, waste or vent) piping system.
 2. Rating: F, 1 hour or 2 hour.
 3. UL Number: WL2078.
 4. Manufacturer/Product: Hilti Construction Chemicals, Inc./Hilti CP643N firestop collar and FS-One MAX Intumescent Firestop Sealant.
 - a. CP643N VOC content: 7.6 g/L.
 - b. Sealant VOC Content 9 g/L.
 5. Install firestop collar to both sides of wall using anchor hooks.
 6. Annular Space: Minimum 0 inch to Maximum 1/2 inch
- E. Insulated Metal Pipes:
1. Pipe Sizes:

- a. Steel Pipe: Nom. 12 inch diameter (or smaller) schedule 10 (or heavier).
 - b. Iron Pipe: Nom. 12 inch diameter (or smaller) cast or ductile iron pipe.
 - c. Copper Tubing: Nom. 6 inches diameter (or smaller) Type L (or heavier) copper tubing.
 - d. Copper Pipe: Nom. 6 inches diameter (or smaller) regular (or heavier) copper pipe.
2. Rating: F, 1 hour or 2 hour.
 3. UL Number: WL5029
 4. Manufacturer/Product: HILTI Retaining collar with FS-One MAX Intumescent firestop sealant.
 - a. VOC content: 9 g/L.
 5. Annular space: Minimum 0 inch, Maximum 1-7/8 inches
 6. Insulation: Nominal 1 inch, 1-1/2 inches, or 2-inch thick glass-fiber pipe insulation or maximum 2-inch thick calcium silicate pipe insulation.
 7. Firestop System: Construct firestop in accordance with UL Design Number.
- II. HEAD OF WALL AT RATED METAL STUD AND GYPSUM BOARD WALLS, METAL ROOF DECK
- A. Rating: 1 Hour and 2 Hour.
 - B. UL Number: HW-D-0042 and HW-D-0049.
 1. Forming Material: Minimum, 4 pcf density mineral wool batt insulation firmly packed into flutes of steel deck for 1 hour and 2 hour rated walls respectively, flush with wall surface, as per UL design requirements.
 - a. Safing: Owens Corning Thermafiber Safing FF Formaldehyde-Free Mineral Wool Safing Insulation.
 - b. At HW-D-0042 assemblies where studs are 3 1/2 inch and wider provide as an alternate to 1a above Hilti preformed mineral wool plugs, CP777 Speed Plugs.
 2. Fill Material: Min 1/8 inch thick (wet) Hilti CFS-SP WB firestop joint spray.
 - a. VOC content: 34 g/L.
- III. CONTROL JOINTS IN RATED GYPSUM BOARD AND METAL STUD PARTITIONS
- A. Fill joint with Owens Corning Thermafiber Safing FF Formaldehyde-Free Mineral Wool Safing Insulation, 4.0 pcf.

IV. FLOOR TO WALL AT RATED METAL STUD AND GYPSUM BOARD WALLS

- A. Fill the joint between the floor and edge of gypsum wallboard at rated and non-rated partitions with Hilti CP606.
1. VOC content: 71 g/L.

V. CABLE TRAY THROUGH 1- OR 2-HOUR GYPSUM BOARD WALLS

- A. Cables: Any combination of the following:
1. Maximum 1/C 750 kcmil (or smaller) single conductor power cable with EPR insulation and PVC jacket.
 2. Maximum 300 pair-No. 24 AWG cable with PVC insulation and jacket.
 3. Maximum 24 1/2 inch diameter fiber-optic cable.
 4. Maximum 3/C, No. 12 AWG metal-clad cable.
- B. Rating: 1 or 2 Hour.
- C. UL Number: W-L-4011.
- D. Manufacturer/Product: Hilti Construction Chemicals, Inc. FS 657 fire blocks, FS-One MAX Intumescent Firestop Sealant.
1. VOC content: 9 g/L.
- E. Annular Space: Minimum 0 inch to Maximum 4 inches.
- F. Open Ladder UL Classified Cable Tray: Maximum 24 inches by 6 inches steel or aluminum.
- G. Apply FS-One MAX into interstices of cables, between cables and cable tray and any voids.

VI. PROTECTION OF ELECTRICAL BOXES IN 1- AND 2-HOUR RATED METAL STUD AND GYPSUM WALLBOARD PARTITIONS

- A. Hilti CLIV CP617 Firestop Putty Pad.
1. VOC content: 4.35 g/L.
- B. Install around each outlet box located within a fire-rated partition or fire barrier.

END OF SECTION

SECTION 07 90 00 – JOINT PROTECTION

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Preparing substrate surfaces.
- B. Sealant and joint backing.
- C. Summary.
 - 1. Exterior joints in vertical surfaces, indicated below:
 - a. Control and expansion joints in veneer masonry, brick.
 - b. Control and expansion joints in stone and cast stone.
 - c. Perimeter joints between materials listed above and frames of doors and windows.
 - 1) Perimeter joint sealants specified in this section shall not come in direct contact with fluid applied membrane air barrier, tapes and sealants specified in Section 07 27 26.
 - d. Joints between different materials listed above.
 - e. Other joints indicated.
 - 2. Exterior joints in horizontal traffic surfaces as indicated below:
 - a. Control, expansion and isolation joints in cast-in-place concrete slabs.
 - b. Other joints as indicated.
 - 3. Interior joints in vertical surfaces and horizontal non-traffic surfaces as indicated below:
 - a. Perimeter joints of exterior openings where indicated.
 - 1) Coordinate type of joint sealant installed around the inside perimeter of exterior openings with Section 07 27 26 – Fluid-Applied Membrane Air Barrier. Sealants that come in direct contact with air barrier membrane and /or tapes shall be compatible with air barrier membrane and/or tapes. Where this condition occurs provide sealants specified in Section 07 27 26.
 - b. Perimeter joints between interior wall surfaces and frames of interior doors and windows.
 - c. Perimeter joints of toilet fixtures.
 - d. Other joints as indicated.

1.02 RELATED SECTIONS

- A. Section 04 20 00 – Unit Masonry: Sealants required in conjunction with concrete masonry units.

- B. Section 04 20 19 – Veneer Unity Masonry: Sealants required in conjunction with brick, and concrete masonry units.
- C. Section 04 43 13 – Mortar-Placed Stone Veneer: Sealants required in conjunction with stone units.
- D. Section 04 72 00 – Cast Stone Masonry: Sealants required in conjunction with stone units.
- E. Section 07 27 26 – Fluid-Applied Membrane Air Barrier: Sealants that are compatible with air barrier membrane and tapes.
- F. Section 07 62 00 – Sheet Metal Flashing and Trim.
- G. Section 07 65 10 – Flexible Flashing: Sealants required in conjunction with flexible flashings.
- H. Section 07 84 00 – Firestopping.
- I. Section 08 41 13 – Aluminum-Framed Entrances and Storefronts: Sealants required in conjunction with glazing method.
- J. Section 08 42 29 – Sliding Automatic Entrances: Sealants required in conjunction with glazing method.
- K. Section 08 80 00 – Glazing: Sealants required in conjunction with glazing methods.
- L. Section 09 21 16 – Gypsum Board Assemblies: Sealants required in conjunction with acoustic treatment.

9. ASTM C1521 – Standard Practice for Evaluating Adhesion of Installed Weatherproofing Sealant Joints.
 10. ASTM E329 – Standard Specification for Agencies Engaged in Construction Inspection, Testing, or Special Inspection.
- B. SWRI (Sealant, Waterproofing and Restoration Institute) – Sealant and Caulking Guide Specification.

1.04 ADHESION, COMPATIBILITY AND STAIN TESTS

- A. The General Contractor shall provide to sealant manufacturers, samples of all substrates which are in contact with sealant, regardless of whether adhesion must be achieved.
- B. For substrates which must support adhesion, submit to the Architect, for record only, sealant manufacturers' reports of adhesion tests conducted in accordance with ASTM C794.
- C. For stone (limestone, cast stone), submit to the Architect, for record only, sealant manufacturers' reports of stain tests for sealants and primers conducted in accordance with ASTM C1248.
- D. For all test results, submit manufacturers' recommendations for application and quality control procedures.

1.05 SUBMITTALS

- A. Submit under provisions of Section 01 33 00 – Submittal Procedures.
- B. Product Data: Provide data indicating sealant chemical characteristics, performance criteria, substrate preparation, limitations, color availability.
- C. Samples: Submit samples illustrating standard as well as expanded sealant colors.
 1. Provide custom colors where standard and expanded colors do not match Architect's color selections.
- D. Certificates from manufacturers of joint sealants attesting that their products comply with specification requirements and are suitable for the use indicated.
- E. Adhesion, compatibility and stain test reports per Article 1.04.
- F. Warranty: Include coverage for installed sealants and accessories failing to achieve airtight, watertight seal, exhibit loss of adhesion or cohesion, and sealants which do not cure.
 1. Silicone Warranty: 20 years.
 2. Urethane Warranty: 5 years.
 3. Warranty against staining stone: 20 years.
 4. Provide 2-year workmanship warranty for all sealants.

- G. Provide SWRI (Sealant and Waterproofing and Restoration Institute) Certification.

1.06 QUALITY ASSURANCE

- A. **Installer Qualifications:** Engage an experienced Installer who has completed joint sealant applications similar in material, design, and extent to that indicated for Project that have resulted in construction with a record of successful in-service performance.
- B. **Testing Laboratory Qualifications:** To qualify for acceptance, an independent testing laboratory must demonstrate to Architect's satisfaction, based on evaluation of laboratory-submitted criteria conforming to ASTM E329, that it has the experience and capability to conduct satisfactorily the testing indicated without delaying progress of the Work.
- C. **Pre-Construction Compatibility, Adhesion Testing and Stain:** Submit to joint sealant manufacturer's samples of materials that will contact or affect joint sealants for compatibility and adhesion testing as indicated below:
 - 1. Use test methods standard with manufacturer to determine which specific joint preparation techniques are required to obtain rapid, optimum adhesion of joint sealants to joint substrates.
 - a. Perform tests under normal environmental conditions that will exist during actual installation.
 - 2. Submit not less than 9 pieces of each type of material, including joint substrates, shims, joint sealant backings, secondary seals, and miscellaneous materials.
 - 3. Schedule sufficient time for testing and analysis of results to prevent delay in the progress of the Work.
 - 4. Investigate materials failing compatibility or adhesion tests and obtain joint sealant manufacturer's written recommendations for corrective measures, including use of specially formulated primers.
 - 5. Testing will not be required when joint sealant manufacturer is able to submit joint preparation data required above that are acceptable to Architect and are based on previous testing of current sealant products for adhesion to, and compatibility with, joint substrates and other materials matching those submitted.
- D. **Product Testing:** Provide comprehensive test data for each type of joint sealant based on tests conducted by a qualified independent testing laboratory on current product formulations within a 24-month period preceding date of Contractor's submittal of test results to Architect.
 - 1. Test elastomeric sealants for compliance with requirements specified by reference to ASTM C920. Include test results for hardness, stain resistance, adhesion and cohesion under cyclic movement (per ASTM C719), low-temperature flexibility, modulus of elasticity at 100 percent strain, effects of heat aging, and effects of accelerated weathering.
 - 2. Include test results performed on joint sealants after they have cured for 1 year.
- E. **Pre-Construction Field Testing:** Prior to installation of joint sealants, field-test their

adhesion to joint substrates as follows:

1. Locate test joints where indicated or, if not indicated, as directed by Architect.
 2. Conduct field tests for each application indicated below:
 - a. Each type of elastomeric sealant and joint substrate indicated.
 - b. Each type of non-elastomeric sealant and joint substrate indicated.
 3. Notify Architect one week in advance of the dates and times when mock-ups will be erected.
 4. Arrange for tests to take place with joint sealant manufacturer's technical representative present.
 5. Test method to determine sealant adhesion characteristic in situ, per ASTM C1521, Method A.
 - a. Purpose: To detect field application problems, such as improper substrate cleaning, use of an improper primer, poor primer application, improper joint configuration.
 - b. Apply sealant to each sample substrate specified. Install joint sealants in 60-inch joint lengths, using same materials and methods for joint preparation and joint sealant installation required for completed work. Allow sealants to cure fully before testing.
 - c. The "Tail" Procedure consists of cutting through the sealant, 6 inches along the bond line at both substrates. Cut across the sealant bead to release one end of the "tail" that is formed per Figure 2 of ASTM C1521. Ensure that the sealant is cut at the substrate and that the sealant bead is free of nicks or jagged edges.
 - d. Grasp the 6-inch sealant tab firmly 1 inch from its bonded edge and pull at a 90-degree angle to effectively extend the 1-inch mark to two times the stated movement capability of the sealant.
 - e. Record the type of failure that occurred and the distance of the mark from the adhesive bond when failure occurred, or the distance recommended by manufacturer without causing failure.
 6. Evaluation of Field Test Results: Sealants not evidencing adhesive failure from testing, in absence of other indications of noncompliance with requirements, will be considered satisfactory. Do not use sealants that fail to adhere to joint substrates during testing.
- F. Field-Constructed Mock-Ups: Prior to installation of joint sealants, apply elastomeric sealants as follows to verify selections made under sample submittals and to demonstrate aesthetic effects as well as qualities of materials and execution:
1. Joints in field-constructed mock-ups of assemblies specified in other Sections that are indicated to receive elastomeric joint sealants specified in this Section.

1.07 QUALIFICATIONS

- A. Manufacturer: Company specializing in manufacturing the Products specified in this section with minimum ten years of documented experience.

- B. Applicator: Company specializing in performing the work of this section with minimum 5 years of documented experience.

1.08 ENVIRONMENTAL REQUIREMENTS

- A. Maintain temperature and humidity recommended by the sealant manufacturer during and after installation.

1.09 DELIVERY, STORAGE AND HANDLING

- A. Deliver materials to project site in original, unopened containers or bundles with labels indicating manufacturer, product name and designations, color, expiration period for use, pot life curing time and mixing instructions for multicomponent requirements.
- B. Store and handle materials in compliance with manufacturer's recommendations to prevent their deterioration or damage due to moisture, high or low temperatures, contaminants or other causes.

1.10 PROJECT CONDITIONS

- A. Joint width: Do not proceed with installation of joint sealants where joint widths are less than allowed by joint sealant manufacturer for application indicated.
- B. Joint substrate conditions: Do not proceed with installation of joint sealants until contaminants capable of interfering with their adhesion are removed from the joint substrates.
- C. Temperature: Do not proceed with installation of joint sealants when ambient and substrate temperature conditions are outside the limits by joint sealant manufacturer.

PART 2 PRODUCTS

2.01 MATERIALS – GENERAL

- A. Compatibility: Provide joint sealants, joint fillers and other related materials that are compatible with one another and with joint substrates under conditions of service and applications, as demonstrated by sealant manufacturer based on testing and field experience.
- B. Colors: Provide color of exposed to view joint sealants to comply with the following:
 - 1. At masonry, provide colors to match masonry and mortar colors.
 - a. At vertical expansion contraction joints, sealant color shall match masonry and/or stone.
 - b. At horizontal joints, sealant color shall match mortar color.
 - 2. Provide selections made by architect from manufacturer's full range of standard colors for products of type indicated. Provide custom colors where the manufacturer's standard colors do not match masonry.

2.02 ELASTOMERIC JOINT SEALANTS

- A. Elastomeric Sealant Standard: Provide manufacturer's standard chemically curing Elastomeric sealant that complies with ASTM C920 and other requirements indicated on each Elastomeric joint sealant data sheet at the end of this section, including those requirements referencing ASTM C920 classifications for type, grade, class and uses.
 - 1. Additional Movement Capability: Where additional movement capability is specified in Elastomeric joint sealant data sheet, provide products with the capability, when tested for adhesion and cohesion under maximum cyclic movement per ASTM C719, to withstand the specified percentage change in the joint width existing at time of installation and remain in compliance with other requirements of ASTM C920 for uses indicated.
- B. Products: Subject to compliance with requirements, provide one of the products specified in each Elastomeric joint sealant data sheet.

2.03 LATEX JOINT SEALANTS

- A. General: Provide manufacturer's standard one-part, non-sag, non-staining, mildew-resistant, paintable latex sealant of formulation indicated that is recommended for exposed applications on interior and protected exterior locations and that accommodates indicated percentage change in joint width existing at time of installation without failing either adhesively or cohesively.
- B. Acrylic Latex Sealant: Provide product complying with ASTM C834.
- C. Products: Subject to compliance with requirements provide one of the following:
 - 1. Acrylic-Latex Sealant
 - a. "AC-20," Pecora Corp.
 - 1) VOC content: 31 g/L.
 - b. "Tremflex 834," Tremco
 - 1) VOC content: 11 g/L.

2.04 SOLVENT – RELEASES – CURING JOINT SEALANTS

- A. Butyl Sealant: Manufacturer's standard one-part, non-sag, solvent-release-curing polymerized butyl sealant complying with ASTM C1311 and formulated with minimum of seventy-five percent (75%) solids to be non-staining, paintable and have a tack-free time of 24 hours or less.
 - 1. "BC-158" Pecora Corp.
 - a. VOC content: 208 g/L.
 - 2. "Tremco Butyl Sealant" Tremco, Inc.
 - a. VOC content: 226 g/L.

2.05 PREFORMED FOAM SEALANTS

- A. Preformed Foam Sealants: Manufacturer's standard preformed; precompressed impregnated open-cell foam sealant manufactured from high-density urethane foam impregnated with a nondrying water repellent agent; factory-produced in precompressed sizes and in a roll or stick form to fit joint widths indicated and to develop a watertight and airtight seal when compressed to the degree specified by manufacturer and complying with the following requirements:
1. Properties: Permanently elastic; mildew resistant, non-migratory, non-staining and compatible with joint substrates and other joint sealants.
 2. Impregnating Agent: Manufacturer's standard.
 3. Density: Manufacturer's standard.
 4. Backing: Pressure sensitive adhesive factory applied to one side with protective wrapping.
 5. Size: As determined by manufacturer.
 6. Products:
 - a. "Backerseal (Greyflex)" Emseal Corp.
 - b. Polyseal by Sandell Mfg. Co., Inc.

2.06 JOINT SEALANT BACKING

- A. General: Provide sealant backings of materials and type that are non-staining, are compatible with joint substrates, sealants, primers and other joint fillers, and are approved for applications indicated by sealant manufacturer based on field experience and laboratory testing.
- B. Plastic Foam Joint Fillers: Preformed, compressible, resilient, non-staining, non-waxing, non-extruding, strips of flexible plastic foam, of material indicated below and of size, shape and density to control sealant depth and otherwise contribute to producing optimum sealant performance.
1. Closed-cell polyethylene foam rod, nonabsorbent to liquid, water and gas, non-outgassing in unruptured state.
 2. Open-cell polyurethane foam rod.
- C. Bond Breaker Tape: Polyethylene tape or other plastic tape as recommended by sealant manufacturer for preventing sealant from adhering to rigid, inflexible joint filler materials or joint surfaces at back of joint where such adhesion would result in sealant failure. Provide self-adhesive tape.

2.07 MISCELLANEOUS MATERIALS

- A. Primer: Material recommended by joint sealant manufacturer for adhesion of sealant to joint substrates indicated. All surfaces shall be primed.
- B. Cleaners for Non-Porous Surfaces: Chemical cleaners acceptable to manufacturers of sealants and sealant backing materials, free of oily residues or other substances capable

of staining or harming in any way joint substrates and adjacent non-porous surfaces and formulated to promote optimum adhesion of sealants with joint substrates.

- C. Masking Tape: Non-staining, non-absorbent material compatible with joint sealants and surfaces adjacent to joints.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Section 01 30 00 – Administrative Requirements: Coordination and Project Condition.
- B. Verify that substrate surfaces and joint openings are ready to receive work.
- C. Verify that joint backing and release tapes are compatible with sealant.

3.02 PREPARATION

- A. Surface cleaning of joints: Clean out joints immediately before installing joint sealants to comply with joint-sealant manufacturer's written instructions and the following requirements:
 - 1. Remove all foreign material from joint substrates that could interfere with adhesion of joint sealant, including dust, paints (except for permanent, protective coatings tested and approved for sealant adhesion and compatibility by sealant manufacturer), old joint sealants, oil, grease, waterproofing, water repellents, water, surface dirt, and frost.
 - 2. Clean porous joint substrate surfaces by brushing, grinding, blast cleaning, mechanical abrading or a combination of these methods to produce a clean, sound substrate capable of developing optimum bond with joint sealants. Remove loose particles remaining after cleaning operations above by vacuuming or blowing out joints with oil-free compressed air. Porous joint substrates include the following:
 - a. Concrete
 - b. Masonry
 - c. Unglazed surfaces of ceramic tile
 - 3. Remove laitance and form-release agents from concrete.
 - 4. Clean nonporous surfaces with chemical cleaners or other means that do not stain, harm substrates, or leave residues capable of interfering with adhesion of joint sealants. Nonporous joint substrates include the following:
 - a. Metal
 - b. Glass
 - c. Glazed surfaces of ceramic tile
- B. Joint Priming: Prime joint substrates. Apply primer to comply with joint-sealant manufacturer's written instructions. Confine primers to areas of joint-sealant bond; do not allow spillage or migration onto adjoining surfaces.
- C. Masking Tape: Use masking tape where required to prevent contact of sealant with

adjoining surfaces that otherwise would be permanently stained or damaged by such contact or by cleaning methods required to remove sealant smears. Remove tape immediately after tooling without disturbing joint seal.

3.03 INSTALLATION

- A. Install sealant in accordance with manufacturer's printed instructions, except where more stringent requirements apply.
- B. Sealant Installation Standard: Comply with recommendations of ASTM C1193 for use of joint sealants as applicable to materials, applications and conditions indicated.
- C. Installation of Sealant Backings: Install sealant backings to comply with the following requirements:
 - 1. Install joint fillers of type indicated to provide support of sealants during application and at position required to produce the cross-sectional shapes and depths of installed sealants relative to joint widths that allow optimum sealant movement capability.
 - a. Do not leave gaps between ends of joint fillers.
 - b. Do not stretch, twist, puncture or tear joint fillers.
 - c. Remove absorbent joint fillers that have become wet prior to sealant application and replace with dry material.
 - 2. Install bond breaker tape between sealants where backer rods are not used between sealants and joint fillers or back of joints.
- D. Installation of Sealants: Install sealants by proven techniques that result in sealants directly contacting and fully wetting joint substrates, completely filling recesses provided for each joint configuration and providing uniform, cross-sectional shapes and depths relative to joint widths that allow optimum sealant movement capability to install sealants at the same time sealant backings are installed.
- E. Complete horizontal joints prior to vertical joints. Lap vertical sealant over horizontal sealant.
- F. Tooling of Non-Sag Sealants: Immediately after sealant application and prior to time skinning or curing begins, tool sealants to form smooth, uniform beads of configuration indicated, eliminate air pockets and ensure contact and adhesion of sealant with sides of joint. Remove excess sealants from surfaces adjacent to joint. Do not use tooling agents that discolor sealants or adjacent surfaces or are not approved by sealant manufacturer.
 - 1. Provide concave joint configurations per Figure 8A in ASTM C1193, unless otherwise indicated.
- G. Installation of Preformed Foam Sealants: Install each length of sealant immediately after removing protective wrapping, taking care not to pull or stretch material and to comply with sealant manufacturer's directions for installation methods, materials and tools that produce seal continuity at ends, turns and intersections of joints. For applications at low ambient temperatures where expansion of sealant requires acceleration to produce seal, apply heat to sealant in conformance with sealant manufacturer's recommendations. **The joint sealer/expansion material shall be installed in strict accordance with manufacturer's**

instructions.

1. Surface preparation: Joint surfaces must be free from gross irregularities, loose particles, foreign matter such as dirt, dust, ice, snow, water and coatings such as grease, oil, release agents, lacquers that may be detrimental to the adhesion of the sealant.
2. Store materials inside at room temperatures, until ready for use.
3. Ensure material nominal size ordered matches field-measured, mean temperature joint size.
4. Remove shrink-wrap packaging, hardboard and self-adhesive release paper.
5. For Backerseal GreyFlex, cut 45 deg. miter where material will be joined

3.04 PROTECTION

- A. Protect joint sealants during and after curing period from contact with contaminating substances or from damage resulting from construction operations or other causes so that they are without deterioration or damage at time of substantial completion. If despite such protection, damage or deterioration occurs, cut out and remove damaged or deteriorated joint sealants immediately so that the repaired installations are indistinguishable from original work.

3.05 CLEANING

- A. Clean off excess sealants or sealant smears adjacent to joints as work progresses by methods and with cleaning materials approved by manufacturers of joint sealants and of products in which joints occur.

3.06 FIELD QUALITY CONTROL

- A. Field-Adhesion Testing: Field test joint-sealant adhesion to joint substrates as follows:
 1. Extent of Destructive Testing: Test completed elastomeric sealant joints as follows:
 - a. Perform procedure every 100 linear feet in the first 1,000 linear feet of joint. If no test failure is observed in the first 1,000 linear feet of joint, perform procedure every 1,000 linear feet thereafter or approximately once per floor elevation.
 2. Test Method: Test joint sealants according to Method A, ASTM C1521.
 3. Inspect joints for complete fill, for absence of voids, and for joint configuration complying with specified requirements. Record results in a field-adhesion-test log.
 4. Record test results in a field-adhesion-test log. Include dates when sealants were installed, names of persons who installed sealants, test dates, test locations, whether joints were primed, adhesion results and percent elongations, sealant fill, sealant configuration, and sealant dimensions.
 5. Repair sealants pulled from test area by applying new sealants following same

procedures used originally to seal joints. Ensure that original sealant surfaces are clean and that new sealant contacts original sealant.

- B. Evaluation of Field Test Results: Sealants not evidencing adhesive failure from testing or noncompliance with other indicated requirements will be considered satisfactory. Remove sealants that fail to adhere to joint substrates during testing or to comply with other requirements. Retest failed applications until test results prove sealants comply with indicated requirements.

JOINT SEALANT SCHEDULE

DESIGNATION	JOINT SEALERS	DESCRIPTION OF JOINT CONSTRUCTION AND LOCATION WHERE SEALANT IS TYPICALLY APPLIED.
ES-1	One-Part Neutral Cure Silicone Sealant	Not Used
ES-2	One-Part Neutral Cure Silicone Sealant	A. Exterior Joints in Vertical Surfaces at: 1. Brick expansion joints. 2. Perimeter joints between brick, and metal frames.
ES-3	One-Part Neutral Cure Silicone Sealant	A. Exterior Joints in Vertical Surfaces at: 1. Stone expansion/contraction joints 2. Joints between cast stone, stone and brick 3. Perimeter joints between cast stone, stone and metal frames 4. Joints between cast stone and stones
ES-4	One-Part Acid Curing Mildew-Resistant Silicone Sealant	Sealing around shower enclosures, sinks, urinals, bathroom fixtures, waterproofing rimless sinks
ES-5	Multi-Polyurethane	Traffic surface joints where joints exceed 5% slope.
ES-6	Multi-Polyurethane	Traffic surfaces where joints are on slopes 5% or less.
AES	Acrylic Sealant	Interior joints in field painted vertical and overhead surfaces, at perimeter of hollow metal frames, in gypsum drywall, in non-movement concrete block joints and all other joints not indicated otherwise.
SRC-S	Butyl Sealant	Bedding Thresholds.
Preformed Foam Sealant		As a secondary sealant used in conjunction with Sealant Joints ES-2 and ES-3, and at locations shown on the Drawings.

Sealants in contact
with fluid applied
membrane air barrier
and tapes per Section
07 27 26-Fluid- Applied
Membrane Air Barrier.

Refer to Section 07 27 26 for sealants
in contact with air barrier membrane and
tape.

ELASTOMERIC JOINT SEALANT DATA SHEET

ELASTOMERIC JOINT SEALANT DESIGNATION: ES-2 – General Weatherproofing

BASE POLYMER: Neutral – Curing Silicone Ultra Low-Modulus Silicone
TYPE: S – (Single Component)
GRADE: NS – (Non-Sag)
CLASS: 100/50
ADDITIONAL MOVEMENT CAPABILITIES: +100%/- 50%
USE RELATED TO EXPOSURE: NT – (Non-Traffic)
USES RELATED TO JOINT SUBSTRATES: M, G, A and applicable to “O” substrates listed
and/or G, A and applicable “O” substrates:

PRIMER: As recommended by sealant manufacturer for proper adhesion to joint substrate.

BACKER RODS: As recommended by sealant manufacturer, compatible with joint substrates, sealant, primer and other joint fillers.

COMPLIANCE:

1. ASTM C920 – Standard Specification for Elastomeric Joint Sealants.
2. Sealant – Waterproofing and Restoration Institute Sealant Validation.

ACCEPTABLE MANUFACTURER/PRODUCTS:

Subject to compliance with requirements of Contract Documents, provide product by one of the manufacturers named below. If not named, submit a substitution according to conditions of the Contract and appropriate Division 1 sections.

1. Dow Corning; DOWSIL 790
 - a. VOC content: 23 g/L.
2. Pecora Corp.; 890 NST (Non-Staining Technology)
 - a. VOC content: 98 g/L.
3. Tremco Inc.; Spectrem 1
 - a. VOC content: 1 g/L.

ELASTOMERIC JOINT SEALANT DATA SHEET

ELASTOMERIC JOINT SEALANT DESIGNATION:

ES-3 – Weatherproofing Sensitive Porous Stone
(Cast Stone, Marble, Sandstone, Limestone,
Granite) and Metal Panels

BASE POLYMER: Neutral – Curing Silicone

TYPE: S – (Single Component)

GRADE: NS – (Non-Sag)

CLASS: 50

ADDITIONAL MOVEMENT CAPABILITIES: + 50%

USE RELATED TO EXPOSURE: NT – (Non-Traffic)

USES RELATED TO JOINT SUBSTRATES: G, M, A and applicable to “O” substrates listed:

PRIMER: As recommended by sealant manufacturer for proper adhesion to joint substrate

BACKER RODS: As recommended by sealant manufacturer, compatible with joint substrates, sealant, primer and other joint fillers.

COMPLIANCE:

1. ASTM C920 – Standard Specification for Elastomeric Joint Sealants.
2. ASTM C1248 – Standard Test Method for Staining of Porous Substrate by Joint Sealants.
3. Sealant – Waterproofing and Restoration Institute Sealant Validation.

ACCEPTABLE MANUFACTURER/PRODUCTS:

Subject to compliance with requirements of Contract Documents, provide product by one of the manufacturers named below. If not named, submit a substitution according to conditions of the Contract and appropriate Division 1 sections.

1. Dow Corning; DOWSIL 756 SMS
 - a. VOC content: 86 g/L.
 - b.
2. Pecora Corp.; 895 NST (Non-Staining Technology)
 - a. VOC content: 98 g/L.
3. Tremco Inc.; Spectrem 3
 - a. VOC content: 18 g/L.

ELASTOMERIC JOINT SEALANT DATA SHEET

ELASTOMERIC JOINT SEALANT DESIGNATION:

ES-4 – Sealing Around Showers, Tubs, Sinks and Plumbing Fixtures

BASE POLYMER: Acid-Curing Silicone
TYPE: S – (Single Component)
GRADE: NS – (Non-Sag)
CLASS: 25

ADDITIONAL MOVEMENT CAPABILITIES:

USE RELATED TO EXPOSURE:

NT – (Non-Traffic)

USES RELATED TO JOINT SUBSTRATES:

G, A and O Substrates as listed:

PRIMER: As recommended by sealant manufacturer for proper adhesion to joint substrates.

BACKER RODS: As recommended by sealant manufacturer compatible with joint substrates, sealant, primer and other joint fillers.

COMPLIANCE:

1. ASTM C920 – Standard Specification for Elastomeric Joint Sealants.

ACCEPTABLE MANUFACTURER/PRODUCTS:

Subject to compliance with requirements of Contract Documents, provide product by one of the manufacturers named below. If not named, submit a substitution according to conditions of the Contract and appropriate Division 1 sections.

1. Dow Corning; DOWSIL 786 silicone mildew-resistant
 - a. VOC content: 22 g/L.
2. Pecora Corp.; 898 sanitary silicone
 - a. VOC content: 82 g/L.
3. Tremco Inc.; Tremsil 200
 - a. VOC content: 1 g/L.

ELASTOMERIC JOINT SEALANT DATA SHEET
ELASTOMERIC JOINT SEALANT DESIGNATION:

ES-5 – Traffic-Grade Sealant on
Slopes Between 5% and 12%

BASE POLYMER: Polyurethane
TYPE: M (Multi Component)
GRADE: NS – (Non-Sag)/P – (Pourable)
CLASS: 25, 50
ADDITIONAL MOVEMENT CAPABILITIES: + 25%
USE RELATED TO EXPOSURE: T (Traffic), I (Immersion)

USES RELATED TO POROUS JOINT SUBSTRATES: M, A and as applicable to “O” substrates indicated

SHORE A HARDNESS: 30-50

PRIMER: As recommended by sealant manufacturer for proper adhesion to joint substrate.

BACKER RODS/BOND BREAKER TAPE: As recommended by sealant manufacturer, compatible with joint substrates, sealant, primer and other joint fillers.

COMPLIANCE:

1. ASTM C920 – Standard Specification for Elastomeric Joint Sealants.
2. ASTM C661 – Standard Test Method for Indentation Hardness of Elastomeric-Type Sealants by Means of a Durometer.

ACCEPTABLE MANUFACTURER/PRODUCTS:

Subject to compliance with requirements of Contract Documents, provide product by one of the manufacturers named below. If not named, submit a substitution according to conditions of the Contract and appropriate Division 1 sections.

1. BASF, Sonneborn; Masterseal SL2 slope grade
 - a. VOC content: 93 g/L.
2. Pecora Corp.; Dynatred
 - a. VOC content: 114 g/L.
3. Tremco Inc.; Dymeric 240FC (Fast Cure)
 - a. VOC content: 5 g/L.

ELASTOMERIC JOINT SEALANT DATA SHEET
ELASTOMERIC JOINT SEALANT DESIGNATION:

ES-6 – Traffic-Grade Sealant on
Slopes 5% and Under

BASE POLYMER: Polyurethane

GRADE: NS – (Non-Sag)/P – (Pourable)
CLASS: 25, 50
ADDITIONAL MOVEMENT CAPABILITIES: + 25%
USE RELATED TO EXPOSURE: T (Traffic)

USES RELATED TO POROUS JOINT SUBSTRATES:

M, A and as applicable to “O” substrates
indicated

SHORE A HARDNESS: 30-50

PRIMER: As recommended by sealant manufacturer for proper adhesion to joint substrate.

BACKER ROD/BOND BACKER TAPE: As recommended by sealant manufacturer, compatible
with joint substrates, sealant, primer and other joint fillers.

COMPLIANCE:

1. ASTM C920 – Standard Specification for Elastomeric Joint Sealants.
2. ASTM C661 – Standard Test Method for Indentation Hardness of Elastomeric-Type Sealants by Means of a Durometer.

ACCEPTABLE MANUFACTURER/PRODUCTS:

Subject to compliance with requirements of Contract Documents, provide product by one of the manufacturers named below. If not named, submit a substitution according to conditions of the Contract and appropriate Division 1 sections.

1. BASF, Sonneborn; Masterseal SL2
 - a. VOC content: 93 g/L.
2. Pecora Corp.; Urexpan NR-200
 - a. VOC content: 20 g/L.
3. Tremco Inc.; Dymeric 240FC (Fast Cure)
 - a. VOC content: 5 g/L.

END OF SECTION

SECTION 08 11 16 – INTERIOR ALUMINUM FRAMES

PART 1 GENERAL

1.01 SUMMARY

A. Related Documents:

1. Provisions established within the General and Supplementary Conditions of the Contract, Division 1 - General Requirements, and the Drawings are collectively applicable to this Section.

B. Section includes interior aluminum frames designated as AL on Drawings for:

1. Aluminum sliding frame systems.
2. Aluminum and glass doors.
3. Aluminum office-front framing system for interior use.

C. Related Sections:

1. Section 08 14 16 – Flush Wood Doors.
2. Section 08 71 00 - Door Hardware.
3. Section 08 80 00 - Glazing.

1.02 SUBMITTALS

A. Submit under provisions of Section 01 33 00 – Submittal Procedures.

B. Product Data: Submit for door, sliding frames and office-front frames.

1. Include information for factory finish, glazing gaskets, accessories and other required components.
2. Include color charts for finish indicating manufacturer's standard colors available for selection.

C. Shop Drawings: Submit schedule indicating opening identification number, frame types, dimensions, and hardware requirements. Use same reference numbers for openings as Contract Drawings.

D. Include elevations and details indicating frame types, profiles, conditions at openings, methods and locations of anchoring, glazing requirements, hardware locations, and reinforcements for hardware, details of connections to special construction and other custom features.

E. Samples: Submit following:

1. Samples indicating quality of finish in selected colors on alloys used for Work.

2. Where normal color and texture variations are expected, include additional samples to show range of such variation.

F. Informational Submittals: Submit manufacturer's instructions.

1.03 QUALITY ASSURANCE

- A. Single-Source Responsibility: Provide aluminum frames, aluminum and glass doors, and accessories produced by a single manufacturer for each type of product indicated.
- B. Manufacturer's Qualifications: Manufacturer shall demonstrate previous experience in manufacturing of interior aluminum door and office-front framing for a period of not less than 10 years on comparable sized project.

1.04 DELIVERY, STORAGE AND HANDLING

- A. Deliver frames and doors in cartons to provide protection during transit and storage at project site.
- B. Inspect frames and doors upon delivery for damage.
 1. Repair minor damage to pre-finished products by means as recommended by manufacturer.
 2. Replace frames and doors that cannot be satisfactorily repaired.
- C. Store frames and doors at project site under cover and as near as possible to final installation location. Do not use covering material that will cause discoloration of aluminum finish.

1.05 ENVIRONMENTAL REQUIREMENTS

- A. Do not begin installation of frames or doors until area of work has been completely enclosed and interior is protected from the elements.
- B. Maintain temperature and humidity in areas of installation within reasonable limits, as close as possible to final occupancy. If necessary, provide temperature control and ventilation to maintain required environmental conditions.

1.06 WARRANTY

- A. Warrant against defects in manufacturing of materials for a period of 2 years from date of substantial completion.
- B. Warrant framing finish against defects, including cracking, flaking, blistering, peeling and excessive fading, chalking and non-uniformity in color for a period of 5 years.
- C. Warrant aluminum and glass doors for the life of door against construction failure, causing wracking of door beyond acceptable tolerances.

PART 2 PRODUCTS

2.01 ACCEPTABLE MANUFACTURERS AND PRODUCTS

- A. Basis of Design: Contract Documents are based on manufacturer and product named below to establish a standard of quality. Other manufacturers with products having equivalent characteristics may be considered, provided deviations are minor and do not change concept as expressed in Contract Documents as judged by Architect. Manufacturers not named may submit as substitutions according to Conditions of the Contract and appropriate Division 1 sections.
 - 1. Raco Interior Products, Inc.: Raco Interior Office Fronts, Solutions II.
 - a. Interior Office-Front Framing: RACO Solutions II OfficeFronts, fixed throat frames to accommodate wall thicknesses indicated on Drawings; with applied full face trim of 2 inch width.
 - 2. Flush sliding cased opening frames with attached sidelights or OfficeFronts: Solutions II.
 - 3. Sliding aluminum and glass doors: Raco Series 400 medium stile, having square glazing stops, black EDPM glazing gaskets.

2.02 MATERIALS

- A. Aluminum: Meeting requirements of ASTM B221, 6063T5 alloy, and as otherwise required to assure compliance with dimensional tolerances and maintain color uniformity. Billets shall be composed of at least 33 percent recycled aluminum.
- B. Anchorage Devices, Clips and Fasteners: Manufacturer's standard type, compatible with materials being secured.
- C. Accessories: As necessary for complete system.
- D. Top load glazing gaskets, black for 1/4 inch glass. Refer to Section 08 80 00 Glazing for glass.

2.03 EXTRUDED ALUMINUM FRAME AND DOOR FABRICATION

- A. Utilize reduced profile corner section for 90-degree corners.
- B. Assemble all door frames, sidelights, and window units with screws utilizing internal screw spline system, insert into the drywall rough opening.
- C. Assemble all sidelights and windows without the use of clips.
- D. Do not exceed maximum size of window or door to meet applicable code requirements.
- E. Factory pre-machine door frame jambs and prepare for hardware, with concealed reinforcement plates, drilled and tapped as required, and fastened within frame with concealed screws.
- F. Manufacturer shall precut and predrill for screw spline joinery. Butt cut snap on trim casings shall be furnished in stock lengths.

2.04 FINISHES

- A. Factory finish extruded frame and door components so that all parts exposed to view upon completion of installation are uniform in finish and color. Exposed surfaces shall be free of scratches and other serious blemishes.
- B. Clear Anodized: Class II AAMA 611 AA-M12C22A31, acid etched, medium matte, clear anodic coating, 0.4 mil thickness – 0.7 mil thickness.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Examine project conditions and verify that project is ready for work of this section to proceed. Do not proceed with installation until unsatisfactory conditions have been corrected.
- B. Verify wall thickness does not exceed manufacturer's recommended tolerances of specified throat size.

3.02 INSTALLATION

- A. Comply with frame and door manufacturer's printed installation instructions and approved Shop Drawings. Do not attempt installation in areas where wall thickness exceeds tolerances of specified throat size.
- B. Install frames plumb and square, free from warp or twist, securely anchored to substrates with fasteners recommended by frame manufacturer. Maintain dimensional tolerances and alignment with adjacent work. Ensure joints are hairline tight and surfaces flush with adjacent components.
- C. Set all frames in correct locations as shown on the drawings, level, square, plumb and in alignment with other work in accordance with the manufacturer's installation instructions and approved Shop Drawings.
- D. Install glass in accordance with Section 08 80 00.

3.03 ADJUSTING AND CLEANING

- A. Protect exposed portions of aluminum surfaces from damage by plaster, lime, acid, cement, and other contaminants.
- B. Touch up marred areas so that touch-up is not visible from a distance of 4 feet. Remove and replace frames that cannot be satisfactorily adjusted.

3.04 PROTECTION

- A. Protect as required to assure that frames and doors will be without damage until Substantial Completion.

Interior Aluminum Frames
Section 08 11 16.5 of 5

END OF SECTION

SECTION 08 12 14 – STANDARD STEEL FRAMES

PART 1 GENERAL

1.01 SUMMARY

A. This Section Includes:

1. Non-Rated Frames.
 - a. Door frames.
 - b. Pocket door frames.

B. Related Sections:

1. Section 08 13 14 – Standard Steel Doors.
2. Section 08 14 16 – Flush Wood Doors.
3. Section 08 71 00 – Door Hardware.
4. Section 09 22 16 – Non-Structural Metal Framing: Securing steel frames to metal studs.
5. Section 09 90 00 – Painting and Coating.

1.02 REFERENCES

A. American National Standards Institute:

6. ANSI A250.7 – Nomenclature for Steel Doors and Steel Frames.
7. ANSI A250.8-SDI-100 – Recommended Specifications for Standard Steel Doors and Frames; 2017 (R2014).
8. ANSI A250.11 – Recommended Erection Instructions for Steel Frames (Formerly SDI-105).

B. ASTM International:

1. ASTM A568 – Standard Specification for Steel Sheet, Carbon, and High-Strength, Low-Alloy, Hot-Rolled and Cold-Rolled, General Requirements for.
 2. ASTM A591 – Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.
 3. ASTM A653 – Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.
 4. ASTM A924 – Standard Specification for General Requirements for Steel Sheet, Metallic-Coated by the Hot-Dip Process.
 5. ASTM A1008 – Standard Specification for Steel Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Alloy with Improved Formability.
- C. SDI – Steel Door Institute:
1. SDI 111 – Recommended Details and Guidelines for Standard Steel Doors and Frames and Accessories.
 2. SDI 112 – Zinc-Coated (Galvanized/Galvannealed) Standard Steel Doors and Frames.
 3. SDI 117 – Manufacturing Tolerances for Standard Steel Doors and Frames.
 4. SDI 122 – Installation and Troubleshooting Guide for Standard Steel Doors and Frames.
 5. SDI 124 – Maintenance of Standard Steel Doors and Frames.

1.03 SUBMITTALS FOR REVIEW

- A. Section 01 33 00 – Submittal Procedures: Procedures for submittals.
- B. Product Data: Indicate frame configuration and finishes.
- C. Shop Drawings: Indicate frame elevations, reinforcement, anchor types and spacings, location of cut-outs for hardware, and finish.
- D. Certificates: Product certificates signed by manufacturer certifying material compliance with specified requirements.
- E. Installation Instructions: Manufacturer's printed installation instructions.

1.04 QUALITY ASSURANCE

- A. Conform to requirements of ANSI A250.8-2017.

1.05 QUALIFICATIONS

- A. Manufacturer: Company specializing in manufacturing products specified in this Section with minimum 5 years of documented experience.

1.06 DELIVERY, STORAGE AND PROTECTION

- A. Section 01 60 00 – Product Requirements: Transport, handle, store and protect products.
- B. Accept frames on site in manufacturer's packaging. Inspect for damage.
- C. Frames shall be stored under cover on 4" wood sills on floors in a manner that will prevent rust and damage. Do not use non-vented plastic or canvas shelters, which create humidity and promote rusting. Frames shall be stored in a vertical position, five units maximum in a stack. Provide 1/4" space between frames to promote air circulation.

1.07 PROJECT CONDITIONS

- A. Section 01 30 00 – Administrative Requirements: Coordination and Project Conditions.
- B. Coordinate the work with frame opening construction, door and hardware installation.
- C. Sequence installation to ensure wire connections are achieved in an orderly and expeditious manner.

PART 2 PRODUCTS

2.01 FRAME MANUFACTURERS

- A. Acceptable Manufacturers: Subject to compliance with requirements of Contract Documents, provide product by one of the manufacturers listed below. If not named, submit as a substitution according to Conditions of the Contract and appropriate Division 1 sections.
 - 1. Ceco Door/Assa Abloy.
 - 2. Curries Company/Assa Abloy.
 - 3. Steelcraft.

2.02 MATERIALS

- A. Frames and frame anchors for each of the levels and models specified shall be provided to meet the requirements of the performance levels specified. The material used in manufacturing these products and components shall comply with ANSI A250.8. Hardware reinforcing on frames shall comply with ANSI A250.6. The physical performance levels shall be in accordance with ANSI A250.4.
- B. Cold-rolled steel shall conform to ASTM designations A1008 – Standard Specification for Steel Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Alloy with Improved Formability and ASTM A568 – Standard Specification for Steel Sheet, Carbon and High-Strength, Low-Alloy, Hot-Rolled and Cold-Rolled, General Requirements for.
- C. Hot-dipped, zinc-coated steel shall be of the alloyed type and comply with ASTM designations A924 – Standard Specification for General Requirements for Steel Sheet, Metallic-Coated by the Hot-Dip Process and ASTM A653 – Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the

Hot-Dip Process.

2.03 FRAMES

- A. Provide metal frames for doors, transoms, sidelights, transom/sidelight frames, windows (borrowed lights) and other openings, according to ANSI A250.8-2017 (R2014), and of types and styles as shown on Drawings and schedules. Conceal fastenings, unless otherwise indicated.
 - 1. Interior Frames:
 - a. Material: Cold-rolled steel steel conforming to ASTM A1008 and ASTM A568.
 - b. Minimum material thickness prior to coating: 0.053 inches (16 gauge).
 - 2. Interior Pocket Door Frames:
 - a. Material: Cold-rolled steel steel conforming to ASTM A1008 and ASTM A568.
 - b. Minimum material thickness prior to coating: 0.053 inches (16 gauge).
 - 3. Exterior Frames:
 - a. Material: Hot-dipped zinc-iron alloy-coated galvanized steel conforming to ASTM A653, coating designation A60.
 - b. Minimum material thickness prior to coating: 0.067 inches (14 gauge).
- B. Door Silencers: Except on weatherstripped frames drill stops to receive 3 silencers on strike jambs of single-door frames and 2 silencers on heads of double-door frames.
- C. Plaster Guards: Provide minimum 0.0179 inch thick steel plaster guards or mortar boxes at back of hardware cutouts where mortar or other materials might obstruct hardware operation and to close off interior of openings.
- D. Reinforce frames over 48 inches with rolled formed steel channels fitted tightly into frame head, flush with top.

2.04 FABRICATION

- A. Corner joints shall have all contact edges closed tight with faces mitered and stops either butted or mitered.
 - 1. Welded Frames: Full profile welded, also specified as fully welded or continuously welded.
 - a. Weld miter joints between head and jamb faces completely along their length either internally or externally.
 - b. Internally weld perimeter profile joints full length of soffit stops and rabbets with hairline seams on external meeting surfaces. Grind and finish face joints smooth.
 - c. Face joints at meeting mullions or between mullions and other frame members shall be completely externally welded on the faces only. All welds shall be ground and finished smooth.

2. Welded frames shall be provided with two temporary steel spreader bars, welded to the jambs at each rabbet of door openings, for shipping and handling purposes only. These temporary spreader bars shall be removed and setting spreaders, supplied by the installer shall be used for installation of the frame. Refer to ANSI A250.11 – Recommended Erection Instructions for Steel Frames.
 3. Pocket door frames shall be knocke down. KD.
- B. Fabricate jambs, and heads straight and uniform throughout their lengths; square and free of defects, warps or buckles.
- C. Fabricate frames with hardware reinforcement plates welded in place. Provide mortar guard boxes.
- D. Prepare frames for silencers. Provide three single silencers for single doors on strike side. Provide two single silencers on frame head at double doors without mullions.
- E. When shipping limitations or site access so dictate, or when advised by the contractor responsible for coordination or installation, frame product for large openings shall be fabricated in sections designated for assembly in the field by others. Alignment plates or angles shall be installed at each joint. Such components shall be the same material and thickness as the frame. Field joints shall be made in accordance with approved Submittal Drawings and shall be field welded by others.
- F. Floor Anchors:
1. Floor anchors shall be provided with two holes for fasteners and shall be secured inside jambs with at least four (4) spot welds per anchor.
 2. Where specified or scheduled, adjustable floor anchors, providing not less than 2 in. (50.8 mm) height adjustment, shall be fastened in place with at least four (4) spot welds per anchor.
 3. For applications that do not permit the use of a floor anchor, an additional jamb anchor shall be substituted at a location not to exceed 8 in. (204 mm) from the base of the jamb.
 4. Floor anchor shall be of same material and thickness as frame.
- G. In cases where electrically or electronically operated hardware is required and indicated on the approved hardware schedule, conduit, hardware enclosures and/or junction boxes shall be provided. Access plates, where required, shall be the same material and thickness as the frame product and shall be fastened with not less than four (4) #8-32 machine screws or #6 sheet metal screws at a spacing not to exceed 12 inc. on center.
- H. Tolerances:
1. Face Widths, Door Stop Heights and Jamb Depths: 0.031 inch.
 2. Throat Openings: 0.063 inch.
 3. Door Rabbets: 0.016 inch.

2.05 FINISHING

A. Steel:

1. Remove weld slag and splatter from exposed surfaces.
2. Fill and sand all tool marks, abrasions and surface blemishes to present smooth uniform surfaces.
3. On exposed surfaces where zinc-iron alloy coating has been removed during fabrication, factory apply rust inhibitive touch-up primer.
4. Fully cure primer prior to shipment.

2.06 SHOP PRIMER

- A. Prime Finish: Frames shall be thoroughly cleaned, and chemically treated to insure maximum paint adhesion. All surfaces of the frame exposed to view shall receive a factory applied coat of rust inhibiting primer, either air-dried or baked-on. The finish shall meet the requirements for acceptance stated in ANSI A250.10 "Test Procedure and Acceptance Criteria for Prime Painted Steel Surfaces for Steel Doors and Frames."
- B. Apply primers to frames after fabrication. Coordinate primer with field-applied finish coatings as specified in Section 09 90 00 for compatibility, with finish coats.

2.07 HARDWARE PREPARATION

- A. Prepare frames for hardware specified elsewhere; comply with DHI A115 series standards; adjust locations to allow for specified clearances and size tolerances, with maximum variation from template dimensions of plus 0.015 inch and minus 0.
- B. Fully Templated Mortise Hardware: Factory blank, reinforce, drill and tap frames in accordance with approved shop drawings and templates provided by hardware supplier.
 1. Factory prepare templated holes 0.5 inch diameter and larger, except mounting and through bolt holes.
 2. Factory prepare templated holes less than 0.5 inch diameter when required for the function of the device (for knobs, levers, cylinders, thumb or turn pieces) or when these holes over-lap function holes.
- C. Mortised Hardware Not Fully Templated: Factory blank and reinforce frames; drill and tap on site.
- D. Reinforce frames in accordance with Table 4 of ANSI A250.8-2017 (R2014).

2.08 FRAME ANCHORAGE

- A. Frame Anchors: Provide anchors appropriate to floor, wall and frame construction.
 1. Provide fasteners, anchor bolts, and expansion shell anchors as required.
- B. Standard Frames:

1. Dry Wall Type:
 - a. Frame product for installation in dry-wall partitions shall be provided with steel stud jamb anchors of suitable design, not less than 0.042 in. thickness, securely welded inside each jamb. Jamb anchors shall be placed a maximum of 18 in. from top and bottom of openings. The minimum number spaced at maximum 32 in. on center, near hinges and directly opposite on strike jambs, provided on each jamb, based on the overall frame height, shall be as follows:
 - 1) Up to 60 in.: 3 anchors.
 - 2) Greater than 60 in. up to 90 in.: 4 anchors.
 - 3) Greater than 90 in. up to 96 in.: 5 anchors.
 - 4) Greater than 96 in.: 5 anchors plus one for each 24 in. or fraction thereof, spaced at 24 in. maximum between anchors.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Section 01 30 00 – Administrative Requirements: Verification of existing conditions before starting work.
- B. Verify that opening sizes and tolerances are acceptable.

3.02 INSTALLATION

- A. General: Install steel frames and accessories according to Shop Drawings, manufacturer's data, and as specified.
- B. Placing Frames: Comply with provisions of ANSI A250.11 and DHI A115.IG, unless otherwise indicated.
- C. Set frames plumb, square, aligned, without twist and at correct elevation, within the following tolerances:
 1. Plumbness: Not more than 0.063 inch out of plumb, measured using a line from the intersection of vertical members and the head to the floor.
 2. Squareness: Not more than 0.063 inch difference between diagonal measurements between corners.
 3. Alignment: Not more than 0.063 inch measured on jambs, through a horizontal line parallel to the plane of the wall.
 4. Twist: Not more than 0.063 inch measured at face corners of jambs, on parallel lines perpendicular to the plane of the wall.
- D. Brace frames rigidly in position while partitions are being constructed.
 1. Remove temporary steel shipping jamb spreaders.
 2. Install wood spreaders at mid-point of frame rabbet height to maintain frame widths.

3. Provide vertical support at center of head for openings exceeding 48 inches in width.
4. Remove wood spreaders after product has been built-in.
- E. Place frames before constructing enclosing walls and ceilings.
- F. Secure anchorages and connections to adjacent construction.
- G. Install hardware in accordance with ANSI A115.IG, manufacturer's templates and instructions.
- H. Keep steel surfaces free of grout, tar, other bonding materials, and sealers; clean surfaces immediately following installation.
- I. Install door silencers; coordinate with field painting to avoid unnecessary masking or cleaning.
- J. Touch up damaged surfaces and exposed field welds with rust inhibitive primer:
 1. Prepare galvanized steel to be finished with latex paints by cleaning with soap and water to remove foreign matter.
 2. Prepare galvanized steel to be finished with alkyd paints by cleaning with turpentine or paint thinner.
 3. Finish exposed field welds to present a smooth uniform surface.
 4. Follow recommendations of final paint finish manufacturer.
- K. Damaged work will be rejected and shall be replaced at no additional cost to the owner.
- L. Coordinate installation of frames with hardware specified in Section 08 71 00 and doors in Section 08 13 14 and Section 08 14 16.

3.03 ADJUSTING

- A. Adjust operable parts for correct clearances and function.
- B. Adjust hinge sets, locksets and other hardware. Lubricate using a suitable lubricant compatible with door and frame coatings.

3.04 CLEANING AND PROTECTION

- A. Remove temporary coverings and protection of adjacent work areas. Repair or replace damaged installed products. Clean installed products in accordance with manufacturer's instructions before Owner's acceptance.
- B. Remove from project site and legally dispose of construction debris associated with this work.
- C. Protect installed products and finished surfaces from damage during construction.

5. ANSI A250.6 – Recommended Practice for Hardware Reinforcing on Standard Steel Doors and Frames.
6. ANSI A250.8 – SDI-100 Recommended Specifications for Standard Steel Doors and Frames; 2017 (R2014).
7. ANSI A250.10 – Test Procedure and Acceptance Criteria for Prime Painted Steel Surfaces for Steel Doors and Frames.
8. ANSI A250.11 – Recommended Erection Instructions for Steel Frames (Formerly SDI-105).

- B. ASTM International:

1. ASTM A568 – Standard Specification for Steel Sheet, Carbon, and High-Strength, Low-Alloy, Hot-Rolled and Cold-Rolled, General Requirements for.
2. ASTM A591 – Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.
3. ASTM A653 – Standard Specification for Steel Sheet, Zinc-Coated (Galvanized)

or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.

4. ASTM A924 – Standard Specification for General Requirements for Steel Sheet, Metallic-Coated by the Hot-Dip Process.
 5. ASTM A1008 – Standard Specification for Steel Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Alloy with Improved Formability.
 6. ASTM E84 – Standard Test Method for Surface Burning Characteristics of Building Materials.
- C. SDI – Steel Door Institute:
1. SDI 111 – Recommended Details and Guidelines for Standard Steel Doors and Frames and Accessories.
 2. SDI 112 – Zinc-Coated (Galvanized/Galvannealed) Standard Steel Doors and Frames.
 3. SDI 117 – Manufacturing Tolerances for Standard Steel Doors and Frames.
 4. SDI 122 – Installation and Troubleshooting Guide for Standard Steel Doors and Frames.
 5. SDI 124 – Maintenance of Standard Steel Doors and Frames.

1.04 SUBMITTALS

- A. Submit under provisions of Section 01 33 00 – Submittal Procedures: Requirements for submittals.
- B. Shop Drawings: Indicate door elevations, internal reinforcement, closure method, and finish. Provide schedule of doors and frames using the same reference numbers for details and openings as those on the Drawings.
- C. Product Data: Indicate door configurations, location of cut-outs for hardware reinforcement.
- D. Manufacturer's Installation Instructions: Indicate special installation instructions.
- E. Manufacturer's Certificate: Certify that Products meet or exceed specified requirements.

1.05 QUALITY ASSURANCE

- A. Provide doors complying with ANSI A250.8-2017 (R2014). "Recommended Specifications for Standard Steel Doors and Frames" as specified, and other specifications herein named.

1.06 QUALIFICATIONS

- A. Manufacturer: Company specializing in manufacturing the Products specified in this section with minimum five years of documented experience.

1.07 DELIVERY, STORAGE AND HANDLING

- A. Deliver, store, protect and handle products to site under provisions of Section 01 60 00 – Product Requirements: Requirements for transporting, handling, storing and protecting products.
- B. Inspect doors upon delivery for damage. Minor damages may be repaired provided refinished items are equal in all respects to new work and acceptable to architect; otherwise, remove and replace damaged items as directed.
- C. Store doors at building site under cover. Place units on minimum 4-inches-high wood blocking. Avoid use of non-vented plastic or canvas shelters which could create humidity chamber. If cardboard wrapper on door becomes wet, remove carton immediately. Provide 1/4-inch spaces between stacked doors to promote air circulation.

1.08 COORDINATION

- A. Coordinate with door opening construction and door frame and door hardware installation.
- B. Coordinate installation to accommodate door hardware electric wire connections.

PART 2 PRODUCTS

2.01 DOOR MANUFACTURERS (STANDARD STEEL DOORS)

- A. Acceptable Manufacturers: Subject to compliance with requirements of Contract Documents, provide product by one of the manufacturers listed below. If not named, submit as a substitution according to Conditions of the Contract and appropriate Division 1 sections.
 - 1. CECO Door/Assa Abloy.
 - 2. Curries Company/Assa Abloy.
 - 3. Steelcraft.

2.02 MATERIALS

- A. Doors and hardware reinforcements for each of the levels and models specified shall be provided to meet the requirements of the performance levels specified. The material used in manufacturing these products and components shall comply with ANSI A250.8. Hardware reinforcing on doors and frames shall comply with ANSI A250.6. The physical performance levels shall be in accordance with ANSI A250.4.

2.03 DOORS

- A. Steel Doors: Provide 1-3/4-inch-thick doors of materials and ANSI A250.8-2017 (R2014) for grades and models specified below.

1. Exterior doors shall meet the following requirements:
 - a. Level: Level 3, extra-heavy-duty.
 - b. Model: Model 2 – Seamless welded construction.
 - c. Physical performance level: Level A, 1,000,000 cycles.
 - d. Thickness: 0.053 inches (16 gauge).
 - e. Material: Hot-dipped zinc-iron alloy-coated galvanized steel conforming to ASTM A653.
 - 1) Coating designation: A60.
- B. Hot-dipped zinc-coated steel shall be of the alloyed type and comply with ASTM designations A924 – Standard Specification for General Requirements for Steel Sheet, Metallic-Coated by the Hot-Dip Process and A653 – Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvanized) by the Hot-Dip Process.

2.04 FABRICATION

- A. Fabricate steel doors to be rigid, neat in appearance and free from defects, warp, or buckle. Where practical, fit and assemble units in manufacturer's plant. Clearly identify work that cannot be permanently factory assembled before shipment, to assure proper assembly at Project site. Comply with ANSI A250.8 requirements.
 1. Internal Construction:
 - a. Vertical steel stiffeners with foamed in place polyurethane insulation chemically bonded to all interior surfaces.
 - b. Basis of Design: Curries ASSA ABLOY 777E or approved equal.
 - 1) Doors shall be stiffened by continuous vertically formed steel sections which, upon assembly, shall span the full thickness of the interior space between door faces. These stiffeners shall be 0.026 in. minimum thickness, spaced so that the vertical interior webs shall be no more than 6 in. apart and securely fastened to both face sheets by spot welds spaced a maximum of 5 in. o.c. vertically. Spaces between stiffeners shall be filled with foamed in place polyurethane insulation chemically bonded to all interior surfaces.
 - 2) Assembly U value with standard frame: 0.41.
 - 3) Assembly R value with standard frame: 2.44.
 2. Design clearances: Fabricate doors and frames to maintain the following clearances:
 - a. The clearance between the door and frame shall be 1/8 inch (3.2 mm) in the case of both single swing and pairs of doors.
 - b. The clearance between the meeting edges of pairs of doors shall be 3/16 inch (4.8 mm) plus or minus 1/16 inch (1.6 mm).
 - c. The clearance measured from the bottom of the door to the bottom of the frame (undercut) shall be a maximum of 3/4 inch (19.1 mm) unless otherwise specified.
 - d. The clearance between the face of the door and the stop shall be 1/16

- inch (1.6 mm) to 3/32 inch (2.4 mm).
- e. All clearances shall be, unless otherwise specified in this document, subject to a tolerance of plus or minus 1/32 inch (0.8 mm).
- 3. Top and Bottom End Closure: Channel 0.053 inch thick inverted unless noted otherwise.
 - 4. Door Edge Design: Provide in accordance with ANSI/SDI A250.8. Provide manufacturer's standard edge.
- B. Tolerances: Comply with SDI 117 "Manufacturing Tolerances Standard Steel Doors and Frames."
 - C. Fabricate concealed stiffeners, reinforcement, edge channels, from either cold-or hot-rolled steel sheet.
 - D. Hot-Dipped Galvannealed Steel Doors and Panels: For the following locations, fabricate doors and panels from galvannealed steel sheet according to SDI 112, galvannealed to ASTM A924 and A653, A60. Close top and bottom edges of doors flush as an integral part of door construction or by addition of minimum 0.053 inch galvannealed steel channels, with channel webs placed even with top and bottom edges. Seal joints in top edges of doors against water penetration. Include galvannealed components and internal reinforcements.
 - 1. At all exterior locations.
 - E. Exposed Fasteners: Unless otherwise indicated, provide countersunk flat or oval heads for exposed screws and bolts.
 - F. Hardware Preparation: Prepare doors to receive mortised and concealed hardware according to final door hardware schedule and templates provided by hardware supplier. Comply with applicable requirements of SDI 107 and ANSI A115 Series specifications for door and frame preparation for hardware.
 - G. Reinforce doors to receive surface-applied hardware. Drilling and tapping for surface-applied hardware may be done at Project site.
 - 1. Minimum hardware reinforcing gages shall comply with Table 4 of ANSI A250.8-2017 (R2014).
 - H. Locate hardware as indicated on Shop Drawings or, if not indicated, according to the Door and Hardware Institute's (DHI) "Recommended Locations for Architectural Hardware for Standard Steel Doors and Frames."

2.05 PRIMER

- A. Prime Finish: Doors shall be thoroughly cleaned, and chemically treated to insure maximum paint adhesion. All surfaces of the door exposed to view shall receive a factory applied coat of rust inhibiting primer, either air-dried or baked-on. The finish shall meet the requirements for acceptance stated in ANSI A250.10 "Test Procedure and Acceptance Criteria for Prime Painted Steel Surfaces for Steel Doors and Frames."

- B. Field-Applied Finish Paint
 - 1. Coordinate primer with field applied finish coatings as specified in Section 09 90 00 for compatibility with finish coats.
 - a. Furnish painting contractor with manufacturer's literature for description of primer used.

PART 3 EXECUTION

3.01 INSTALLATION

- A. General: Install steel doors and accessories according to Shop Drawings, manufacturer's data and as specified.
 - 1. Doors shall be installed in accordance with ANSI/DHI A115.1G.
- B. Door Installation: Fit hollow-metal doors accurately in frames, within clearances specified in ANSI A250.8.
- C. Coordinate installation of doors with installation of frames specified in Section 08 12 14 and hardware specified in Section 08 71 00.
- D. Damaged work will be rejected and shall be replaced at no additional cost to the Owner.

3.02 ADJUSTING AND CLEANING

- A. Prime Coat Touch-Up: Immediately after erection, sand smooth any rusted or damaged areas of prime coat and apply touch-up of compatible air-drying primer.
- B. Protection Removal: Immediately before final inspection, remove protective wrappings from doors and frames.

END OF SECTION

SECTION 08 14 16 – FLUSH WOOD DOORS

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. This Section includes the following flush wood doors, non-rated:
 - 1. Solid core doors with plastic laminate faces.
 - 2. Factory finishing of flush wood doors.
 - 3. Factory fitting flush wood doors to frames and factory machining for hardware.

1.02 RELATED SECTIONS

- A. Section 08 11 16- Interior Aluminum Frames.
- B. Section 08 12 14 – Standard Steel Frames.
- C. Section 08 71 00 – Door Hardware.

1.03 REFERENCES

- A. American National Standards Institute:
 - 1. ANSI A115 – W Series, Wood Door Hardware Standards.
- B. Door and Hardware Institute:
 - 1. DHI-WDHA-3 – Recommended Hardware Locations for Wood Doors.
- C. National Electrical Manufacturers Association:
 - 1. NEMA LD3 – High Pressure Decorative Laminates.
- D. Window and Door Manufacturers Association:
 - 1. ANSI/WDMA 1.S.1A-13 – Industry Standard for Architectural Wood Flush Doors.

1.04 SUBMITTALS FOR REVIEW

- A. Section 01 33 00 – Submittals: Procedures for submittals.
- B. Product Data: For each type of door indicate details of core and edge construction, and factory-finishing specifications.
- C. Shop Drawings: Illustrate door opening criteria, elevations, sizes, types, swings, undercuts required, special beveling, special blocking for hardware, factory machining criteria, and factory finishing criteria.
- D. Construction Samples: Submit four samples of door construction, 5 by 5 inch in size, cut

from top corner of door.

- E. Finishing Samples: Submit a set of 3 illustrating the range of color and grain of the specified door face material, minimum 6 x 6 inch in size illustrating:
 - 1. Plastic laminate door faces: Color, texture and pattern.
- F. Manufacturer's full lifetime warranty.

1.05 SUBMITTALS FOR INFORMATION

- A. Section 01 33 00 - Submittals: Procedures for submittals.
- B. Manufacturer's Installation Instructions: Indicate special installation instructions.

1.06 QUALITY ASSURANCE

- A. Quality Standard: Comply with the following standard:
 - 1. Meet or exceed ANSI/WDMA 1.S.1 A-13 Industry Standard for Architectural Wood Flush Doors.
- B. Single-Source Responsibility: Obtain doors from one source and by a single manufacturer.

1.07 DELIVERY, STORAGE AND PROTECTION

- A. Section 01 60 00 – Product Requirements: Transport, handle, store and protect products.
- B. Deliver, store, protect and handle products under provisions of WDMA and manufacturer's care and handling instructions.
- C. Store doors flat on a level surface in a dry, well-ventilated building. Doors shall be kept at least 4 inches off the floor and shall have protective coverings under the bottom door and over the top. Covering shall protect doors from dirt, water and abuse, and shall allow for air circulation under and around the stack.
- D. Doors shall not be exposed to direct light (artificial or natural). Wrap individual doors with opaque wrapping.
- E. Do not subject doors to extremes of heat and or humidity. Do not allow doors to come in contact with water. HVAC systems shall be operational and balanced, providing a temperature range of 50 to 90 degrees F and 30% to 50% relative humidity.
- F. Do not install doors in buildings with wet plaster or cement.
- G. When handling doors, always lift and carry. Do not drag across other doors or surfaces.
- H. Each door shall be marked on top rail with door opening number.

1.08 PROJECT CONDITIONS

- A. Coordinate the work with door opening construction, door frame and door hardware installation.
- B. Conditioning: Do not deliver or install doors until conditions for temperature and relative humidity have been stabilized and will be maintained in storage and installation areas during the remainder of the construction period to comply with the following requirements applicable to Project's geographical location:
 - 1. Deliver, store, protect and handle products under provisions of WDMA and manufacturer's care and handling instructions.

1.09 WARRANTY

- A. General Warranty: Door manufacturer's warranty specified in this Article shall not deprive the Owner of other rights the Owner may have under other provisions of the Contract Documents and shall be in addition to, and run concurrent with, other warranties made by the Contractor under requirements of the Contract Documents.
- B. Door Manufacturer's Warranty: Submit written agreement on door manufacturer's standard form signed by manufacturer, Installer, and Contractor, agreeing to repair or replace defective doors that have warped (bow, cup or twist) more than 1/4 inch in a 42-by-84-inch section or that show telegraphing of core construction in face veneers exceeding 0.01 inch in a 3-inch span, or do not conform to tolerance limitations of referenced quality standards.
 - 1. Warranty shall also include installation and finishing that may be required due to repair or replacement of defective doors where defect was not apparent prior to hanging.
 - 2. Warranty shall be in effect during the following period of time after date of Substantial Completion.
 - a. Solid Core Interior Doors: "Full Life of Original Installation."

PART 2 PRODUCTS

2.01 MANUFACTURERS/PRODUCTS

- A. Basis of Design: Contract Documents are based on manufacturer and product named below to establish a Standard of Quality. Other acceptable manufacturers with products having equivalent characteristics may be considered, provided deviations are minor and do not change concept as expressed in Contract Documents as judged by Architect.
 - 1. Basis of Design, Plastic Laminate Wood Doors:
 - a. Manufacturer/Product: Masonite Architectural, Aspiro Series | Marshfield-Algoma, Interior Solid Core Flush Laminate-Faced (HPDL) Doors – Choice Laminate.
 - 1) Non-rated: Aspiro Series, Structural Composite Lumber, No added Urea-Formaldehyde, FSC Certified (extra heavy-duty performance level), Model A-SCLC-B-NR.

B. Acceptable Manufacturers: Subject to compliance with requirements of Contract Documents, provide product by one of the manufacturers below. If not named, submit as substitution according to Conditions of the Contract and appropriate Division 1 section.

1. Eggers Industries, Architectural Door Division.
2. VT Industries.

2.02 WORKMANSHIP

A. Comply with ANSI/WDMA 1.S.1A-13.

2.03 PERFORMANCE STANDARD

A. Comply with ANSI/WDMA I.S. 1A-13 Extra Heavy Duty, Performance Duty Level.

B. Cross band required to meet ANSI/WDMA 1.S 1A-13 required performance duty level.

2.04 DOOR TYPES (PLASTIC LAMINATE)

A. Door designation per ANSI/WDMA 1.S.1A-13.

B. Flush Interior Doors (Non-Rated): SCLC-HPDL-5, Environmental Structural Composite Lumber Core Door with decorative laminate each side (5-ply), 1-3/4 inches thick.

2.05 FABRICATION

A. Door Core Construction: Comply with the following requirements:

1. Non-Rated: Extra Heavy Duty Performance Level Environmental Structural Composite Lumber Core.
2. Bond stiles and rails to core, abrasive sand core assembly to achieve uniform thickness before veneering.

B. Vertical Edges (Stiles)

1. Non-Rated (Plastic Laminate):
 - a. Manufacturer's standard laminated hardwood edge or SCL.
 - b. Edges, same laminate as door facing, applied after face.
 - c. Joints: No joints allowed.

C. Horizontal Edge (Rails)

1. Mill option structural composite lumber or hardwood lumber.

D. Adhesive:

1. Type I or Type II.

E. Machining for non-rated doors:

1. Factory fit and machine doors for frames and finish hardware in accordance with hardware requirements and dimensions.

F. Plastic laminate:

1. Colors, Patterns and Finishes: As indicated on list of finishes.
2. Faces: NEMA LD-3, HGS (nominal 0.048 inch) high-pressure decorative laminate.

2.06 FABRICATION

A. Fabricate flush wood doors to comply with following requirements:

1. Factory fit doors to suit frame-opening sizes Indicated, with the following uniform clearances and bevels:
2. Factory machine doors for hardware that is not surface applied. Locate hardware to comply with DHI-WDHS-3 recommended hardware locations for wood flush doors. Comply with final hardware schedules, door frame Shop Drawings, ANSI A115.W Series Standards and hardware templates.
 - a. Coordinate measurements of hardware mortises in metal frames to verify dimensions and alignment before proceeding with factory machining.

2.07 FACTORY FINISHING

- A. General: Comply with ANSI/WDMA 1.S.1A-13 standard's requirements for factory finishing.
- B. Finish wood doors at factory.
- C. Plastic Laminate: As specified.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Examine installed door frames prior to hanging door:
 1. Verify that frames comply with indicated requirements for type, size, location and swing characteristics and have been installed with plumb jambs and level heads.
 2. Reject doors with defects.
- B. Do not proceed with installation until unsatisfactory conditions have been corrected.

3.02 INSTALLATION

- A. Hardware: For installation see Section 08 71 00 – Door Hardware.
- B. Manufacturer's Instructions: Install wood doors to comply with manufacturer's instructions

and referenced quality standard and as indicated.

- C. Factory-Fitted Doors: Align in frames for uniform clearance at each edge.
- D. Factory-Laminated Doors: Restore finish before installation, if fitting or machining is required at the job site.
- E. Do not install doors until the HVAC system is operating.

3.03 ADJUSTING AND PROTECTION

- A. Operation: Rehang or replace doors that do not swing or operate freely.
- B. Finished Doors: Refinish or replace doors damaged during installation.
- C. Protect doors as recommended by door manufacturer to ensure that wood doors will be without damage or deterioration at the time of Substantial Completion.

END OF SECTION

SECTION 08 31 13 – ACCESS DOORS AND FRAMES

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Non-rated access doors.
- B. Provide for access to controls, valves, traps, dampers, cleanouts and similar items requiring operation behind inaccessible finished surfaces.
- C. Coordinate exact locations with various trades to assure proper placement of access doors and panels.

1.02 RELATED SECTIONS

- A. Section 09 90 00 – Painting and Coating: Field paint finish.

1.03 SUBMITTALS

- A. General: Submit the following in accordance with Section 01 33 00 – Submittal Procedures.
 - 1. Product data in form of manufacturer's technical data and installation instructions for each type of access door assembly, including setting Drawings, templates, instructions and directions for installation of anchorage and devices.

1.04 QUALITY ASSURANCE

- A. Single-Source Responsibility: Obtain access doors for entire project from one source from a single manufacturer.
- B. Size Variations: Obtain Architect/Engineer acceptance of manufacturer's standard size units, which may vary slightly from sizes indicated.
- C. Coordination: Furnish inserts and anchoring devices that must be built into other work for installation of access doors. Coordinate delivery with other work to avoid delay.

1.05 COORDINATION

- A. Section 01 30 00 – Administrative Requirements: Requirements for coordination.
- B. Verification: Obtain specific locations and sizes for required access doors from trades requiring access to concealed equipment, and indicate on submittal schedule.

1.06 CLOSEOUT SUBMITTALS

- A. Section 01 70 00 – Execution and Closeout Requirements: Closeout procedures.
- B. Project Record Documents: Record actual locations of access units.

PART 2 PRODUCTS

2.01 MANUFACTURERS

A. Basis of Design: Contract Documents are based on manufacturer and products named below to establish a Standard of Quality. Other acceptable manufacturers with products having equivalent characteristics may be considered, provided deviations are minor and do not change concept as expressed in Contract Documents as judged by Architect.

1. Basis of Design Selections:

- a. Manufacturer: Milcor Inc.
- b. Products:

1) Access Door Style "DW"

B. Acceptable Manufacturers: Subject to compliance with requirements of Contract Documents, provide product by one of the manufacturers named below. If not named, submit as substitution according to Conditions of the Contract and appropriate Division 1 sections.

- 1. Larsens Manufacturing Company.
- 2. Nystrom Building Products.

2.02 ACCESS UNITS – GYPSUM BOARD WALLS AND CEILINGS

A. At gypsum board openings: Milcor Access Door Style "DW":

- 1. 3203-014, Door size 14 inches by 14 inches.
- 2. 3203-019, Door size 24 inches by 24 inches.
- 3. 3203-036, Door size 24 inches by 36 inches.

B. Fabrication:

- 1. Fabricate frames of 16-gauge steel.
- 2. Fabricate door panels of 16-gauge steel.
- 3. At drywall access doors provide galvanized drywall bead.
- 4. Weld, fill, and grind joints to assure flush, square unit.
- 5. Hardware:
 - a. Hinges: Double-acting concealed spring type.
 - b. Locks: Key-operated cylinder lock with two keys.

2.03 FINISHES

A. Base Metal Protection: Prime coat units with baked on primer for wall and ceiling units.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Ensure that rough openings for door and frame are correctly sized and located.

3.02 LOCATION

- A. Coordinate with plumbing and HVAC Drawings for equipment which requires access. Items which require access include, but are not limited to, valves, traps, drains, and cleanouts. Refer to Schedule at the end of this Section.

3.03 INSTALLATION

- A. Install units according to printed manufacturer's instructions.
- B. Install frames plumb and level in opening. Secure rigidly in place.
- C. Position unit to provide convenient access to concealed work requiring access.

3.04 SCHEDULE

- A. Minimum Sizes: Coordinate with mechanical specifications and with the specific project requirements.
- B. Walls:
 - 1. In unrated walls, 14 inches by 14 inches: Plumbing valves, reset buttons, control manometers, etc.
 - 2. In unrated walls, 24 inches by 24 inches: Plumbing fittings at toilets, mechanical filter banks, access hatches, areas requiring work access for the unit replacement, etc.
- C. Ceilings:
 - 1. In gypsum board ceilings, 14 inches by 14 inches: Above ceiling cut-off valves, duct dampers, fire and/or smoke dampers, meters, registers, etc.
 - 2. In gypsum board ceilings, 24 inches by 36 inches: HVAC filter units, remote duct dampers, remote fire dampers, remote electrical J-boxes, access hatches, etc.

END OF SECTION

SECTION 08 33 10 – ROLLING COUNTER DOOR

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes: Electric tube motor operated rolling counter door
- B. Related Sections:
 - 1. Section 08 71 00 Finish Hardware. Master keyed cylinder.
 - 2. Section 09 90 00 – Painting and Coating: Field painting items not finished.
 - 3. Division 26 - Electrical wiring and conduit, fuses, disconnect switches, connection of operator to power supply, and installation of control station and wiring
- C. Products Supplied, But Are Not Installed Under This Section:
 - 1. Control Station

1.02 SUBMITTALS

- A. Reference Section 01 33 00 Submittal Procedures: Submit the following items:
 - 1. Product Data.
 - 2. Shop Drawings: Include special conditions not detailed in Product Data. Show interface with adjacent work.
 - 3. Quality Assurance/Control Submittals:
 - a. Provide manufacturer and installer qualifications - see below.
 - b. Provide manufacturer's installation instructions.
 - 4. Closeout Submittals:
 - a. Operation and Maintenance Manual
 - b. Certificate stating that installed materials comply with this specification

1.03 QUALITY ASSURANCE

- A. Qualifications:
 - 1. Installer Qualifications: Manufacturer's approval.

1.04 DELIVERY STORAGE AND HANDLING

- A. Reference Section 01 60 00 Product Requirements.
- B. Follow manufacturer's instructions.

1.05 WARRANTY

- A. Standard Warranty: Two years from date of shipment against defects in material and workmanship.
- B. Maintenance: Submit for owner's consideration and acceptance of a maintenance service agreement for installed products

PART 2 PRODUCTS

2.01 MANUFACTURER

- A. Basis of Design: Contract Documents are based on manufacturer and product named below to establish a Standard of Quality. Other acceptable manufacturers as listed in Paragraph B, below with products having equivalent characteristics may be considered, provided deviations are minor and do not change concept as expressed in Contract Documents as judged by Architect.
 - 1. Basis of Design product selections:
 - a. Manufacturer: Cornell.
 - b. Product: Rolling counter door.
 - c. Series: ESC10.
 - B. Acceptable Manufacturer: Subject to compliance with requirements of Contract Documents, provide product by one of the manufacturers listed below.
 - 1. The Cookson Company.
 - 2. Clopay Building Products.
 - C. Requests for substitutions will be considered in accordance with provisions of Section 01 60 00.

2.02 MATERIALS

- A. Curtain:
 - 1. Stainless Steel: No. 1F, interlocked flat-faced slats, 1-1/2 inches high by 1/2 inch deep, minimum 22-gauge AISI type 304 #4 finish stainless steel with stainless steel angle bottom bar with lift handles and vinyl sensing edge seal.
 - 2. Finish:
 - a. Stainless Steel: type 304 #4 finish
- B. Endlocks:

1. Fabricate interlocking slat sections with high strength molded nylon endlocks riveted to ends of alternate slats
- C. Guides:
1. Fabrication:
 - a. Stainless Steel: 12 gauge formed shapes.
 2. Finish:
 - b. Stainless Steel: type 304 #4 finish
- D. Shaft Assembly:
1. Tube Motor Shaft Assembly:
 - a. Barrel: Steel pipe capable of supporting curtain load with maximum deflection of 0.03 inches per foot of width
- E. Brackets:
1. Fabricate from reinforced steel plate with bearings at rotating support points to support counterbalance shaft assembly and form end closures.
 2. Finish:
 - a. Standard (Stock Color): Zirconium treatment followed by a gray baked-on polyester powder coat; minimum 2.5 mils cured film thickness
- F. Hood:
1. Minimum 24 -gauge stainless steel with reinforced top and bottom edges.
 2. Finish:
 - a. Stainless steel: type 304 #4 finish

2.03 OPERATION

- A. Electric Tube Motor Operator: Rated for a maximum of 10 cycles per day, cULus recognized, rating as recommended by door manufacturer for size and type of door, 110 Volts, 1 Phase. Provide complete with electric tube motor, maintenance free electric brake, emergency manual crank hoist and control station. Motor shall be protected against overload with an auto-reset thermal sensing device. Operator shall be equipped with an emergency manual crank hoist assembly that safely cuts operator power when engaged. A disconnect chain shall not be required to engage or release the manual crank hoist. Operator shall be capable of 10-14 RPM. Fully adjustable, mechanical internal worm limit switch mechanism shall synchronize the operator with the door. The electrical contractor shall mount the control station and supply the appropriate disconnect switch, all conduit and wiring per the overhead door wiring instructions.

B. Control Station:

1. (Tube Motor Only): Flush mounted: Rocker Switch; NEMA 1

C. Control Operation:

1. Constant pressure to close:
 - a. 2-wire, electric sensing edge seal extending full width of counter door bottom bar. Contact before counter door fully closes shall cause counter door to immediately stop downward travel and reverse direction to the fully opened position. Provide a self-coiling cable connection to control circuit.

2.04 ACCESSORIES

A. Locking:

1. Masterkeyable cylinder lock: Operable from coil side of bottom bar. Provide interlock switches to cut out motor operation when locks are engaged.
 - a. Standard Mortise Cylinder. Coordinate with Section 08 71 00 Finish Hardware.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Examine substrates upon which work will be installed and verify conditions are in accordance with approved shop drawings.
- B. Coordinate with responsible entity to perform corrective work on unsatisfactory substrates.
- C. Commencement of work by installer is acceptance of substrate.

3.02 INSTALLATION

- A. Install door and operating equipment with necessary hardware, anchors, inserts, hangers and supports.
- B. Follow manufacturer's installation instructions.

3.03 ADJUSTING

- A. Following completion of installation, including related work by others, lubricate, test, and adjust doors for ease of operation, free from warp, twist, or distortion

3.04 CLEANING

- A. Clean surfaces soiled by work as recommended by manufacturer.
- B. Remove surplus materials and debris from the site.

3.05 DEMONSTRATION

- A. Demonstrate proper operation to Owner's Representative.
- B. Instruct Owner's Representative in maintenance procedures.

END OF SECTION

SECTION 08 41 13 – ALUMINUM-FRAMED ENTRANCES AND STOREFRONTS

PART 1 GENERAL

1.01 SUMMARY

- A. Section includes aluminum-framed storefronts including aluminum doors.
- B. Field testing aluminum storefront(s):
 - 1. Field testing mock-up in accordance with AAMA 503 Voluntary Specification for Field Testing of Newly Installed Storefronts, Curtain Walls and Sloped Glazing.
 - 2. Field testing aluminum storefront windows as selected by Architect, installed in the building façade, in accordance with AAMA 503 Voluntary Specification for Field Testing of Newly Installed Storefronts, Curtain Walls and Sloped Glazing Systems.
 - 3. The Contractor is responsible for hiring and paying for the testing services as specified in this Section by an AAMA accredited independent laboratory or testing agency or a laboratory or testing agency in full compliance with ISO/IEC 17025 including repairing, retesting and if required forensic testing any specimens that do not comply with the prescribed air leakage and water penetration resistance requirements of this Section.
 - a. Refer to Submittals and Qualification articles for requirements.
- C. Related Sections:
 - 1. Section 07 27 26 – Fluid-Applied Membrane Air Barriers: Tying air barrier system to storefront frames.
 - 2. Section 07 90 00 – Joint Protection: System perimeter sealant and backup materials.
 - 3. Section 08 71 00 – Door Hardware: Hardware for entrance doors.
 - 4. Section 08 80 00 – Glazing: Installing glass within storefront framing and entrance doors.
 - 5. Section 08 42 29 – Sliding Automatic Entrances: Installing automatic entrances in storefront framing.
 - 6. Section 12 24 13-Manual Window Shades.
- D. Mock-up:
 - 1. Related Sections:
 - a. Section 04 20 19 – Veneer Unit Masonry. Field testing aluminum storefront as part of the mock-up using AAMA 503 Voluntary

Specification for Field Testing of Newly Installed Storefronts, Curtain Walls and Sloped Glazing, current edition at the time of bid.

- G. SSPC: The Society for Protective Coatings:
1. SSPC Paint 20 – Zinc-Rich Primers (Type I – Inorganic and Type II – Organic).
 2. SSPC Paint 25 – Red Iron Oxide, Zinc Oxide, Raw Linseed Oil, and Alkyd Primer.

1.03 SYSTEM DESCRIPTION

- A. Aluminum-framed storefront and entrance systems include tubular aluminum sections, aluminum entrances, shop fabrication, factory finishing, related flashings, anchorage and attachment devices.
1. Where required, due to wind load and spacing requirements of framing, provide tubular sections with supplementary internal steel framing.
- B. System Assembly: Site assembled.

1.04 PERFORMANCE REQUIREMENTS

- A. System Assembly: Accommodate without damage to components or deterioration of seals, movement within system, movement between system and peripheral construction,

dynamic loading and release of loads, deflection of structural support framing.

- B. Wind Loads: Design and size components to withstand dead and live loads caused by positive and negative wind pressure acting normal to plane of wall, including building corners:
 - 1. Wind load for exterior assemblies, based on International Building Code, 2015 Edition.
 - a. Refer to Structural drawings for notes regarding the components and cladding design loads.
- C. Deflection: Limit mullion deflection to L/175 for spans up to 13'-6" and L/240 plus 1/4 inch for spans over 13'-6" of span; with full recovery of glazing materials.
- D. Air Infiltration: Test specimen shall be tested in accordance with ASTM E283. Air infiltration rate shall not exceed 0.06 cfm per sq ft. at a static air pressure differential of 6.24 psf.
- E. Water Leakage: None, when measured in accordance with ASTM E331. There shall be no leakage at a minimum static pressure differential of 8 psf as defined by AAMA 501.
- F. Expansion/Contraction: Provide for expansion and contraction within system components caused by cycling temperature range of 170 degrees F (95 degrees C) over 12-hour period without causing detrimental effect to system components and anchorage.
- G. System Internal Drainage: Drain water entering joints, condensation occurring in glazing channels, or migrating moisture occurring within system, to exterior by weep drainage network.
- H. Air and Vapor Seal: Maintain continuous air barrier and vapor retarder throughout assembly, primarily in line with pane of glass and heel bead of glazing compound.
- I. Entrance Doors:
 - 1. Air Infiltration: For single acting butt hinge entrances in the closed and locked position, the test specimen shall be tested in accordance with ASTM E283 at a pressure differential of 6.24 psf. for single doors. A single 3'-0" by 7'-0" entrance door and frame shall not exceed .50 cfm per lineal foot of perimeter crack.
 - 2. Structural: Corner strength shall be tested by dual moment load test procedure and certified by an independent testing laboratory to ensure weld compliance and corner integrity.

1.05 SUBMITTALS

- A. Section 01 33 00 – Submittal Procedures.

- B. Shop Drawings: Indicate system dimensions, framed opening requirements and tolerances, affected related Work and expansion and contraction joint location and details.
- C. Product Data: Submit component dimensions, describe components within assembly, anchorage and fasteners, door hardware and internal drainage details.
- D. Manufacturer's Certificate: Certify products meet or exceed specified requirements.
- E. Samples: Submit two samples, 12 inches by 12 inches, illustrating finished aluminum.
- F. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency for each type of aluminum-framed storefronts.
- G. Design Data: Indicate framing member structural and physical characteristics, calculations, dimensional limitations.
- H. An NFRC Component Modeling Approach (CMA) generated label certificates shall be provided by the manufacturer. The label certificate shall be project specific and will contain the thermal performance ratings of the manufacturer's framing combined with the specified glass, and the glass spacer used in the fenestration of the glass, at NFRC standard test as defined in Table 4-3 in NFRC 100.
- I. Independent Field Testing Laboratory: Provide the name and contact information of the AAMA LAP-3 Accredited Independent Laboratory or testing agency responsible for performing the initial field testing, retesting and if necessary forensic testing of the storefront system.
 - 1. In lieu of being AAMA accredited, the independent field testing laboratory or field testing agency shall be ISO/IEC 17025 accredited. The laboratory/testing agencies accreditation shall only be granted by an accreditation body, or AB, that has an MRA (Mutual Recognition Arrangement) with ILAC (International Laboratory Accreditation Cooperation).
 - a. Those accreditation bodies that are a signatory to ILAC MRA include the following:
 - 1) A2LA: The American Association for Laboratory Accreditation.
 - 2) IAS: The International Accreditation Service.
 - 2. The Contractor shall retain the services of an independent testing laboratory and pay for the costs associated with the initial field testing. Costs associated with retesting and if necessary forensic testing in the event the specimens do not conform to the prescribed air leakage and water resistance requirements shall be paid for by the Contractor.
 - 3. Include a copy of the signed agreement between the Contractor and Testing Laboratory which includes the following costs:

- a. Costs associated with the initial field testing of the mock-up as well as the costs associated with the initial field testing of specimens identified in the Field Quality Control Article of this Section.
 - b. Provide a unit cost per square foot for field testing for air leakage and water leakage. This cost will be used to adjust up or down the budget cost outlined in the Field Quality Control Article of this Section.
4. Laboratories/testing agencies that are ISO/IEC 17025 accredited shall submit a copy of their current certificate of accreditation, along with the name of the accreditation body. The certificate shall remain current through the projects one-year warranty period as listed in Section 10 20 00.
- a. The testing agency shall provide proof that the testing agency is capable of performing, as a minimum, the methods and requirements for field testing storefront products as outlined in ASTM E783 for air leakage, ASTM E1105 for water penetration and AAMA 503.
 - b. The field testing agency shall meet the criteria identified in AAMA LAP-3 Section 7.0 which includes Sections 7.1 through 7.7.

1.06 QUALIFICATIONS

- A. Manufacturer and Installer: Company specializing in manufacturing aluminum glazing systems with minimum three years of documented experience.
- B. Independent Field Testing Agency: The field testing agency shall be AAMA accredited in accordance with LAP-3.
 1. In lieu of the field testing agency being accredited in accordance with AAMA LAP-3, the field testing agency may be ISO/IEC17025 accredited.

1.07 QUALITY ASSURANCE

- A. Perform work in accordance with AAMA-SFM-1.

1.08 DELIVERY, STORAGE AND PROTECTION

- A. Section 01 60 00 – Product Requirements: Product Storage and Handling Requirements.
- B. Protect finished aluminum surfaces with wrapping or strippable coating. Do not use adhesive papers or sprayed coatings which bond when exposed to sunlight or weather.

1.09 ENVIRONMENTAL REQUIREMENTS

- A. Section 01 60 00 – Product Requirements.
- B. Do not install sealants or glazing materials when ambient temperature is less than 40 degrees F (5 degrees C) during and 48 hours after installation.

1.10 COORDINATION

- A. Section 01 30 00 – Administrative Requirements: Coordination and project conditions.

1.12 WARRANTY

- A. Manufacturer's product warranty: Submit for Owner's acceptance, manufacturer's warranty for storefront system as follows:
 - 1. Warranty period: 2 years from date of substantial completion of the project.

PART 2 PRODUCTS

2.01 ALUMINUM-FRAMED STOREFRONTS AND ENTRANCE DOORS

- A. Basis of Design: Contract Documents are based on manufacturer and product named below to establish a Standard of Quality.
 - 1. Kawneer Co., Inc
 - a. Storefront Trifab VG 451T (Thermal) Framing System for exterior installations.
 - b. Framing Profile: 2 inches by 4 1/2 inches
 - 1) Center
 - c. Entrance Doors: 500 Heavywall. Refer to door schedule for locations of aluminum doors identified as AL in the door material heading in the schedule.
- B. Acceptable Manufacturers and Products: Subject to compliance with requirements of Contract Documents, provide product by one of the manufacturers named below. If not named, submit as substitution according to General Conditions of the Contract and appropriate Division 1 sections.
 - 1. EFCO:
 - a. Series 403 (T) for exterior installation with high-performance sill.
 - b. Door: D518 Durastile.
 - 2. TubeLite Inc.
 - a. Series T14000 for exterior installation with high-performance sill.
 - b. Door: Monumental Series.
- C. Product Description:
 - 1. Aluminum Frame: Thermally Broken 2 inch by 4 1/2 inch profile.
 - 2. Doors: Aluminum framed glass doors; 2 inches thick, nominal 5 inch wide top rail and vertical stiles, nominal 10 inch wide bottom rail; square glazing stops. All walls of the door members shall be a minimum .188 inch nominal thickness with .050 inch thick glass stops.

- a. Door Frames: Heavywall, 2 inch by 4 1/2 inch profile.
- D. Door Hardware:
 - 1. Refer to Section 08 71 00 for hardware.
- E. Door Weatherstripping:
 - 1. The door weathering on a single or pair of doors shall be comprised of a thermoplastic elastomer weathering on a tubular shape with a semi-rigid polymeric backing.

2.02 COMPONENTS

- A. Extruded Aluminum: ASTM B221; 6063 Alloy, T6 Temper Typical, 6061 Alloy, T6 Temper for Extruded Structural Members.
- B. Sheet Aluminum: ASTM B209, 5005 Alloy, H15 on H34 Temper
- C. Steel Sections: ASTM A36, shaped to suit mullion sections, galvanized.
- D. Glazing Materials: As specified in Section 08 80 00.
- E. Hardware: As specified in Section 08 71 00.
- F. Sealant and Backing Materials:
 - 1. Sealant Used within System (Not Used for Glazing): Manufacturer's standard materials to achieve weather, moisture, and air infiltration requirements.
 - a. Sealants used within the system shall not come in contact with air barrier membrane, including sealants and tapes. Refer to Section 07 27 26-Fluid-Applied Membrane Air Barrier.
 - 2. Perimeter Sealant: Specified in Section 07 90 00.
- G. Fasteners: Stainless or hot-dip galvanized steel.
 - 1. Use stainless steel where fasteners are exposed and where fastening into preservative-treated lumber and or plywood Type 304 or 316.
- H. Gaskets: Glazing gaskets shall be extruded EPDM rubber.
- I. Thermal Barrier for Trifab VG 451T: Manufacturer's standard thermal break.
- J. Sill Flashing: Provide manufacturer's thermally broken high-performance flashing for use at all storefront sills.
- K. Flat Fillers: Provide each head and jamb member with manufacturer's standard continuous flat filler.
 - 1. At thermally broken systems provide manufacturer's aluminum thermal flat filler. The use of PVC fillers is not acceptable.

2. Provide a cap plate on top of each exterior vertical mullion.
3. Provide a cap plate on top of each vertical stile on each exterior aluminum door.

2.03 FABRICATION

- A. Fabricate components with minimum clearances and shim spacing around perimeter of assembly, yet enabling installation and dynamic movement of perimeter seal.
- B. Accurately fit and secure joints and corners. Make joints flush, hairline and weatherproof.
- C. Prepare components to receive anchor devices. Fabricate anchors.
- D. Arrange fasteners and attachments to conceal from view.
- E. Prepare components with internal reinforcement for door hardware.
- F. Reinforce framing members for imposed loads.

2.04 SHOP FINISHING

- A. Clear Anodized Aluminum Surfaces: AAMA 611, AA-M10C21A41/AA-M45C22A41 Architectural Class I, clear anodized 0.7 mils anodized coating.
- B. Concealed Steel Items: Galvanized to ASTM A123, 1.2 oz./sq.ft. coating thickness, galvanize after fabrication.
- C. Apply bituminous paint to concealed aluminum and steel surfaces in contact with cementitious or dissimilar metals.
- D. Touch-Up Primer for Galvanized Steel Surfaces: SSPC Paint 20 zinc rich.
- E. Extent of Finish:
 1. Apply factory coating to surfaces exposed at completed assemblies.
 2. Apply finish to surfaces cut during fabrication so no natural aluminum is visible in completed assemblies, including joint edges.
 3. Apply touch-up materials recommended by coating manufacturer for field application to cut ends and minor damage to factory applied finish.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Section 01 30 00 – Administrative Requirements: Coordination and Project Conditions.
- B. Verify dimensions, tolerances and method of attachment with other Work.
- C. Verify wall openings and adjoining air and vapor seal materials are ready to receive Work

of this Section.

3.02 INSTALLATION

- A. Install wall system in accordance with AAMA SFM-1 Aluminum Store Front and Entrance Manual.
- B. Attach to structure to permit sufficient adjustment to accommodate construction tolerances and other irregularities.
- C. Provide alignment attachments and shims to permanently fasten system to building structure.
- D. Align assembly plumb and level, free of warp or twist. Maintain assembly dimensional tolerances, aligning with adjacent Work.
- E. Install Sill Flashings: Turn up ends and edges; seal to adjacent work to form watertight dam.
- F. Install integral flashings and integral sealers.
- G. Set thresholds in bed of mastic and secure.
- H. Install hardware using templates provided. Refer to Section 08 71 00 for installation requirements.
- I. Coordinate installation of glass with Section 08 80 00; separate glass from metal surfaces.
- J. Coordinate installation of perimeter sealants with Section 07 90 00.
- K. Bottoms of exterior aluminum doors shall be undercut $\frac{1}{4}$ inch above the threshold.

3.03 ERECTION TOLERANCES

- A. Section 01 40 00 – Quality Requirements: Tolerances.
- B. Maximum Variation from Plumb: 0.06 inches every 3 ft non-cumulative or 1/16 inches per 10 ft, whichever is less.
- C. Maximum Misalignment of Two Adjoining Members Abutting in Plane: 1/32 inch.

3.04 QUALITY CONTROL-MOCK-UP TESTING

- A. Field test storefront mock-up in accordance with AAMA 503 current edition at the time of bid. Testing shall be performed by an accredited independent testing agency, in compliance with the requirements of this section, employed and paid for by the Contractor. The specimen shall be tested for air leakage and water penetration per the Field Quality Control Article of this Section.
 - 1. Notification of Testing: The Contractor shall provide a minimum of one-week notice to the storefront installer, storefront manufacturer, glazier, caulking contractor, Architect and Owner as to when the fenestration products are ready for testing, including any retesting and forensic testing if required. The

Contractor, storefront installer, storefront manufacturer, glazier, caulking contractor, Architect and Owner shall be present for the test(s).

2. If the specimen does not conform to the prescribed air leakage and water penetration resistance requirements, the storefront manufacturer and installer shall perform a site inspection and determine the reason(s) for non-compliance. The non-compliant specimen shall be repaired and retested at no additional cost to the Owner. Wherever air/water leakage has occurred, the framing shall be made air/water tight in a manner acceptable to the architect and/or owner's representative. Remedial work involving the use of curing-type compounds shall be allowed to set before it is re-checked for leakage.
3. Provide test report in accordance with AAMA 503.

3.05 FIELD QUALITY CONTROL

- A. The newly installed storefront shall be field tested by an accredited independent testing agency, in compliance with the requirements of this section, employed and paid for by Contractor, in accordance with AAMA 503 current edition at the time of bid.
 1. Testing shall be performed soon after the "test area," hereafter referred to as "specimen," is installed, adjusted and cleaned, sealants are cured and prior to the installation of gypsum wallboard, insulation and finish materials.
 2. If interior wall materials have been installed, they shall be removed from the perimeter of the specimen to allow for visual inspection to check for water leakage. The cost (labor and materials, including any overtime) to remove and re-install the gypsum wallboard, insulation or other finish materials shall be the responsibility of the General Contractor.
- B. Specimen:
 1. The test specimen's size and location shall be selected by the Architect. For budget purposes the Contractor shall include in his proposal the cost to test three (3) openings each opening measuring 100 square feet in area.
 - a. The specimens shall include perimeter seals, typical splices, frame intersections, and a minimum of two vision lites and two spandrel lites, if applicable, containing an intermediate vertical and an intermediate horizontal member. See Figure 1 at the end of this section for typical test assemblies.
 - b. Inspection of specimen: The testing agency shall perform a pre-test inspection which includes the following:
 - 1) Check and record in the test report the plumb, level and square condition of the specimen.
 - 2) Report the pre-test condition of all surfaces to confirm that the specimen is in a condition where a judgment can be made as to whether or not water penetration is a result of testing.
- C. Tests:

1. ASTM Test Methods: Field testing procedures and test apparatus shall meet the most current version available during the bid phase of the project.
 2. Resistance to Air Infiltration Using Static Air Pressure Difference: ASTM E783.
 - a. This test shall only be performed on punched openings.
 - b. The maximum allowable rates of air leakage for field testing shall not exceed 1.5 times the amount indicated in the performance requirements or 0.09 cfm/ft², whichever is greater.
 - c. Where air infiltration and water penetration are conducted in sequence, the test for air leakage shall be performed before the test for water penetration.
 - d. Follow AAMA 503 procedures if residual water from rain or other sources maybe located in test specimen prior to proceeding with air leakage test.
 3. Resistance to Water Penetration Using Static Air Pressure Difference: ASTM E1105, Procedure A, Uniform Static Air Pressure Difference.
 - a. Field water penetration resistance tests shall be conducted at a static test pressure of two-thirds of the amount in the performance requirements but not less than 6.24 psf. No water penetration is permitted
- D. When testing results in leakage, eliminate causes of leaks and retest until no leaks occur. In addition to retesting the system(s) that did not pass, air/water test one additional opening as selected by the Architect. The costs for retesting and if necessary forensic testing shall be paid for by the Contractor. The cost for testing the additional opening as selected by the Architect will be paid by the Owner based on the unit cost submitted in accordance with the Submittals Article of this Section.

3.06 MANUFACTURER'S FIELD SERVICES

- A. Section 01 40 00 – Quality Requirements: Manufacturers' field services.
- B. Storefront and glass product manufacturers to provide field surveillance of installation of their Products.
- C. Monitor and report installation procedures and unacceptable conditions.

3.07 ADJUSTING

- A. Adjust operating hardware for smooth operation.

3.08 CLEANING

- A. Remove protective material from pre-finished aluminum surfaces.
- B. Wash down surfaces with solution of mild detergent in warm water, applied with soft, clean wiping cloths. Take care to remove dirt from corners. Wipe surfaces clean.
- C. Remove excess sealant by method acceptable to sealant manufacturer.

3.09 PROTECTION OF INSTALLED CONSTRUCTION

- A. Protect finished Work from damage.

END OF SECTION

FIGURES

FIGURE 1: STOREFRONT

NOTE 10: The pressure measuring device shall take into account the difference that may exist between the static pressure in the interior of the building and the static pressure on the exterior. It may be possible to open a window or door in a room to balance the pressure. If this is not possible, a measurement of the outdoor wind speed and/or indoor building pressure shall be made and the test pressure adjusted accordingly.

SECTION 08 42 29 - SLIDING AUTOMATIC ENTRANCES

PART 1 - GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.02 SUMMARY

- A. This Section includes the following types of automatic entrances:
 - 1. Exterior and interior, single slide, sliding automatic entrances.
- B. Related Sections:
 - 1. Section 07 90 00 – Joint Protection: Sealants to the extent not specified in this section.
 - 2. Section 08 41 13 - Aluminum-Framed Entrances and Storefronts: For installing sliding automatic entrances in storefront framing.
 - 3. Section 08 71 00 – Finish Hardware: For hardware to the extent not specified in this Section.
 - 4. Section 08 80 00 - Glazing: For materials and installation requirements of glazing for automatic entrances.
 - 5. Division 26 Sections for electrical connections provided separately, including conduit and wiring, for power to sliding automatic entrances.

1.03 REFERENCES

- A. General: Standards listed by reference, including revisions by issuing authority, form a part of this specification section to extent indicated. Standards listed are identified by issuing authority, authority abbreviation, designation number, title or other designation established by issuing authority. Standards subsequently referenced herein are referred to by issuing authority abbreviation and standard designation.
- B. Underwriters Laboratories (UL):
 - 1. UL 325 – Standard for Door, Drapery, Gate, Louver, and Window Operators and Systems.
- C. American National Standards Institute (ANSI) / Builders' Hardware Manufacturers Association (BHMA):
 - 1. ANSI/BHMA A156.10: Standard for Power Operated Pedestrian Doors.
 - 2. ANSI/BHMA A156.5: Standard for Auxiliary Locks and Associated Products
- D. American Society for Testing and Materials (ASTM):

1. ASTM B221 - Standard Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes.
 2. ASTM B209 - Standard Specification for Aluminum and Aluminum-Alloy Sheet and Plate
- E. American Association of Automatic Door Manufacturers (AAADM):
- F. National Fire Protection Association (NFPA):
1. NFPA 101 – Life Safety Code.
 2. NFPA 70 – National Electric Code.
- G. International Code Council (ICC):
1. IBC: 2015 International Building Code
- H. International Organization for Standardization (ISO):
1. ISO 9001 - Quality Management Systems
 2. ISO 14025 – Environmental Labels and Declarations -- Type III Environmental Declarations -- Principles and Procedures
 3. ISO14040 – Environmental Management -- Life Cycle Assessment -- Principles and Framework
 4. ISO 14044 – Environmental Management -- Life Cycle Assessment -- Requirements and Guidelines
 5. ISO 21930 – Sustainability in Buildings and Civil Engineering Works -- Core Rules For Environmental Product Declarations Of Construction Products And Services
- I. National Association of Architectural Metal Manufacturers (NAAMM):
1. Metal Finishes Manual for Architectural and Metal Products.
- J. American Architectural Manufacturers Association (AAMA):
1. AAMA 607.1 - Clear Anodic Finishes for Architectural Aluminum.
 2. AAMA 611 Voluntary Specification for Anodized Architectural Aluminum.
 3. AAMA 701 Voluntary Specification for Pile Weatherstripping and Replaceable Fenestration Weatherseals.

1.04 DEFINITIONS

- A. Activation Device: Device that, when actuated, sends an electrical signal to the door operator to open the door.

- B. Safety Device: Device that prevents a door from opening or closing, as appropriate.

1.05 PERFORMANCE REQUIREMENTS

- A. General: Provide automatic entrance door assemblies capable of withstanding loads and thermal movements based on testing manufacturer's standard units in assemblies similar to those indicated for this Project.
- B. Operating Range: Minus 30 deg F to 130 deg F.
- C. Opening-Force Requirements for Egress Doors: Force shall be adjustable; but, not more than 50 lbf required to manually set swinging egress door panel(s) in motion.
- D. Closing-Force Requirements: Not more than 30 lbf required to prevent door from closing.

1.06 SUBMITTALS

- A. General: Submit the following in accordance with Conditions of the Contract and Division 1 Specification Sections.
- B. Shop Drawings: Include plans, elevations, sections, details, hardware mounting heights, and attachments to other work.
- C. Color Samples for selection of factory-applied color finishes.
- D. Closeout Submittals:
 - 1. Owner's Manual.
 - 2. Warranties.
- E. Reports: Based on evaluation performed by a qualified agency, for automatic entrance door assemblies.
 - 1. Evaluation Report for compliance with IBC.

1.07 QUALITY ASSURANCE

- A. Installer Qualifications: Manufacturer's authorized representative, with certificate issued by AAADM, who is trained for installation and maintenance of units required for this Project.
- B. Manufacturer Qualifications: A qualified manufacturer with a manufacturing facility certified under ISO 9001.
- C. Manufacturer shall have in place a national service dispatch center providing 24 hours a day, 7 days a week, emergency call back service.
- D. Certifications: Automatic sliding door systems shall be certified by the manufacturer to meet performance design criteria in accordance with the following standards:
 - 1. ANSI/BHMA A156.10.

2. NFPA 101.
 3. UL 325 listed.
 4. IBC 2015.
- E. Source Limitations: Obtain automatic entrance door assemblies through one source from a single manufacturer.
- F. Product Options: Drawings indicate sizes, profiles, and dimensional requirements of automatic entrance door assemblies and are based on the specific system indicated. Refer to Division 1 Section "Product Requirements."
- G. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
- H. Emergency-Exit Door Requirements: Comply with requirements of authorities having jurisdiction for automatic entrances serving as a required means of egress.

1.08 PROJECT CONDITIONS

- A. Field Measurements: General Contractor shall verify openings to receive automatic entrance door assemblies by field measurements before fabrication and indicate measurements on Shop Drawings.
- B. Mounting Surfaces: General Contractor shall verify all surfaces to be plumb, straight and secure; substrates to be of proper dimension and material.
- C. Other trades: General Contractor shall advise of any inadequate conditions or equipment.

1.09 COORDINATION

- A. Templates: Check Shop Drawings of other work to confirm that adequate provisions are made for locating and installing automatic entrances to comply with indicated requirements.
- B. Electrical System Roughing-in: Coordinate layout and installation of automatic entrance door assemblies with connections to power supplies.

1.10 WARRANTY

- A. Automatic Entrances shall be free of defects in material and workmanship for a period of one (1) year from the date of substantial completion.
- B. During the warranty period the Owner shall engage a factory-trained technician to perform service and affect repairs. A safety inspection shall be performed after each adjustment or repair and a completed inspection form shall be submitted to the Owner.
- C. During the warranty period all warranty work, including but not limited to emergency service, shall be performed during normal working hours.

PART 2 - PRODUCTS

2.01 MANUFACTURER AND PRODUCTS

- A. Basis of Design: Contract Documents are based on manufacturer and product named below to establish a Standard of Quality. Other acceptable manufacturers as listed in Paragraph B, below with products having equivalent characteristics may be considered, provided deviations are minor and do not change concept as expressed in Contract Documents as judged by Architect.
 - 1. Basis of Design product selections:
 - a. Manufacturer: Stanley Access Technologies.
 - b. Product: Dura-Glide 2000 sliding automatic entrances.
 - B. Acceptable Manufacturer: Subject to compliance with requirements of Contract Documents, provide product by one of the manufacturers listed below.
 - 1. Assa Abloy Entrance Systems.
 - 2. Horton Automatics.
 - C. Requests for substitutions will be considered in accordance with provisions of Section 01 60 00.

2.02 MATERIALS

- A. Aluminum: Alloy and temper recommended by manufacturer for type of use and finish indicated.
 - 1. Headers, stiles, rails, and frames: 6063-T6.
 - 2. Extruded Bars, Rods, Profiles, and Tubes: ASTM B 221.
 - 3. Sheet and Plate: ASTM B 209.
- B. Sealants and Joint Fillers: Performed under Division 7 Section "Joint Sealants".

2.03 AUTOMATIC ENTRANCE DOOR ASSEMBLIES

- A. General: Provide manufacturer's standard automatic entrance door assemblies including doors, sidelights, framing, headers, carrier assemblies, roller tracks, door operators, activation and safety devices, and accessories required for a complete installation.
- B. Sliding Automatic Entrances:
 - 1. Single Slide Entrances:
 - a. Configuration: One sliding leaf and one full sidelight.
 - b. Traffic Pattern: Two-way.
 - c. Emergency Breakaway Capability: Sliding leaf only.
 - d. Mounting: Between jambs.

2.04 COMPONENTS

- A. Framing Members: Manufacturer's standard extruded aluminum reinforced as required to support imposed loads.
 - 1. Nominal Size: 1 3/4 inch by 4 1/2 inch.
 - 2. Concealed Fastening: Framing shall incorporate a concealed fastening pocket, and continuous flush insert cover, extending full length of each framing member.
- B. Stile and Rail Doors and Sidelights: Manufacturer's standard 1 3/4 inch thick glazed doors with extruded-aluminum tubular stile and rail members. Incorporate concealed tie-rods that span full length of top and bottom rails.
 - 1. Glazing Stops and Gaskets: Snap-on, extruded-security aluminum stops and preformed gaskets.
 - 2. Stile Design: Medium stile; 3 1/2 inch nominal width.
 - 3. Bottom Rail Design: Minimum 10 inch nominal height.
 - 4. Muntin Bars: None.
- C. Glazing: Furnished under Section 08 80 00 Glazing. All Glazing furnished under separate section shall be 1/4 inch tempered at interior sliding door and 1 inch insulated, hermetically sealed at exterior door.
- D. Headers: Fabricated from extruded aluminum and extending full width of automatic entrance door units to conceal door operators, carrier assemblies, and roller tracks. Provide hinged or removable access panels for service and adjustment of door operators and controls. Secure panels to prevent unauthorized access.
 - 1. Mounting: Concealed, with one side of header flush with framing.
 - 2. Capacity: Capable of supporting up to 220 lb per panel, up to four panels, over spans up to 14 feet without intermediate supports.
- E. Carrier Assemblies and Overhead Roller Tracks: Manufacturer's standard carrier assembly that allows vertical adjustment of at least 1/8 inch; consisting of urethane with precision steel lubricated ball-bearing wheels, operating on a continuous roller track. Support panels from carrier assembly by load wheels and anti-riser wheels with factory adjusted cantilever and pivot assembly. Minimum two ball-bearing load wheels and two anti-rise rollers for each active leaf. Minimum load wheel diameter shall be 2 1/2 inch; minimum anti-rise roller diameter shall be 2 inch.
- F. Thresholds: Manufacturer's standard thresholds as indicated below:
 - 1. Continuous standard tapered extrusion double bevel.
 - 2. All thresholds to conform to details and requirements for code compliance.
- G. Fasteners and Accessories: Manufacturer's standard corrosion-resistant, non-staining, non-bleeding fasteners and accessories compatible with adjacent materials.
- H. Signage: Provide signage in accordance with ANSI/BHMA A156.10.

2.05 DOOR OPERATORS

- A. General: Provide door operators of size recommended by manufacturer for door size, weight, and movement; for condition of exposure; and for long-term, operation under normal traffic load for type of occupancy indicated.
- B. Electromechanical Operators: Self-contained overhead unit powered by a minimum of 1/4 horsepower, permanent-magnet DC motor with gear reduction drive, microprocessor controller; and encoder.
 - 1. Operation: Power opening and power closing.
 - 2. Features:
 - a. Adjustable opening and closing speeds.
 - b. Adjustable open check and close check speeds.
 - c. Adjustable hold-open time between 0 and 30 seconds.
 - d. Obstruction recycle.
 - e. On/Off switch to control electric power to operator.
 - f. Energy conservation switch that reduces door-opening width.
 - g. Closed loop speed control with active braking and acceleration.
 - h. Adjustable obstruction recycle time delay.
 - i. Self-adjusting stop position.
 - j. Self-adjusting closing compression force.
 - k. Onboard sensor power supply.
 - l. Onboard sensor monitoring.
 - m. Optional Switch to open/Switch to close operation.
 - n. Fire alarm interface, configurable to safely open or close the entrance on signal from fire alarm system.
 - 3. Mounting: Concealed.
 - 4. Drive System: Synchronous belt type.
- C. Electrical service to door operators shall be provided under Division 26 Electrical. Minimum service to be 120 VAC, 5 amps.

2.06 ELECTRICAL CONTROLS

- A. Electrical Control System: Electrical control system shall include a microprocessor controller and a high-resolution position encoder. The encoder shall monitor revolutions of the operator shaft and send signals to microprocessor controller to define door position and speed.
 - 1. The high-resolution encoder shall have a resolution of not less than 1024 counts per revolution. Systems utilizing external magnets and magnetic switches are not acceptable.
 - 2. Electrical control system shall include a 24 VDC auxiliary output rated at 1 amp.
- B. Performance Data: The microprocessor shall collect, and store performance data as follows:

1. Counter: A non-resettable counter to track operating cycles.
 2. Event Reporting: Unit shall include non-volatile event and error recording including number of occurrences of events and errors, and cycle count of most recent events and errors.
 3. LED Display: Display presenting the current operating state of the controller.
- C. Controller Protection: The microprocessor controller shall incorporate the following features to ensure trouble free operation:
1. Automatic Reset Upon Power Up.
 2. Main Fuse Protection.
 3. Electronic Surge Protection.
 4. Internal Power Supply Protection.
 5. Resettable sensor supply fuse protection.
 6. Motor Protection, over-current protection.
- D. Soft Start/Stop: A “soft-start” “soft-stop” motor driving circuit shall be provided for smooth normal opening and recycling.
- E. Obstruction Recycle: Provide system to recycle the sliding panels when an obstruction is encountered during the closing cycle. If an obstruction is detected, the system shall search for that object on the next closing cycle by reducing door closing speed prior to the previously encountered obstruction location, and will continue to close in check speed until doors are fully closed, at which time the doors will reset to normal speed. If obstruction is encountered again, the door will come to a full stop. The doors shall remain stopped until obstruction is removed and operate signal is given, resetting the door to normal operation.
- F. Programmable Controller: Microprocessor controller shall be field programmable.
1. The following parameters may be adjusted:
 - a. Operating speeds and forces as required to meet specified ANSI/BHMA standard.
 - b. Adjustable and variable features specified.
 - c. Reduced opening position.
 2. Manual programming shall be available through local interface which has a two-digit display with a selection control including three push buttons.

2.07 ACTIVATION AND SAFETY DEVICES

- A. Combined Activation and Safety Sensors: Combined activation and safety sensors shall, in a single housing, detect motion and presence in accordance with ANSI/BHMA A156.10. Motion shall be detected using K-band microwave technology, presence by active infrared reflection technology.

1. Mounting Height: Up to 11.5 feet above finish floor
 2. Temperature Range: Between -31°F and 131°F in all environmental conditions
 3. Relays: Form C, 50V at 0.3A for both activation and safety. Hold time of less than 0.5 seconds.
 4. Detection Pattern: When detection is made in the activation zone, and the entrance opens, the safety zone shall extend through the threshold on each side; creating an X-pattern. When activation and safety zones are cleared and the entrance closes the sensor will ignore the X-pattern safety zones.
 5. Combined motion and presence sensors shall be equal to or better than X-Zone Sensor by Optex.
- B. Photoelectric Beams: In addition to the threshold sensor include a minimum of two (2) doorway holding beams. Photoelectric beams shall be pulsed infrared type, including sender receiver assemblies for recessed mounting.
- C. Presence Sensor Monitoring: Sliding automatic entrances control system shall include a means to verify the functionality of all active presence sensors in accordance with ANSI/BHMA A156.10. A detected fault shall cause automatic operation to cease until the fault is corrected.

2.08 HARDWARE

- A. General: Provide units in sizes and types recommended by automatic entrance door and hardware manufacturers for entrances and uses indicated.
- B. Emergency Breakaway Feature: Provide release hardware that allows panel to swing out in direction of egress to full 90 degrees from any position in sliding mode. Maximum force to open panel shall be 50 lbf according to ANSI/BHMA A156.10. Interrupt powered operation of panel operator while in breakaway mode.
1. Emergency breakaway feature shall include at least one adjustable detent device mounted in the top of each breakaway panel to control panel breakaway force.
 2. Limit Arms: Limit arms shall be provided to control swing of sliding or non-sliding panels on break-out; swing shall not exceed 90 degrees. Limit arms shall be spring loaded to prevent shock, and include adjustable friction damping.
- C. Deadlocks: Manufacturer's standard deadbolt operated by exterior cylinder and interior thumb turn; with minimum 1 inch long throw bolt; ANSI/BHMA A156.5, Grade 1.
1. Cylinders: As specified in Section 08 71 00 Finish Hardware.
 2. Hook Latch: Laminated-steel hook, mortise type, BHMA A156.5, Grade 1.
- D. Control Switch: Provide manufacturer's standard header mounted rocker switches and door position switch to allow for full control of the automatic entrance door. Controls to include, but are not limited to:
1. One-way traffic

2. Reduced Opening
 3. Open/Closed/Automatic
- E. Power Switch: Sliding automatic entrances shall be equipped with a two position On/Off rocker switch to control power to the door.
- F. Sliding Weather Stripping: Manufacturer's standard replaceable components complying with AAMA 701; made of wool, polypropylene, or nylon woven pile with nylon-fabric or aluminum-strip backing.
- G. Weather Sweeps: Manufacturer's standard adjustable nylon brush sweep mounted to underside of door bottom.

2.09 FABRICATION

- A. General: Factory fabricates automatic entrance door assembly components to designs, sizes, and thickness indicated and to comply with indicated standards.
1. Form aluminum shapes before finishing.
 2. Use concealed fasteners to greatest extent possible.
 - a. Where fasteners are subject to loosening or turning out from thermal and structural movements, wind loads, or vibration, use self-locking devices.
 - b. Reinforce members as required to receive fastener threads.
- B. Framing: Provide automatic entrances as prefabricated assemblies.
1. Fabricate tubular and channel frame assemblies with manufacturer's standard mechanical or welded joints. Provide sub-frames and reinforcement as required for a complete system to support required loads.
 2. Perform fabrication operations in manner that prevents damage to exposed finish surfaces.
 3. Form profiles that are sharp, straight, and free of defects or deformations.
 4. Prepare components to receive concealed fasteners and anchor and connection devices.
 5. Fabricate components with accurately fitted joints with ends coped or mitered to produce hairline joints free of burrs and distortion.
- C. Doors: Factory fabricated and assembled in profiles indicated. Reinforce as required to support imposed loads and for installing hardware.
- D. Door Operators: Factory fabricated and installed in headers, including adjusting and testing.
- E. Glazing: Fabricate framing with minimum glazing edge clearances for thickness and type of glazing indicated.

- F. Hardware: Factory install hardware to the greatest extent possible; remove only as required for final finishing operation and for delivery to and installation at Project site.

2.10 ALUMINUM FINISHES

- A. General: Comply with NAAMM Metal Finishes Manual for Architectural and Metal Products for recommendations for applying and designing finishes. Finish designations prefixed by AA comply with system established by Aluminum Association for designing finishes.
- B. Class II, Clear Anodic Finish: AA-M12C22A31 Mechanical Finish: as fabricated; Chemical Finish: etched, medium matte; Anodic Coating: Architectural Class II, clear coating 0.40 mils minimum complying with AAMA 611-98, and the following:
 - 1. AAMA 607.1
 - 2. Applicator must be fully compliant with all applicable environmental regulations and permits, including wastewater and heavy metal discharge.]

PART 3 - EXECUTION

3.01 INSPECTION

- A. Examine conditions for compliance with requirements for installation tolerances, header support, and other conditions affecting performance of automatic entrances. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION

- A. General: Do not install damaged components. Fit frame joints to produce joints free of burrs and distortion. Rigidly secure non-movement joints.
- B. Entrances: Install automatic entrances plumb and true in alignment with established lines and grades without warp or rack of framing members and doors. Anchor securely in place.
 - 1. Install surface-mounted hardware using concealed fasteners to greatest extent possible.
 - 2. Set headers, carrier assemblies, tracks, operating brackets, and guides level and true to location with anchorage for permanent support.
- C. Door Operators: Connect door operators to electrical power distribution system as specified in Division 26 Sections.
- D. Glazing: Performed under Section 08 80 00 Glazing in accordance with sliding automatic entrance manufacturer's instructions.
- E. Sealants: Comply with requirements specified in Section 07 90 00 Joint Protection.

3.03 FIELD QUALITY CONTROL

- A. Testing Services: Factory Trained Installer shall test and inspect each automatic entrance

door to determine compliance of installed systems with applicable ANSI standards.

3.04 ADJUSTING

- A. Adjust door operators, controls, and hardware for smooth and safe operation, for tight closure, and complying with requirements in ANSI/BHMA A156.10.

3.05 CLEANING AND PROTECTION

- A. Clean glass and aluminum surfaces promptly after installation. Remove excess glazing and sealant compounds, dirt, and other substances. Repair damaged finish to match original finish. Comply with requirements in Division 8 Section "Glazing", for cleaning and maintaining glass.

END OF SECTION

SECTION 08 71 00 – FINISH HARDWARE

PART 1 – GENERAL:

1.01 SUMMARY:

- A. Section includes the supply and installation of the Finish Hardware.
 - 1. Include the termination of all Electrified Hardware.
 - 2. Include field verification of any existing doors, frames or hardware.

- B. Related Sections
 - 1. Division 1
 - 2. Sealants – Division 7 / Division 7
 - 3. Openings – Division 8 / Division 8
 - 4. Finishes – Division 9 / Division 9
 - 5. Fire Alarm – Division 13/ Division 28
 - 6. Electrical – Division 16 / Division 26
 - 7. Security – Division 16 / Division 28

1.02 REFERENCES:

- A. Documents and Institutes that shall be used in estimating, detailing and installing the items specified.
 - 1. International Building Code – Current/Adopted Edition
 - 2. ICC/ANSI A117.1 – Accessible and Usable Building and Facilities - Current/Adopted Edition
 - 3. NFPA 70 – Current/Adopted Edition
 - 4. NFPA80 –Standards For Fire Doors and Fire Windows – Current/Adopted Edition
 - 5. NFPA101 – Life Safety Code – Current/Adopted Edition
 - 6. NFPA105 – Installation of Smoke-Control Door Assemblies – Current/Adopted Edition.
 - 7. ANSI - American National Standards Institute
 - 8. BHMA – Builders Hardware Manufacturers Association
 - 9. UL – Underwriters Laboratory
 - 10. DHI – Door and Hardware Instatitute
 - 11. Texas Accessibility Standards – Current Adopted Edition
 - 12. Local Building Codes

1.03 SUBMITTALS

- A. Comply with pertinent provisions of Division 01.

- B. Finish Hardware Schedule to be in vertical format to include:
 - 1. Heading #/Hardware Set
 - 2. Door #, Location, Hand, Degree of Opening, Door Size and Type, Frame Size and Type, Fire Rating
 - 3. Quantity, type, style, function, product, product number, size, fasteners, finish and manufacturer of each hardware item.
 - 4. Location of hardware set cross-referenced to indications on Drawings both on floor plans and in door and frame schedule.
 - 5. Keying schedule
 - 6. Title Sheet, Index, Abbreviations, Manufacturers List, Template List and Templates.
 - 7. Mounting locations for hardware.

8. Explanation of abbreviations, symbols, and codes contained in schedule.
 9. Date of the Finish Hardware Specification and Drawing / Door Schedule used in completing the Finish Hardware Schedule.
 10. In Name, Company and Date of Field Verification if required.
 11. Door Index; include door number, heading number, and hardware group.
 12. Name and phone number for local manufacturer's representative for each product.
 13. Submit in conjunction with Door and Frame Submittal.
 14. Operation Description of openings with electrified hardware.
- C. Product Data: Provide product data in the form of a binder, manufacturer's technical product fact sheets for each item of hardware. Include whatever information may be necessary to show compliance with requirements, including instructions for installation and for maintenance of operating parts and finish.
- D. Wiring Diagrams: Provide Riser/Elevation and Point to Point Wiring Diagrams for all openings with electrified hardware. Include all information that is necessary for coordination with other trades.
- E. Samples: Provide samples as requested by Owner or Architect with Heading # and Door# marked on boxes. All samples will be returned to the contractor and used on doors for which they were marked.
- F. Templates: Provide templates of finish hardware items to each fabricator of doors, frames and other work to be factory or shop prepared for the installation of hardware.
- G. Keying Schedule: After meeting with the Owner, a keying schedule shall be submitted using keyset symbols referenced in DHI manual "Keying Systems and Nomenclature." The keying schedule shall be indexed by door number, keyset, hardware heading number, cross keying instructions and special key stamping instructions.
- H. Operations and maintenance data: At the completion of the job, provide to the Owner one hard copies or one electronic copy of an Owner's operation and maintenance manual. The manual shall consist of a labeled hardcover three ring binder with the following technical information:
1. Title page containing: Project name, address and phone numbers. Supplier's name, address and phone numbers.
 2. Table of Contents.
 3. Copy of final (file and field use/as-installed) Finish Hardware Schedule.
 4. Final Keying Schedule.
 5. Maintenance instruction, adjustment, and preservation of finishes for each item of hardware.
 6. Catalog pages for each items of hardware.
 7. Installation Instructions for each item of hardware
 8. Parts List for each item of hardware.
 9. As installed point to point wiring diagrams for electrified hardware.
 10. Warranties include Order #.
- 1.04 QUALITY ASSURANCES
- A. Substitutions: Request for substitutions shall not be accepted within this project. Architect, Owner and Finish Hardware Consultant have selected one (1) specified and two (2) equals listed hereinafter in the Hardware Schedule. By this selection process they have established three (3) equal products for competitive pricing, while insuring no

unnecessary delays by a substitution process. If any specified product is listed as a "No Substitution" product, this product will be supplied as specified, with no alteration or request of substitution. The reason for this is to comply with the uniformity established at this project. Parts and supplies are inventoried for these particular products for ease and standardization of replacement.

- B. **Supplier Qualifications:** Supplier shall be recognized architectural finish hardware supplier, with warehousing facilities, who have been furnishing hardware in the project vicinity for a period of not less than 2 year and who is or employs a DHI Certified AHC, DHC, DHSC or person with a minimum of 10 years of experience as a hardware supplier. This person shall be available at reasonable times during the course of the work for consultation about products hardware requirements, to the Owner, Architect and General Contractor.
- C. **Installer Qualifications (Mechanical Hardware):** All finish hardware shall be installed by the Finish Hardware Installer with a minimum of at least two (2) years documented experience. Installer shall attend a pre-installation meeting between the General Contractor, Finish Hardware Supplier/s, hardware manufacturer's representative for locks, closers and exit devices, and all door / frame suppliers. The Finish Hardware Installer shall be responsible for the proper installation and function of all doors and hardware.
- D. **Installer Qualifications (Electrified Hardware):** All electrified finish hardware (power source, electrified locking or control device, switching device, through wire device and monitoring device) shall be installed by an Electronic Access Control Installer licensed by the Texas Department of Public Safety. The Electrified Finish Hardware Installer shall have a minimum of at least two (2) years of documented experience. Installer shall attend a pre-installation meeting between the General Contractor, Finish Hardware Supplier/s, Electrical Contractor, Fire Alarm Contractor, Security Contractor, hardware manufacturer's representative for electrified hardware, all door / frame suppliers. The Electrified Finish Hardware Installer shall be responsible for the proper installation, termination and function of all opening with electrified hardware. Installation shall include termination of all electrified products (including the required wire to the power supply and/or junction box).

1.05 DELIVERY, STORAGE AND HANDLING

- A. **Marking and packaging:** Mark each item or package separately, with identification related to hardware set number, door number and keyset symbol.
- B. **Delivery:**
 - 1. Deliver individually packaged and properly marked finish hardware at the proper time and location to avoid any delays in construction or installation.
 - 2. At time of delivery, inventory hardware jointly with representatives of hardware supplier and hardware installer until each is satisfied that count is correct.
- C. **Storage:** Store hardware in enclosed, dry and locked area.

1.06 WARRANTY

- A. All finish hardware products shall be covered by a 1 year factory warranty from the date of substantial completion of the project.

- B. Supply warranty verification to the owner for all products that provide factory warranty. Warranty should include Factory Order # and date.

1.07 MAINTENANCE

- A. Maintenance Service
 - 1. None
- B. Extra Materials:
 - 1. All extra screws, fasteners, and all special installation tools furnished with the hardware shall be turned over to the owner at the completion of the job.

PART 2 – PRODUCTS

2.01 MATERIALS

- A. Screws and Fasteners:
 - 1. All closers and exit devices provided for exterior doors, hollow metal doors, and all other required shall be provided with thru-bolts.
 - 2. All finish hardware shall be installed to manufacturer's recommendations, using screws, attachments and installation tools provided with the hardware. No other screws or attachments are acceptable.
 - 3. All other products to meet door and frame conditions.
- B. Hinges:
 - 1. Template: Provide templated units only.
 - 2. Exterior: All exterior hinges shall be stainless steel base with stainless steel pin and stainless steel finish.
 - 3. Interior: All interior hinges steel based.
 - 4. Interior corrosive: All interior hinges at corrosive areas shall be stainless steel base with stainless still pin and stainless steel finish.
 - 5. All hinges on doors over 36" wide, with exit devices, or with push/pull shall be heavy weight.
 - 6. Electric Hinge: Provide minimum 8 wire.
 - 7. Provide non-removable pins for outswinging doors that are locked or are lockable.
 - 8. All hinges on doors with door closers shall be ball bearing.
 - 9. All hinges shall be full mortise.
 - 10. Size: Provide 4 ½ x 4 ½ hinges on doors up to 3'0" in width. Provide 5 x 4 ½ hinges over 3'0" to 4'0" in width. Reference manufacturers catalog for all other sizes.
 - 11. Number of Hinges: Provide number of hinges indicated but not less than 3 hinges for door leaf for doors 90" or less in height and one additional hinge for each 30" of additional height.
 - 12. Adjust hinge width as required for door, frame, trim and wall conditions to allow proper degree of opening.
 - 13. Provide hinges conforming to ANSI/BHMA A156.1.
 - 14. Provide spring hinges where specified. Provide two spring hinges and one bearing hinge per door leaf for doors 90 inches (2286 mm) or less in height. Provide one additional bearing hinge for each 30 inches (762 mm) of additional door height.
 - 15. Supply from the following list of manufacturers:
 - Ives IVE
 - Hager HAG

Bommer BOM

- C. Grade 1 Cylindrical Locks
1. All locks on this project should be manufacturer by the same manufacturer.
 2. All locks shall meet the new ANSI/BHMA A156.2, Series 4000, Grade 1.
 3. All cylindrical locks shall be UL Listed for 3 hour fire door. Review lock for any height restriction.
 4. Provide locks with standard 2-3/4 inches (70 mm) backset, unless noted otherwise, with a 1/2 inch (13 mm) latch throw. Provide proper latch throw for UL listing at pairs.
 5. Provide standard ASA strikes unless extended lip strike is necessary for frame/trim or 7/8" lip strike is necessary at pair with overlapping astragal.
 6. Provide dust box.
 7. Lockset shall adjust to fit door thickness from 1 3/4" to 2 1/8".
 8. Supply from the following list of manufacturers:
 9. Schlage SCH
Falcon FAL
Best BES
- D. Grade 2 Cylindrical Locks
1. All locks on this project should be manufacturer by the same manufacturer.
 2. All locks shall meet the new ANSI/BHMA A156.2, Series 4000, Grade 2.
 3. All cylindrical locks shall be UL Listed for 3 hour fire door. Review lock for any height restriction.
 4. Provide locks with standard 2-3/4 inches (70 mm) backset, unless noted otherwise, with a 1/2 inch (13 mm) latch throw. Provide proper latch throw for UL listing at pairs.
 5. Provide standard ASA strikes unless extended lip strike is necessary for frame/trim or 7/8" lip strike is necessary at pair with overlapping astragal.
 6. Provide dust box.
 7. Lockset shall adjust to fit door thickness from 1 3/4" to 2 1/8".
 8. Supply from the following list of manufacturers:
 9. Schlage SCH
Falcon FAL
Best BES
- E. Exit Devices
1. All exit device types on this project should be manufactured by the same manufacturer.
 2. Exit devices are to be architectural grade touch bar type. Touchpad to extend one half of door width.
 3. Mechanism case to be smooth.
 4. Exit devices shall meet ANSI A156.3, Grade 1.
 5. All exit devices are UL listed Panic Exit or Fire Exit Hardware.
 6. All lever trim to match lock trim in design and finish.
 7. Dogging: Non-rated devices are to be provided with dogging. Less dogging where shown in Hardware Sets (some exterior, electrical rooms, electrified) Cylinder dogging as shown in hardware sets.
 8. Exit devices are to be supplied and installed with thru-bolts for exterior, hollow metal doors, or as required for application.
 9. Provide proper power supply for exit devices as required. Coordinate with Fire Alarm, Electrical and Security Contractor.
 10. Push pads shall be metal, no plastic inserts allowed.

11. Exit devices shall have a flush end cap.
12. Exit devices shall be ordered with the correct strike for application.
13. Exit devices shall be order in the proper length to meet door width.
14. Exit devices shall have deadlatching.
15. Exit device shall be provided in width/height required based on door size.
16. Install exit devices with fasteners supplied by exit device manufacturer.
17. Mount mechanism case flush on face of doors, or provide spacers to fill gaps behind devices. Where glass trim or molding projects off face of door, provide glass bead kits as required.
18. Provide proper concealed vertical rods for wood or hollow metal doors as required.
19. Factory or field drill weep holes for exit devices used in full exterior applications, highly corrosive areas, and where noted in the hardware sets.
20. Supply from the following list of manufacturers:

Von Duprin	VON	35/98 Series
Falcon	FAL	
Detex	DET	

F. Pull Plates/Pulls/Push Plate

1. Pull and Push Plates to meet ANSI 156.6 for .050" thickness.
2. Pull and Push Plate size to 4" x 16".
3. Pull Plate to have 10" center and 1" round on pull plate with concealed fasteners.
4. Provide straight and offset pulls with fasteners as required
5. Provide concealed fasteners for all applications.
6. Prep plate for cylinder/lock as required.
7. Supply from the following list of manufacturers

Ives	IVE
Trimco	TRI
Rockwood	ROC

G. Door Closers

1. All door closers on this project should be manufactured by the same manufacturer.
2. Provide door closers conforming to ANSI/BHMA A156.4 Grade 1 requirements by BHMA certified independent testing laboratory. ISO 9000 certify closers. Stamp units with date of manufacture code.
3. Door closers shall be furnished with standard cover. Provide full cover as shown in hardware sets.
4. Size in accordance with the manufacturers recommendations for door size and condition.
5. Door closers shall be furnished with delayed action, hold-open as listed in the Hardware Sets.
6. Door closers shall be mounted out of the line of sight wherever possible (i.e., room side of corridor doors, etc.) with parallel arm mounting on out swinging doors.
7. All closer installation shall include thru bolts on exterior, hollow metal doors or where required for application.
8. Provide special templates, drop plates, mounting brackets, or adapters for arms as required for details, overhead stops, and other door hardware items interfering with closer mounting.
9. Hydraulic Fluid: Fireproof, passing requirements of UL10C, and requiring no seasonal closer adjustment for temperatures ranging from 120 degrees F to -30 degrees F.

10. Spring Power: Continuously adjustable over full range of closer sizes, and providing reduced opening force as required by accessibility codes and standards.
 11. Supply from the following list of manufacturers

LCN	LCN
Falcon	FAL
Norton	NOR
- H. Door Protection Plates
1. Protective plates shall meet ANSI A156.6 requirements for .050 thickness.
 2. Protection plates should be fabricated from stainless steel.
 3. Protection plate shall be height as shown in Hardware Sets. Width shall be 10" by 2" less than door width on single door or pair with a mullion and 1" less than door width on pair of doors without a mullion.
 4. Beveled 4 edges.
 5. Provide kickplate on all doors with closers, unless not required for aesthetic reasons.
 6. Prep protective plates for hardware as required.
 7. Supply from the following list of manufacturers:

Ives	IVE
Rockwood	ROC
Trimco	TRI
- I. Door Stops and Holders:
1. Supply wall stops at all openings to protect doors or door hardware. Install so lock does not lock unintentionally. Install blocking in wall where wall stop will be mounted.
 2. When wall conditions do not permit use of wall stop provide floor stops with risers as needed to adjust for floor conditions.
 3. When wall conditions do not permit use of wall stop provide overhead stops. Jamb mount where required to not be visible from Corridor.
 4. Exterior Ground Level Doors: Provide security floor stop.
 5. Exterior Roof Doors: Provide heavy duty overhead stop.
 6. Supply from the following list of manufacturers:

Glynn Johnson	GLY
Rockwood	ROC
Trimco	TRI
- J. Silencers
1. Provide silencers on all doors without seal. 3 for single doors and 2 for pairs.
 2. Provide silencers as required for frame conditions. SR64 for hollow metal frames. SR65/SR66 for wood frames.
 3. At wood frames, insure height of stop is compatible with silencer.
 4. Supply from the following list of manufacturer's

Ives	IVE
Rockwood	ROC
Trimco	TRI
- K. Thresholds/Weatherstripping
1. Thresholds on doors in the accessible path shall conform to accessibility codes.
 2. Threshold should be based on sill detail.
 3. Smoke seal shall be teardrop design bulb seal.
 4. Exterior seal/thresholds shall be silicone or brush as shown in hardware sets.

5. Drip strips shall protrude 2 ½" and be 4" wider than opening.
6. At S Label single doors provide seals on frame to comply with UL1784
7. At S Label pair of doors provide seals on frame and as meeting stile to comply with UL1784.
8. Automatic Door Bottom shall be mortised to comply with accessibility codes.
9. Supply from the following list of manufacturer's
Zero ZER
National Guard NGP
Pemko PEM

2.03 KEYING:

- A. General: Finish Hardware Supplier shall meet in person with owner to finalize keying requirements prior to the locks and exit devices being ordered and match existing or start a new Master Key System for the project. During keying meeting all hardware functions should be reviewed with the owner to finalize lock and exit device functions. During keying meeting determine all expansion required.
- B. Cylinders: Provide the correct and quantity of cylinders for all applications.
- C. Keys: Provide nickel silver keys only. Furnish 2 change keys for each lock: 5 control keys: 5 master keys for each master system and 5 grandmaster keys for each grandmaster key system. Deliver all keys to Owners' Representative.
- D. Cores and keys shall be provided with identification stamping.
- E. Provide construction keying / construction cores for this project with constructions keys.
- F. Provide Bitting List to Owner.

2.04 KEY CONTROL:

- A. Key Management: Key control shall be provided, by supplying a complete key storage and management system. Each key shall be fully cut, indexed, tagged and installed on cabinet hooks by the lock supplier and shipped with the locks. Key cabinet provided shall be wall-mounted type with capacity plus 50%.

PART 3 – EXECUTION:

3.01 EXAMINATION:

- A. Examine doors, frames and related items for conditions that would prevent the proper application of any finish hardware items. Do not proceed with installation until all defects are corrected.
- B. Existing Door and Frame Compatibility: Field verify existing doors and frames receiving new hardware and existing conditions receiving new openings. Verify that new hardware is compatible with existing door and frame preparation and existing conditions.
- C. Examine roughing-in for electrical power systems to verify actual locations of wiring connections before electrified door hardware installation.
- D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION:

- A. Follow Door and Hardware Institute Publication:
Recommended Location for Architectural Hardware for Standard Steel Doors and Frames
Recommended Location for Builder's Hardware for Custom Steel Doors and Frames
Recommended Locations for Architectural Hardware for Wood Flush Door
- B. Install each hardware item in compliance with manufacturer's instructions and recommendations, using only fasteners provided by manufacturer.
- C.
- D. Follow ANSI A117.1-1998 Accessible and Usable Building and Facilities and Texas Accessibility Standards.
- E. Review mounting locations with Architect where required.
- F. Mount closers on room side of corridor doors, inside of exterior doors, and stair side of stairway doors from corridors. Closers should not be visible in corridors, lobbies and other public spaces where possible.
- G. Locate power supplies in accessible location and indicate in as-builts where located.
- H. Set threshold in full bed of sealant complying with requirements specified in Division 07.
- I. Pre Installation meeting required with attendees to include Architect, General Contractor, Mechanical Hardware Installer, Electrified Hardware Installer, Finish Hardware Supplier and Manufacturer's Representative for Exit Device, Locks and Closers and Door/Frame Suppliers before installation begins.

3.03 FIELD QUALITY CONTROL:

- A. After installation has been completed, obtain the services of an Architectural Hardware Consultant to check for proper installation of finish hardware, according to the finish hardware schedule and keying schedule. In addition, check all hardware for adjustments and proper operation.

3.04 ADJUST AND CLEAN:

- A. Adjust, clean and inspect all hardware, to ensure proper operation and function of every opening. Replace items, which cannot be adjusted to operate freely and smoothly as intended for the application made.

3.05 PROTECTION:

- A. The General Contractor shall use all means at his disposal to protect all finish hardware items from abuse, corrosion and other damage until the owner accepts the project as complete.

3.06 TRAINING

- A. After installation has been completed, provide training to the Owner on the operation of the Finish Hardware and programming of any electrified hardware.

3.07 HARDWARE SCHEDULE

- A. These hardware set shown below are for use as a guideline. Provide hardware as required to meet the requirements of the openings, security, and code requirements.

HARDWARE SET LAYOUT

- 0 – Existing, No Hardware Required or Cylinders
- 1 – Lockset - Office
- 2 – Lockset – Storeroom
- 3 – Latchset - Privacy
- 4 – Latchset - Passage
- 5 – Lockset - Classroom
- 6 – Hospital Latch
- 7 – Panic Hardware
- 8 – Push/Pull
- 9 – Sliding

END OF SECTION

SECTION 08 80 00 – GLAZING

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Glass and glazing for doors, interior aluminum frames, aluminum storefront and sliding automatic entrances.

1.02 RELATED SECTIONS

- A. Section 08 11 16 - Interior Aluminum Frames: Aluminum sliding doors, frames and office framing.
- B. Section 08 41 13 – Aluminum-Framed Entrances and Storefronts.
- C. Section 08 42 29 – Sliding Automatic Entrances.

1.03 REFERENCES

- A. American Society of Civil Engineers:
 - 1. ASCE 7 – Minimum Design Loads for Buildings and Other Structures.
- B. ASTM International:
 - 1. ASTM C162 – Standard Terminology of Glass and Glass Products.
 - 2. ASTM C864 – Standard Specification for Dense Elastomeric Compression Seal Gaskets, Setting Blocks and Spaces.
 - 3. ASTM C920 – Standard Specification for Elastomeric Joint Sealants.
 - 4. ASTM C1036 – Standard Specification for Flat Glass.
 - 5. ASTM C1048 – Standard Specification for Heat-Treated Flat Glass - Kind HS, Kind FT Coated and Uncoated Glass.
 - 6. ASTM C1193 – Standard Guide for Use of Joint Sealants.
 - 7. ASTM E283 – Standard Test Method for Determining the Rate of Air Leakage Through Exterior Windows, Curtain Walls, and Doors Under Specified Pressure Differences Across the Specimen.
 - 8. ASTM E330 – Standard Test Method for Structural Performance of Exterior Windows, Curtain Walls, and Doors by Uniform Static Air Pressure Difference.
 - 9. ASTM E546 – Standard Test Method for Frost Point of Sealed Insulating Glass Units.
 - 10. ASTM E576 – Standard Test Method for Frost Point of Sealed Insulating Glass Units in the Vertical Position.

11. ASTM E773 – Standard Test Method for Seal Durability of Sealed Insulating Glass Units.
 12. ASTM E774 – Standard Specification for Sealed Insulating Glass Units.
 13. ASTM E1300 – Standard Practice for Determining the Minimum Thickness and Type of Glass Required to Resist a Specific Load.
- C. Glass Association of North America:
1. GANA (GM) – FGMA Glazing Manual; Glass Association of North America.
 2. GANA (SM) – FGMA Sealant Manual; Glass Association of North America.
- D. Consumer Products Safety Commission, CPSC 16 CFR 1201 – Safety Standard for Architectural Glazing.

1.04 DEFINITIONS

- A. Sealed Insulating Glass Unit Surfaces:
1. Surface 1 – Exterior surface of outer pane.
 2. Surface 2 – Interior surface of outer pane.
 3. Surface 3 – Interior surface of inner pane.
 4. Surface 4 – Exterior surface of inner pane.

1.05 SYSTEM DESCRIPTION

- A. Design Requirements:
1. Size glass to withstand dead loads and positive and negative live loads acting normal to plane of glass, including increased loads at building corners, in accordance with 2015 IBC code.
 - a. Design wind load:
 - 1) Refer to Structural drawings for components and cladding design loads.
 - b. Size glass to withstand dead loads and positive and negative live loads acting normal to plane of glass to the design pressures listed above in accordance with ASTM E1300.
 2. Limit glass deflection to 3/4 inch or flexure limit of glass with full recovery of glazing materials, whichever is less.

1.06 SUBMITTALS

- A. Section 01 33 00 – Submittal Procedures.

- B. Product Data on Glass Types Specified: Provide structural, physical and environmental characteristics, size limitations, special handling or installation requirements.
- C. Product Data on Glazing Compounds: Provide chemical, functional, and environmental characteristics, limitations, special application requirements. Identify available colors.
- D. Manufacturer's Installation Instructions: Indicate special precautions required.
- E. Manufacturer's Certificate: Certify that products meet or exceed specified requirements.
- F. Provide material safety and data sheets on all products.
- G. Verification Samples:
 - 1. Flat Glass Materials: Two 12-inch by 12-inch samples of each glass type specified.
 - 2. Sealed Insulating Glass Units: Two 12-inch by 12-inch samples representative of unit construction.
- H. Quality Assurance/Control Submittals:
 - 1. Design Data: Glass size calculations, prepared in accordance with specified method.
 - 2. Certificates: Contractor's certification that:
 - a. Products of this section, as provided, meet or exceed specified requirements.
 - b. Fabricator of flat glass and sealed insulating glass meets specified qualifications.
 - c. Installer of products of this section meets specified qualifications.

1.07 QUALITY ASSURANCE

- A. Glazing Standards: Comply with recommendations of GANA Glazing Manual and GANA Sealant Manual, except where more stringent requirements are indicated. Refer to those publications for definitions of glass and glazing terms not otherwise defined in this section or other referenced standards.
- B. Safety Glazing Standard: Where safety glass is indicated or required by authorities having jurisdiction, provide type of products indicated which comply with testing requirements of CPSC 16 CFR Part 1201 for category II materials.
 - 1. Identification of Safety Glazing: Each pane of safety glazing installed in hazardous locations shall be identified in accordance with the building code.
- C. Single-Source Responsibility for Glass: To ensure consistent quality of appearance and performance, provide materials produced by a single manufacturer or fabricator for each kind and condition of glass indicated and composed of primary glass obtained from a single source for each type and class required.
- D. Qualifications:

1. Manufacturer, Flat Glass Materials: Minimum five (5) years of documented experience producing glass products specified in this section.
2. Fabricator of Flat and Sealed Insulating Glass: Minimum five (5) years of documented experience.
3. Installer: Minimum five (5) years of documented experience installing products specified in this section, and approved by fabricator.

1.08 ENVIRONMENTAL REQUIREMENTS

- A. Do not install glazing when ambient temperature is less than 50 degrees F.
- B. Maintain minimum ambient temperature before, during and 24 hours after installation of glazing compounds.

1.09 FIELD MEASUREMENTS

- A. Verify that field measurements are as indicated on Shop Drawings.

1.10 COORDINATION

- A. Coordinate the Work with glazing frames, wall openings and perimeter air and vapor seal to adjacent Work.

1.11 WARRANTY

- A. Section 01 70 00 – Execution and Closeout Requirements: Product warranties and product bonds.
- B. Provide ten (10) year warranty to include replacement of sealed glass units exhibiting seal failure, interpane dusting or misting.

PART 2 PRODUCTS

2.01 MANUFACTURERS

- A. Glass Manufacturers: Subject to compliance with requirements, provide products of one of the following manufacturers:
 1. Manufacturers of Flat Glass Materials:
 - a. Vitro Architectural Glass
 2. Manufacturers offering equivalent products include but are not limited to:
 - a. AGC Flat Glass
 - b. Pilkington
 3. Substitutions: Section 01 60 00 – Product Requirements.

2.02 GLASS FABRICATORS

- A. Subject to compliance with requirements, provide products on one of the following fabricators:
 - 1. Fabricators of Flat Glass Materials:
 - a. Cristacurva
 - b. Oldcastle Glass
 - c. Tristar Glass, Inc.
 - d. Trulite

2.03 GLASS PRODUCTS – GENERAL

- A. Primary Glass Standard: Provide primary glass which complies with ASTM C1036 requirements, including those indicated by reference to type, class, quality and if applicable, form, finish, mesh and pattern.
- B. Heat-Treated Glass Standard: Provide heat-treated glass which complies with ASTM C1048 requirements, including those indicated by reference to kind, condition, type, quality, class, and, if applicable, form, finish and pattern.
- C. Tempered Glass Standard: Provide tempered glass which complies with ASTM C1048 requirements, including those indicated by reference to kind, condition, type, quality, class, and, if applicable, form, finish, and pattern.
 - 1. Safety Glass: Furnish tempered glass conforming to CPSC 16 CFR 1201, Category II at locations where safety glass is required by the Code. Refer to the contract documents for the applicable code and year.
- D. Sizes: Fabricate glass to sizes required for glazing openings indicated, with edge clearances and tolerances complying with recommendations of glass manufacturer. Provide thicknesses indicated or, if not otherwise indicated, as recommended by glass manufacturer for application indicated.
- E. Provide the same exterior tinted glass from the same manufacturer.

2.04 GLASS COMPONENTS

- A. Safety Glass (Type SG): Conform to CPSC 16 CFR 120, Category II.
 - 1. Clear tempered glass (Type SG-CT): ASTM C1048, Kind FT fully tempered, Condition A, uncoated, Type 1 transparent flat, Class 1 clear, quality q3 glazing select; with horizontal tempering, 1/4 inch thick.
 - a. Manufacturer: Vitro Architectural Glass
 - b. Clear
 - 1) Visible light transmittance: 89%
 - 2) Shading coefficient: 0.94
 - 3) Solar heat gain coefficient: 0.81
 - 4) Summer U: 0.93
 - 5) Winter U: 1.02

2.05 SEALED INSULATING GLASS UNITS

- A. Fabricate units in accordance with ASTM E774, Class CBA, with components and performance characteristics specified.
- B. Insulated Glass Units, Type SIG-A:
 - 1. Outer Pane
 - a. Glass Type: Vitro Architectural Glass Optigray with Solarban 70 low-e coating on #2 surface
 - b. Glass Color: Gray
 - c. Glass Thickness: 1/4 inch
 - d. Heat Treating
 - 1) Fully tempered
 - 2. Air Space: 1/2 inch wide, hermetically sealed, argon-filled
 - 3. Inner Pane
 - a. Glass Type: Vitro Architectural Glass
 - b. Glass Color: Clear
 - c. Glass Thickness: 1/4 inch
 - d. Heat Treating
 - 1) Fully Tempered
 - 4. Performance Characteristics
 - a. Transmittance:
 - 1) Ultraviolet: 4 percent
 - 2) Visible: 47 percent
 - 3) Total Solar Energy: 18 percent
 - b. Exterior Reflectance:
 - 1) Visible light: 8 percent
 - c. U-Value:
 - 1) Winter nighttime: 0.28
 - 2) Summer daytime: 0.26
 - d. Shading Coefficient: 0.28
 - e. Solar Heat Gain Coefficient: 0.24
 - f. Light to solar gain: 1.96
 - 5. Provide unit edge seals meeting requirements of ASTM E773, with aluminum spacers having mitered and corners, and silicone sealant for glass-to-spacer seals.

2.06 MISCELLANEOUS GLAZING MATERIAL

- A. Compatibility: Provide materials with proven record of compatibility with surfaces contacted in installation.
- B. Cleaners, Primers and Sealers: Type recommended by sealant or gasket manufacturer.
- C. Setting Blocks: ASTM C864, neoprene, 80 to 90 Shore A durometer hardness; length 4 inches, width of glazing rabbet space less 1/16-inch, height required for glazing method, pane weight and pane area.
- D. Spacer shims: ASTM C864, neoprene, 50 to 60 Shore A durometer hardness; length 3 inches, one half height of glazing stop, thickness required for application, one face self-adhesive.
- E. Glazing Gaskets: ASTM C864, resilient polyvinyl chloride, extruded shape to fit glazing channel retaining slot; black color.
- F. Glazing Clips: Manufacturer's standard type.
- G. Sealants: Specified in Section 07 90 00.
- H. Silicone Polyester Enamel: Type recommended by flat glass materials manufacturer; color selected by Architect.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verify that openings for glazing are correctly sized and within tolerance.
- B. Verify that surfaces of glazing channels or recesses are clean, free of obstructions and ready to receive glazing.

3.02 PREPARATION

- A. Clean contact surfaces with solvent and wipe dry.
- B. Seal porous glazing channels or recesses with substrate compatible primer or sealer.

3.03 GLAZING – GENERAL

- A. Comply with combined recommendations of manufacturers of glass, sealants, gaskets and other glazing materials, except where more stringent requirements are indicated, including those in referenced glazing publications.
- B. Glazing channel dimensions as indicated on Drawings provide necessary bite on glass, minimum edge and face clearances, and adequate sealant thicknesses, with reasonable tolerances. Adjust as required by Project conditions during installation.
- C. Protect glass from edge damage during handling and installation as follows:
 - 1. Use a rolling block in rotating glass units to prevent damage to glass corners. Do not impact glass with metal framing. Use suction cups to shift glass units within openings; do not raise or drift glass with a pry bar. Rotate glass lites with flares or

bevels on bottom horizontal edges so edges are located at top of opening, unless otherwise indicated by manufacturer's label.

2. Remove damaged glass from Project site and legally dispose of offsite. Damaged glass is glass with edge damage or other imperfections that, when installed, weaken glass and impair performance and appearance.
- D. Apply primers to joint surfaces where required for adhesion of sealants, as determined by preconstruction sealant-substrate testing.
- E. Install elastomeric setting blocks in sill rabbets, sized and located to comply with referenced glazing standard, unless otherwise required by glass manufacturer. Set blocks in thin course of compatible sealant suitable for heel bead.
- F. Do not exceed edge pressures stipulated by glass manufacturers for installing glass lites.
- G. Provide spacers for glass sizes larger than 50 united inches (length plus height) as follows:
1. Locate spacers inside, outside and directly opposite each other. Install correct size and spacing to preserve required face clearances, except where gaskets and glazing tapes are used that have demonstrated ability to maintain required face clearances and comply with system performance requirements.
 2. Provide 1/8-inch minimum bite of spacers on glass and use thickness equal to sealant width. With glazing tape, use thickness slightly less than final compressed thickness of tape.
- H. Provide edge blocking to comply with requirements of referenced glazing publications, unless otherwise required by glass manufacturer.
- I. Set glass lites in each series with uniform pattern, draw, bow and similar characteristics.
- J. Where wedge-shaped gaskets are driven into one side of channel to pressurize sealant or gasket on opposite side, provide adequate anchorage so gasket cannot walk out when installation is subjected to movement.

3.04 INSTALLATION

- A. Install sealants in accordance with sealant manufacturer's written instructions and recommendations.
- B. Gasket Glazing (Dry):
1. Fabricate compression gaskets in lengths recommended by gasket manufacturer to fit openings exactly, with stretch allowance during installation.
 2. Secure compression gaskets in place with joints located at corners to compress gaskets producing a weathertight seal without developing bending stresses in glass. Seal gasket joints with sealant recommended by gasket manufacturer.
 3. Install gaskets so they protrude past face of glazing stops.

- C. Installation of glazing in interior aluminum frames and sliding glass doors is specified in Section 08 11 16.
- D. Installation of glazing in aluminum-framed entrances and storefronts is specified in Section 08 41 13.
- E. Installation of glazing in sliding automatic entrances is specified in Section 08 42 29.

3.05 CLEANING

- A. Clean work under provisions of Section 01 70 00.
- B. Remove glazing materials from finish surfaces.
- C. Remove labels after work is complete.
- D. Clean glass.

3.06 PROTECTION OF FINISHED WORK

- A. After installation, mark pane with an "X" by using removable plastic tape or paste.

3.07 GLASS SCHEDULE

EXTERIOR GLASS

- EXT- GLA At all aluminum doors provide Glass Type SIG-A/
- EXT- GLB At all exterior storefront frames provide Glass Type SIG-A.
- EXT- GLC At exterior sliding automatic entrances provide Glass Type SIG-A

INTERIOR GLASS

- INT- GLA At all interior aluminum framing provide Glass Type SG-CT.
- INT- GLB At all interior sliding glass doors and frames provide Glass Type SG-CT.
- INT- GLC At interior sliding automatic entrance provide Glass Type SG-CT.

END OF SECTION

SECTION 08 91 19 – FIXED LOUVERS

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Fixed louvers and frames.
 - 1. Stationary type, horizontal, wind-driven, rain-resistant style blades.
- B. Bird screening.

1.02 RELATED SECTIONS

- A. Section 07 27 26 – Fluid-Applied Membrane Air Barrier: Tying air barrier membrane to louver.
- B. Section 07 90 00 – Joint Protection: Sealant at louver perimeter.
- C. Section 23 31 00 – HVAC Ducts and Casings: Ductwork attachment to louver.

1.03 REFERENCES

- A. Air Movement and Control Association International Inc.
 - 1. AMCA 500-L (Air Movement Control Association) – Test Method for Louvers, Dampers, and Shutters.
- B. ASTM International:
 - 1. ASTM A666 – Standard Specification for Austenitic Stainless Steel Sheet, Strip Plate and Flat Bar.
 - 2. ASTM B209 – Standard Specification for Aluminum and Aluminum-Alloy Sheet and Plate.
 - 3. ASTM B221 – Standard Specification for Aluminum and Aluminum-Alloy Extruded Bars, Rods, Wire, Shapes, and Tubes.

1.04 PERFORMANCE REQUIREMENTS

- A. Louver:
 - 1. Louvers shall meet the performance requirements established by the AMCA 500L test procedure.
 - 2. Louvers shall bear the AMCA Certified Ratings Seal for Water Penetration, Air Performance and Wind Driven Rain.
 - 3. Louvers shall have a minimum free area of 40 percent based on the standard 48 in W x 48 in H test specimen.
 - 4. Louvers shall be not less than 99 percent effective against wind-driven rain when

subjected to a rainfall rate of 3 inches per hour and a wind speed of 29 miles per hour.

a. The beginning point of water penetration shall be greater than 1,250 feet per minute free area velocity.

5. Frame:

a. Depth: Minimum 4 inches.

b. Thickness: Minimum .081 inch.

6. Blade:

a. Thickness: Minimum .063 inch.

7. Louvers shall withstand wind loadings of minimum 25 lbs./sq.ft.

1.05 SUBMITTALS

A. Submit under provisions of Section 01 33 00 – Submittal Procedures.

B. Shop Drawings: Indicate louver layout plan and elevations, opening and clearance dimensions, tolerances; head, jamb and sill details; blade configuration, screens, and frames.

C. Product Data: Provide data describing design characteristics, maximum recommended air velocity, design free area, materials and finishes.

D. Samples: Submit two 4 inch x 4 inch metal samples, illustrating finish and color.

E. Manufacturer's Certificate: Certify products meet or exceed specified requirements.

1.06 QUALITY ASSURANCE

A. Perform Work in accordance with AMCA Certification for water penetration, air performance, and wind driven rain, in compliance with AMCA 500-L. Attach AMCA seal to each louver.

1.07 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing Products specified in this section with minimum three years of experience.

1.08 FIELD MEASUREMENTS

A. Verify field measurements prior to fabrication.

1.09 COORDINATION

A. Coordinate work under provisions of Section 01 30 00 – Administrative Requirements.

B. Coordinate the Work with installation of:

1. Masonry Veneer
- C. Coordinate the Work with installation of mechanical ductwork.

PART 2 PRODUCTS

2.01 MANUFACTURERS AND PRODUCTS

- D. Acceptable Manufacturers and Products: Subject to compliance with requirements of Contract Documents, provide product by one of the manufacturers named below. If not named, submit as a substitution according to Conditions of the Contract and appropriate Division 1 sections.
1. Airo-lite; SCH401 (Storm Class Horizontal)
 2. Greenheck Louvers; EHH401
 3. Ruskin Louvers; EME420DD

2.02 MATERIALS

- A. Aluminum: 6063 alloy, T5/T6 temper; extruded shape.

2.03 SCREENS

- A. Bird Screen: .625" (5/8") to .75" (3/4") by .040 to .050 inch flattened expanded aluminum, in removable frame. Provide at all louvers.
- B. Bird screen shall be mounted in the same frame. Mount screen on the rear of the louver.

2.04 ACCESSORIES

- A. Fasteners and Anchors: Aluminum or stainless steel type.
- B. Primer: Zinc chromate, alkyd type.
- C. Extended Sill Flashings: Of same material as louver frame.
- D. Sealants: Type specified in Section 07 90 00.
- E. Clip Angles: 1-1/2 inches by 1-1/2 inches by 1/8 aluminum angles.

2.05 FABRICATION

- A. Louver Frame: Minimum 4 inches deep, minimum .081 inch thick extruded aluminum.
- B. Louver Blade Design: Material thickness of minimum .063 inch extruded aluminum.
1. Horizontal rain resistant blades.
- C. Louver Frame:

1. Louver head shall incorporate front drain gutter to channel water to the louver side frame or jambs where water is channeled through vertical downspouts and out the integral sill.
- D. Sill Flashings: Roll formed or Extruded to required shape, single length in one piece per location.
- E. Screens: Louver shall be equipped with a framed, removable rear mounted bird screen.
- F. Each factory assembled louver section shall be designed to withstand wind loadings of minimum 25 pounds per square foot.
- G. At louver head and jambs not installed within curtain wall framing provide a continuous 0.125 inch aluminum channel with 1 inch flanges. Cope and seal corners. Channel shall be welded to the louver frame.

2.06 FACTORY FINISHES

- A. Clear Anodized Aluminum Surfaces: AA-C21A41 non-specular as fabricated mechanical finish, medium matte chemical finish, and Architectural Class I 0.7 mils (0.018 mm) clear anodized coating.
 1. Conform to AAMA 611.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verify site conditions under provisions of Section 01 30 00 – Administrative Requirements: Coordination and Project conditions.
- B. Verify that prepared openings are ready to receive work and opening dimensions are as indicated on Shop Drawings.

3.02 INSTALLATION

- A. Install louver assembly in accordance with manufacturer's instructions.
- B. Install louvers level and plumb.
- C. Install flashings and align louver assembly to ensure moisture shed from flashings and diversion of moisture to exterior.
- D. Secure louvers in opening framing with exposed fasteners and aluminum clip angles.
- E. Install bird screen and frame to interior of louver.
 1. Install bird screens at all intake, combustion air and exhaust louvers.
- F. Install perimeter sealant and backing rod in accordance with Section 07 90 00.

3.03 ADJUSTING

- A. Adjust work under provisions of Section 01 70 00 – Execution and Closeout Requirements: Testing, adjusting and balancing.

3.04 CLEANING

- A. Clean work under provisions of Section 01 70 00 – Execution and Closeout Requirements: Final cleaning.
- B. Strip protective finish coverings.
- C. Clean surfaces and components.

3.05 SCHEDULE

NAME	SIZE	TYPE	AIR VOLUME (CFM)	MINIMUM FREE AREA (SF)	MAX FACE VELOCITY (FPM)	MAXIMUM PRESSURE DROP (IN H2O)
L1	36"x12"	INTAKE	200	1.2	175	0.05

END OF SECTION

SECTION 09 21 16 – GYPSUM BOARD ASSEMBLIES

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Paper Faced Gypsum Board.
- B. Glass-Mat Gypsum Board.
- C. Tile Backer Board.
- D. Drywall Suspension System.
- E. Trim Accessories and Reveals.
- F. Acoustical Sealants and Acoustic Spray.
- G. Acoustic Insulation.
- H. Mold and Moisture Resistant Joint Treatment.

1.02 RELATED SECTIONS

- A. Section 05 40 00 – Cold-Formed Metal Framing: Securing gypsum wallboard to metal framing.
- B. Section 06 10 53 – Miscellaneous Carpentry: Wood blocking for support of fixtures, equipment and trim.
- C. Section 06 16 43 – Gypsum Sheathing: Glass-faced sheathing.
- D. Section 07 21 16 – Blanket Insulation: Thermal insulation.
- E. Section 07 84 00 – Firestopping: Sealing penetrations in fire-rated assemblies with firestopping.
- F. Section 07 90 00 – Joint Protection.
- G. Section 08 31 13 – Access Doors and Frames: Metal access panels.
- H. Section 09 22 16 – Non-Structural Metal Framing: Metal stud framing for walls, partitions, furring, soffits and ceilings.
- I. Section 09 30 00-Tile: Securing tile to tile backer board.
- J. Section 09 72 10-Wall Coverings: Providing a level 4 finish at walls scheduled to receive wall coverings.
- K. Section 09 90 00 – Painting and Coating: Painting gypsum wall board.

1.03 ASSEMBLY PERFORMANCE REQUIREMENTS

- A. Sound Transmission Characteristics: For gypsum board assemblies with STC ratings, provide materials and construction identical to those of assemblies whose STC ratings were determined according to ASTM E90 and classified according to ASTM E413 by a qualified independent testing agency.
- B. Fire Resistance: Provide gypsum board assemblies with fire-resistance ratings indicated.

1.04 REFERENCES

- A. ASTM International:
 - 1. ASTM C475 – Standard Specification for Joint Compound and Joint Tape for Finishing Gypsum Board.
 - 2. ASTM C635 – Standard Specification for Manufacture, Performance, and Testing of Metal Suspension Systems for Acoustical Tile and Lay-In Panel Ceilings.
 - 3. ASTM C636 -Standard Practice for Installation of Metal Ceiling Suspension Systems for Acoustical Tile and Lay-In Panels.

 - 7. ASTM C834 – Standard Specification for Latex Sealants.
 - 8. ASTM C840 – Standard Specification for Application and Finishing of Gypsum Board.
 - 9. ASTM C919 – Standard Practice for Use of Sealants in Acoustical Applications.
 - 10. ASTM C954 – Standard Specification for Steel Drill Screws for the Application of Gypsum Panel Products or Metal Plaster Bases to Steel Studs from 0.033 in. to 0.112 in. in Thickness.
 - 11. ASTM C1002 – Standard Specification for Steel Drill Screws for the Application of Gypsum Board or Metal Plaster Bases.
 - 12. ASTM C1047-Standard Specification for Accessories for Gypsum Wallboard and Gypsum Veneer Base.
 - 13. ASTM C1178 – Standard Specification for Coated Glass Mat Gypsum Backing Panel.
 - 14. ASTM C1396 – Standard Specification for Gypsum Board.
 - 15. ASTM C1658 – Standard Specification for Glass Mat Gypsum Panels.

16. ASTM D3273 – Standard Test Method for Resistance to Growth of Mold on the Surface of Interior Coatings in an Environment Chamber.
 17. ASTM D3274 – Standard Test Method for Evaluating Degree of Disfigurement of Paint Films by Microbial (Fungal or Algal) Growth or Soil and Dirt Accumulation.
 18. ASTM E84 – Standard Test Method for Surface Burning Characteristics of Building Materials.
 19. ASTM E90 – Standard Test Method for Laboratory Measurement of Airborne-Sound Transmission Loss of Building Partitions.
 20. ASTM E119 – Standard Test Methods for Fire Tests of Building Construction and Materials.
 21. ASTM E413-Classification for Rating Sound Insulation.
- B. Gypsum Association (GA):
1. GA-214 – Recommended Specification: Levels of Gypsum Board Finish.
 2. GA-216 – Recommended Specifications for the Application and Finishing of Gypsum Board.
 3. GA-600 – Fire Resistance Design Manual.
- C. Underwriters Laboratories, Inc.
1. UL Fire Resistance Directory, Current Edition.
- D. Intertek Testing Services:
1. WH (Warnock Hersey) – Certification Listings.
- 1.05 PERFORMANCE CHARACTERISTICS
- A. Acoustic Attenuation for Identified Interior Partitions: Refer to Drawings for STC values in accordance with ASTM E90.
- 1.06 SUBMITTALS
- A. Section 01 33 00 – Submittal Procedures.
- B. Manufacturer’s Literature and Data:
1. Cornerbead, edge trim and aluminum reveals.
 2. Ceiling Suspension System.
 3. Finishing materials.

- a. Provide product data for mold and moisture resistant joint compound and test reports performance under ASTM D3273 and D3274.
- 4. Gypsum board, each type.
- C. Test Results:
 - 1. Fire rating text, each fire rating required for each assembly.

1.07 QUALITY ASSURANCE

- A. Finishing Materials: Obtain finishing materials from either the same manufacturer that supplies gypsum board and other panel products or from a manufacturer acceptable to gypsum board manufacturer.
- B. Fire-Test-Response Characteristics: Where fire-resistance-rated gypsum board assemblies are indicated, provide gypsum board assemblies that comply with the following requirements:
 - 1. Fire-Resistance Ratings: As indicated by GA File Numbers in GA-600 "Fire Resistance Design Manual" or design designations in UL "Fire Resistance Directory" or in the listing of another testing and inspecting agency acceptable to authorities having jurisdiction.
 - 2. Gypsum board assemblies indicated are identical to assemblies tested for fire resistance according to ASTM E119 by an independent testing and inspecting agency acceptable to authorities having jurisdiction.
- C. Perform work in accordance with GA-214, GA-216 and ASTM C840.
- D. For fire-rated assemblies perform work in accordance with the UL Fire-Resistance Directory.

1.08 PRODUCT DELIVERY, STORAGE AND HANDLING

- A. Deliver materials to the project site with manufacturer's labels intact and legible. Handle materials with care to prevent damage to edges or surfaces.
- B. Store materials indoors under cover, stacked flat to prevent sagging and off the floor, protected from weather, direct sunlight, surface contamination and damage from construction traffic or other causes.
- C. Store adhesives in dry area and protect against freezing.

1.09 PROJECT CONDITIONS

- A. Environmental Conditions, General: Establish and maintain environmental conditions for applying and finishing gypsum board to comply with ASTM C840 requirements or gypsum board manufacturer's recommendations, whichever are more stringent.
- B. Maintain a room temperature of not less than 40 degrees F for mechanical attachment of gypsum board. For finishing of gypsum board, maintain not less than 50 degrees F (10

degrees C) for 48 hours before application and continuously after until dry. Do not exceed 95 degrees F (35 degrees C) when using temporary heat sources.

- C. Ventilation: Ventilate building spaces as required to dry joint treatment materials. Avoid drafts during hot, dry weather to prevent finishing materials from drying too rapidly.

1.10 MOCK-UP

- A. Section 01 40 00 – Quality Requirements: Requirements for mock-up.
- B. Construct mock-up, 12 feet by 10 feet, including aluminum reveals, joint tape and taping, and bedding compound for Level Four finish. Install panels vertically.
- C. Locate where directed by Architect/Engineer.
- D. Incorporate accepted mock-up as part of Work.

1.11 PRE-INSTALLATION MEETINGS

- A. Section 01 30 00 – Administrative Requirements: Pre-installation meeting.
- B. Convene minimum two weeks prior to commencing work of this section.

PART 2 PRODUCTS

2.01 GYPSUM BOARD PRODUCTS

- A. General: Provide gypsum board of types indicated in maximum lengths available that will minimize end-to-end butt joints in each area indicated to receive gypsum board application.

Note: The use of gypsum wallboard imported, marketed or distributed by a foreign manufacturer will not be allowed.

- 1. Widths: Provide gypsum board in widths of 48 inches and minimum lengths of 120 inches.
- B. Paper Faced Gypsum Wall Board: Fire-resistive Type X, ASTM C1396 and as follows:
 - 1. Acceptable Manufacturers and Products: Subject to compliance with requirements of Contract Documents, provide products by one of the manufacturers listed below, in accordance with UL Design Number U465 for one-hour fire-rated wall assemblies, and non-rated assemblies unless otherwise noted.
 - a. Georgia-Pacific Gypsum, LLC: ToughRock Fireguard X.
 - b. National Gypsum Co.: Gold Bond Fire-Shield Gypsum Board.
 - c. United States Gypsum Co.: Sheetrock Brand Firecode X Panels.
 - 2. Edges: Tapered and featured (rounded or beveled) for prefilling.
 - 3. Thickness 5/8 inch, unless otherwise indicated.

4. Use:
 - a. Base layer at single layer application.
 - b. At ceilings.
- C. Glass Mat, Water-Resistant Mold-Resistant Interior Wall Panel: Coated inorganic glass mat-faced, water-resistant, treated core gypsum wall board.
 1. Acceptable Manufacturers and Products: Subject to compliance with requirements of contract documents, provide products by one of the manufacturers listed below, in accordance with UL Design Number U465 for one-hour fire-rated wall assemblies, and non-rated assemblies.
 - a. Georgia-Pacific Gypsum, LLC: DensArmor Plus Fireguard Interior Panel.
 - b. National Gypsum Company: Gold Bond Brand eXP Fire- Shield Interior Extreme Gypsum Panel.
 - c. USG: Sheetrock Brand Glass-Mat Interior Panels Mold Tough Firecode X.
 2. Standards:
 - a. ASTM C1658 – Standard Specification for Glass Mat Gypsum Panels.
 3. Resists the growth of mold when tested, as manufactured, according to ASTM D3273.
 - a. Panel shall have a score of 10.
 4. Exposure Warranty: Minimum 12 months.
 5. Type: Type X.
 6. Size:
 - a. Thickness: 5/8 inch.
 - b. Width: 4'-0".
 - c. Length: 10'-0".
 7. Edges: Tapered.
 8. Use mold- and moisture-resistant joint treatments with this board.
 9. Use:
 - a. Continuous 3 inch high strip at base of walls where paper faced gypsum board is installed.
- D. Tile Backer Board: Water-resistant treated core with glass mat moisture-protectant coating and glass mats, both sides. The face is surfaced with heat-cured copolymer water-resistant coating.
 1. Acceptable Manufacturers and Products: Subject to compliance with requirements of contract documents, provide products by one of the

manufacturers listed.

- a. Georgia-Pacific Gypsum, LLC: DensShield Fireguard Tile Backer.
- b. National Gypsum Company: Gold Bond Brand eXP Fireshield Tile Backer, Type X.
- c. USG: Durock Brand Glass-Mat Tile Backer Board, Type X.

2. Standards:

- a. ASTM C1178 – Standard Specification for Coated Glass Mat Water-Resistant Gypsum Backing Panel.

3. Resists the growth of mold when tested, as manufactured, according to ASTM D 3273.

- a. Panel shall have a score of 10.

4. Type: Type X.

5. Size:

- a. Thickness: 5/8 inch.
- b. Width: 4'-0".
- c. Length: 8'-0".

6. Use mold and moisture resistant joint treatments with this board. Where tile is installed use mortar used to set tile to treat fasteners and panel joints.

7. Use: Base layer at single layer application.

2.02 DRYWALL SUSPENSION SYSTEM

- A. General: Provide components complying with ASTM C754 for conditions indicated.
- B. Wire Hangers: ASTM A641, Class 1 zinc coating, soft temper, 12 gauge diameter.
- C. Grid Suspension System for Interior Ceilings: ASTM C635, manufacturer's standard hot-dipped galvanized direct-hung grid suspension system composed of main beams and cross-furring members than interlock to form a modular supporting network.

1. USG Drywall Suspension System

- a. Class: Heavy Duty
- b. Main Tee: DGLW-26 – 12-foot length, 1-1/2 inch face
- c. Cross Tee: DGLW424 – 4-foot length, 1-1/2 inch face.
 - 1) DGLW224, 2 foot long accessory cross tee, 1-1/2 inch face
- d. Molding: DGWM-24, 1 inch by 1-1/2 inch by 12 feet long
- e. DGSC-180 splice clip, for joining two in-line main tees field cut to length, or for joining two grid tees intersecting off module.

2. Substitutions: Products from the following manufacturers may be submitted:

- a. Armstrong Drywall Grid System.

2.03 TRIM ACCESSORIES

- A. Accessories for Interior Installation: Cornerbead, edge trim and control joints complying with ASTM C1047 and requirements indicated below:

1. Material: Formed metal or plastic, with metal complying with the following requirement:
 - a. Steel sheet zinc coated by hot-dip process or rolled zinc.
2. Shapes indicated below by referenced to Fig. 1 designations in ASTM C1047:
 - a. Cornerbead on outside corners, unless otherwise indicated.
 - b. L-bead with face flange only; face flange formed to receive joint compound. Use L-bead at window openings, door openings, casements and where indicated.
 - c. One-piece control joint formed with V-shaped slot and removable strip covering slot opening equal to USG 093.

- B. Aluminum Reveals:

1. Basis of Design: Contract documents are based on product from Fry Reglet Architectural Metals to establish a standard of quality. Substitutions are permitted in accordance with Section 01 60 00.
 - a. Material: Extruded aluminum alloy 6063 T5.
2. Products:
 - a. Refer to drawings for model numbers and finish. Snap-in reveals.
 - 1) Provide snap-in reveal where vinyl wallcovering and/or vinyl wall protection is shown on Drawings.
 - b. Corner trim: As required.
 - c. Accessories:
 - 1) Factory-fabricated "T," "L," "+" intersections for horizontal and vertical joints, and/or outside and inside corners. Joints shall be mitered in the factory and heliarc welded with 6-inch-long legs. Finish to match reveals.
 - 2) End caps: As required.

2.04 JOINT TREATMENT MATERIALS

- A. General: Provide joint treatment materials complying with ASTM C475 and the recommendations of both the manufacturers of sheet products and of joint treatment materials for each application indicated.
- B. Joint Tape for Gypsum Board:

1. 2 inch wide 10 by 10 glass fiber mesh tape.(all)
- C. Setting-Type Joint Compounds manufactured to ASTM C475. Factory-packaged, mold and moisture resistant, job-mixed, chemical-hardening powder products formulated for uses indicated.
1. Where setting-type joint compounds are indicated as a taping compound only or for taping and filling only, use formulation that is compatible with other joint compounds applied over it.
 2. Prefilling: At open joints, rounded or beveled panel edges, damaged surfaces, and laminating gypsum boards together.
 3. Gypsum board installed in non-tile, non-wet areas, scheduled for painting:
 - a. Embedding and first coat: For embedding glass fiber tape and first coat on joint fasteners and trim flanges, use setting-type taping compound.
 - b. Fill coat: For second coat use setting-type, sandable topping compound.
 - c. Finish coat: For third coat, use setting-type, sandable topping compound.
- D. Tile backer board:
1. At tile backer board installed in areas scheduled to be tiled, imbed glass fiber tape in mortar used to install tile. Refer to Section 09 30 00 – Tiling.

2.05 ACOUSTICAL SEALANT AND SPRAY

- A. Acoustical Sealant for Exposed and Concealed Joints: Manufacturer's standard non-sag, paintable, non-staining latex sealant complying with ASTM C834, ASTM C919 and the following requirements.
1. Product is effective in reducing airborne sound transmission through perimeter joints and openings in building construction as demonstrated by testing representative assemblies according to ASTM E90.
- B. Products: Subject to compliance with requirements, provide one of the following:
1. Acoustical Sealant for Exposed and Concealed Joints:
 - a. AC-20 FTR (fire and temperature rated) Acoustical and Insulation Sealant; Pecora Corp.; VOC content 31 g/L < 250 g/L.
 - b. Sheetrock Brand Acoustical Sealant; United States Gypsum Co.; VOC content 15 g/L < 250 g/L.
 - c. Tremco Acoustical Sealant, VOC content 150 g/L < 250 g/L.
 2. Acoustic spray for Head of Wall Exposed and Concealed Joints:
 - a. Hilti CP 572 Smoke and Acoustic Spray: VOC content 91 g/L < 250 g/L.
 - 1) Sound transmission classification: STC 56.
 - 2) Flame spread/Smoke developed: 10/5.
 - 3) Spary shall be mold and mildew resistant per ASTM G21 with a rating of zero (0) no growth.

- 4) Spray has a movement capability of 12.5 percent.
- 5) Accessories:
 - a) CP 767 Speed Strips.
 - b) CP 777 Speed Plugs
 - c) Mineral wool.

2.06 ACOUSTIC INSULATION

- A. ASTM C665, Type 1; friction fit type, unfaced, cut to fit stud spacing.
 - 1. Thickness:
 - a. 3 1/2 inches at 3 5/8 inch metal studs.
 - b. 6 inches at 6 inch metal studs.
 - 2. Facing: Unfaced.
 - 3. Flame/smoke properties: 25/450 in accordance with ASTM E84.
 - 4. Material shall be formaldehyde free.
 - 5. Products/Manufacturer:
 - a. Certainteed sustainable insulation CertaPro AcoustaTherm Batts, Certainteed Corporation.
 - b. Unfaced formaldehyde-free batt insulation, Johns Manville.
 - c. EcoTouch Pink Fiberglass Insulation, Owens Corning
 - d. Substitutions per Section 01 60 00.

2.07 MISCELLANEOUS MATERIALS

- A. General: Provide auxiliary materials for gypsum board construction that comply with referenced standards and recommendations of gypsum board manufacturer.
- B. Gypsum Board Screws: Self-drilling, self-tapping steel screws.
 - 1. For steel framing less than 0.03 inch thick, comply with ASTM C1002.
 - 2. For steel framing from 0.033 inch thick to 0.112 inch thick, comply with ASTM C954.
 - 3. Provide Type S or Type S-12 screws, rust resistant, lengths as required to suit application as noted below:
 - a. Where securing one layer of 5/8 inch Type "X" gypsum wallboard to framing: Provide 1 inch long steel screws unless noted otherwise.
 - b. Where securing tile backer board to framing: Provide type of screw and minimum length as recommended by board manufacturer.
- C. Sealant:
 - 1. ASTM C920, Type S, Grade NS, Class 25, Use NT, Use 1, Use M, Use G. Flexible mildew-resistant 100% silicone sealant.

2. Manufacturers/products:
 - a. Laticrete/Latasil VOC content 37.16 g/L < 250 g/L.
 - b. Sealing joints in glass-faced tile backing board.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Examine substrates to which gypsum board assemblies attach or abut, installed hollow metal frames, and structural framing, with installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of assemblies specified in this Section. Do not proceed with installation until unsatisfactory conditions have been corrected.

3.02 INSTALLATION OF STEEL FRAMING FOR SUSPENDED AND FURRED CEILINGS

- A. Install in accordance with ASTM C636.
- B. Suspend ceiling hangers from building structural members and as follows:
 1. Install hangers plumb and free from contact with insulation or other objects within ceiling plenum that are not part of supporting structural or ceiling suspension system. Splay hangers only where required to miss obstructions and offset resulting horizontal forces by bracing, countersplaying or other equally effective means.
 2. Where width of ducts and other construction within ceiling plenum produces hanger spacings that interfere with the location of hangers required to support standard suspension system members, install supplemental suspension members and hangers in form of trapezes or equivalent devices. Size supplemental suspension members and hangers to support ceiling loads within performance limits established by referenced standards.
 3. Secure wire hangers by looping and wire-tying, either directly to structures or to inserts, eyescrews or other devices and fasteners that are secure and appropriate for substrate and in a manner that will not cause them to deteriorate or otherwise fail.
 4. Do not support ceilings directly from permanent metal forms. Furnish cast-in-place hanger inserts that extend through forms.
 5. Do not attach hangers to steel deck tabs.
 6. Do not attach hangers to steel roof deck. Attach hangers to structural members.
 7. Do not connect or suspend steel framing from ducts, pipes or conduit.
- C. Sway-brace suspended steel framing with hangers used for support.
- D. Install suspended steel framing components in sizes and at spacings indicated, but not less than that required by the referenced steel framing installation standard.

1. Grid Suspension System:
 - a. Wire Hangers: Maximum 48 inches o.c. At ceilings where tile backer board is installed, install wire hangers at maximum 36 inch o.c.
 - b. Main Beams: Maximum 48 inches o.c.
 - c. Cross Furring Members (Furring Members): Maximum 16 inches o.c.
- E. Installation Tolerances: Install steel framing components for suspended ceilings so that cross-furring or grid suspension members are level to within 1/8 inch in 12 feet (3 mm in 3.6 m) as measured both lengthwise on each member and transversely between parallel members.
- F. Grid Suspension System: Attach perimeter wall track or angle where grid suspension system meets vertical surfaces. Mechanically join main beam and cross-furring members to each other and butt-cut to fit into wall track.

3.03 APPLYING AND FINISHING GYPSUM BOARD – GENERAL

- A. Gypsum Board Application and Finishing Standards: Install and finish gypsum panels to comply with ASTM C840, GA-214, GA-216 and UL assembly numbers.
- B. Confirm sound-attenuation blankets have been installed where indicated prior to installing gypsum panels unless blankets are readily installed after panels have been installed on one side.
- C. Install ceiling board panels perpendicular to framing members spaced at 16 inches o.c. and across framing to minimize the number of abutting-end joints and to avoid abutting-end joints in the central area of each ceiling. Stagger abutting-end joints of adjacent panels not less than one framing member. Install gypsum and/or tile backer board panels on ceiling before wall/partition board application.
- D. Install gypsum panels with face side out. Do not install imperfect, damaged or damp panels. Butt panels together for a light contact at edges and ends with not more than 1/16 inch of open space between panels. Do not force into place.
- E. Locate both edge or end joints over supports, except in ceiling applications where intermediate supports or gypsum board back-blocking is provided behind end joints. Do not place tapered edges against cut edges or ends. Stagger vertical joints on opposite sides of partitions. Avoid joints other than control joints at corners of framed openings where possible.
- F. Attach gypsum panels to steel studs so leading edge or end of each panel is attached to open (unsupported) edges of stud flanges first.
- G. Attach gypsum panels to framing provided at openings and cutouts.
- H. Form and install control and expansion joints at locations indicated and as follows with space between edges of adjoining gypsum panels, as well as supporting framing behind gypsum panels:
 1. Ceilings: Install joints in ceilings exceeding 900 square feet in area. The distance between ceiling control joints shall not exceed 30 feet in either direction. Install control joints where ceiling framing or furring changes direction.

2. Partitions, walls and wall furring: Install joints in partitions, walls and wall furring with runs exceeding 30 feet. Distance between control joints shall not exceed 30 feet, and control joints shall be installed where an expansion joint occurs in the base exterior wall.
 3. At all door frames, provide control joints at each corner of the door frame and extend joints from top of frame up to bottom of structure/ deck. At all door frames located in interior partitions, locate control joints on both sides of partitions. At door frames on exterior walls provide control joints on interior side.
 4. At all window frames, provide control joints at each corner, starting at the floor line and extending up to the structure. At all window frames located in interior partitions, locate control joints on both sides of partitions and extend up to bottom of structure/deck. At window frames on exterior walls provide control joints on interior side.
- I. Cover both faces of steel stud partition framing with gypsum panels in concealed spaces (above ceilings, etc.), except in chassis that are braced internally.
1. Except where concealed application is indicated or required for sound, fire, air or smoke ratings, coverage may be accomplished with scraps of not less than 8 sq. ft. in area.
 2. Fit gypsum panels around ducts, pipes and conduits.
 3. Where partitions intersect steel beams, steel joists, and other structural members projecting below underside of roof decks, cut gypsum panels to fit profile formed by beams, joists, and other structural members; allow 1/2 inch wide joints to install sealant. Where partitions intersect the bottom of roof decks, cut gypsum wallboard to the profile of the deck; allow 1/2 inch wide joints to install sealant.
- J. At non-rated, non-load-bearing partitions that extend to the underside of the roof deck, isolate perimeter of the gypsum board partitions at structural abutments and roof deck, as detailed. Provide 1/2 inch wide spaces at these locations. Seal joints between abutting structural surfaces, roof deck etc. with acoustical sealant, unless otherwise noted.
- K. At fire-rated non-load-bearing partitions, terminate the gypsum panels 1/2 inch below the bottom/sides/top of beams, joists, roof deck. Refer to UL head wall assemblies HW-D-0042 and HW-D-0049 for steel decks in the UL Fire Resistance Directory.
- L. Where STC-rated gypsum board assemblies are indicated, seal construction at perimeters, behind control and expansion joints, openings and penetrations with a continuous bead of acoustical sealant including a bead at both faces of the partitions. Comply with ASTM C919 and manufacturer's recommendations for location of edge trim and closing off sound flanking paths around or through gypsum board assemblies, including sealing partitions above acoustical ceilings.
- M. Space fasteners in gypsum panels according to referenced gypsum board application and finishing standard and manufacturer's recommendations.
1. Space screws a maximum of 12 inches o.c. for vertical applications.
 2. At fire-rated partitions, space fasteners in conformance with specified UL Design

Numbers.

- N. Space fasteners in panels that are tile substrates a maximum of 6 inches o.c.

3.04 GYPSUM BOARD APPLICATION METHODS

- A. Single-Layer Application: Install gypsum wallboard panels as follows:

1. On ceilings, apply gypsum panels prior to wall/partition board application to the greatest extent possible and at right angles to framing, unless otherwise indicated.
2. On partitions/walls, apply gypsum panels vertically (parallel to framing), and provide panel lengths that will minimize end joints.
 - a. Stagger abutting end joints not less than one framing member in alternate courses of board.

- B. Paper Faced Gypsum Board:

1. Unless otherwise noted install the following system at all interior metal stud partition walls and interior side of exterior walls.
 - a. Install a layer of paper faced gypsum board.
 - b. Install a layer of paper faced gypsum board on ceilings.

- C. Glass-Mat Gypsum Board:

1. Unless otherwise noted install the following system at all interior metal stud partition walls and interior side of exterior walls.
 - a. Continuous 3 inch high strip of glass-mat gypsum board placed at base of walls where paper faced gypsum board is installed.

- D. Tile Backer Board:

1. Install tile backer board panels around the perimeter of all shower walls, and all areas scheduled to be tiled. Install with coated surface away from studs. Locate edge joints parallel to and on framing. Stagger intermediate end joints of adjacent lengths. Secure boards to studs with Type S-12 bugle head, self-tapping, rust resistant, fine thread minimum 1 5/8 inch screws at 6 inches o.c or type of fastener recommended by board manufacturer. At light gauge framing provide Type S, bugle self-tapping rust-resistant 1 1/4 inch screws at 6 inches o.c. or type of fastener recommended by board manufacturer. Butt ends and edges. Install with 1/4 inch open space where panels abut other construction or penetrations. Seal ends, cut edges and penetrations of each piece with water-resistant adhesive or where recommended by board manufacturer with water-resistant joint compound. Panels shall be installed horizontally.
 - a. Where ceilings are installed, extend tile backer board to ceiling leaving a 1/8 inch gap at corner.

- b. Where ceilings are not installed, extend tile backer board up to the underside of the roof deck.

E. Single-Layer Fastening Methods: Apply gypsum panels to supports as follows:

1. Fasten with screws.
2. At rated partitions comply with UL Design numbers for fastening.

3.05 INSTALLING TRIM ACCESSORIES

A. General: For trim accessories with back flanges, fasten to framing with the same fasteners used to fasten gypsum board. Otherwise, fasten trim accessories according to accessory manufacturer's directions for type, length and spacing of fasteners.

B. Install cornerbead at all external corners.

C. Install edge trim where edge of gypsum panels would otherwise be exposed. Provide edge trim type with face flange formed to receive joint compound, except where other types are indicated.

1. Install LC-bead where gypsum panels are tightly abutted to other construction and back flange can be attached to framing or supporting substrate.

D. Install control joints according to ASTM C840 and manufacturer's recommendations and in specific locations approved by Architect for visual effect.

E. Aluminum Trim and Reveals:

1. Tapeable Flange Shapes:
 - a. Install moldings after gypsum board is installed. Verify a steel backing plate has been installed behind the moldings.
 - b. Secure the moldings to the backing plate/stud framing using Type S or S-12 screws at 8 inches o.c.
 - c. Prior to taping, clean attachment flanges.
 - d. Tape flanges using self-adhesive fiberglass tape.
 - e. Field cut trim using a chop saw with a 150-tooth blade for non-ferrous metal. Lubricate blade prior to cutting per manufacturer's instructions.

3.06 ACOUSTICAL SEALANT AND SPRAY

A. Acoustical Sealant and Spray Application Standard: Comply with recommendations of ASTM C919 for use of joint sealants in acoustical applications as applicable to materials, applications and conditions indicated. Install sealant and spray in sound-rated interior partitions.

1. Install acoustical sealant prior to installing gypsum board panels. Gypsum board panels shall be pushed into the sealant.
2. Install acoustic spray backings of type to support spray during application in accordance with manufacturer's written installation instructions.

3.07 ACOUSTIC INSULATION

- A. Install insulation in accordance with insulation manufacturer's instructions.
 - 1. Place acoustic insulation in partitions tight within spaces, around cut openings, behind electrical and mechanical items within or behind partitions, and tight to items passing through partitions.
- B. Install insulation where shown on the Drawings.
- C. Trim insulation neatly to fit spaces. Insulate miscellaneous gaps and voids.

3.08 FINISHING GYPSUM BOARD ASSEMBLIES

- A. General: Treat gypsum board joints, interior angles, flanges of cornerbead, edge trim, control joints, penetrations, fastener heads, surface defects and elsewhere as required to prepare gypsum board surfaces for decoration.
- B. Prefill open joints, rounded or beveled edges and damaged areas using setting-type compound.
- C. Apply joint tape over gypsum board joints, except those with trim accessories having flanges not requiring tape.
- D. Apply joint tape over gypsum board joints and to flanges of trim accessories as recommended by trim accessory manufacturer.
- E. Levels of Gypsum Board Finish: Provide the following levels of gypsum board finish per GA-214.
 - 1. Level 1 for ceiling plenum areas, concealed areas and where indicated, unless a higher level of finish is required for fire-resistance-rated assemblies and sound-rated assemblies.
 - 2. Level 4 for walls and ceilings exposed to view.
 - a. Level 4 for walls scheduled to receive wall coverings.
- F. Use the following joint compound combinations as applicable to the finish levels specified.
 - 1. Sandable Setting Type: Embedding and First Coat: Sandable setting-type joint compound. Fill (Second) coat: Sandable setting-type joint compound. Finish (Third) Coat: Sandable setting-type joint compound.
- G. Level 1:
 - 1. All joints and interior angles shall have tape set in joint compound. Surface shall be free of excess joint compound. Tool marks and ridges are acceptable.
- H. Level 4 finish for all surfaces to be painted and/or schedule to receive wall coverings.

1. All joints and interior angles shall have tape embedded in joint compound and two separate coats of joint compound applied over all flat joints and one separate coat of joint compound applied over interior angles.
2. All fastener heads and accessories shall be covered with three separate coats of joint compound.
3. All joint compounds shall be smooth and free of tool marks and ridges.

I. Glass-Faced Tile Backing Board:

1. Tile substrate (walls) in wet areas. Georgia-Pacific DS001 system, National Gypsum Company tile application, USG tile application and CertainTeed tile application.
 - a. Install fasteners flush with coated surface; do not countersink.
 - b. Leave a minimum 1/8 inch gap in all vertical corners and fill with 100% silicone sealant. Bed self-adhesive 2-inch-wide fiberglass mesh tape into sealant. Follow installation requirements of board manufacturer.
 - c. At all other joints bed self-adhesive 2-inch-wide fiberglass mesh tape into material used to set tiles. Coordinate with Section 09 30 00 – Tiling.
 - d. Fill 1/4 inch joint between shower pan with 100 percent silicone sealant. Do not install tile backer board into shower pan mortar bed.

3.09 FIELD QUALITY CONTROL

- A. Above-Ceiling Observation: Architect will conduct an above-ceiling observation prior to installation of gypsum board ceilings and report any deficiencies in the Work observed. Do not proceed with installation of gypsum board to ceiling support framing until deficiencies have been corrected.
1. Notify Architect one week in advance of the date and the time when the Project, or part of the Project, will be ready for an above-ceiling observation.
 2. Prior to notifying Architect, complete the following in areas to receive gypsum board ceilings:
 - a. Installation of eighty percent (80%) of lighting fixtures, powered for operation.
 - b. Installation, insulation and leak and pressure testing of water piping systems.
 - c. Installation of air duct systems.
 - d. Installation of air devices.
 - e. Installation of mechanical system control air tubing.
 - f. Installation of ceiling support framing.

3.10 CLEANING AND PROTECTION

- A. Promptly remove any residual joint compound from adjacent surfaces.
- B. Provide final protection and maintain conditions, in a manner acceptable to Installer, that ensure gypsum board assemblies are without damage or deterioration at the time of

Substantial Completion.

- C. Remove and replace panels that are wet, moisture damaged and mold damaged.
 - 1. Indications that panels are wet or moisture damaged include, but are not limited to, discoloration, sagging or irregular shape.
 - 2. Indications that panels are mold damaged include, but are not limited to, fuzzy or splotchy surface contamination and discoloration.

3.11 PARTITION IDENTIFICATION

- A. Identify rated partitions and smokestop partitions required to have protected openings with permanent signs or stencils above ceilings and in concealed spaces.
- B. Partitions to be identified:
 - 1. Fire rated walls with protected openings.
- C. Stencil with minimum 3-inch-high red lettering with minimum 3/8 inch stroke "FIRE AND/OR SMOKE BARRIER-PROTECT ALL OPENINGS" every 20'-0".
- D. Identification to be done in a manner acceptable to the authority having jurisdiction.

END OF SECTION

SECTION 09 22 16 – NON-STRUCTURAL METAL FRAMING

PART 1 GENERAL

1.01 WORK INCLUDED

- A. Interior (drywall) non-load-bearing non-structural framing.
- B. Furring.
- C. Accessories.

1.02 RELATED SECTIONS

- A. Section 01 33 00 – Submittal Procedures.
- B. Section 01 60 00 – Product Requirements: Product substitution procedures.
- C. Section 06 10 53 – Miscellaneous Carpentry: Securing wood blocking to steel studs.
- D. Section 07 21 16 – Blanket Insulation: Insulation within framing members of studs.
- E. Section 09 21 16 – Gypsum Board Assemblies: Securing gypsum wall board and aluminum trim and reveals to framing.
- F. Section 10 26 00 – Wall Protection: Installing metal stud blocking behind:
 - 1. Corner Guards.
 - 2. Chair Rails.
- G. Section 10 28 00 – Toilet, Bath and Laundry Accessories: Supporting toilet accessories off steel stud framing.

- 1.04 PERFORMANCE REQUIREMENTS – INTERIOR (DRYWALL) NON-LOAD-BEARING STEEL STUD FRAMING
- A. Maximum Allowable Deflection: L/240 span, with a minimum load of 5 pounds per square foot applied perpendicular to walls.
 - 1. Where tile is installed, the deflection shall be L/360, with a minimum load of 5 pounds per square foot applied perpendicular to walls.
 - B. Design framing system to accommodate deflection of building. Structure and construction tolerances:
 - 1. Vertical Deflection: 1/2 inch.
- 1.05 SUBMITTALS – INTERIOR (DRYWALL) NON-LOAD-BEARING NON-STRUCTURAL FRAMING
- A. Section 01 33 00 – Submittal Procedures: Submittal Procedures.
 - B. Product Data: Provide data describing standard framing member materials and finish, product criteria, load charts, limitations and type of fasteners.
 - C. Manufacturer's height limiting tables indicating products provided based on:
 - 1. Composite framing.

2. Non-composite fully braced: Gypsum board on both sides of stud stop maximum 12 inches below top track.
 3. Non-composite fully braced: Bracing spacing above gypsum board on both sides of stud is less than Lu.
 4. Non-composite: Bracing spaced at 48 inches on center with gypsum board on one side.
- D. Studs and runners: Provide documentation that framing member's certification is according to:
1. SFIA's Code Compliance Certification Program for Cold-Formed Steel Structural and Non-Structural Framing Members based on checking mechanical properties, coatings, dimensions and labeling per:
 - a. IBC 2015: AISI S220 and ASTM C645, Section 10.
 2. SSMA's Code Compliance Certification Program for Cold-Formed Steel Structural and Non-Structural Framing Members based on checking mechanical properties, coatings, dimensions and labeling per:
 - a. IBC 2015: AISI S220 and ASTM C645, Section 10.
 3. CSSA's Code Compliance Certification Program for Cold-Formed Steel Structural and Non-Structural Framing Members based on checking mechanical properties, coatings, dimensions and labeling per:
 - a. IBC 2015: AISI S220 and ASTM C645, Section 10.
- 1.06 QUALITY ASSURANCE – INTERIOR (DRYWALL) NON-LOAD-BEARING NON-STRUCTURAL FRAMING
- A. Single-Source Responsibility for Steel Framing: Obtain steel framing members from a single manufacturer, unless otherwise noted.
1. Furnish framing materials in accordance with SSMA – Product Technical Information.
- B. Code-Compliance Certification of Studs and Tracks: Provide certification of code compliance of studs and track that framing members are certified in accordance with product certification program of:
1. CSSA: Certified Steel Stud Association.
 2. SFIA: Steel Framing Industry Association.
 3. SSMA: Steel Stud Manufacturer's Association.
- C. Fire – Test Response Characteristics: Where fire-resistance-rated gypsum board assemblies are indicated, provide assemblies that comply with the following requirements:
1. Provide materials and construction identical to those tested in assembly

indicated, according to ASTM E119 by an independent testing agency.

2. Dynamic Head-of-Wall Assemblies (HW-D): Vertical deflection assemblies provided in fire-resistance-rated assemblies as indicated, labeled and listed by UL, Warnock Hersey or another testing and inspecting agency acceptable to authorities having jurisdiction.
- D. STC-Rated Assemblies: For STC-rated assemblies, provide materials and construction identical to those tested in an assembly indicated, according to ASTM E90 and classified according to ASTM E413 by an independent testing agency.
- E. Perform work in accordance with ASTM C754.
- F. Installer qualifications: Company specializing in performing the work of this Section with minimum 5 years of experience.

1.07 DELIVERY, STORAGE AND HANDLING

- A. Protect metal framing from corrosion, deformation and other damage during delivery, storage and handling.
- B. Store metal framing, protect with a waterproof covering and ventilate to avoid condensation.

PART 2 PRODUCTS

2.01 MANUFACTURERS

- A. Manufacturers for Interior (Drywall) Studs: Subject to compliance with requirements, provide metal framing by one of the following:
 1. ClarkDietrich Building Systems
 2. Marino/Ware – A Division of Ware Industries
 3. The Steel Network, Inc.
- B. Basis-of-Design Product: The design for connecting devices for interior (drywall) framing is based on The Steel Network, Inc.

Subject to compliance with requirements, provide named product or a comparable product by:

1. ClarkDietrich Building Systems.

2.02 INTERIOR (DRYWALL) FRAMING

- A. General: Provide steel framing members complying with IBC 2015, ASTM C645 Section 10 and AISI S220 and the following requirements:

1. Provide G60 hot-dip galvanized coating where framing members are in direct contact with masonry or concrete surfaces.
 2. Protective Coating: ASTM A653, G40 hot-dip galvanized coating.
- B. Steel Studs and Runners: IBC 2015, ASTM C645 Section 10 and AISI S220, with flange edges of studs bent back 90 degrees and doubled over to form 3/16-inch-wide minimum lip (return), and complying with the following requirements for minimum thickness of base (uncoated) metal and for depth:
1. Thickness: 30 mil (20-gauge Drywall), minimum thickness, 0.0296 inches, design thickness 0.0312-inch, minimum yield, 33 ksi.
 2. At walls with ceramic tile provide: 33 mil (20 gauge Structural), minimum thickness 0.0329 inches, design thickness 0.0346-inch minimum yield, 33 ksi.
 3. Depth: As indicated.
 4. Track: 1-1/4 inches. Gauge of track to match stud gauge unless otherwise noted.
- C. Deflection Clips: 1-1/2 inches by 3 inches slotted leg by 33 mils VertiClip SLD angle or VertiTrack VTD as manufactured by The Steel Network. Width of clip to match depth of stud. Clip shall be manufactured from steel conforming to ASTM A653A, Grade 50, Class 1, 50 KS1 minimum yield strength, 65 KS1 minimum tensile strength, G-60 hot-dipped galvanized coating. Clips shall be designed for positive attachment to structure and stud web using step bushing to provide frictionless vertical movement. Provide clips with attached bushing and screws. At sloping beams and roof deck, bend horizontal leg as required so that vertical leg remains plumb. Use only deflection connection products that comply with ICC Acceptance Criteria AC261 such as Report No. ESR-1903 (or equivalent). Site fabricated clips are not permitted.
1. Alternate Deflection Track: MaxTrak (SLT) Slotted Track as manufactured by ClarkDietrich. Substitutions permitted according to the Conditions of the Contract and appropriate Division 01 Sections. At fire rated partitions provide a top runner that allows the partition head to expand and contract with movement of the structure while maintaining continuity of the fire-resistance-rated assembly indicated, in thickness not less than indicated for studs and in a width to accommodate depth of the studs. Comply with UL 2079. Refer to Section 07 84 00 Firestopping for approved fire stop materials.
 - a. Product Type: ASTM C955.
 - b. Material Specifications: ASTM A1003/A1003M Structural Grade 33 Type H, (ST33H): 33ksi minimum yield strength, 45ksi minimum tensile strength, 33 mil minimum thickness (20-gauge, 0.0329-inch Min. Thickness, 0.0346-inch design thickness,) with ASTM C955 CP60 coating.
- D. Flat Steel Plate: Steel sheet complying with ASTM A653 or ASTM A568 with minimum base metal thickness as follows:
1. Thickness:
 - a. 54 mils, (16 gauge) minimum thickness 0.0538 inches, 33 ksi steel.

2. Width: 6 inches, unless noted otherwise.
 3. Length: 10 feet.
- E. Fasteners for Metal Framing: Provide fasteners of type, material, size, corrosion resistance, holding power and other properties required to fasten steel framing and furring members securely to substrates involved; complying with the recommendations of gypsum board manufacturers for applications indicated.
- F. Clip Angles: 30 mils, (20 gauge) minimum thickness 0.0296 inches, 33 ksi steel. Size as shown on Drawings.
- G. Bridging:
1. Bridging: BridgeBar 75 as manufactured by The Steel Network or approved equal.
- H. Radiused track: Galvanized track G60 coating in accordance with ASTM A653, 30 mil, minimum thickness 0.0296 inches, 2 ½, 3 5/8 inch and 6 inches Flex-C Trac with galvanized sliding steel strap as manufactured by Flex-Ability Concepts.
- I. Utility Angles: Used to connect, reinforce and secure metal stud framing.
1. Size: As shown on Drawings.
 2. Thickness: 30 mils, (20 gauge) minimum 0.0296 inches, unless otherwise noted on Drawings.

2.03 ANCHORS, CLIPS AND FASTENERS

- A. Steel Shapes and Clips: ASTM A36, zinc coated by the hot-dip process according to ASTM A123.
- B. Powder-Actuated Anchors: Federal Specification FF-P-395b. Manufactured from AISI 1062 or 1065 steel, austempered to a minimum core hardness of 50 to 54 HRC and zinc plated in accordance with ASTM B 633. Provide fasteners listed or approved by one or more of the following and of type, diameter and length as required by structural design calculations:
1. Underwriters Laboratory.
 2. Factory Mutual.
 3. International Code Council (ICC).
- C. Mechanical Fasteners: Corrosion-resistant coated, self-drilling, self-threading steel drill screws. Provide screw type and size as required by structural design calculations for the specific condition and thickness of materials being joined.
1. Head Type: Low profile head beneath sheathing, manufacturer's standard elsewhere.

2.04 MISCELLANEOUS MATERIALS

- A. Galvanizing Repair Paint: SSPC-Paint 20 or DOD-P-21035, with dry film containing a minimum of 94 percent zinc dust by weight.

2.05 FABRICATION

- A. Fabricate metal framing and accessories plumb, square, true to line, and with connections securely fastened, according to manufacturer's recommendations and the requirements of this Section.
 - 1. Fabricate framing assemblies in jig templates.
 - 2. Cut framing members by sawing or shearing; do not torch cut.
 - 3. Fasten metal framing members by screw fastening as standard with fabricator. Wire tying of framing members is not permitted.
 - a. Locate mechanical fasteners and install according to metal framing manufacturer's instructions with screw penetrating jointed members by not less than 3 exposed screw threads.
 - 4. Fasten other materials to metal framing by bolting, or screw fastening according to manufacturer's recommendations.
- B. Reinforce, stiffen, and brace framing assemblies to withstand handling, delivery, and erection stresses. Lift fabricated assemblies to prevent damage or distortion.
- C. Fabrication Tolerances: Fabricate assemblies to a maximum allowable tolerance variation from plumb, level, and true to line of 1/8 inch in 10 feet and as follows:
 - 1. Spacing: Space individual framing members no more than plus or minus 1/8 inch from plan location. Cumulative error shall not exceed minimum fastening requirements of sheathing or other finishing materials.
 - 2. Squareness: Fabricate each metal framing assembly to a maximum out-of-square tolerance of 1/8 inch.

PART 3 EXECUTION

3.01 INSPECTION

- A. Verify that building framing components are ready to receive work.
- B. Beginning of installation means acceptance of existing conditions.

3.02 INSTALLATION – GENERAL

- A. Install metal framing and accessories plumb, square, true to line and with connections securely fastened, according to manufacturer's recommendations and the requirements of this Section.
 - 1. Cut framing members by sawing or shearing; do not torch cut.

2. Fasten metal framing members by screw fastening, as standard with fabricator. Wire tying of framing members is not permitted.
 - a. Locate mechanical fasteners and install according to metal framing manufacturer's instructions with screw penetrating joined members by not less than 3 exposed screw threads.
- B. Install framing members in one-piece lengths, unless splice connections are indicated for track or tension members.
- C. Provide temporary bracing and leave in place until framing is permanently stabilized.
- D. Fasten reinforcement plate over web penetrations that exceed size of manufacturer's standard punched openings.
- E. At all locations where multiple studs and tracks occur, fasten studs and tracks together at maximum 24-inch o.c.

3.03 INSTALLATION – INTERIOR (DRYWALL) STEEL FRAMING

- A. Examine substrates to which gypsum board assemblies attach or abut, installed hollow metal frames, cast-in-anchors, and structural framing, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of drywall construction. Do not proceed with installation until satisfactory.
- B. Steel Framing Installation Standard: Install steel framing to comply with ASTM C754 and with ASTM C840 requirements that apply to framing installation.
- C. Install supplementary framing, blocking and bracing at terminations in gypsum board assemblies to support fixtures, equipment services, heavy trim, grab bars, toilet accessories, furnishings, wall protection or similar construction. Comply with details indicated and with recommendations of gypsum board manufacturer or, if none available, with United States Gypsum Co.'s "Gypsum Construction Handbook."
 1. Coordinate with Section 06 10 53 – Miscellaneous Carpentry for rigid wall backing plates at locations specified.
 2. Coordinate with Section 09 21 16 – Gypsum Board Assemblies for steel backing plate behind aluminum trim and reveals.
 3. Coordinate with Section 10 26 00 – Wall Protection for metal stud blocking:
 - a. Corner guards.
 - b. Chair rails.
- D. Isolate steel framing from building structure and underside of roof deck at locations indicated to prevent transfer of loading imposed by structural movement. Comply with details shown on Drawings.
- E. Do not bridge building control and expansion joints with steel framing or furring members. Independently frame both sides of joints with framing or furring members as indicated.

- F. Install runners (tracks) at floors, top of partitions, ceilings and structural walls and columns where gypsum board stud assemblies abut other construction.
- G. Installation Tolerances: Install each steel framing and furring member so that fastening surface do not vary more than 1/8 inch (3 mm) from the plane formed by the faces of adjacent framing.
- H. Extend partition framing full height to structural supports, underside of roof deck, except where partitions are indicated to terminate above suspended ceilings. Continue framing over frames for doors and openings and frame around ducts penetrating partitions above ceiling to provide support for gypsum board.
 - 1. At deflection clips, cut studs 1/2 inch short of full height to provide perimeter relief.
 - 2. STC-rated and fire-resistance-rated partitions that extend to the underside of roof decks or other continuous solid structural surfaces to obtain ratings, install framing around structural and other members extending below floor/roof slabs and decks, as needed, to support gypsum board closures needed to make partitions continuous from floor to underside of solid structure.
- I. Install steel studs and furring in sizes and at spacings indicated.
 - 1. Single-Layer Construction: Space studs 16 inches o.c., unless otherwise indicated.
- J. Install steel studs so flanges point in the same direction and leading edge or end of each gypsum board panel can be attached to open (unsupported) edges of stud flanges first.
- K. Frame door, borrowed light, and cased openings with minimum two studs and one nested track. Attach vertical studs at jambs with screws either directly to frames or to jamb anchor clips on door frames.
 - 1. At jambs install two channel shaped metal studs and one metal track. The metal track shall be nested within the metal stud as shown. Boxed stud and track shall be screw attached together using #10-16 screws at maximum 24 inches o.c. Attach second stud to boxed stud/track using #10-16 screws at maximum 24 inches o.c.
 - 2. At the frame head, provide a steel track for openings up to 3'-0" wide. For openings wider than 3'-0" provide box header.
 - 3. Install cripple studs at head adjacent to each jamb stud, with a minimum 1/2-inch clearance from jamb stud to allow for installation of control joint.
- L. Frame openings, other than door openings, to comply with details indicated or, if not indicated, as required for door openings. Install framing below sills of openings to match framing required above door heads.
- M. Coordinate installation of wood bucks, anchors and wood blocking with electrical and mechanical work to be placed within or behind stud framing.
- N. Blocking: Coordinate with Section 06 10 53 – Miscellaneous Carpentry.

- O. Coordinate placement of insulation in stud spaces made inaccessible after stud framing erection.
- P. Horizontal Bridging: At the following partitions install bridge bar or approved equal to each stud spaced as follows:
 - 1. Non-Composite-Fully Braced where the gypsum wall board on both sides stops at or just above the ceiling and the stud continues to deck. Spacing of horizontal bridging shall be based on the Lu (critical unbraced length for lateral-torsional buckling) shown in the schedule titled "Interior Wall Heights-Non-Composite-Fully Braced"
 - 2. Non-Composite-Braced where the stud framing and gypsum wallboard on one side of the wall stops at the deck. Spacing of horizontal bridging shall be at maximum 48 inches on center
- Q. Radiused Track: Install radiused track in accordance with manufacturer's instructions. Splice track segments by overlapping bands from one track to another and attaching screwed fasteners at overlapping plates or flange intervals. Screw penetrations of not less than 3 exposed screw threads. Fasten reinforcement plate over web penetrations that exceed size of manufacturer's standard punched openings.

3.04 SCHEDULE

- A. Maximum Variation from Plumb, Level and True Position: 1/8 inch in 10 feet.

SCHEDULE (NOTE: Table was taken from the SSMA Product Technical Guide).

- B. Interior Wall Heights-Composite, based on maximum allowable deflection of L/240 span, with a minimum load of 5 pounds per square foot applied perpendicular to walls.

Composite limiting heights are based on a single layer of 5/8 inch Type X gypsum board installed in the vertical orientation to both sides of the wall over the full height using minimum No. 6 Type S drywall screws spaced a maximum of 16 inches on center but not less than the spacing noted in Section 09 21 16 Gypsum Board Assemblies for rated and non-rated partitions.

At interior partitions that include an STC rating install studs at 16 inches on center.

1.	Stud	Spacing	Height Limitation
	162S125-30	12"	11'-10"
	162S125-30	16"	10'-9"
	250S125-30	12"	15'-10"
	250S125-30	16"	14'-5"
	362S125-30	12"	18'-3"
	362S125-30	16"	16'-7"
	600S125-30	12"	27'-1"
	600S125-30	16"	24'-7"

- C. Interior Wall Heights-Non-Composite-Fully Braced, based on maximum allowable

deflection of L/240 span, with a minimum load of 5 pounds per square foot applied perpendicular to walls.

NOTE: Limiting heights listed below are based on steel properties only (non-composite) without contribution of sheathing. Properly fastened sheathing required to be considered fully braced.

Non-Composite-Fully Braced limiting heights are based on the gypsum board on both sides of the partition stopping at or above the ceiling and the stud framing continues to deck and the distance between the deck and the top of the gypsum board is limited to Lu (Critical unbraced length for lateral-torsional buckling). Members are also considered fully braced, using horizontal bridging as specified in this section installed within 12 inches from the top track and the distance between the bridging and the top of the gypsum board is less than Lu)

1.	Stud	Spacing	Height Limitation	Lu (inches)
	162S125-30	12"	9'-3"	29.2
	162S125-30	16"	8'-5"	29.2
	250S125-30	12"	12'-9"	28.9
	250S125-30	16"	11'-7"	28.9
	362S125-30	12"	17'-0"	28.6
	362S125-30	16"	15'-6"	28.6
	600S125-30	12"	25'-2"	27.6
	600S125-30	16"	22'-11"	27.6

- D. Interior Wall Heights-Non-Composite-Braced at 48 inches o.c., based on maximum allowable deflection of L/240 span, with a minimum load of 5 pounds per square foot applied perpendicular to walls.

Non-Composite-Braced at 48 inches o.c. limiting heights are based on the stud framing along with the gypsum board on one side of the wall stopping at the floor/roof deck and the distance between the horizontal bracing is 48 inches o.c. maximum and the horizontal bridging is installed within 12 inches of the top track.

1.	Stud	Spacing	Height Limitation
	162S125-30	12"	9'-3"
	162S125-30	16"	8'-5"
	250S125-30	12"	12'-10"
	250S125-30	16"	11'-8"
	362S125-30	12"	17'-1"
	362S125-30	16"	15'-6"
	600S125-30	12"	25'-4"
	600S125-30	16"	23'-0"

- E. Ceramic Tile: Minimum 3 5/8 inch metal studs.

Interior Wall Heights-Non-Composite based on maximum allowable deflection of L360 span, with a minimum load of 5 pounds per square foot applied perpendicular to walls.

Non-composite limiting heights are based on the properties of stud framing alone.

1.	Stud	Spacing	Height Limitation
	362S125-33	12"	15'-4"
	362S125-33	16"	14'-0"
	600S125-33	12"	22'-10"
	600S125-33	16"	20'-9"

END OF SECTION

SECTION 09 30 00 – TILING

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Wall Tiles.
- B. Floor Tile.
- C. Setting Materials.
- D. Tile Accessories.
- E. Waterproofing Membranes.
- F. Sealants.

1.02 RELATED SECTIONS

- A. Section 01 40 00 – Quality Requirements.
- B. Section 01 45 23 – Concrete In-Situ Relative Humidity and pH Testing:
- C. Section 01 45 29 – Testing Laboratory Services.
- D. Section 03 30 00 – Cast-In-Place Concrete: Preparing floor slab for tile application.
- E. Section 07 90 00 – Joint Protection: Sealants installed at movement joints.
- F. Section 09 21 16 – Gypsum Board Assemblies: Tile backer board.

1.03 REFERENCE STANDARDS

- A. Installation Specifications:
 - 1. ANSI A108 Series/A118 Series/A136.1 – American National Standard Specifications for the Installation of Ceramic Tile (Compendium of the following).
 - a. ANSI A108.1B-2010 – Installation of Ceramic Tile on a Cured Portland Cement Mortar Setting Bed with Dryset or Latex Portland Cement Mortar.
 - b. ANSI A108.5-2010 – Installation of Ceramic Tile with Dry-Set Portland Cement Mortar or Latex-Portland Mortar (not published separately).
 - c. ANSI A108.6-2010 – Installation of Ceramic Tile with Chemical Resistant, Water Cleanable Tile Setting and Grouting Epoxy.
 - d. ANSI A108.13-2016 – Installation of Load Bearing, Bonded, Waterproof Membranes for Thin-Set Ceramic Tile and Dimension Stone.
- B. Material Specifications:
 - 1. ANSI A118.3-2013 – Chemical Resistant, Water Cleanable Tile Setting and Grouting Epoxy and Water Cleanable Tile Setting Epoxy Adhesive.

2. ANSI A118.4-2018 – Latex Modified Portland Cement Mortar (not published separately).
3. ANSI A118.10-2014 – Standard Specifications for Load Bearing, Bonded, Waterproof Membranes for Thin-Set Ceramic Tile and Dimension Stone Installations.
4. ANSI A118.15-2018 – Improved Latex Modified Cement Mortars.
5. ANSI A137.1-2017 – American National Standard Specifications for Ceramic Tile.
6. ANSI A137.2-2013 – American National Standard Specifications for Glass Tile.
7. TCNA – (Tile Council of North America) Handbook for Ceramic, Glass and Stone Tile Installation, Current Edition.

C. ASTM:

1. ASTM C373 – Standard Test Method for Water Absorption, Bulk Density, Apparent Porosity and Apparent Specific Gravity of Fired Whiteware Products.
2. ASTM C648 – Standard Test Method for Breaking Strength of Ceramic Tile.
3. ASTM C650 – Standard Test Method for Resistance of Ceramic Tile to Chemical Substances.
4. ASTM D5957 – Standard Guide for Flood Testing Horizontal Waterproofing Installation.

D. ISO – International Organization of Standardization

1. 13007 Standards for Adhesives and Grouts.

1.04 SUBMITTALS

A. Section 01 33 00 – Submittal Procedures.

B. Product Data: Provide product data and installation instructions for the following materials:

1. Floor tiles.
2. Wall tiles.
3. Waterproof membranes.
4. Mortar bond coat materials.
5. Grout materials.
6. Tile accessories.
7. Cleaners and sealers.

8. Sealants.

C. Samples:

1. Provide digital image and product information for verification of Basis of Design products.

D. Manufacturer's Certificate: Each product manufacturer furnishing products under this section shall certify in writing that the products are recommended for the intended use.

1.05 CLOSEOUT SUBMITTALS

A. Section 01 70 00 – Execution and Closeout Requirements.

B. Maintenance Data: Include recommended cleaning methods, cleaning materials, stain removal methods, and polishes and waxes.

1.06 QUALITY ASSURANCE

A. Comply with applicable parts of ANSI A108 series of tile installation standards included under "American National Standard Specifications for the Installation of Ceramic Tile."

B. Comply with applicable parts of Tile Council of America (TCA) "Handbook for Ceramic Tile Installations," Latest Edition.

C. Single-Source Responsibility for Tile: Obtain each color, grade, type, composition and variety of tile from a single source with resources to provide products of consistent quality in appearance and physical properties without delaying progress of the work.

D. Single-Source Responsibility for Setting and Grouting Materials: Obtain ingredients of a uniform quality from one manufacturer for each, epoxy and admixture component and from one source or producer for each aggregate.

E. Installer Qualifications: Engage an experienced Installer who has successfully completed tile installations similar in material, design and extent to than indicated for Project.

1.07 DELIVERY, STORAGE AND HANDLING

A. Section 01 30 00 – Administrative Requirements.

B. Deliver and store packaged materials in original containers with seals unbroken and label intact until time of use. Comply with requirements of ANSI A137.1 for labeling sealed tile packages.

C. Prevent damage or contamination to materials by water, freezing, foreign matter and other causes.

D. Handle tile with temporary protective coating on exposed surfaces to prevent coated services from contacting backs or edges of other items. If despite these precautions coating does contact bonding surfaces of tile, remove coating from bonding surfaces before setting tile.

1.08 PROJECT CONDITIONS

- A. Section 01 60 00 – Product Requirements.
- B. Maintain environmental conditions and protect work during and after installations to comply with referenced standards and manufacturer's printed recommendations.
- C. Vent temporary heaters to exterior to prevent damage to tile work from carbon dioxide buildup.
- D. Maintain temperatures at 50 degrees F (10 degrees C) or more in tiled areas during installation and for 7 days after completion, unless higher temperatures are required by referenced installation standard or manufacturer's instructions.

1.09 PRE-INSTALLATION MEETINGS

- A. Convene four weeks prior to commencing work of this section, under provisions of Section 01 30 00 – Administrative Requirements: Pre-installation meeting.

DO NOT PROCEED WITH THE INSTALLATION OF THE TILE AND WATERPROOFING MEMBRANE, IF APPLICABLE, PRIOR TO THE PRE-INSTALLATION MEETING.

DO NOT PROCEED WITH THE PRE-INSTALLATION MEETING IF ANY ONE OF THE FOLLOWING PARTIES IS NOT IN ATTENDANCE:

**INSTALLER
OWNER'S REPRESENTATIVE (IF APPLICABLE)
ARCHITECT
GENERAL CONTRACTOR
PLUMBING CONTRACTOR, IF APPLICABLE**

PART 2 PRODUCTS

2.01 MANUFACTURERS/PRODUCTS/COLORS

- A. Manufacturers: Refer to the "List of Finishes" located on the Drawings for a list of manufacturer's, products and colors for wall tiles, and floor tiles on the floors and walls.

2.02 PRODUCTS – GENERAL

- A. ANSI Standard for Ceramic Tile: Comply with ANSI A137.1 "American Standard Specifications for Ceramic Tile" for types, compositions and grades of tile indicated.
 - 1. Furnish tile complying with "Standard Grade" requirements unless otherwise indicated.
- B. Water Absorption, ASTM C373
 - 1. Impervious – Tiles exhibiting 0.5% or less.
 - 2. Vitreous – Tiles exhibiting more than 0.5% but not more than 3.0%.
 - 3. Semi-Vitreous – Tiles exhibiting more than 3.0% but not more than 7.0%.
 - 4. Non-Vitreous – Tile exhibiting more than 7.0%.

- C. ANSI Standard for Tile Installation Materials: Comply with ANSI standard referenced with products and materials indicated for setting and grouting.
- D. Coefficient of Friction:
 - 1. Per ANSI A137.1-2012, ceramic tile selected for level interior spaces expected to be walked upon when wet shall have a minimum wet DCOF AcuTest value of 0.42.
- E. Colors, Textures and Patterns: Where manufacturer's standard products are indicated for tile, grout and other products requiring selection of colors, surface textures, patterns and other appearance characteristics, provide specific products or materials complying with the following requirements:
 - 1. Match color, texture and pattern indicated by reference to manufacturer's standard designations for these characteristics.
 - 2. Provide tile trim and accessories that match color and finish of adjoining tile.
- F. Factory Blending: For tile exhibiting color variations within the ranges selected during sample submittals, blend tile in factory and package accordingly so that tile units taken from one package show the same range in colors as those taken from other packages and match approved samples.
- G. Where factory-mounted tile is specified, provide back- or edge-mounted tile assemblies methods as standard with manufacturer unless another mounting method is indicated.
 - 1. Where tile is indicated for installation in wet areas, do not use back- or edge-mounted tile assemblies unless tile manufacturer specifies that this type of mounting is suitable for these kinds of uses and has been successfully used on other projects.

2.03 TILE PRODUCTS

- A. Refer to "List of Finishes" as shown on the Drawings for each wall tile, and floor tile product specified including manufacturer, composition, size, thickness and color.
- B. Trim Units: Provide tile trim units to match characteristics of adjoining flat tile and to comply with the following requirements:
 - 1. Size and shapes: As indicated on the Drawings and in the "List of Finishes."
 - 2. Shapes: As follows, selected from manufacturer's standard shapes:
 - a. Internal corners: Field-buttet square corners, except use cove base and cap angle pieces designed to member with stretcher shapes.
 - b. Floor edge protection: Cove shaped profile.

2.04 TILE ACCESSORIES

- A. Floor Edge Protection: Schluter profile as shown on Drawings Sizes: Verify H dimension with specified tile prior to bidding.
 - 1. Sizes: Verify H dimension with specified tile prior to bidding.

- a. AE 100, H = 3/8 inch
 - b. AE 125, H = 1/2 inch
2. Provide appropriate size (height) for transitioning from specified tile floor material to adjacent dissimilar floor.
- B. Edge Protection for Tiled Edges and Outside Corners: Schluter profile as shown on Drawings
1. Sizes: Verify H dimension with specified tile prior to bidding.
 - a. Color(s) as selected by Architect
 2. Provide inside and outside corners and connectors.
- C. Cove Shaped Profile: Schluter profile as shown on Drawings.
1. Sizes: Verify H dimension with specified tile prior to bidding.
 - a. AHK 1S 100, H = 3/8 inch
 - b. AHK 1S 125, H = 1/2 inch
 2. Provide 90 degree inside and outside corners, connectors and end caps.

2.05 WATERPROOFING FOR THIN-SET TILE INSTALLATIONS

- A. Fluid Applied Waterproofing/Crack Isolation Membrane: Manufacturer's standard factory-prepackaged, job-mixed, proprietary self-curing fluid and reinforcing fabric which meets ANSI A118.10 and is IAPMO listed for use as a waterproofing shower pan liner.
1. Fluid Applied Waterproofing
 - a. Laticrete Hydroban waterproof membrane; Laticrete International, Inc.
 - 1) VOC content: 2.39 g/L.
 - b. Mapelastic AquaDefense; Mapei
 - 1) VOC content: 0 g/L.
 - c. 8 + 9 Rapid waterproofing and crack- isolation; Ardex Americas.
 - 1) VOC content: 0 g/L.
 - 2) SK mesh reinforcing fabric and SK Drain tie in fabric.

2.06 SETTING MATERIALS

- A. Latex-Portland Cement Mortar: Provide products from the following manufacturers and complying with the ANSI and ISO 13007 standards indicated. Note: The use of organic adhesives complying with ANSI A136.1 will not be allowed.
1. Provide products for setting the following types of tiles:
 - a. Ceramic.
 - b. Porcelain.
 - c. Stone (dimensionally stable).

- d. Mosaic tile.
- 2. Product/Manufacturer:
 - a. Ultraflex 2/Mapei Corporation
 - 1) Standards: ANSI A118.4 and ISO 13007 Classification C2EP1.
 - 2) VOC content: 0 g/L.
 - b. 253 Gold/Laticrete International, Inc.
 - 1) Standards: ANSI A118.4 and ISO 13007 Classification C2
 - 2) VOC content: 0 g/L.
 - c. Ardex X4/Ardex Americas.
 - 1) Standards: ANSI A118.4 and ISO 13007 Classification C2TE.
 - 2) VOC content: 0 g/L.
- B. Latex-Portland Cement Mortar: Provide products from the following manufacturers and complying with the ANSI and ISO 13007 standards indicated. Note: The use of organic adhesives complying with ANSI A136.1 will not be allowed.
 - 1. Provide products for setting the following types of tiles:
 - a. Tiles weighing more than 5 pounds per square foot.
 - b. Setting larger tiles, tiles with at least one edge greater than 15 inches long.
 - 2. Product/Manufacturer:
 - a. Ultraflex LFT/Mapei Corporation
 - 1) Standards: ANSI A118.4 and ISO 13007 Classification C2TES1P1.
 - 2) VOC content: 0 g/L.
 - b. 4-XLT/Laticrete International, Inc.
 - 1) Standards: ANSI A118.4, A118.15 and ISO 13007 C2TES2
 - 2) VOC content: 2.56 g/L.
 - c. Ardex X5/Ardex Americas
 - 1) Standards: ANSI A118.4 and ISO 13007 C2TE.
 - 2) VOC content: 0 g/L.

2.07 GROUTING MATERIALS

- A. Commercial grade water-cleanable epoxy grout: ANSI A118.3 and ISO 13007 Classification R2/RG, R2: Reaction Resin Adhesive, improved, RG: Reaction Resin Grout; color(s) as selected from manufacturer's standard colors.
 - 1. Use: All locations floors and walls unless noted otherwise, for grout joints 1/16 inch to 3/8 inch
 - 2. Product/Manufacturer:
 - a. Kerapoxy CQ/Mapei Corporation

- 1) Standards: ANSI A118.3 and ISO 13007 Classification R2/RG.
 - 2) VOC content: 8 g/L.
- b. SpectraLOCK Pro Premium/Laticrete International, Inc.
- 1) Standards: ANSI A118.3 and ISO 13007 Classification RG and EN.
 - 2) VOC content: 0.031 g/L.
- c. Ardex WA epoxy/Ardex Americas.
- 1) Standards: ANSI A118.3 and ISO 13007 R2T RG.
 - 2) VOC content: 2.67 g/L.

2.08 CLEANERS/SEALERS

- A. Sealer: Tile sealer as recommended by tile manufacturer for sealing natural stone and unglazed ceramic tile..
1. Product/Manufacturer:
 - a. UltraCare Penetrating Plus Stone, Tile & Grout Sealer/Mapei Corporation.
 - 1) VOC Content: 45 g/L.
 - b. StoneTech BulletProof Sealer/Laticrete International, Inc.
 - 1) VOC Content: 20 g/L.
 - c. FILA Surface Care Solutions: Product approved by Ardex Americas for use with Ardex specified materials.

2.09 PRIMERS

- A. For gypsum-based walls, provide primer recommended by manufacturer of setting materials.

2.10 SEALANTS

- A. Sealant shall comply with ASTM C920, Single, Multi-Component or Pourable, Use T, Uses M and G as recommended by tile manufacturer for sealing joints in floor tile. Color of sealant to match grout color.
1. Product/Manufacturer:
 - a. Mapesil T/Mapei Corporation
 - 1) VOC content: 44 g/L.

2.11 MIXING MORTAR AND GROUT

- A. Mix mortars and grouts to comply with requirements of referenced standards and manufacturers including those for accurate proportioning of materials, water, or additive content, type of mixing equipment, selection of mixer speeds, mixing containers, mixing time, and other procedures needed to produce mortars and grouts of uniform quality with optimum performance characteristics for application indicated.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Examine substrates and areas where tile will be installed, with installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of installed tile.
 - 1. Verify that substrates for setting tile are firm, dry, clean and free from oil or waxy films and curing compounds.
 - 2. Verify that installation of grounds, anchors, recessed frames, electrical and mechanical units of work, and similar items located in or behind tile have been completed before installing tile.
 - 3. New concrete surfaces shall be mechanically prepared to a minimum ICRI (International Concrete Repair Institute) CSP #3 to CSP #5. **Note:** Installing tile over troweled surfaces is not permitted.
- B. Verify concrete floors are dry to a maximum moisture content allowed by flooring manufacturer and exhibit negative alkalinity, carbonization or dusting.
 - 1. Relative Humidity Test Method: Perform humidity testing using in situ probes in accordance with ASTM F2170.
 - a. Waterproofing Membranes: Maximum moisture in concrete/mortar bed shall not exceed 75 percent relative humidity unless otherwise noted by the manufacturer.
- C. Do not proceed with installation until unsatisfactory conditions have been corrected.

3.02 PREPARATION

- A. Blending: For tile exhibiting color variations within the ranges selected during sample submittals, verify that tile has been blended in factory and packaged accordingly so that tile units taken from one package show the same range in colors as those taken from other packages and match approved samples. If not factory blended, either return to manufacturer or blend tiles at Project site before installing.

3.03 INSTALLATION – GENERAL

- A. ANSI Tile Installation Standard: Comply with parts of ANSI 108 Series of Tile Installation Standards included under “American National Standard Specifications for the Installation of Ceramic Tile” that apply to type of setting and grouting materials and methods indicated.
- B. TCNA Installation Guidelines: TCNA “Handbook for Ceramic, Glass and Stone Tile

Installation"; comply with TCNA Installation Methods indicated.

- C. Extend tile work into recesses and under or behind equipment and fixtures to form a complete covering without interruptions except as otherwise shown. Terminate work neatly at obstructions, edges and corners without disrupting patterns or joint alignments.
- D. Accurately form intersections and returns. Perform cutting and drilling of tile without marring visible surfaces. Carefully grind cut edges of tile abutting trim, or built in items for straight aligned joints. Fit tile close to electrical outlets, piping fixtures, and other penetrations so that plates and covers overlap tile.
- E. Jointing Pattern: Unless otherwise shown, lay tile in grid pattern. Align joints when adjoining tiles on the floor, base and walls are the same size. Lay out tile work and center tile fields in both directions in each space or on each wall. Adjust to minimize tile cutting. Provide uniform widths unless otherwise shown.
- F. Lay out tile wainscots to next full tile beyond dimension indicated.
- G. Grout tile to comply with the requirements of the following installation standards:
 - 1. For epoxy grouts, comply with ANSI A108.6.
- H. Allow tiles to set firmly for 48 hours before grouting.
- I. Prime surfaces as required using materials recommended by manufacturer of setting materials.
- J. Tile accessories:
 - 1. Floor edge protection: Provide floor edge between dissimilar flooring types
 - 2. Edge protection for Tiled Edges and Outside Corners: Refer to drawings for location of edge protection.
 - 3. Cove Shaped Profile: Provide cove shaped tile or Schluter profile at all floor tile to wall tile transitions.

3.04 WATERPROOFING INSTALLATION

- A. Install waterproofing membrane in compliance with waterproofing manufacturer's instructions to produce a waterproof membrane of uniform thickness bonded securely to substrate. Install all required flashings at corners and wall to floor edges.
 - 1. Extend waterproofing membrane up walls a minimum of 3 inches.
 - 2. At showers coat all vertical walls covered with tile. Refer to applicable TCNA number.
- B. Do not install mortar bed and or tile over waterproofing until waterproofing has been tested in accordance with ASTM D5957 to determine that it is watertight.

3.05 FLOOR, INTERIOR – INSTALLATION METHODS, THIN-SET LOAD-BEARING WATERPROOF MEMBRANE, OVER BONDED MORTAR BED (FOR SLAB-ON-GROUND CONSTRUCTION

WHERE BENDING STRESS DOES NOT OCCUR)

Mortar Bed: Install tile to comply with requirements indicated below for setting bed methods, TCNA installation methods related to types of subfloor construction, and group types:

1. Portland Cement Mortar Bed: ANSI A108.1B – Installation of Ceramic Tile on a Bonded Cured Portland Cement Mortar Bed with Dryset or Latex Portland Cement Mortar.
 - a. Concrete subfloors, interior, bonded waterproof membrane: Installed over concrete or cured mortar bed:
 - 1) TCNA F112.
 - 2) Mortar Bed, ANSI A108.1B required with membrane.
 - 3) Waterproof Membrane: ANSI A108.13.
 - 4) Bond Coat: Latex-Portland Cement Mortar, ANSI A108.5.
 - 5) Grout: Epoxy Grout, ANSI A108.6.
 - b. Concrete subfloors, interior, curbless shower receptor, coated glass mat water-resistant gypsum tile backer board:
 - 1) TCNA B422C-Curbless Shower Receptor
 - 2) Mortar Bed Reinforcing, ANSI A108.1B.
 - 3) Waterproof Membrane: ANSI A108.13. Waterproof membrane shall be bonded to mortar bed.
 - 4) Bond Coat: Latex-Portland Cement Mortar, ANSI A108.5.
 - 5) Grout: Epoxy Grout, ANSI A108.6.

3.06 FLOOR, INTERIOR – INSTALLATION METHODS, THIN-SET LOAD-BEARING WATERPROOF MEMBRANE, OVER CONCRETE FLOORS (FOR SLAB-ON-GROUND CONSTRUCTION WHERE BENDING STRESS DOES NOT OCCUR)

- A. Concrete: Install tile to comply with requirements indicated below for setting bed methods, TCNA installation methods related to types of subfloor construction and group types:
 1. Concrete subfloors, interior, bonded waterproof membrane: Installed over concrete:
 - a. TCNA F122
 - b. Waterproof Membrane: ANSI A108.13
 - c. Bond Coat: Latex-Portland Cement Mortar, ANSI A108.5.
 - d. Grout: Epoxy Grout, ANSI A108.6.

3.07 WALL TILE, INTERIOR – INSTALLATION METHOD, SHOWER WALLS (WET AREA)

- A. Install types of tile designated for wall applications to comply with requirements indicated below for setting-bed methods, TCNA installation methods related to subsurface wall conditions and grout types.
 1. Thin-Set Mortar:
 - a. Shower Walls, Interior, Metal Stud.

- 1) Coated Glass Mat Water Resistant Gypsum Tile Backer Board over Metal Studs: TCA W245
 - 2) Waterproof membrane: ANSI A108.13. Coat all vertical surfaces scheduled to receive tiles.
 - 3) Bond Coat: Latex-Portland Cement Mortar, ANSI A108.5.
 - 4) Grout: Epoxy Grout, ANSI A108.6.
- b. Shower Receptor: Concrete subfloors, interior, shower receptor, coated glass mat water-resistant gypsum tile backer board:
- 1) TCNA B422C-Curbless Shower Receptor.
 - 2) Mortar Bed Reinforcing, ANSI A108.1B.
 - 3) Waterproof Membrane: ANSI A108.13. Waterproof membrane shall be bonded to mortar bed.
 - 4) Bond Coat: Latex-Portland Cement Mortar, ANSI A108.5.
 - 5) Grout: Epoxy Grout, ANSI A108.6.
- 3.08 WALL TILE, INTERIOR – INSTALLATION METHOD OVER COATED GLASS MAT WATER-RESISTANT GYPSUM BACKER BOARD (DRY AREA)
- A. Install types of tile designated for wall applications to comply with requirements indicated below for TCNA installation methods related to subsurface wall conditions and grout types.
1. Thin-Set Mortar:
 - a. Walls, Interior
 - 1) Coated Glass Mat Water Resistant Gypsum Tile Backer Board over Metal Studs: TCNA W245
 - 2) Bond Coat: Latex-Portland Cement Mortar, ANSI A108.5.
 - 3) Grout: Epoxy Grout, ANSI A108.6.
- 3.09 MOVEMENT JOINTS
- A. Perimeter Joint
1. TCNA EJ171G at thin-set installations.
 2. TCNA EJ171I at mortar bed installations.
 3. Provide sealant, matching color of grout and bond breaker tape, around the perimeter of the tile floor.
- B. Contraction and Construction Joint
1. TCNA EJ171A at mortar bed installation.
 2. TCNA EJ171B at thin-set installation.
 3. Provide sealant, matching color of grout and backer rod or bond breaker tape.
- C. Vertical movement joint in tile and backer board and wall framing.

1. TCAN EJ171K

3.10 CLEANING

- A. Cleaning: Upon completion of placement and grouting, clean all ceramic tile surfaces so they are free of foreign matter, in conformance with tile and grout manufacturer's instructions.
 1. Clean tile using epoxy grout film remover, in accordance with manufacturer's instructions.
- B. Finished Tile Work: Leave finished installation clean and free of cracked, chipped, broken, unbonded and otherwise defective tile work.
- C. Provide final protection and maintain conditions in a manner acceptable to manufacturer and installer that ensures that tile is without damage or deterioration at time of Substantial Completion.
- D. Seal tile and grout with sealer in accordance with manufacturer's instructions.

END OF SECTION

SECTION 09 51 13 – ACOUSTICAL PANEL CEILINGS

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Suspended metal grid ceiling system.
- B. Acoustical ceiling panels.
- C. Wire hangers, fasteners, main runners, cross tees, wall angle moldings and perimeter trim.

1.02 RELATED SECTIONS

- A. Section 23 37 00 – Air Outlets and Inlets: Air diffusion devices in ceiling system.
- B. Section 26 51 00 – Interior Lighting: Light fixtures in ceiling systems.
- C. Section 27 51 16 - Public Address and Mass Notification Systems: Speakers in ceiling systems.
- D. Section 28 31 00 – Fire Detection and Alarm: Fire alarm components in ceiling system.

1.03 REFERENCE STANDARDS

- A. ASTM A1008 – Standard Specification for Steel, Sheet, Cold Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Alloy with Improved Formability.
- B. ASTM A641 – Standard Specification for Zinc-Coated (Galvanized) Carbon steel Wire.
- C. ASTM A653 - Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) by the Hot-Dip Process.
- D. ASTM C423 – Sound Absorption and Sound Absorption Coefficients by the Reverberation Room Method.
- E. ASTM C635 – Standard Specification for the Manufacture, Performance and Testing of Metal Suspension Systems for Acoustical Tile and Lay-in Panel Ceilings.
- F. ASTM C636 – Standard Practice for Installation of Metal Ceiling Suspension Systems for Acoustical Tile and Lay-in Panels.
- G. ASTM E84-94 – Standard Test Method for Burning Characteristics of Building Materials.
- H. ASTM E119 – Standard Test Methods for Fire Tests of Building Construction and Materials.
- I. ASTM E1414 – Standard Test Method for Airborne Sound Attenuation Between Rooms Sharing a Common Ceiling Plenum.
- J. ASTM E1264 – Classification of Acoustical Ceiling Products.

K. ANSI Standard S12.60 -2010/Part 1. Acoustical Performance Criteria, Design Requirements, and Guidelines for Schools Part 1: Permanent Schools.

L. CISCA – Acoustical Ceilings: Use and Practice.

1.04 SUBMITTALS

A. Section 01 33 00 – Submittal Procedures.

B. Product Data: Provide data on metal grid system components and acoustical units.

C. Samples: Submit two samples full size 6 x 6 inch in size illustrating material and finish of each acoustical unit specified.

D. Provide 12-inch-long samples of each metal grid system specified.

1.05 QUALITY ASSURANCE

A. Conform to CISCA Requirements.

B. Single-Source Responsibility: Provide acoustical panel units and grid components by a single manufacturer.

1.06 QUALIFICATIONS

A. Manufacturer: Company specializing in manufacturing products specified in this section with minimum five years of recommended experience.

B. Installer: Company specializing in performing work of this section with minimum five years of documented experience.

1.07 ENVIRONMENTAL REQUIREMENTS

A. Maintain uniform temperature and humidity levels as recommended by the manufacturer prior to, during and after acoustical unit installation.

1.08 EXTRA MATERIALS

A. Section 01 70 00 – Execution and Closeout Requirements.

B. Provide 1 percent of total acoustical unit area of extra tile panels to Owner of each panel type specified.

C. Provide 1 percent of exposed suspension system to Owner of each grid type specified.

1.09 SEQUENCING

A. Sequence work to ensure acoustic ceilings are not installed until building is enclosed, sufficient heat is provided, dust-generating activities have terminated, and overhead work is completed, tested and approved.

B. Install acoustic units after interior work is dry.

1.10 WARRANTY

- A. Refer to each product specified for warranty requirements.

PART 2 PRODUCTS

2.01 MANUFACTURERS – SUSPENSION SYSTEM

- A. Armstrong.
- B. USG.
- C. CertainTeed.

2.02 SUSPENSION SYSTEM MATERIALS

- A. Non-Fire-Rated Grid: ASTM C635, intermediate duty; hot-dipped galvanized. Exposed grid surface width shall be 15/16, "Prelude XL" as manufactured by Armstrong.
 - 1. Color: White Aluminum.
- B. Fire-Rated Grid: ASTM C635, heavy-duty; G60 hot-dipped galvanized with aluminum cap. Exposed grid surface shall be 15/16 inch, "Prelude Plus XL Fire Guard" as manufactured by Armstrong.
 - 1. Color: White Aluminum.
- C. Wall Angle Molding: 7/8 inch hemmed angle molding.
- D. Support Channels and Hangers: Galvanized steel; size and type to suit application.
- E. Select wire diameter so that the stress at 3 times the hanger load (ASTM C635, Table 1, direct hung) will be less than the yield stress of wire with a minimum requirement of 12-gauge wire.

2.03 MANUFACTURERS – ACOUSTICAL UNITS

- A. Armstrong.
- B. USG.
- C. CertainTeed.

2.04 ACOUSTICAL CEILING PANELS

- A. Acoustical Ceiling Panels conforming to ASTM E1264 and as follows:
 - 1. ACT 1: 24 inches by 24 inches by 3/4 inch anti-microbial panels, Armstrong Ultima Square Lay-In, Item No. 1910.
 - a. Composition: Mineral Fiber
 - b. NRC: 0.75

- c. CAC: 35
 - d. LR: 0.90
 - e. Sag Resistant: Humiguard+
 - f. Anti-Microbial: BioBlock+
 - g. Color: White
 - h. Recycled Materials:
 - 1) 75.1 percent pre-consumer
 - 2) 1 percent post-consumer
 - i. VOC formaldehyde: Free of formaldehyde-based resins.
 - j. Grid: Install ceiling panels with Armstrong "Prelude XL" Grid System.
 - k. Products from the following manufacturers may be submitted:
 - 1) USG: Mars ClimaPlus, Item No. 86185. Grid system to be DONN DX Suspension System.
 - 2) CertainTeed: Symphony M 75, Item No. 1222-75-1. Grid system to be 15/16 inch Classic Stab.
- ACT 2: Not Used.
2. ACT 3: 24 inches by 24 inches by 3/4 inch anti-microbial panels, Armstrong Health Zone Ultima, Item No. 1935.
- a. Composition: Mineral Fiber
 - b. NRC: 0.70
 - c. CAC: 38
 - d. LR: 0.86
 - e. Complies with USDA/FSIS for guidelines in food processing areas.
 - f. Sag Resistant: Humiguard+
 - g. Anti-Microbial: BioBlock+
 - h. Color: White
 - i. Recycled Materials:
 - 1) 76.3 percent pre-consumer
 - 2) 0 percent post-consumer
 - j. VOC formaldehyde: Free of formaldehyde-based resins.
 - k. Grid: Install ceiling panels with Armstrong "Prelude Plus XL Fire Guard" Grid System.
 - l. Products from the following manufacturers may be submitted:
 - 1) USG: Mars Healthcare, Item No. 86169. Grid system to be DONN DXLA Suspension System.
 - 2) CertainTeed: RX Symphony M, Item No. 1222-RXS-1. Grid system to be 15/16" Classic Aluminum Capped Stab System.
 - m. Location: Kitchens.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Section 01 30 00 – Administrative Requirements.

- B. Verify that layout of hangers will not interfere with other work.

3.02 INSTALLATION – LAY-IN GRID SUSPENSION SYSTEM

- A. Install suspension systems to comply with ASTM C635 and ASTM C636, with hangers supported only from building structural members. Do not secure to metal roof deck. Locate hangers not more than 4'-0" on center along main runner direct-hung suspension system with additional hangers at ends of suspension members, at light fixtures, and 6 inches from vertical surfaces, leveling to tolerance of 1/8 inch in 12'-0".
- B. Secure wire hangers by looping and wire-tying, either directly to structures or to inserts, eye-screws, or other devices that are secure and appropriate for substrate, and which will not deteriorate or fail with age or elevated temperatures.
- C. Do not tie framing to:
 - 1. HVAC ductwork, sprinkler piping or conduit.
 - 2. Metal roof deck.
- D. Install hangers plumb and free from contact with insulation or other objects within ceiling plenum which are not part of supporting structural or ceiling suspension system. Splay hangers only where required to miss obstructions and offset resulting horizontal force by bracing, counterplaying or other equally effective means.
- E. Install edge moldings of type indicated at perimeter of acoustical ceiling area and at locations where necessary to conceal edges of acoustical units.
- F. Screw-attach moldings to substrate at intervals not over 16 inches on center, and not more than 3" from ends, leveling with ceiling suspension system to tolerance of 1/8 inch in 12'-0". Miter corners accurately and connect securely.

3.03 LAY-IN CEILING PANELS:

- A. Install acoustical panels in coordination with suspension system, with edges concealed by support of suspension members.
- B. Arrange and orient directionally-patterned units (if any) in a manner shown by reflected ceiling plans.
- C. Install in level plane and straight line courses, in accordance with Drawings and manufacturer's printed instructions.
- D. Seal joints in acoustical units around ducts, pipes, electrical outlets, etc., with acoustical sealant.
- E. Cutting Acoustic Units:
 - 1. Cut to fit irregular grid and perimeter edge trim.
- F. Where round obstructions occur, install preformed closures to match perimeter molding.

3.04 ADJUST AND CLEAN

- A. Clean soiled or discolored unit surfaces after installation. Comply with manufacturer's instructions for cleaning and touch-up of minor finish damage. Touch up scratches, abrasions, voids and other defects in painted surfaces. Remove and replace work which cannot be successfully cleaned and repaired to permanently eliminate evidence of damage. Remove and replace damaged or improperly installed units.

END OF SECTION

SECTION 09 65 00 – RESILIENT FLOORING

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Resilient Tile Flooring:
 - 1. Luxury Vinyl Tile.
 - 2. Rubber Tile- Alternate
- B. Resilient Sheet Flooring:
 - 1. Heterogeneous Sheet Vinyl Rubber Sheet.
- C. Resilient Base.
- D. Resilient Accessories.

1.02 RELATED SECTIONS

- A. Section 01 45 23 – Concrete In-Situ Relative Humidity and pH Testing.
- B. Section 03 30 00 – Cast-In-Place Concrete.
- C. Section 07 26 13 – Moisture Control System.

1.03 REFERENCE STANDARDS

- A. ASTM International:
 - 1. ASTM E84 – Standard Test Method for Surface Burning Characteristics of Building Materials.
 - 2. ASTM E648 – Standard Test Method for Critical Radiant Flux of Floor Covering Systems Using a Radiant Energy Source.
 - 3. ASTM E662 – Standard Test Method for Specific Optical Density of Smoke Generated by Solid Materials.
 - 4. ASTM F1303 – Standard Specification for Sheet Vinyl Floor Coverings with Backing.
 - 5. ASTM F1344 – Standard Specification for Rubber Floor Tile.
 - 6. ASTM F1700 – Standard Specification for Solid Vinyl Floor tile.
 - 7. ASTM F1859 – Standard Specification for Rubber Sheet Floor Covering Without Backing.

8. ASTM F1861 – Standard Specification for Resilient Wall Base.
 9. ASTM F2170 – Standard Test Method for Determining Relative Humidity in Concrete Floor Slabs Using In Situ Probes.
- B. National Fire Protection Association:
1. NFPA 253 – Standard Method of Test for Critical Radiant Flux for Floor Covering Systems Using a Radiant Heat Energy Source.
 2. NFPA 258 – Test Method for Specific Density of Smoke Generated by Solid Materials.

1.04 SUBMITTALS

- A. Submit under provisions of Section 01 33 00 – Submittal Procedures.
- B. Product Data: Provide data on specified products, describing physical and performance characteristics; sizes, patterns and colors available.
- C. Seaming Plan: Provide a seaming plan showing all seams.
- D. Samples:
1. Submit two samples, 6 by 6 inch in size illustrating color and pattern for each floor material for each color specified.
 2. For accessories: Manufacturer's standard-size samples, but not less than 12 inches long, of each accessory color and pattern specified.
- E. Quality Assurance Submittals: Submit the following:
1. Copies of the bond and moisture test results. A diagram of the area showing the location and results of each test shall be submitted.
 2. Manufacturer's Instructions: Current published manufacturer's installation and maintenance instructions.
- F. Submit a certificate from each flooring manufacturer specified indicating that the installer is qualified to install the specified product.

1.05 QUALITY ASSURANCE

- A. Flooring products shall be tested in accordance with ASTM E84, ASTM E648 and ASTM E662 with fire performance characteristics as follows:
1. Critical Radiant Flux per ASTM E648: .45 watts/cm², Class 1.
 2. Smoke Density per ASTM E662: Less than 450.
- B. Installer qualifications: Engage installer that is certified by floor covering manufacturer as

competent in the technique for installing flooring materials.

1. Installer shall have a minimum of five (5) years of experience installing specified products.
 2. The flooring installer shall provide an effective project manager to manage the installers and ensure that all of the required procedures are followed, documented and that the installation guides are followed as required.
- C. Manufacturer's Field Services: Upon Architect's request, each flooring manufacturer shall provide field services consisting of product use, recommendations, and periodic site visits for inspection of installation in accordance with manufacturer's instructions.
1. Site Visits: Minimum of three visits.

1.06 DELIVERY, STORAGE AND HANDLING

- A. Deliver, store, protect and handle products to site under provisions of Section 01 60 00 – Product Requirements.

1.07 ENVIRONMENTAL REQUIREMENTS

- A. Maintain temperatures in spaces where products will be installed for time period before, during and after installation as recommended by manufacturer.

1.08 MAINTENANCE DATA

- A. Submit under provisions of Section 01 70 00 – Execution and Closeout Requirements.
- B. Maintenance Data: Include maintenance procedures, recommended maintenance materials, and suggested schedule for cleaning, stripping and re-waxing.

1.09 EXTRA MATERIALS

- A. Furnish to the Owner not less than one roll and/or full box, unopened, of each class, wearing surface, color, pattern and size of flooring installed.
- B. Furnish to the Owner 10 linear feet for each 500 linear feet of each different type and color of wall base installed.

1.10 SEQUENCING AND SCHEDULING

- A. Install flooring and accessories after other finishing operations, including painting, have been completed.
- B. Do not install flooring products over cementitious underlayment until the slabs have cured and are sufficiently dry to bond with adhesive as determined by flooring manufacturer's recommended bond and moisture test.

1.11 WARRANTY

- A. Flooring products shall be warranted within the specified term and conditions after the

date of substantial completion:

1. Warranty Period commencing on the Date of Substantial Completion:
 - a. Luxury Vinyl Tile: 10-year warranty.
 - b. Heterogenous Sheet Vinyl: 5-year warranty. Rubber Sheet: 5-year warranty.
 - c. Rubber Tile: 1 year warranty.
 - d. Rubber Base: 1-year manufacturing and workmanship warranty.

1.12 PRE-INSTALLATION MEETINGS

- A. Conduct a pre-installation meeting to verify project requirements, substrate conditions, manufacturer's installation instructions and manufacturer's warranty requirements.

PART 2 PRODUCTS

2.01 MANUFACTURERS

- A. Products: Subject to compliance with requirements, provide the products identified in the "List of Finishes" on the Drawings and specified in each Product Data Sheet at end of this Section.

2.02 RESILIENT TILE

- A. Luxury Vinyl Tile: Products complying with ASTM F1700, Class 3 (Printed Film), Type B - Embossed, and with the requirements in Luxury Vinyl Tile Product Data Sheet at the end of the section.
- B. Rubber Tile: Products complying with ASTM F1344 and with the requirements in Rubber Tile Product Data Sheet at the end of the section.

2.03 RESILIENT SHEET

- A. Heterogenous Sheet Vinyl Products complying with ASTM F1303 and with requirements in Heterogenous Sheet Vinyl Flooring Data Sheet at the end of this section.
- B. Rubber Sheet: Products complying with ASTM F1859 and with the requirements in the Sheet Rubber Product Data Sheet at the end of this section.

2.04 RESILIENT WALL BASE

- A. Rubber Wall Base Thermoset Vulcanized Rubber (Type TS): Products complying with F1861, Group 1, and requirements specified in the Rubber Wall Base Product Data Sheet at end of this Section.

2.05 RESILIENT ACCESSORIES

- A. Provide tapered vinyl moldings to match rubber base as recommended by flooring manufacturer for both edges and transitions of flooring materials specified. Provide vertical lip on molding of a maximum of 1/4 inch. Provide bevel change in level between 1/4 and 1/2 inch with a slope no greater than 1:2.

2.06 INSTALLATION ACCESSORIES

- A. Concrete Slab Primer: Non-staining type as recommended by flooring manufacturer.
- B. Trowelable Underlayments and Patching Compounds: Latex-modified, Portland cement-based formulation provided or approved by flooring manufacturer for applications indicated.
- C. Adhesives: Water-resistant type recommended by flooring manufacturer to maintain flooring warranty.
- D. Sheet Flooring Heat Weld Compound: As recommended by sheet flooring manufacturer.
- E. Capping Strip: As recommended by sheet flooring manufacturer.
- F. Filler for Coved Base: As recommended by sheet flooring manufacturer.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verify concrete floors are dry to a maximum moisture content allowed by flooring manufacturer, and exhibit negative alkalinity, carbonization, or dusting.
- B. Perform all of the following tests, bond and moisture test and relative humidity test on all floors scheduled to receive resilient flooring. Refer to Section 01 45 23 for testing requirements. If any one of the tests specified fails, the concrete is not sufficiently dry for the installation of the resilient flooring products scheduled. The general contractor shall immediately notify the architect of the results of the tests.

1. Bond and Moisture Test: Use this test to determine if the concrete is sufficiently dry as well as to determine the compatibility of resilient flooring adhesives to concrete subfloors after removal of old adhesives, curing agents, breaker compounds, dust inhibitors, oil, grease, paint, varnish and other special surface treatments or conditions. Using the flooring material and recommended adhesives, install 3 feet by 3 feet panels spaced approximately 50 feet apart throughout the subfloor area. Select areas next to walls, columns or other light traffic areas. Tape edges of panels to prevent edge drying of adhesive.

If the panels are securely bonded after a period of 72 hours, you may conclude that the subfloor surface is dry and sufficiently clean of foreign material for satisfactory installation of the resilient flooring. Material can be considered "securely bonded" if an unusual amount of force is required to lift it from the subfloor.

2. Relative Humidity Test Methods: Perform humidity testing using in situ probes in accordance with ASTM F2170.

Before performing the tests, the buildings permanent HVAC system shall have been running for a minimum of 90 days.

- a. **For the first 1,000 square feet perform three tests.**
- b. **For each additional 1,000 square feet perform 1 test per 1,000**

square feet.

3. The surface of the concrete must have a pH of 9 or less.
- C. Relative Humidity Levels: In accordance with manufacturer's requirements.
- D. Verify floor and lower wall surfaces are free of substances that may impair adhesion of new adhesive and finish materials.
 1. Concrete floors with curing, hardening and breaking compounds shall be abraded with mechanical methods only to remove compounds. Use Blastrac or similar equipment.
- E. Comply with ASTM F710 and manufacturer's recommendations for surface preparation.
 1. Concrete floors with steel troweled (slick) finish shall be properly roughened up (sanded) to ensure suitable adhesion.

3.02 PREPARATION

- A. Acclimate the flooring in a secure storage area per the manufacturer's recommendations.
- B. Remove subfloor ridges and bumps. Fill minor or local low spots, cracks, joints, holes and other defects with subfloor filler to achieve smooth, flat, hard surface.
 1. Do not proceed with the Work until the surface has been properly prepared. Flooring installer shall immediately notify the Contractor of any deficiencies in the floor substrate.
- C. Prohibit traffic until filler is cured.
- D. Vacuum clean substrate.
- E. Apply primer to surfaces, where required by flooring manufacturer.

3.03 GENERAL INSTALLATION – RESILIENT FLOORING

- A. Comply with floor covering manufacturer's installation directions and other requirements indicated that are applicable to each type of floor covering installation included in Project.
- B. Where demountable partitions and other items are indicated for installing on top of finished resilient floor, install flooring before these items are installed.
- C. Scribe flooring to walls, columns, cabinets, floor outlets, and other appurtenances to produce tight joints.
- D. Where floor finishes are different on opposite sides of door, terminate flooring under centerline of door.
- E. Install edge strips at unprotected or exposed edges, where flooring terminates and where indicated. Secure resilient strips by adhesive.
- F. Extend resilient flooring into toe spaces, door reveals, closets and similar openings

without interrupting floor pattern.

- G. At movable partitions, install flooring under partitions without interrupting floor pattern.
- H. Maintain reference markers, holes, or openings that are in place or plainly marked for future cutting by repeating on finish flooring as marked on subfloor. Use chalk or other nonpermanent marking device.
- I. Install resilient flooring on covers for telephone and electrical ducts and similar items occurring within finished floor areas. Maintain overall continuity of color and pattern with pieces of flooring installed on these covers. Tightly adhere edges to perimeter of floor around covers and to covers.
- J. Install feature strips and floor markings where indicated. Fit joints tightly.
- K. Adhere resilient floor covering to flooring substrates without producing open cracks, voids, raising and puckering at joints, telegraphing of adhesive spreader marks or other surface imperfections in completed tile installation.
- L. Use full spread of adhesive applied to substrate in compliance with flooring manufacturer's directions including those for trowel notching, adhesive mixing and adhesive open and working times.

3.04 INSTALLATION – TILE FLOORING

- A. Lay out tiles from center marks established with principal walls, discounting minor offsets, so tiles at opposite edges of room are of equal width. Adjust as necessary to avoid using cut widths at perimeter that equal less than one-half of a tile. Install tiles square with room axis, unless otherwise indicated.
- B. Match tiles for color and pattern by selecting tiles from cartons in sequence as the manufacturer recommends. Cut tiles neatly around all fixtures. Discard broken, cracked, chipped, or deformed tiles.
 - 1. Lay tiles in pattern with respect to location of colors, patterns, and sizes as indicated on Drawings.
 - 2. If pattern is not identified on Drawings, lay tiles per manufacturers recommendations.
- C. Luxury Vinyl Tile to be rolled with a 100-pound roller in both directions immediately after installation.

3.05 INSTALLATION – SHEET FLOORING

- A. Roll out resilient sheet flooring material with top surface up. Trim off all damaged edges. Allow material to relax for duration as recommended by manufacturer.
- B. Refer to manufacturer's recommendations for method of seam cutting and sealing.
- C. Heterogenous sheet vinyl flooring to be rolled with a 100-pound roller in both directions immediately after installation.

- D. Provide integral cove wall base where shown on the Drawings, include cove fillet support strip and top edge cap trim. Construct flash cove base in accordance with the flooring manufacturer's instructions. Weld seams per manufacturer's instructions.

3.06 INSTALLATION – BASE AND ACCESSORIES

- A. General: Install products specified in this section using methods indicated according to manufacturer's installation directions.
- B. Apply resilient wall base to walls, columns, pilasters, casework and other permanent fixtures in rooms and areas where base is required. Install wall base in lengths as long as practicable. Tightly adhere wall base to substrate throughout length of each piece, with base in continuous contact with horizontal and vertical substrates.
 - 1. On irregular substrates, fill voids along top edge of resilient wall base with manufacturer's recommended adhesive filler material.
 - 2. Install inside and exterior corners before installing straight pieces.
 - 3. Form inside corners on job from straight pieces of maximum lengths possible by cutting an inverted V-shaped notch in toe of wall base at the point where corner is formed. Shave back of base where necessary to produce snug fit to substrate.
 - 4. Form outside corners on job from straight pieces of maximum lengths possible by shaving back of base at point where bending will occur. Remove a strip perpendicular to length of base and only deep enough to produce a snug fit without bends whitening or removal of more than half the thickness of wall base.
- C. Place resilient accessories so they are butted to adjacent materials of type indicated and bond to substrates with adhesive. Install reducer strips at edges of flooring that otherwise would be exposed.

3.07 CLEANING

- A. Clean work under provisions of Section 01 70 00 – Execution and Closeout Requirements.
- B. Remove excess adhesive from floor, base and wall surfaces without damage.
- C. Clean all resilient products specified, in accordance with manufacturer's written instructions.
 - 1. Products that require a polish or wax should be done so according to the manufacturer's recommendations unless noted otherwise.
- D. The contractor shall provide its own equipment for floor care and take all precautions to secure area for safety and use appropriate signage such as "WET FLOOR" signs. Signs shall be in English and Spanish.

3.08 PROTECTION OF FINISHED WORK

- A. Protect finished Work under provisions of Section 01 70 00 – Execution and Closeout

Requirements.

- B. Prohibit traffic on floor finish and stair treads for a duration as recommended by the manufacturer.
- C. Protect the flooring using plywood, Masonite or a similar product for the duration of the project as recommended by the flooring manufacturer.

3.09 PRODUCT DATA SHEET 1 – LUXURY VINYL FLOOR TILE

- A. Basis of Design: Refer to “List of Finishes” on the drawings.
- B. Vinyl Floor Tile Designation: LVT.
- C. Reference Specifications: ASTM F1700, Class 3, Type B – Embossed.
- D. Adhesive: Recommended by flooring manufacturer for substrate indicated and to maintain warranty.
- E. Colors and Patterns: As scheduled on the Drawings.

3.10 PRODUCT DATA SHEET 2 – RUBBER FLOOR TILE

- A. Basis of Design: Refer to “List of Finishes” on the drawings.
- B. Rubber Floor Tile Designation: RT.
- C. Reference Specifications: ASTM F1344.
- D. Adhesive: Recommended by flooring manufacturer for substrate indicated and to maintain warranty.
- E. Seams: Heat weld.
- F. Colors and Patterns: As scheduled on the Drawings.

3.11 PRODUCT DATA SHEET 3– RUBBER SHEET FLOORING

- A. Basis of Design: Refer to “List of Finishes” on the drawings.
- B. Rubber Sheet Flooring Designation: RS.
- C. Reference Specifications: ASTM F1859.
- D. Adhesive: Recommended by flooring manufacturer for substrate indicated and to maintain warranty.
- E. Seams: Heat weld.
- F. Colors and Patterns: As scheduled on the Drawings.

3.12 PRODUCT DATA SHEET 4 – HETEROGENEOUS SHEET FLOORING

- A. Basis of Design: Refer to "List of Finishes" on the drawings.
- B. Linoleum Floor Tile Designation: RS.
- C. Reference Specifications: ASTM F1303.
- D. Adhesive: Recommended by flooring manufacturer for substrate indicated and to maintain warranty.
- E. Seams: Heat weld.
- F. Colors and Patterns: As scheduled on the Drawings.

3.13 PRODUCT DATA SHEET 5 – RUBBER WALL BASE

- A. Basis of Design: Refer to "List of Finishes" on the drawings.
- B. Rubber Wall Base Designation: RB.
- C. Reference Specifications: ASTM F1861, Group 1 (solid), Style B (coved).
- D. Form: 4 inches high, rolls.
- E. Style: Cove with top-set toe.
- F. Adhesive: As recommended by manufacturer.
- G. Exterior Corners: Job formed only.
- H. Interior Corners: Job formed only.
- I. Colors and Pattern: As scheduled on the Drawings.

END OF SECTION

SECTION 09 68 13 – TILE CARPETING

PART 1 GENERAL

1.01 SUMMARY

- A. Section includes carpet tile and accessories.
- B. Related Sections:
 - 1. Section 01 45 23 – Concrete In-Situ Relative Humidity and pH Testing.
 - 2. Section 09 65 00 – Resilient Flooring.

1.02 REFERENCES

- A. Carpet and Rug Institute:
 - 1. CRI Carpet Installation Standard – Standard for Installation of Commercial Carpet.
 - 2. CRI Green Label Plus Testing Program.
 - 3. CRI Model Specifications for Commercial Carpets.
- B. Consumer Products Safety Commission:
 - 1. CPSC 16 CFR 1630 – Standard for the Surface Flammability of Carpets and Rugs.
- C. National Fire Protection Association:
 - 1. NFPA 253 – Standard Method of Test for Critical Radiant Flux for Floor Covering Systems Using a Radiant Heat Energy Source.

1.03 SUBMITTALS

- A. Section 01 33 00 – Submittal Procedures.
- B. Product Data: Submit data on specified products, describing physical and performance characteristics; sizes, patterns, colors available, and method of installation.
- C. Samples:
 - 1. Submit four carpet tiles illustrating color and pattern design for each carpet color selected.
 - 2. Exposed edge, transition and other accessory stripping: 12-inch-long samples.
- D. Manufacturer's Installation Instructions: Submit special procedures, perimeter conditions requiring special attention, and maintenance instructions.

1.04 CLOSEOUT SUBMITTALS

- A. Section 01 70 00 – Execution and Closeout Requirements: Closeout procedures.
- B. Operation and Maintenance Data: Submit maintenance procedures, recommended maintenance materials, and suggested schedule for cleaning.

1.05 QUALITY ASSURANCE

- A. Surface Burning Characteristics:
 - 1. Floor Finishes: Comply with the following:
 - a. At corridors and rooms or spaces not separated from corridors by partitions extending from floor to underside of ceiling provide carpet tile complying with Class II, minimum 0.22 watts/sq cm when tested in accordance with NFPA 253.
 - b. In all occupancies, provide carpet tile which complies with DOC FF-1 "Pill Test" CPSC 16 CFR Part 1630 or with ASTM D 2859.
- B. Texture Appearance Retention Rating: Rating classifications as determined by CRI Model Specifications for Commercial Carpets.
 - 1. Carpet Tiles to be greater than or equal to 3.0 TARR for Heavy Traffic Level Classification.

1.06 QUALIFICATIONS

- A. Installer: Company specializing in performing work of this section with minimum five years of experience approved by manufacturer.
 - 1. Floor Covering Installation Contractors Association (FCICA) or International Certified Floorcovering Installers Association (ICFI) certified carpet installers.

1.07 PRE-INSTALLATION MEETINGS

- A. Section 01 30 00 – Administrative Requirements: Pre-installation meeting.
- B. Convene minimum one week prior to commencing work of this section.

1.08 ENVIRONMENTAL REQUIREMENTS

- A. Section 01 60 00 – Product Requirements.
- B. Store materials in area of installation for 48 hours prior to installation.
- C. Maintain minimum 70 degrees F ambient temperature 3 days prior to, during and 24 hours after installation.
- D. Ventilate installation area during installation and for 3 days after installation.

PART 2 PRODUCTS

2.01 MANUFACTURERS

- A. Products: Subject to compliance with requirements, provide the products identified in the "List of Finishes" on the Drawings.

2.02 CARPET TILE

- A. Carpet Tile: Products meeting the testing and product requirements of the Carpet and Rug Institute Green Label Plus Program.

2.03 COMPONENTS

- A. Carpet Tiles CPT: Refer to "List of Finishes" on drawings.

2.04 ACCESSORIES

- A. Subfloor Filler: Cementitious Type recommended by flooring material manufacturer.\
- B. Moldings and Edge Strips: Vinyl; color as selected.
- C. Adhesives: As recommended by the manufacturer.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Section 01 30 00 – Administrative Requirements: Coordination and project conditions.
- B. Verify floor surfaces are smooth and flat within tolerances specified in Section 03 30 00 – Cast-in-Place Concrete and are ready to receive work.
- C. Verify concrete floors are ready for carpet installation by testing for relative humidity and alkalinity. Obtain instructions when test results are not within specified limits.
 - 1. Relative humidity: In accordance with manufacturer's requirements.
 - 2. Alkalinity: pH range of 5-9.

3.02 PREPARATION

- A. It shall be the responsibility of the General Contractor to present the floors in a condition to receive the carpet.
- B. Surface to receive carpet tiles must be free of dirt, solvents, oil, grease, paint, plaster, moisture and other substances detrimental to proper performance of adhesive and carpet.
- C. Concrete Surfaces

1. The General Contractor must submit to the floor covering installation contractor prior to installation a written report on the moisture and alkalinity condition of the concrete slab.
2. Check to ensure there is no dusting. A primer may be needed to prevent dusting.

3.03 INSTALLATION

- A. Install Carpet tile in accordance with manufacturer's written instructions and with CRI Carpet Installation Standard to maintain uniformity of direction and lay of pile.
- B. Do not mix carpet from different cartons unless from same dye lot or otherwise noted.
- C. Butt carpet tile edges firmly together to form seams without gaps. Remove adhesive promptly from face of carpet.
- D. Where carpet meets dissimilar floor surface, proper edge molding shall be used.
- E. Install edge moldings where carpet edge is exposed and at transitions to other floor coverings. Edge moldings shall be securely anchored to substrate.

3.04 CLEANING

- A. Section 01 70 00 – Execution and Closeout Requirements: Final cleaning.
- B. Remove excess adhesive from floor, base and wall surfaces without damage.
- C. Clean and vacuum carpet surfaces.

3.05 PROTECTION OF INSTALLED CONSTRUCTION

- A. Section 01 70 00 – Execution and Closeout Requirements: Protecting installed construction.
- B. Do not permit traffic over unprotected floor surface.
 1. Cover carpeting in traffic areas with protective non-staining building paper. Do not use plastic sheeting.

END OF SECTION

SECTION 09 72 10 - WALLCOVERINGS

PART 1 GENERAL

1.01 SUMMARY

A. Division Includes:

1. Wallcoverings

B. Related Sections:

1. Section 09 21 16 - Gypsum Board Assemblies: Level 4 finish.
2. Section 09 90 00 - Painting and Coating: Primer

1.02 REFERENCES

A. American Society for Testing and Materials (ASTM):

1. E84 - Test Method for Surface Burning Characteristics of Building Materials.
2. F793 – Standard Classification of Wallcovering by Use Characteristics

B. Gypsum Association

1. GA-214 - Recommended Levels of Finish for Gypsum Board, Glass Mat & Fiber Reinforced Gypsum Panels.

1.03 SUBMITTALS

A. For each type of wallcovering material specified, the contractor shall submit:

1. For architect's approval: One 7" x 7" sample, labeled with the appropriate material name and SKU information.
2. For Owner's approval: A copy of the maintenance instructions, as provided by the manufacturer.

1.04 QUALITY ASSURANCE

A. Installer: Installation by skilled commercial wallcovering contractor with no less than three years of documented experience installing wallcovering of the types and extent required.

B. Surface Burning Characteristics Classification: Provide materials that meet Class I/A rating when tested in accordance with ASTM E84 for flame spread and smoke developed.

C. Field Samples: Prepare field samples for architect's review and establish requirements for seaming and finish trim.

1. Install sample panel of each type wallcovering specified in area designated by architect.

2. Maintain corrected and approved samples to serve as a standard of performance for the project.

1.05 PRODUCT DELIVERY, STORAGE, AND HANDLING

- A. Deliver wall coverings to the project site in unbroken and undamaged original factory packaging and clearly labeled with the manufacturer's identification label, quality or grade, and lot number.
- B. Store materials in a clean, dry storage area with temperature maintained above 55-degrees Fahrenheit with normal humidity.
- C. Inspect wall covering to verify that the delivered product is correct and that the color is accurate to what was ordered.
- D. Store material within original packaging to prevent damage.

1.06 PROJECT CONDITIONS

- A. Do not apply wallcoverings when surface and ambient temperatures are outside the temperature ranges required by the wallcovering manufacturer.
- B. Provide continuous ventilation and heating facilities to maintain substrate surface and ambient temperatures between 65-85° Fahrenheit.
- C. Apply adhesive when substrate surface temperature and ambient temperature is above 55° Fahrenheit and relative humidity is below forty percent.
- D. Maintain constant recommended temperature and humidity for at least seventy-two hours prior to and throughout the installation period, and for seventy-two hours after wallcovering installation completion.
- E. Provide not less than 80-foot-candles per square foot lighting level measured mid-height at substrate surfaces.
- F. Gypsum board finish shall be completed to comply with AWCI specification, Level 4 or higher.

1.07 WARRANTY

- A. Submit manufacturer's written warranty against manufacturing defects.

1.08 MAINTENANCE

- A. Maintenance instructions: Include precautions against cleaning materials and methods that may be detrimental to finishes and performance.

PART 2 PRODUCTS

2.01 MANUFACTURER AND PRODUCT

- A. Refer to "List of Finishes" on drawings.

2.02 ACCESSORIES

- A. Adhesives: Heavy-duty clear or clay based premixed vinyl adhesive.
- B. Substrate Primer/Sealer: White pigmented acrylic base primer/sealer specifically formulated for use with vinyl wallcoverings.
 - 1. Refer to Section 09 90 00 – Painting and Coating for primer.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Examine substrates and installation conditions to ensure surface conditions meet or exceed a Level 4 finish, per GA-214: Recommended Levels of Gypsum Board of Finish for Gypsum Board, Glass Mat & Fiber Reinforced Gypsum Panels and permanent lighting should be installed and operational.
- B. Test substrate with a suitable moisture meter and verify that moisture content does not exceed four percent.
- C. Verify substrate surface is clean, dry, smooth, structurally sound, and free from surface defects and imperfections that would show through the finished surface. The moisture content of the wall shall be checked with a moisture meter and not be over 7 percent.
- D. Evaluate all painted surfaces for the possibility of pigment bleed-through.
- E. Notify the contractor and architect in writing of any conditions detrimental to the proper and timely completion of the installation.
- F. Examine the product and verify that the color, scale and design are what was specified, the product is free from defects and the alignment of the pattern across panels is correct.

3.02 INSTALLATION

- A. Acclimate wallcovering in the area of installation a minimum of twenty-four hours before installation.
- B. Read and follow the manufacturer's installation instruction sheet contained in each roll of wallcovering. This is a custom product and therefore the installation requires a higher attention to detail than installation of standard wallcovering.
- C. Adhesive: Apply a uniform coat of adhesive as recommended by the manufacturer.
- D. Primer: Use a quality pigmented acrylic wallcovering primer if needed and recommended by manufacturer.
- E. Install wall covering in accordance with the Installation Diagram included with the finished goods. Double- Cut seams to provide pattern match.
- F. Apply wallcovering to the substrate using a wallcovering smoother, wrapped with a soft cloth, to remove air bubbles. Do not use sharp edged smoothing tools. Smooth material on the wall from the middle to the outside edge.

- G. Remove excess adhesive immediately after the wallcovering is applied. Clean as recommended by manufacturer.
- H. Stop installation of material that is questionable in appearance and notify the manufacturer's representative for an inspection.

3.03 CLEAN-UP

- A. Upon completion of installation, remove all exposed adhesive immediately using a soft cloth and a warm, mild soap solution and rinse thoroughly with water and dry with clean towel prior to using.
- B. Upon completion of the work, remove surplus materials, rubbish, and debris resulting from the wallcovering installation. Leave areas in neat, clean, and orderly condition. Contractor shall protect finished wallcovering from damage.

END OF SECTION

SECTION 09 90 00 – PAINTING AND COATING

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. This Section includes surface preparation, painting and finishing of exposed interior and exterior items and surfaces.
 - 1. Surface preparation, priming and finish coats specified in this section are in addition to shop priming and surface treatment specified under other sections.
- B. Paint exposed surfaces whether or not colors are designated in “schedules,” except where a surface or material is specifically indicated not to be painted or is to remain natural. Where an item or surface is not specifically mentioned, paint the same as similar adjacent materials or surfaces. If color or finish is not designated, the Architect will select from standard colors or finishes available. Sherwin Williams Coatings listed at the end of this specification where used to establish the level of quality of the coating systems. The coating manufacturer shall match the colors identified in the finish schedule.
 - 1. Painting includes field painting exposed bare pipes and ducts (including color coding), hangers, exposed steel and iron work, and primed metal surfaces of mechanical and electrical equipment.
- C. Painting is not required on pre-finished items, finished metal surfaces, concealed surfaces, operating parts, and labels.
 - 1. Pre-finished items not to be painted include the following factory-finished components:
 - a. Acoustic materials.
 - b. Finished mechanical and electrical equipment.
 - c. Light fixtures.
 - d. Switchgear.
 - e. Distribution cabinets.
 - f. Plastic laminate wood doors.
 - g. Metal lockers.
 - h. Plastic laminate covered architectural casework.
 - i. Metal flashings.
 - j. Storefront system.
 - 2. Concealed surfaces not to be painted include wall or ceiling surfaces in the following generally inaccessible areas:
 - a. Furred areas.
 - b. Pipe spaces.
 - c. Ceiling plenums.
 - 3. Finished metal surfaces not to be painted include:
 - a. Anodized aluminum.
 - b. Stainless steel.
 - c. Chromium plate.

- d. Copper.
 - e. Bronze or brass.
4. Operating parts not to be painted include moving parts of operating equipment such as the following:
- a. Valve and damper operators.
 - b. Linkages.
 - c. Sensing devices.
 - d. Motor and fan shafts.
5. Labels: Do not paint over Underwriters Laboratories, Factory Mutual or other code-required labels or equipment name, identification, performance rating, or nomenclature plates.

1.02 RELATED SECTIONS

- A. Section 05 12 00 – Structural Steel Framing: Shop Primed Items.
- B. Section 05 21 00 – Steel Joist Framing: Shop Primed Items.
- C. Section 05 50 00 – Metal Fabrications: Shop Primed Items.
- D. Section 08 12 14 – Standard Steel Frames: Shop Primed, Field Painted.
- E. Section 08 13 14 – Standard Steel Doors: Shop Primed, Field Painted.
- F. Section 09 21 16 – Gypsum Board Assemblies: Finishing gypsum board prior to application of paint.
- G. Section 09 72 10 - Wall Covering: Preparation and priming of substrate scheduled to receive wall covering.
- H. Section 22 05 53 – Identification for Plumbing Piping and Equipment.
- I. Section 23 05 53 – Identification for HVAC Piping and Equipment.
- J. Section 26 05 53 – Identification for Electrical Systems.
- K. Section 27 05 53 – Identification for Communication Systems.

1.03 REFERENCES

- A. Steel Structures Painting Council
 - 1. SP-1 Solvent Cleaning
 - 2. SP-2 Hand Tool Cleaning
 - 3. SP-3 Power Tool Cleaning
 - 4. SP-13 Nace No. 6 Surface Preparation for Concrete

B. ASTM

1. ASTM D 3359 – Standard Test Methods for Rating Adhesion by Tape Test.

1.04 SUBMITTALS

A. Submit in accordance with Section 01 33 00 – Submittal Procedures.

B. Product Data: Manufacturer's data sheets on each paint and coating product shall include:

1. Product characteristics.
2. Surface preparation instructions and recommendations.
3. Primer requirements and finish specification.
4. Storage and handling requirements and recommendations.
5. Application methods.

C. Samples: Upon selection of colors by the Architect, submit samples for Architect's review of color and texture only. Provide a listing of material and application for each coat of each finish sample.

1. On 12 inch by 12 inch hardboard, provide one sample of each paint color listed in the color schedule, with texture to simulate actual conditions. Resubmit samples as requested by Architect until acceptable sheen, color and texture are achieved. Samples shall be stepped to show primer, first coat and second coat.
2. On actual wall surfaces, duplicate painted finishes of prepared samples as directed by Architect. On at least 100 square feet of surface as directed, provide full-coat finish samples until required sheen, color and texture is obtained; simulate finished lighting conditions for review of in-place work.
3. Do not proceed with painting until materials and finishes are approved by Architect.

1.05 QUALITY ASSURANCE

A. Single-Source Responsibility: Provide primers and undercoat paint produced by the same manufacturer as the finish coats.

B. Coordination of Work: Review other sections in which primers are provided to ensure compatibility of the total systems for various substrates. On request, furnish information on characteristics of finish materials to ensure use of compatible primers.

1. Notify the Architect of problems anticipated using the materials specified.

C. Material Quality: Provide the manufacturer's best quality trade sale paint material of the various coating types specified. Paint material containers not displaying manufacturer's product identification will not be acceptable.

1. Proprietary names used to designate colors or materials are not intended to imply that products named are required or to exclude equal products of other manufacturers.
 2. Federal Specifications establish a minimum quality level for paint materials, except where other product identification is used. Provide written certification from the manufacturer that materials provided meet or exceed these criteria.
 3. Products that comply with qualitative requirements of applicable Federal Specifications, yet differ in quantitative requirements, may be considered for use when acceptable to the Architect. Furnish material data and manufacturer's certificate of performance to Architect for proposed substitutions.
- D. Chemical Component Restrictions: The manufacturer shall demonstrate that the following chemical compounds are not used as ingredients in the manufacture of the product:
1. Halomethanes:
 - a. Methylene chloride
 2. Chlorinated ethanes:
 - a. 1,1,1-trichloroethane
 3. Aromatic solvents:
 - a. Benzene
 - b. Toluene (methylbenzene)
 - c. Ethylbenzene
 4. Chlorinated ethylenes:
 - a. Vinyl chloride
 5. Polynuclear aromatics:
 - a. Naphthalene
 6. Chlorobenzenes:
 - a. 1,2-dichlorobenzene
 7. Phthalate esters:
 - a. Di (2-ethylhexyl) phthalate
 - b. Butyl benzyl phthalate
 - c. Di-n-butyl phthalate
 - d. Di-n-octyl phthalate
 - e. Diethyl phthalate
 - f. Dimethyl phthalate
 8. Miscellaneous semi-volatile organics:

- a. Isophorone
- 9. Metals and their compounds:
 - a. Antimony
 - b. Cadmium
 - c. Hexavalent chromium
 - d. Lead
 - e. Mercury
- 10. Preservatives (anti-fouling agents)
 - a. Formaldehyde
- 11. Ketones:
 - a. Methyl ethyl ketone
 - b. Methyl isobutyl ketone
- 12. Miscellaneous volatile organics:
 - a. Acrolein
 - b. Acrylonitrile
- E. Packaging Requirements:
 - 1. Toxics in packaging:
 - a. The manufacturer shall demonstrate that paint cans and their components are not fabricated with lead.

1.06 DELIVERY, STORAGE AND HANDLING

- A. Deliver materials to the job site in the manufacturer's original, unopened packages and containers bearing manufacturer's name and label and the following information:
 - 1. Product name or title of material.
 - 2. Product description (generic classification or binder type).
 - 3. Federal Specification number, if applicable.
 - 4. Manufacturer's stock number and date of manufacture.
 - 5. Contents by volume, for pigment and vehicle constituents.
 - 6. VOC content.
 - 7. Thinning instructions.
 - 8. Application instructions.
 - 9. Color name and number.

- B. Store materials not in use in tightly covered containers in a well-ventilated area at a minimum ambient temperature of 45 degrees F (7 degrees C). Maintain containers used in storage in a clean condition, free of foreign materials and residue.
 - 1. Protect from freezing. Keep storage area neat and orderly. Remove oily rags and waste daily. Take necessary measures to ensure that workers and work areas are protected from fire and health hazards resulting from handling, mixing, and application.
- C. Provide coating systems which are VOC compliant as specified.

1.07 JOB CONDITIONS

- A. Section 01 60 00 – Product Requirements.
- B. Do not apply materials when surface and ambient temperatures are outside temperature ranges required by paint manufacturer.
- C. Apply water-based paints only when the temperature of surfaces to be painted and surrounding air temperatures are between 50 degrees F (10 degrees C) and 90 degrees F (32 degrees C).
- D. Apply solvent-thinned paints only when the temperature of surfaces to be painted and surrounding air temperatures are between 45 degrees F (7 degrees C) and 95 degrees F (35 degrees C).
- E. Do not apply paint in snow, rain, fog or mist, when the relative humidity exceeds 85 percent, at temperatures less than 5 degrees F (3 degrees C) above the dew point, or to damp or wet surfaces.
 - 1. Painting may continue during inclement weather if surfaces and areas to be painted are enclosed and heated within temperature limits specified by the manufacturer during application and drying periods.
- F. Provide lighting level of 80-foot candle measured mid-height at substrate surface.

1.08 PRE-PAINTING CONFERENCE

- A. Prior to finish painting, exterior and interior, General Contractor shall schedule a "Pre-Painting Conference" to be attended by the Architect, Contractor, painting subcontractor and Manufacturer's Representative. (Manufacturer's Rep. to attend when required for special finishes.)
- B. Agenda to include submittal of color and finishes sample (RE: Article 1.04 "Submittals" for review of color samples.
- C. Contractor to record discussions of conference including agreements and/or disagreements and distribute a copy of record to each party in attendance.

PART 2 PRODUCTS

2.01 MANUFACTURERS

- A. Basis of Design: Contract Documents are based on manufacturer and product named below to establish a standard of quality. Other acceptable manufacturers with products having equivalent characteristics may be considered, provided deviations are minor and does not change concept as expressed in Contract Documents as judged by Architect.
 - 1. Basis of Design Product Selections: Sherwin-Williams.
- B. Acceptable Manufacturers: Subject to compliance with requirements of Contract Documents, provide product by one of the manufacturers named alphabetically below. If not named, submit as substitution according to Conditions of the Contract and appropriate Division 1 sections.
 - 1. Benjamin Moore and Co.
 - 2. Pratt & Lambert
- C. Concrete Curing and Sealing Compound:
 - 1. W.R. Meadows Co. or approved equivalent.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Examine substrates and conditions under which painting will be performed for compliance with requirements for application of paint. Do not begin paint application until unsatisfactory conditions have been corrected.
 - 1. Start of painting will be construed as the Applicator's acceptance of surfaces and conditions within a particular area.

3.02 PREPARATION

- A. General Procedures: Remove hardware and hardware accessories, plates, machined surfaces, lighting fixtures, and similar items in place that are not to be painted, or provide surface-applied protection prior to surface preparation and painting. Remove these items if necessary for complete painting of the items and adjacent surfaces. Following completion of painting operations in each space or area, have items reinstalled by workers skilled in the trades involved.
 - 1. Clean surfaces before applying paint or surface treatments. Remove oil and grease prior to cleaning. Schedule cleaning and painting so that dust and other contaminants from the cleaning process will not fall on wet, newly painted surfaces.
- B. Surface Preparation: Clean and prepare surfaces to be painted in accordance with the manufacturer's instructions for each particular substrate condition and as specified.
 - 1. Provide barrier coats over incompatible primers or remove and reprime. Notify Architect in writing of problems anticipated with using the specified finish-coat material with substrates primed by others.

2. Ferrous Metals: Clean non-galvanized ferrous-metal surfaces that have not been shop coated; remove oil, grease, dirt, loose mill scale and other foreign substances. Use solvent or mechanical cleaning methods that comply with recommendations of the Steel Structures Painting Council.
 - a. Touch up bare areas and shop-applied prime coats that have been damaged. Wire-brush, clean with solvents recommended by the paint manufacturer and touch up with the same primer as the shop coat.
 3. Galvanized Surfaces: Allow to weather a minimum of 6 months prior to coating. Clean per SSPC-SP1 using detergent and water or a degreasing cleaner, then prime as required. When weathering is not possible or the surface has been treated with chromates or silicates, first Solvent Clean per SSPC-SP1 and apply a test area, priming as required. Allow the coating to dry at least one week before testing. If adhesion is poor, Brush Blast per SSPC-SP7 as necessary to remove these treatments.
 4. Cementitious Materials: Prepare concrete masonry block to be painted. Remove loose cement, efflorescence, chalk, dust, dirt, grease, and oils.
 - a. Determine alkalinity and moisture content of surfaces by performing appropriate tests. If surfaces are sufficiently alkaline to cause the finish paint to blister and burn, correct this condition before application. Do not paint surfaces where moisture content exceeds that permitted in manufacturer's written instructions.
 - 1) Mortars shall be cured for a minimum of 30 days at 75 degrees F unless the manufacturer's products are designed for application prior to 30-day period.
 - 2) The surface of the mortar shall have a pH of between 6 and 9 and a moisture content of 15 percent or lower.
 - 3) Concrete block surfaces shall be dry before priming.
 - b. Damaged areas shall be repaired using appropriate materials.
 - 1) Fill bug holes, air pockets and other voids with a cement patching compound.
 5. Drywall: Surface must be clean and dry. All nail or screw heads must be set and spackled. Joints must be taped and covered with joint compound. Spackled fastener heads and tape joints must be sanded smooth and all dust removed prior to painting.
- C. Materials Preparation: Carefully mix and prepare paint materials in accordance with manufacturer's directions.
1. Maintain containers used in mixing and application of paint in a clean condition, free of foreign materials and residue.
 2. Stir material before application to produce a mixture of uniform density; stir as required during application. Do not stir surface film into material. Remove film and if necessary, strain material before using.
 3. Use only thinners approved by the paint manufacturer, and only within recommended limits.

3.03 APPLICATION

- A. Apply paint in accordance with manufacturer's directions. Use applicators and techniques best suited for substrate and type of material being applied.
 - 1. Non-zinc coated architectural metals, steel doors and steel frames shall have all coatings spray applied. Brush application is not acceptable.
- B. Do not paint over dirt, rust, scale, grease, moisture, scuffed surfaces, form release agents, sealers or conditions detrimental to formation of a durable paint film.
 - 1. Paint colors, surface treatments, and finishes are indicated in "schedules."
 - 2. Provide finish coats that are compatible with primers used.
 - 3. The number of coats and film thickness required is the same regardless of the application method. Do not apply succeeding coats until the previous coat has cured as recommended by the manufacturer. Sand between applications where sanding is required to produce an even smooth surface in accordance with the manufacturer's directions.
 - 4. Apply additional coats when undercoats, stains or other conditions show through final coat of paint until paint film is of uniform finish, color and appearance. Give special attention to ensure that surfaces, including edges, corners, crevices, welds and exposed fasteners, receive a dry film thickness equivalent to that of flat surfaces.
 - 5. The term "exposed surfaces" includes areas visible when permanent or built-in fixtures, convactor covers, covers for finned tube radiation, grilles, and similar components are in place. Extend coatings in these areas as required to maintain the system integrity and provide desired protection.
 - 6. Paint surfaces behind movable equipment and furniture same as similar exposed surfaces. Paint surfaces behind permanently fixed equipment or furniture with prime coat only before final installation of equipment.
 - 7. Paint interior surfaces of ducts, where visible through registers or grilles, with a flat, non-specular black paint.
 - 8. Paint back sides of access panels and removable or hinged covers to match exposed surfaces.
 - 9. Finish exterior doors on tops, bottoms, side edges and interior surfaces same as exterior faces.
 - 10. Apply a primer as scheduled over all surfaces that are shop primed from the manufacturer/fabricator that are scheduled to be painted.
- C. Scheduling Painting: Apply first coat to surfaces that have been cleaned, pre-treated, or otherwise prepared for painting as soon as practicable after preparation and before subsequent surface deterioration.
 - 1. Allow sufficient time between successive coats to permit proper drying. Do not

recoat until paint has dried to where it feels firm, and does not deform or feel sticky under moderate thumb pressure and where application of another coat of paint does not cause lifting or loss of adhesion of the undercoat.

- D. Minimum Coating Thickness: Apply materials at not less than the manufacturer's recommended spreading rate. Provide a total dry film thickness of the entire system as recommended by the manufacturer.
- E. Mechanical and Electrical work: Painting mechanical and electrical work is limited to items exposed in mechanical equipment rooms and in occupied spaces.
- F. Prime Coats: Before application of finish coats, apply a prime coat of material as scheduled to material that is required to be painted or finished. Reprime surfaces that are factory primed. Recoat primed and sealed surfaces where evidence of suction spots or unsealed areas in first coat appears to assure a finish coat with no burn through or other defects due to insufficient sealing.
- G. Pigmented (Opaque) Finishes: Completely cover to provide an opaque, smooth surface of uniform finish, color, appearance and coverage. Cloudiness, spotting, holidays, laps, brush marks, runs, sags, ropiness or other surface imperfections will not be acceptable.
- H. Completed Work: Match approved samples for color, texture and coverage. Remove, refinish or repaint work not in compliance with specified requirements.
- I. Block Fillers: Apply block fillers to concrete masonry block at a rate to ensure complete coverage with pores filled.

3.04 CLEANING

- A. Cleanup: At the end of each work day, remove empty cans, rags, rubbish and other discarded paint materials from the site.
- B. Upon completion of painting, clean glass and paint-spattered surfaces. Remove spattered paint by washing and scraping, using care not to scratch or damage adjacent finished surfaces.

3.05 PROTECTION

- A. Protect work of other trades, whether to be painted or not, against damage by painting. Correct damage by cleaning, repairing or replacing and repainting, as acceptable to Architect.
- B. Provide "wet paint" signs to protect newly painted finishes. Remove temporary protective wrappings provided by others for protection of their work after completion of painting operations.
 - 1. At completion of construction activities of other trades, touch up and restore damaged or defaced painted surfaces.

3.06 EXTERIOR PAINT SCHEDULE

- A. General: Provide the following paint systems for the various substrates, as indicated:

B. Metals

1. Ferrous Metal and Zinc Coated Metal:

- a. High Gloss Waterbased Acrylic Urethane Enamel: 2 finish coats over primer on properly prepared surface.
- b. Primer (factory primed and bare/unpainted steel surface):
 - 1) Sherwin-Williams Pro Industrial Pro-Cryl Universal Primer (B66-W00310 Series) (5.0-10.0 mils wet, 1.9-3.8 mils dry).
 - 2) VOC: Less than 96 g/L.
- c. First and Second Coats:
 - 1) Sherwin-Williams Waterbased Acrolon 100 Waterbased Urethane High Gloss (B65-700 Series) (4.0 – 8.0 mils wet, 1.8 – 3.6 mils dry per coat) spray applied.
 - 2) VOC: Less than 98 g/L

C. Concrete Block:

- 1. Two coats over primer on properly prepared surfaces.
- 2. Primer: Sherwin-Williams Pro Industrial Heavy-Duty Block Filler (B42W00150). (16.0-21.0 mils wet, 8.0-10.5 mils dry)
 - a. VOC: Less than 50 g/L
- 3. First and Second Coats: Sherwin-Williams ConFlex XL Smooth High-Build Acrylic Coating (CF11W0050 Series) (13.0-16.0 mils wet, 6.0-7.5 mils dry per coat). A total dry film thickness of 12-15 mils and a surface with 10 pinholes or less shall be provided for a waterproofing system.
 - a. VOC: Less than 50 g/L.

3.07 INTERIOR PAINT SCHEDULE

A. General: Provide the following paint systems for the various substrates as indicated.

B. Metals (Structural steel columns, joists, trusses, beams, doors, door frames)

1. Ferrous Metals and Zinc-Coated Metals:

- a. Semi-Gloss Latex: 2 finish coats over primer on properly prepared surface.
- b. Primer:
 - 1) Sherwin-Williams Pro Industrial Pro-Cryl Universal Primer (B66W00310 Series) (5.0-10.0 mils wet, 1.9-3.8 mils dry).
 - 2) VOC: 96 g/L.
- c. First and Second Coats:
 - 1) Sherwin-Williams Pro Industrial Acrylic Semi-Gloss (B66-650

- Series) (6.0-12.0 mils wet, 2.1-4.2 mils dry per coat).
2) VOC: Less than 50 g/L.
- C. Exposed Concrete Floors (Sealed)
1. Concrete densifier and chemical hardener.
 2. First Coat:
 - a. W.R. Meadows LIQUI-HARD.
 - 1) VOC concrete-curing compounds: 0 g/L.
- D. Special Coatings
1. Gypsum Drywall Walls and Ceilings Microbicidal Coating: Coating shall comply with EPA Reg. No. 64695-1. Furnish sample on 2 foot by 2 foot piece of drywall for Architect to approve prior to application.
 - a. Satin latex enamel: 2 finish coats over primer on properly prepared surface.
 - b. Texture: Orange Peel, USG Sheetrock Brand Wall and Ceiling Spray.
 - c. Primer:
 - 1) Sherwin-Williams ProMar 200 Zero VOC Interior Latex Primer (B28W02600 Series) (4.0 mils wet, 1.0 mils dry).
 - 2) VOC: 0 g/L.
 - d. Satin First and Second Coats:
 - 1) Sherwin-Williams SuperPaint Interior Latex Satin with Sanitizing Technology (A87W0001) (4.0 mils wet, 1.7 mils dry per coat).
 - 2) VOC: Less than 50 g/L.

END OF SECTION

SECTION 10 14 00 – SIGNAGE

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Interior room plaques.

1.02 SUBMITTALS

- A. Manufacturer's Data: Submit manufacturer's descriptive literature and specifications, including color samples of material for selection, as applicable for approval.
- B. Submit Shop Drawings listing sign styles, lettering and locations, and overall dimensions of each sign.
- C. Submit full size sample sign of type, style and color specified including method of attachment.
- D. Sign manufacturer shall provide written certification that all interior signs comply with the 2010 Americans with Disabilities Act.

1.03 QUALITY ASSURANCE

- A. Interior signs shall comply with the requirements of the Americans with Disabilities Act-2010 ADA Standards for Accessible Design.

1.04 DELIVERY, STORAGE AND HANDLING

- A. Section 01 60 00 - Product Requirements: Product storage and handling requirements.
- B. Package signs, labeled in name groups.
- C. Store adhesive attachment tape at ambient room temperatures.

1.05 ENVIRONMENTAL REQUIREMENTS

- A. Section 01 60 00 - Product Requirements: Environmental conditions affecting products on site.
- B. Do not install signs when ambient temperature is lower than recommended by manufacturer.
- C. Maintain this minimum temperature during and after installation of signs.

PART 2 PRODUCTS

2.01 INTERIOR ROOM PLAQUE SIGNAGE

- A. Sign material shall consist of melamine plastic (high-pressure decorative laminate), approximately 1/8 inch thick. Edges of signs shall not have sharp or abrasive edges.
- B. All signs shall be of one-piece construction. Added-on and/or engraved characters will

not be approved.

- C. All letters, numbers and/or symbols shall contrast with their background with either light characters on a dark background or dark characters on a light background. Braille may be either the same color as the background or the same color as the characters.
- D. Characters and background shall have a non-glare finish.
- E. All interior signs shall have the following characteristics:
 - 1. Characters and symbols: Raised 1/32 inch minimum above the sign background.
 - 2. Character style: Sans serif character.
 - a. Acceptable fonts include:
 - 1) Helvetica.
 - 2) Arial.
 - 3. Character case: Uppercase.
 - 4. Character height: Character height measured vertically from the baseline of the character shall be 5/8 inch minimum and 2 inches maximum based on the height of the uppercase letter "I."
 - 5. Character stroke thickness: Stroke thickness of the uppercase letter "I" shall be 15 percent maximum of the height of the character.
 - 6. Character spacing: Character spacing shall be 1/8 inch minimum and maximum 4 times the raised character stroke width.
 - a. Characters shall be separated from raised borders and decorative elements minimum 3/8 inch.
 - 7. Braille:
 - a. Braille shall be Grade 2. Sign manufacturer shall
 - b. Braille dots shall have a domed or rounded shape and shall comply with the Braille dimensions listed in the 2010 Standard.
 - 1) The indication of an uppercase letter or letters shall only be used before the first word of sentences, proper nouns and names, individual letters of the alphabet, initials and acronyms.
 - c. Braille shall duplicate the raised characters and shall be positioned below the corresponding text.
 - 1) If text is multi-lined, Braille shall be placed below the entire text.
 - 2) Braille shall be separated 3/8 inch minimum from tactile characters and 3/8 inch minimum from raised borders and decorative elements.

F. Pictograms:

1. Pictograms shall be provided on signs installed at the following spaces:
 - a. Restrooms, toilet rooms.
 - b. Locker rooms, dressing rooms.
2. Pictograms shall have a field height of minimum 6 inches. Note: Pictogram characters and Braille shall not be located in the pictogram field.
3. Pictograms shall contrast with their field with either a light pictogram on a dark field or a dark pictogram on a light field.
 - a. Pictograms and their field shall have a non-glare finish.
4. Pictograms shall have text descriptions located directly below the pictogram. Text descriptors shall comply with Paragraph E of this article.
5. Provide male pictograms at spaces used by men. Provide female pictograms at spaces used by women. At toilet rooms indicated to be used by both men and women, provide both male and female pictograms on the same sign.

G. International Symbol of Accessibility

1. The International Symbol of Accessibility shall be provided on signs installed at the following spaces:
 - a. Restrooms, toilet rooms.
 - b. Locker rooms, dressing rooms.
2. The International Symbol shall comply with the figure shown in the 2010 Standards.
3. The International Symbol of Accessibility shall contrast with the background per Paragraph F, Subparagraph 3 of this Article, including non-glare finish.

H. Corner Style: Square.

2.02 INTERIOR ROOM PLAQUE SIGN SIZE

- A. Provide size of sign as required to fit designated room names, room numbers, pictograms, International Symbol of Accessibility, and/or Braille.

2.03 SIGN SCHEDULE

- A. Provide one interior room plaque sign for each interior door.
- B. Means of egress signs:
 1. Provide tactile signs complying with TAS at the following locations:
 - a. Exit discharge.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Examine installation areas to ensure that proper condition exist for timely completion of installation.

3.02 PREPARATION

- A. Verify that mounting locations and height for each sign will comply with ADA Accessibility Guidelines.
- B. Mounting locations should be smooth and free of all dirt, dust, grease, etc.

3.03 INSTALLATION

- A. Mount signs level and plumb using manufacturer's recommended standard mounting hardware of vinyl foam tape or holes and screws.
- B. Remove excess adhesives, etc. from exposed sign surfaces as recommended by adhesive manufacturer. Clean sign surfaces as needed.
- C. Where signs are mounted to vision glass (sidelights, borrowed lights, etc.), provide a backing plate made of the same materials, size, thickness and background color as the sign. Mount backing plate on opposite side of glass using foam tape or adhesive. Backing plate shall be aligned with sign in order to hide the sign's mounting.

END OF SECTION

SECTION 10 21 15 – PLASTIC TOILET COMPARTMENTS

PART 1 GENERAL

1.01 SUMMARY

- A. Section includes solid plastic toilet compartments.
- B. Related Sections:
 - 1. Section 06 10 53 – Miscellaneous Carpentry: Concealed wood framing and blocking for compartment support.
 - 2. Section 10 28 00 – Toilet, Bath and Laundry Accessories.

1.02 REFERENCES

- A. ASTM A666 – Standard Specification for Austenitic Stainless-Steel Sheet, Strip, Plate, and Flat Bar.
- B. ASTM E84-Standard Test Methods for Surface Burning Characteristics of Building Materials.
- C. National Fire Protection Association (NFPA) 286 – Standard Methods of Fire Tests for Evaluating Contribution of Wall and Ceiling Interior Finish to Room Fire Growth.
- D. Texas Accessibility Standards, 2012 Edition.

1.03 SUBMITTALS

- A. Section 01 33 00 – Submittal Procedures.
- B. Shop Drawings: Indicate partition plan, elevation views, dimensions, details of wall and floor supports, door swings.
- C. Product Data: Submit data on panel construction, hardware and accessories.
- D. Samples: Submit two 6 x 6 inch in size illustrating panel finish, color and sheen.
- E. Manufacturer's Installation Instructions: Submit special procedures, perimeter conditions requiring special attention, and maintenance instructions.

1.04 COORDINATION

- A. Section 01 30 00 – Administrative Requirements: Coordination and project conditions.
- B. Coordinate Work with placement of support framing and anchors in wall.

1.05 QUALITY ASSURANCE

- A. Solid plastic products to be independently certified in writing by the manufacturer indicating compliance to appropriate building codes governing the project as it applies to the use of "plastic in a commercial building."

- B. Toilet partitions and urinal screens shall be installed only by manufacturer-approved installers.
- C. Fire Hazard Classification: Pass NFPA 286.

1.06 WARRANTY

- A. Manufacturer to supply a written warranty covering all plastic components and plastic hardware against breakage, corrosion and delamination for a period of 15 years.

PART 2 PRODUCTS

2.01 SOLID PLASTIC TOILET COMPARTMENTS

- A. Manufacturers:
 - 1. Accurate Partitions Corp., Floor-Mounted, Overhead-Braced.
 - 2. Comtec Industries Model Floor-Mounted, Overhead-Braced Standard Series S200.
 - 3. Scranton Products, Model Floor-Mounted, Overhead-Braced.
 - 4. Substitutions: Refer to Section 01 60 00 – Product Requirements.
- B. Product Description: Floor-mounted, overhead-braced toilet compartments.
- C. Panels, doors and pilasters shall be fabricated from high-density polyethylene (HDPE) containing a minimum of 10% recycled material manufactured under high pressure, forming a single component section which is waterproof, non-absorbent and has a self-lubricating surface that resists marking with pens, pencils or other writing utensils. All panels, doors and pilasters to arrive at job-site with special protective plastic covering.

2.02 COMPONENTS

- A. Toilet Compartments: Solid molded plastic panels, doors and pilasters, floor-mounted and headrail-braced.
 - 1. Color: Single color as selected.
- B. Door and Panel Dimensions:
 - 1. Thickness: 1 inch
 - 2. Door Width: 24 inch minimum.
 - 3. Accessible Door Width: 32-inch clear opening with the door open 90 degrees, measured between the face of the door and the opposite stop, out-swinging or in-swinging as shown on Drawings.
 - 4. Height: 55 inches.
 - 5. Thickness of Pilasters: 1 inch.

- C. Toe clearance: Provide a minimum of 12 inches between the finish floor and the bottom of the toilet partitions.

2.03 CHARACTERISTICS

- A. Doors, panels and pilasters shall have all edges machined to a radius of .250 inch and all exposed surfaces to be free of saw marks.
- B. Aluminum edging strips to be fastened to the bottom edge of all doors and panels using vandal-proof stainless-steel fasteners.

2.04 HARDWARE

- A. Hinges:
 - 1. 8 inches long, fabricated from heavy-duty extruded aluminum with bright-dipped anodized finish, wrap-around flanges, adjustable on 30-degree increments, through bolted to doors and pilasters with stainless steel, Torx head sex bolts.
 - 2. Hinges operate on field-adjustable nylon cams, field adjustable in 30-degree increments and self closing.
 - 3. Each handicapped door to include: (2) door pulls and (1) wall stop. Door pull shall be placed on each side of the door near the latch.
 - 4. Door strike and keeper shall be fabricated from heavy aluminum extrusion (6463-T5 alloy) with bright-dipped anodized finish with wrap-around flange surface-mounted and thru-bolted to pilaster with star head security pin, stainless steel barrel bolts. Size of strike shall be 6 inches in length.
 - 5. Door latch housing shall be fabricated from heavy aluminum extrusion (6463-T5 alloy) with bright-dipped anodized finish, surface-mounted, and through-bolted to door with star-head security pin, stainless steel barrel bolts. Slide bolt and button shall be heavy aluminum with "Tuff-Coat Black" anodized finish.
- B. 20-gauge stainless steel pilaster shoes shall be anchored to finished floor with plastic anchors and #14 by 1-1/2 inches star-head security pin, stainless steel screws.
- C. Full-length continuous heavy-duty wall brackets. Brackets shall be used for all panels to pilaster, pilaster to wall, and panel to wall connections. Wall brackets shall be through-bolted to panels and pilaster with star-head security pin, stainless steel barrel bolts. Attachment of brackets to adjacent wall construction shall be accomplished by #14 by 1-1/2 inch star-head security pin, stainless steel screws anchored directly behind the vertical edge of panels and pilasters at 13-inch intervals along the full length of bracket and at each 13-inch interval alternately spaced between anchor connections.
- D. Headrail shall be heavy aluminum extrusion (6463-T5 alloy) with bright-dipped anodized finish in anti-grip configuration weighing not less than 1.188 lbs. per linear foot. Headrail shall be fastened to top of pilasters and headrail brackets by through-bolting with star-head security pin, stainless steel barrel bolts (no cadmium-plated bolts allowed).
- E. Headrail brackets shall be 18-gauge stainless steel.

- F. Provide coat hook with door bumper on all doors.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Section 01 30 00 – Administrative Requirements: Coordination and project conditions.
- B. Verify field measurements are as indicated on Shop Drawings.
- C. Verify correct spacing of and between plumbing fixtures.
- D. Verify correct location of built-in framing, anchorage and bracing.

3.02 INSTALLATION

- A. Erection of partitions shall be in accordance with the manufacturer's recommendations.
- B. Attach continuous wall brackets securely to walls using anchor devices.
- C. Attach panels and pilasters to continuous brackets.
- D. Field touch-up of scratches or damaged finish will not be permitted. Replace damaged or scratched materials with new materials.
- E. No evidence of drilling, cutting or patching shall be visible in the finished work.

3.03 ERECTION TOLERANCES

- A. Section 01 40 00 – Quality Requirements: Tolerances.
- B. Maximum Variation From Indicated Position: 1/4 inch.
- C. All partitions shall be erected straight, level and plumb.
- D. Clearance at vertical edges of door shall be uniform top to bottom and shall not exceed 1/4 inch.

3.04 ADJUSTING

- A. Section 01 70 00 – Execution and Closeout Requirements: Testing, adjusting and balancing.
- B. Adjust and align hardware to uniform clearance at vertical edge of doors, not exceeding 3/16 inch.
- C. Adjust hinges to position doors in partial opening position when unlatched. Return out-swinging doors to closed position.
- D. Adjust adjacent components for consistency of line or plane.

END OF SECTION

SECTION 10 22 26 - MANUALLY OPERATED PAIRED PANEL OPERABLE PARTITIONS

PART 1 GENERAL

1.01 SUMMARY

- A. This Section includes the following:
 - 1. Manually operated, paired panel operable partitions.

1.02 RELATED SECTIONS

- A. Division 5 Sections for primary structural support, including pre-punching of support members by structural steel supplier per operable partition supplier's template.
- B. Division 9 Sections for wall and ceiling framing at head and jambs.

1.03 REFERENCES

- A. ASTM International
 - 1. ASTM E84 – Standard Test Method for Surface Burning Characteristics of Building Materials.
 - 2. ASTM E90- Standard Test Method for Laboratory Measurement of Airborne Sound Transmission Loss of Building Partitions and Elements.
 - 3. ASTM E413 – Classification for Rating Sound Insulation.
 - 4. ASTM E557-Standard Guide for Architectural Design and Installation Practices for Sound Isolation between Spaces Separated by Operable Partitions.

1.04 QUALITY ASSURANCE

- A. Installer Qualifications: An experienced installer who is certified in writing by the operable partition manufacturer, as qualified to install the manufacturer's partition systems for work similar in material, design, and extent to that indicated for this Project.
- B. Acoustical Performance: Test operable partitions in an independent acoustical laboratory in accordance with ASTM E90 test procedure and classified in accordance with ASTM E413 to attain no less than the STC rating specified. Provide a complete and unedited written test report by the testing laboratory upon request.
- C. Preparation of the opening shall conform to the criteria set forth per ASTM E557 Standard Practice for Architectural Application and Installation of Operable Partitions.

1.05 SUBMITTALS

- A. Product Data: Material descriptions, construction details, finishes, installation details, and operating instructions for each type of operable partition, component, and accessory specified.
- B. Shop Drawings: Show location and extent of operable partitions. Include plans, elevations, sections, details, attachments to other construction, and accessories. Indicate dimensions, weights, conditions at openings, and at storage areas, and required installation, storage, and operating clearances. Indicate location and installation

requirements for hardware and track, including floor tolerances required and direction of travel. Indicate blocking to be provided by others.

- C. Setting Drawings: Show imbedded items and cutouts required in other work, including support beam punching template.
- D. Samples: Color samples demonstrating full range of finishes available by architect. Verification samples will be available in same thickness and material indicated for the work.
- E. Reports: Provide a complete and unedited written sound test report indicating test specimen matches product as specified.

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Clearly mark packages and panels with numbering systems used on Shop Drawings. Do not use permanent markings on panels.
- B. Protect panels during delivery, storage, and handling to comply with manufacturer's direction and as required to prevent damage.

1.07 WARRANTY

- A. Provide written warranty by manufacturer of operable partitions agreeing to repair or replace any components with manufacturing defects.
- B. Warranty period: Two (2) years from date of Substantial Completion.

PART 2 PRODUCTS

2.01 MANUFACTURERS AND PRODUCTS

- A. Basis of Design: Contract Documents are based on manufacturer and product named below to establish a Standard of Quality. Other acceptable manufacturers with products having equivalent characteristics may be considered provided deviations are minor and do not change concept as expressed in Contract Documents as judged by the Architect.
 - 1. Basis of Design:
 - a. Manufacturer: Modernfold, Inc.
 - b. Product: Acousti-Seal Legacy #932 manually operated paired panel operable partition.
- B. Acceptable Manufacturers: Subject to compliance with requirements of Contract Documents provide product: by one of the manufacturers below:
 - 1. Hufcor.
 - 2. Panelfold.

2.02 OPERATION

- A. Series of paired flat panels hinged together in pairs, manually operated, top supported with operable floor seals.

- B. Final Closure:
 - 1. Hinged panel closure

2.03 PANEL CONSTRUCTION

- A. Nominal 3-inch thick panels in manufacturer's standard 48-inch widths. All panel horizontal and vertical framing members fabricated from minimum 18-gage or 16-gage formed steel with overlapped and welded corners for rigidity. Top channel is reinforced to support suspension system components. Frame is designed so that full vertical edges of panels are of formed steel and provide concealed protection of the edges of the panel skin.
- B. Panel Skin:
 - 1. Roll-formed steel wrapping around panel edge. Panel skins shall be lock formed and welded directly to the frame for unitized construction. Acoustical ratings of panels with this construction:
 - a. 52 STC
- C. Hinges for Closure Panels, and Pocket Doors shall be:
 - 1. Full leaf butt hinges, attached directly to panel frame with welded hinge anchor plates within panel to further support hinge mounting to frame. Lifetime warranty on hinges. Hinges mounted into panel edge or vertical astragal are not acceptable.
- D. Panel Trim: No vertical trim required or allowed on edges of panels; minimal groove appearance at panel joints.
- E. Panel Weights, Steel Skin:
 - 1. 52 STC - 11 lbs./square foot

2.04 PANEL FINISHES

- A. Panel face finish shall be:
 - 1. Reinforced heavy duty vinyl with woven backing weighing not less than 30 ounces per lineal yard as selected by Architect.
- B. Panel trim: Exposed panel trim of one consistent color from manufacturer's standard offering.

2.05 SOUND SEALS

- A. Vertical Interlocking Sound Seals between panels: Roll-formed steel astragals, with reversible tongue and groove configuration in each panel edge for universal panel operation. Rigid plastic or aluminum astragals or astragals in only one panel edge are not acceptable.
- B. Horizontal Top Seals: Continuous contact extruded vinyl bulb shape with pairs of non-contacting vinyl fingers to prevent distortion without the need for mechanically operated parts.
- C. Horizontal Bottom Seals:

1. Modernfold IA2 bottom seal: Automatic operable seals providing nominal 2-inch operating clearance with an operating range of +1/2-inch to -1-1/2-inch which automatically drop as panels are positioned, without the need for tools or cranks.

2.06 SUSPENSION SYSTEM

A. #14 Suspension System

1. Suspension Tracks: Minimum 7-gage, 0.18-inch roll formed steel. Track shall be supported by adjustable steel hanger brackets connected to structural support pairs of 1/2-inch diameter threaded rods. Brackets shall support the load bearing surface of the track.
 - a. Exposed track soffit: Steel, removable for service and maintenance, attached to track bracket without exposed fasteners, and pre-painted off-white.
2. Carriers: One all steel trolley with steel-tired ball bearing wheels per panel (except hinged panels). Non-steel tires are not acceptable.
3. Warranty period: Twenty (20) years.

2.07 OPTION

A. Pocket Door:

1. Pocket Doors: Acousti-Seal Pocket Doors by Modernfold, Inc., with same construction, finish, and appearance as the adjacent panels.

PART 3 EXECUTION

3.01 INSTALLATION

- A. General: Comply with ASTM E557, operable partition manufacturer's written installation instructions, Drawings and approved Shop Drawings.
- B. Install operable partitions and accessories after other finishing operations, including painting have been completed.
- C. Match operable partitions by installing panels from marked packages in numbered sequence indicated on Shop Drawings.
- D. Broken, cracked, chipped, deformed, or unmatched panels are not acceptable.

3.02 CLEANING AND PROTECTION

- A. Clean partition surfaces upon completing installation of operable partitions to remove dust, dirt, adhesives, and other foreign materials according to manufacturer's written instructions.
- B. Provide final protection and maintain conditions in a manner acceptable to the manufacturer and Installer that ensure operable partitions are without damage or deterioration at time of Substantial Completion.

3.03 ADJUSTING

- A. Adjust operable partitions to operate smoothly, easily, and quietly, free from binding, warp, excessive deflection, distortion, nonalignment, misplacement, disruption, or malfunction, throughout entire operational range. Lubricate hardware and other moving parts.

3.04 EXAMINATION

- A. Examine flooring, structural support, and opening, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of operable partitions. Proceed with installation only after unsatisfactory conditions have been corrected.

3.05 DEMONSTRATION

- A. Demonstrate proper operation and maintenance procedures to Owner's representative.
- B. Provide Operation and Maintenance Manual to Owner's representative.

END OF SECTION

SECTION 10 26 00 – WALL PROTECTION

PART 1 GENERAL

1.01 SUMMARY

A. Section Includes:

1. Corner Guards.
2. Chair Rails.
3. Semi-Rigid Impact-Resistant Wallcoverings.

B. Related Sections:

1. Section 06 10 53 – Miscellaneous Carpentry.
2. Section 09 21 16 – Gypsum Board Assemblies.
3. Section 09 22 16 – Non-Structural Metal Framing: Backing plate and metal stud framing for securing the following:
 - a. Corner guards.
 - b. Chair rails.

C. References:

1. ANSI, American National Standards Institute.
2. ASTM, American Society for Testing and Materials.
3. NFPA, National Fire Protection Association.
4. UL, Underwriters Laboratory.
5. ADA, Americans with Disabilities Act.

1.02 PERFORMANCE REQUIREMENTS

- A. Corner Guards:** Resist lateral impact force of 100 lbs at any point without damage or permanent set.

1.03 SUBMITTALS

- A.** Submit under provisions of Section 01 33 00 – Submittal Procedures.
- B.** Product data indicating compliance with specified requirements. Include physical dimensions, features, wall mounting brackets with mounted measurements, anchorage details, and rough-in measurements.
- C.** Shop Drawings showing methods of attachment to substrate and locations of wall

protection.

- D. Samples: Submit one section of wall protection illustrating component design, configuration, selection of color, pattern and surface texture.
 - 1. 12-inch-long samples of each type of, wall and corner guard required. Include examples of joinery, corners, and field splices.
 - 2. 7 by 9-inch samples of each rigid sheet or panel type wall surface protection material required.
 - 3. Provide trim accessories in color to match wall protection. Provide sample for verification to architect prior to ordering.
- E. Manufacturer's Installation Instructions – Indicate installation rough-in measurements and instructions.
- F. Manufacturer's Certificate – Certify that products meet or exceed flame spread rating for surface finish.

1.04 QUALITY ASSURANCE

- A. Fire Performance Characteristics: Proved UL classified wall protection assemblies with NFPA Class A fire rating. Comply with ASTM E 84 for the fire performance characteristics indicated below. Identify components with markings from testing and inspection organization.
 - 1. Flame Spread: 25 or less.
 - 2. Smoke Developed: 450 or less.
- B. Single-Source Responsibility: Obtain wall surface protection system components from a single source.
- C. Deliver materials in original factory wrappings and containers, clearly labeled with manufacturer and brand name.
- D. Store materials in original undamaged packages and containers inside a well-ventilated area protected from weather, moisture, soiling, extreme temperatures, and humidity.
 - 1. Maintain room temperature within the storage area between 60 degrees F (16 degrees C) and 80 degrees F (27 degrees C) during the period plastic materials are stored. Keep materials out of direct sunlight to avoid excessive surface temperatures.
 - 2. Store rigid plastic corner guard, wall guard, and semi-rigid wall covering attains the ambient room installation temperature of between 65 degrees F (18 degrees C) and 75 degrees F (24 degrees C).
- E. Chemical and Stain Resistance: Provide wall protection system components with chemical and stain resistance in accordance with ASTM D1308.
- F. Color Consistency: Provide components matched in accordance with SAE J-1545-(Delta

E) with a color difference no greater than 1.5 units using CIE Lab, CIE CMC, CIE LCh, Hunter Lab or similar color space scale systems.

- G. Impact Strength: Provide assembled wall protection units that have been tested in accordance with the applicable provisions of ASTM F476.

1.05 PROJECT CONDITIONS

- A. Maintain ambient temperature within building at not less than 65 degrees F (18 degrees C) or greater than 75 degrees F (24 degrees C) for a minimum 72 hours prior to beginning installation.
- B. Do not install wall surface protection system components until the space is enclosed, weatherproof and climate controlled.
- C. Do not install semi-rigid wall protection systems until temperature is stable and permanent lighting is in place.

1.06 MAINTENANCE

- A. Maintenance Instructions: Include precautions against cleaning materials and methods that may be detrimental to finishes and performance.
- B. Replacement materials: Minimum 2 percent of each type, color, and pattern of wall surface protection materials and components. **Include accessory components as required. Replacement materials shall be from the same production run as installed materials. Package with protective coverings and appropriate labels.

1.07 FIELD MEASUREMENTS

- A. Verify field measurement prior to fabrication.

1.08 COORDINATION

- A. Coordinate Work with wall or partition sections for installation of concealed blocking or anchor devices.

PART 2 PRODUCTS

2.01 MANUFACTURERS

- A. Basis of Design: Koroseal Wall Protection Systems. Drawings and specifications are based on manufacturer's literature from Koroseal Wall Protection Systems unless otherwise indicated.
- B. Substitutions: Under provisions of Section 01 60 00.

2.02 COMPONENTS

- A. Plastic Sheet Wallcovering Material: Textured, chemical- and stain-resistant, high-impact, acrylic modified vinyl plastic sheets, thickness as indicated. Comply with specified requirements of ASTM D256 for impact resistance and ASTM E84 for flame spread and smoke developed characteristics. Color: As selected by Architect from the manufacturer's

full range of standard colors.

- B. Rigid Plastic Material: Extruded, textured, chemical- and stain-resistant, high-impact, acrylic modified vinyl plastic, thickness as indicated. Comply with specified requirements of ASTM D256 for impact resistance and ASTM E84 for flame spread and smoke developed characteristics. Color: As selected by Architect from the manufacturer's full range of standard colors.
- C. Fasteners: Provide non-corrosive metal screws, bolts, and other fasteners compatible with aluminum components, hardware, anchors, and other items being fastened. Use theft-proof fasteners where exposed to view.

2.03 CORNER GUARDS

- A. Surface-Mounted, Resilient Plastic Corner Guards: CG1, EP1
 - 1. Cover: Rigid, impact-resistant plastic, minimum 0.078 inch (1.9mm) thick, in dimensions and profiles indicated.
 - 2. Retainer: Continuous, one-piece, extruded aluminum retainer, minimum 0.062 inch (1.6 mm) thick.
 - 3. CG#: G100 Series, 2 inch by 2 inch. Height indicated in feet after CG designation; corner Radius: 1/4 inch.
 - 4. EP#: G110 Series, 2 inch by 2 inch. Height indicated in feet after EP designation: high impact filler sheet.
 - 5. Accessories: Prefabricated aluminum retainer with concealed splices, mounting hardware and other accessories as required.
 - a. End Caps:
 - 1) Match plastic cover color.
 - 2) Field adjustable for close alignment with snap-on plastic covers.
 - 6. Color: As selected. Refer to Finish Schedule
 - 7. Screws: As recommended by the manufacturer.

2.04 WALL GUARDS

- A. Chair Rail Type Wall Guard: CR2
 - 1. Model CH20, 2-1/8 inches chair rail with full-length vinyl cover and PVC retainer.
 - 2. Color: As selected. Refer to Finish Schedule.

2.05 IMPACT-RESISTANT WALLCOVERINGS

- A. Semi-rigid, integrally colored Sheet Wallcovering: Semi-rigid, embossed, impact-resistant plastic sheets or roll stock. Comply with fire performance characteristics specified and be chemical- and stain-resistant.
 - 1. 500 Series: Solid Colors.
 - a. Sheet/Roll Thickness: 0.040 inch (1.0 mm) thick, Class I/A Fire-Rated.
 - 2. Color: As Selected. Refer to Finish Schedule.
 - 3. Screws: As recommended by manufacturer.
- B. Color Matched or Complimentary Accessory Moldings: Manufacturer's Standard.
 - 1. J-Molding: #MO82.
 - 2. Divider Bar: #87/88.
 - 3. Inside Corner: #MO83.
 - 4. Outside Corner: #85.
 - 5. Color: As selected.
- C. Color Matched Caulk: Manufacturer's Standard.
- D. Adhesive and Primer: As recommended by the manufacturer.

2.06 FABRICATION

- A. Comply with requirements indicated for design, dimensions, details, finish and member sizes, including wall thicknesses of components.
- B. Shop-assemble components to the greatest extent possible. Disassemble only as necessary for shipping and handling.
- C. Fabricate component with tight seams and joints with exposed edges rolled. Provide surfaces free of evidence of wrinkling, chipping, uneven coloration, dents and other imperfections. Fabricate members and fittings to produce flush, smooth and rigid hairline joints.
- D. Brackets, Flanges, Fittings and Anchors: Provide wall brackets, flanges, miscellaneous fitting and anchors for interconnection of members to other construction.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Examine areas and conditions in which wall surface protection components and wall protection systems will be installed.
- B. Complete finishing operations, including painting, before beginning installation of wall surface protection system materials.

- C. Wall surfaces to receive impact-resistant wallcovering materials shall be dry and free from dirt, grease, loose paint, and scale.
- D. Do not proceed with installations until unsatisfactory conditions have been corrected.
- E. Verify rough-in for components are correctly sized and located.

3.02 PREPARATION

- A. Properly prepare substrate and clean to remove dust, debris and loose particles.

3.03 INSTALLATION

- A. Install wall surface protection units plumb, level and true to line without distortions.
- B. Do not use materials with chips, cracks, voids, stains or other defects that might be visible in the finished work.
- C. Install aluminum retainers, mounting brackets, and other accessories in strict accordance with the manufacturer's instructions.
- D. Where splices occur in horizontal runs of over 20 feet (6 m), splice aluminum retainer and plastic cover at same locations along the run.
- E. Position surface-mounted corner guards atop wall base.
- F. Install semi-rigid vinyl wallcovering sheets with texture running in the same direction for uniform appearance.
 - 1. Provide continuous "J" -molding at all exposed ends of semi-rigid wall covering.
- G. Coordinate installation of vinyl fabric wall covering with corner guard frame and cover.

3.04 ERECTION TOLERANCES

- A. Maximum Variation from Required Height for Horizontal Rails: 1/4 inch (6mm).
- B. Maximum Variation from Level or Plane for Visible Length for Horizontal Rails: 1/4 inch (6 mm).

3.05 CLEANING

- A. Clean plastic covers and accessories using a standard non-ammonia-based household cleaning agent.
- B. Clean metal components in accordance with the manufacturer's recommendations.
- C. Remove excess adhesive in manner recommended by manufacturer.

3.06 PROTECTION

- A. Protect installed materials to prevent damage by other trades.

Del Valle Health and Wellness Center
Central Health
Del Valle, Texas
Project No. 2070.00

Wall Protection
Section 10 26 00.7 of 7

END OF SECTION

SECTION 10 28 00 – TOILET, BATH AND LAUNDRY ACCESSORIES

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Toilet, washroom accessories.
- B. Grab bars.
- C. Attachment hardware.
- D. Molded pipe insulation.
- E. Baby changing station.

1.02 RELATED SECTIONS

- A. Section 06 10 53 – Miscellaneous Carpentry: Wood backing.
- B. Section 09 22 16 – Non-Structural Metal Framing: Wood and steel backing.
- C. Section 10 21 15 – Plastic Toilet Compartments.

1.03 REFERENCES

- A. ASTM International:
 - 1. ASTM A125/A123M – Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel Products.
 - 2. ASTM A153/A153M – Standard Specification for Zinc Coating (Hot-Dip) on Iron and Steel Hardware.
 - 3. ASTM A269 – Standard Specification for Seamless and Welded Austenitic Stainless Steel Tubing for General Service.
 - 4. ASTM A653/A653M – Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.
 - 5. ASTM A666 – Standard Specification for Austenitic Stainless Steel Sheet, Strip, Plate, and Flat Bar.
 - 6. ASTM B456 – Standard Specification for Electrodeposited Coatings of Copper Plus Nickel Plus Chromium and Nickel Plus Chromium.
 - 7. ASTM C1036 – Standard Specification for Flat Glass.
 - 8. ASTM F2285 – Standard Consumer Safety Performance Specification for Diaper-Changing Tables for Commercial Use.
- B. Federal Specification Unit:

1. FS A-A-3002 – Mirrors, Glass.

1.04 SUBMITTALS

- A. Section 01 33 00 – Submittal Procedures.
- B. Product Data: Provide data on accessories describing size, finish, details of function, attachment methods.
- C. Manufacturer's Installation Instructions.

1.05 REGULATORY REQUIREMENTS

- A. Conform to ADA (Americans with Disabilities Act) code for access for the handicapped.

1.06 FIELD MEASUREMENTS

- A. Verify that field measurements are as indicated on product data.

1.07 COORDINATION

- A. Coordinate the work with the placement of internal wall reinforcement and reinforcement of toilet partitions to receive anchor attachments.

1.08 WARRANTY

- A. Baby Changing Station: Manufacturer's 5-year limited warranty.

PART 2 PRODUCTS

2.01 MANUFACTURERS

- A. ASI.
- B. Bobrick Washroom Equipment, Inc.
- C. Bradley Inc.
- D. Truebro, Inc. Model No. 102.
- E. Koala Kare Products.
- F. Standard Textile (Shower curtains).
- G. Substitutions: Under provisions of Section 01 60 00.

2.02 MATERIALS

- A. Sheet Steel: ASTM A366.
- B. Stainless Steel Sheet: ASTM A666, Type 304.

- C. Tubing: ASTM A269, stainless steel.
- D. Mirror Glass: Float glass, Type I, Class 1, Quality q1 (ASTM C1036), with silvering, copper coating, and suitable protective organic coating to copper backing in accordance with FS A-A-3002.
 - 1. Provide tempered glass.
- E. Adhesive: Two-component epoxy type, waterproof.
- F. Fasteners, Screws and Bolts: Hot-dip galvanized, tamper-proof.
- G. Expansion Shields: Fiber, lead or rubber as recommended by accessory manufacturer for component and substrate.
- H. Anchor Plates: Provide grab bar manufacturer's standard anchor plates for grab bar installation required. Anchor plates shall be a minimum of 12-gauge steel with mounting holes.
- I. Piping Insulation: Fully molded, closed-cell vinyl, complying with ASTM D635 for burning characteristics and ASTM C177, thermal conductivity.
- J. Baby Changing Station:
 - 1. Hinges: Reinforced, steel-on-steel hinge mechanism and metal mounting hardware.
 - 2. Operation: Hidden pneumatic cylinder for safe open/close motions.
 - 3. Microban Antimicrobial: Stable, embedded antimicrobial technology, which inhibits the growth of bacteria. Antimicrobial claim shall be substantiated by standard industry test methodology equal to Kirby-Baver test.
 - 4. Material: Molded FDA-approved high-density polyethylene (HDPE).
 - 5. Accessories:
 - a. Molded graphic instructions and safety messages in 6 languages.
 - 6. Integral, built-in liner dispenser for use with 3-ply chemical-free biodegradable bed liners.
 - 7. Door Decal.
 - 8. Hardware Kit.

2.03 FABRICATION

- A. Weld and grind joints of fabricated components, smooth.
- B. Form exposed surfaces from single sheet of stock, free of joints. Form surfaces flat without distortion. Maintain surfaces without scratches or dents.

- C. Fabricate grab bars of tubing, free of visible joints, return to wall with end attachment flanges. Form bar with 1-1/2 inches clear of wall surface. Knurl grip surfaces.
- D. Shop assemble components and package complete with anchors and fittings.
- E. Provide steel anchor plates, adapters and anchor components for installation.

2.04 KEYING

- A. Master key all accessories; supply 6 keys to Owner.

2.05 FINISHES

- A. Galvanizing: ASTM A123 to 1.25 oz/sq.yd. Galvanize ferrous metal and fastening devices.
- B. Shop Primed Ferrous Metals: Pre-treat and clean, spray apply one coat primer and bake.
- C. Chrome/Nickel Plating: ASTM B456, Type SC 2 satin finish.
- D. Stainless Steel: No. 4 satin luster finish.
- E. Back paint components where contact is made with building finishes to prevent electrolysis.
- F. Molded Pipe Insulation: Light Grey.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verify that site conditions are ready to receive work and dimensions are as instructed by the manufacturer.
- B. Verify exact location of accessories for installation.

3.02 PREPARATION

- A. Deliver inserts and rough-in frames to site for timely installation.
- B. Provide templates and rough-in measurements as required.

3.03 INSTALLATION

- A. Install accessories in accordance with manufacturers' instructions and ADA.
- B. Install plumb and level, securely and rigidly anchored to substrate.
- C. At all specified "handicapped" lavatories, provide molded insulation at P-traps and hot and cold-water angle valves.

3.04 SCHEDULE (Note: Toilet accessories listed are based on products from Bobrick unless otherwise

indicated.)

*Not all products listed may be used. Refer to Drawings.

- TA-1 Grab bar: B-6806.99 Length as indicated in Drawings (NOTE: In locations where the flush valve conflicts with the grab bar, the rear grab bar shall be 36" long and located on the open side of the toilet area. Center the grab bar between the flush control and the wall or lavatory)
- TA-2 Not Used
- TA-3 Grab bar: For 36" x 36" shower compartment; B-6861.99
- TA-4 Grab bar: For 30" x 60" roll-in shower compartment: B-6806.99 – Custom Fabrication. Size to comply with Sheet G2.2 and/or G3.2 as applicable to project.
- TA-5 Surface mounted single roll toilet tissue dispenser: B-2730
- TA-6 Surface mounted dual roll toilet tissue dispenser: B-2740
- TA-7 Surface mounted soap dispenser: B-2111, 40 oz. capacity.
- TA-8 Steel channel frame tempered mirror, custom size, B-1658-1840.
- TA-9 Steel channel frame tempered mirror, custom size, B-1658-3636.
- TA-10 Toilet partition mounted napkin disposal: B-354 serves two compartments.
- TA-11 Toilet partition mounted napkin disposal: B-254 serves one compartment.
- TA-12 Surface-mounted sanitary napkin disposal: B-270.
- TA-13 Recessed Sanitary Napkin/Tampon Vendor: B-352, .25-coin operation.
- TA-14 Robe Hook: B-7671
- TA-15 Utility Shelf: B-224, 4 holders, 3 hooks
- TA-16 Recessed Combination Towel Dispenser/Waste Receptacle. Model B-3944, 12 gal. capacity
- TA-17 Surface-Mounted Paper Towel Dispenser: Model B-262.
- TA-18 Shower Rod: B-6047

NOTE: Mount the bottom of the shower rod at 81 inches above the shower floor at transfer showers, roll in showers and non-accessible showers.
- TA-19 Shower Curtain Hook: B-204-1
- TA-20 Shower Curtain at Transfer Showers and 36-inch-wide Non-Accessible Shower Stalls:

Manufacturer: Standard Textile
Pattern: Bezel CM7681 or Matrix CM7683
100 percent FR Polyester
Passes Cal 19 & NFPA 701
Mildew Resistant, Liquid Resistant and Machine Washable
Fastener Support: Metal grommets
Color: As selected by Architect

Width: 42 inches
Length: Length as required in order that the bottom of the curtain is 1 inch above the shower floor.
Number of hooks: 7

TA-21 Shower Curtain at Roll in Showers:

Manufacturer: Standard Textile
Pattern: Bezel CM7681 or Matrix CM7683
100 percent FR Polyester
Passes Cal 19 & NFPA 701
Mildew Resistant, Liquid Resistant and Machine Washable
Fastener Support: Metal grommets
Color: As selected by Architect

Width: 70 inches.
Length: Length as required in order that the bottom of the curtain is 1 inch above the shower floor.
Number of Hooks: 12.

TA-22 Folding Shower Seat: B-5181 reversible for right or left-hand field installation.

TA-23 Baby Changing Station: Horizontal design surface-mounted with molded Braille instructions, Model KB200-00 crème, 200-lb. capacity. Station shall protrude not more than 4 inches when closed. Provide sanitary bed liners, Model KB150-99.

TA-24 Recessed Specimen Pass-Through Cabinet: Type 304 stainless steel; Model B-505.

TA-25 Surface Mounted Twin Jumbo Roll Toilet Tissue Dispenser: OFCI.

TA-26 Automatic Roll Towel Dispenser: Model B-72974.

TA-27 Surface Mounted Waste Receptacle: Model B-279.

TA-28 Electric Hand Dryer: World Dryer VERDEdri, Hi-speed Surface Mounted ADA compliant hand dryer, Q-972A, polished stainless-steel cover with the following features.

Size: 13.3 inches high by 11.6 inches wide by 3.9 inches deep.
Voltage: Universal controls accepting 115/208/230 VAC.
12 second dry time.
Replaceable HEPA filter.
Air flow, 64 CFM.
Air velocity, 225 MPH (19,800 LFM).

Activate by automatic infrared sensor with 30 second vandal shut-off.
Provide HI/LOW speed control.
Dryer to provide exit air temperature of 130-degree F. at ambient air 70-degree F.
Dryer to have an ingress protection rating of minimum IP 24.
IP = International Protection Rating or Ingress Protection Rating.
First Digit 2 = Protected from touch by fingers and objects greater than 12 millimeters (0.472 inches).
Second digit 4 = Splashing water, protected from water spray from any direction.

END OF SECTION

SECTION 10 44 00 – FIRE PROTECTION SPECIALTIES

PART 1 GENERAL

1.01 SUMMARY

- A. This Section Includes the Following:
 - 1. Fire extinguisher cabinets, non-rated.
 - 2. Fire extinguishers.
 - 3. Fire extinguisher mounting brackets.

1.02 RELATED SECTIONS

- A. Section 09 22 16 – Non-Structural Metal Framing: Rough opening in metal stud walls.

1.03 REFERENCES

- A. National Fire Protection Association:
 - 1. NFPA 10 – Standard for Portable Fire Extinguishers.
- B. Underwriters Laboratories Inc.:
 - 1. UL – Fire Protection Equipment Directory.

1.04 SUBMITTALS

- A. Section 01 33 00 – Submittal Procedures.
- B. Product data for each type of product specified. For fire extinguisher cabinets include rough-in dimensions, details showing mounting methods, relationships of box and trim to surrounding construction, door hardware, cabinet type and materials, trim style, door construction, panel style, and materials.

1.05 QUALITY ASSURANCE

- A. Single-Source Responsibility: Obtain fire extinguisher cabinets from one source from a single manufacturer.

1.06 CLOSEOUT SUBMITTALS

- A. Section 01 70 00 – Execution and Closeout Requirements: Closeout procedures.
- B. Operation and Maintenance Data: Submit test, refill or recharge schedules and re-certification requirements.

1.07 ENVIRONMENTAL REQUIREMENTS

- A. Section 01 60 00 – Product Requirements: Environmental conditions affecting products

on site.

- B. Do not install extinguishers when ambient temperatures are capable of freezing extinguisher ingredients.

PART 2 PRODUCTS

2.01 MANUFACTURERS

- A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. J.L. Industries.
2. Larsens Manufacturing Co.
3. Walter Kidde, Division of Kidde, Inc.

Model numbers listed in the schedule at the end of this section are based on Larsens Manufacturing Co., Architectural Series.

2.02 FIRE EXTINGUISHER CABINETS

- A. General: Provide fire extinguisher cabinets where indicated.
- B. Construction: Manufacturer's standard enameled steel box, with trim, frame, door, and hardware to suit cabinet type, trim style, and door style indicated. Weld all joints and grind smooth. Miter and weld perimeter door frames.
- C. Cabinet Type: Suitable for mounting conditions indicated, of the following types:
 1. Semi Recessed: Cabinet box (tub) semi recessed in walls of sufficient depth to suit style of trim indicated. Total recessed depth for box shall not 4" for non-rated FEC-1 cabinets. Cabinet trim may not project more than 4" from wall surface.
- D. Trim Style: Fabricate trim in one piece with corners mitered, welded and ground smooth.
 1. Exposed Trim: One-piece combination trim and perimeter door frame overlapping surrounding wall surface with exposed trim face and wall return at outer edge (back bend).
 - a. Rolled edge semi-recessed with 2-1/2" backbend depth.
 - b. Trim Metal: Enameled steel.
- E. Door Material and Construction: Manufacturer's standard door construction, of material indicated, coordinated with cabinet types and trim styles selected.
 1. Enameled Steel: Manufacturer's standard finish.
- F. Door Style: Full flush opaque panel of material indicated.

- G. Identify fire extinguisher in cabinet with "**FIRE EXTINGUISHER**" lettering vertically on door in die-cut letters, red in color.
- H. Identify bracket-mounted extinguishers with "**FIRE EXTINGUISHER**" in red letter decals applied to wall surface. Use letter size, style and location as selected by Architect.
- I. Door Hardware: Provide manufacturer's standard door-operating hardware of proper type for cabinet type, trim style, and door material and style indicated. Provide concealed or continuous-type hinge permitting door to open 180 degrees. Provide recessed handle and "Larsen Loc."

2.03 FINISHES FOR FIRE EXTINGUISHER CABINETS – GENERAL

- A. Comply with NAAMM "Metal Finishes Manual" for recommendations relative to application and designations of finishes.
- B. Protect mechanical finishes on exposed surfaces from damage by application of strippable, temporary protective covering prior to shipment.

2.04 STEEL FIRE EXTINGUISHER CABINET FINISHES

- A. Surface Preparation: Solvent-clean surfaces in compliance with SSTs-SP 1 to remove dirt, oil, grease, and other contaminants that could impair paint bond. Remove mill scale and rust, if present, from uncooked steel in compliance with CPC-SP 5 (White Metal Blast Cleaning) or CPC-SP 8 (Pickling).
- B. Baked Enamel Finish: Immediately after cleaning and pretreatment, apply manufacturer's standard 2-coat baked enamel finish consisting of prime coat and thermosetting topcoat. Comply with paint manufacturer's instructions for application and baking to achieve a minimum dry film thickness of 2.0 mils.
 - 1. Color and Gloss: As selected by Architect from manufacturer's standard choices for color and gloss, paint exterior and interior of cabinet.

2.05 FIRE EXTINGUISHER

- A. General: Provide fire extinguishers for each cabinet and other locations indicated, in colors and finishes selected by Architect from manufacturer's standard, that comply with authorities having jurisdiction.
- B. Dry Chemical Type, (DC10): UL-rated 60B:C, 10-lb nominal capacity, in enameled steel container.
- C. Multipurpose Dry Chemical Type, (MP10): UL-rated 4-A: 80B:C, 10-lb nominal capacity, in enameled steel container.
- D. Ansul Clean Agent Fire Extinguisher, FE36: UL rated 2-A:10-B:C, Model FE13 as distributed by Koetter Fire Protection.

2.06 MOUNTING BRACKETS

- A. Brackets: Designed to prevent accidentally dislodging extinguisher, of sizes required for

type and capacity of extinguisher indicated, in plated finish.

1. Provide standard brackets for each type of extinguisher not located in cabinets.

PART 3 EXECUTION

3.01 INSTALLATION

- A. Install items included in this section in locations and at mounting heights indicated, or if not indicated, at heights to comply with applicable regulations of governing authorities. Examine walls and partitions for thickness and framing for cabinets to verify cabinet depth and mounting prior to cabinet installation.
 1. Prepare recesses in walls for fire extinguisher cabinets as required by type and size of cabinet and style of trim and to comply with manufacturer's instructions.
 2. Securely fasten mounting brackets and fire extinguisher cabinets to structure, square and plumb, to comply with manufacturer's instructions.
 3. Where exact location of bracket-mounted fire extinguishers is not indicated, locate as directed by Architect.

3.02 SCHEDULE

- A. Provide the following:
 1. Non-Fire-Rated Fire Extinguisher Cabinet (**FEC-1**): Larsens **2409-6R**. Manufacture cabinet with 2-1/2" return trim. Mount bottom of cabinet at 2'-0" above finished floor. Provide and install an **MP10** fire extinguisher in each cabinet.
 2. Fire Extinguisher One (**FE1**)-**DC10**, dry chemical type with standard bracket. Mount bracket at 36 inches above finish floor.
 - a. Install one wall-mounted fire extinguisher in the following spaces:
 - 1) Electrical Rooms
 3. Fire Extinguisher Two (**FE2**)-Ansul Clean Agent **FE36** with standard bracket. Mount bracket at 36 inches above finish floor
 - a. Install one wall-mounted fire extinguisher at the following rooms:
 - 1) MDF

END OF SECTION

SECTION 10 51 00 – METAL LOCKERS

PART 1 GENERAL

1.01 SUMMARY

- A. This Section includes the following:
 - 1. Metal lockers and accessories.
 - 2. Provide fasteners and anchorage devices to install lockers provided under this section.
 - 3. Provide metal filler panels to fill between banks of lockers and adjacent construction.

1.02 RELATED SECTIONS

- A. Section 06 10 53 – Miscellaneous Carpentry: Wood blocking.

1.03 SUBMITTALS

- A. Product Data: Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for each type of locker.
- B. Shop Drawings: Show lockers in detail, method of installation, fillers, trim, base and accessories. Include locker numbering sequence information.
- C. Samples: Submit four 3-inch by 6-inch samples of each color selected.
- D. Maintenance Data: For adjusting, repairing and replacing locker doors and latching mechanisms to include in maintenance manuals specified in Division 1.

1.04 QUALITY ASSURANCE

- A. Uniformity and Single Manufacturer Requirements: Provide each type of metal locker as produced by a single manufacturer, including necessary mounting accessories, fittings and fastenings.
- B. Installer's Qualifications: Lockers to be installed by an experienced agent of the manufacturer.

1.05 DELIVERY, STORAGE AND HANDLING

- A. Packing and Shipping: Do not deliver metal lockers until building is enclosed and ready for locker installation.
- B. Storage and Protection: Protect materials from damage during delivery, handling, storage and installation.

1.06 WARRANTY

- A. Locker manufacturer shall warrant the lockers for the lifetime use of the original

purchaser from date of shipment. Warranty shall include all defects in material and workmanship, excluding finish, vandalism and improper installation.

PART 2 PRODUCTS

2.01 MANUFACTURERS/PRODUCTS

- A. Basis of Design: Contract Documents are based on manufacturer and product named. Other acceptable manufacturers with products listed in Paragraph B below having equivalent products may be submitted.
 - 1. Basis of Design Manufacturer: DeBourgh Manufacturing Company.
 - 2. Product: Core Hallway Corridor All-Welded Locker.
 - 3. Size:
 - a. Width by depth:
 - 1) 12 inches wide by 12 inches deep
 - b. Door height:
 - 1) 12 inches wide by 24 inches high
 - c. Tier:
 - 1) Three tier
- B. Acceptable Manufacturers and Products: Subject to compliance with requirements of Contract Documents, provide products by one of the manufacturers listed below.
 - 1. Lyon, All-Welded Lockers.
 - 2. Penco, All-Welded Lockers.

2.02 FABRICATION

- A. Locker Construction:
 - 1. Lockers to be welded unibody construction with exposed welds sanded smooth.
 - 2. No bolts, screws or rivets used in assembly of locker units.
 - 3. Ship lockers set-up, ready to be anchored in place in accordance with manufacturer's instructions.
- B. Body of Lockers:
 - 1. Tops, bottoms and sides: Exterior sides constructed of 16 gauge domestic cold-rolled sheet steel for maximum durability with 18 gauge intermediate partitions.

2. Backs: Solid sheet of 18 gauge cold-rolled sheet steel welded to frames of sides and intermediate partitions.
 3. Shelves and intermediate partitions: Constructed of 18 gauge cold-rolled sheet steel welded to sides and intermediate partition construction.
 - a. At designated accessible lockers provide one shelf at 15 inches above the finished floor.
 - 1) If accessible lockers are not shown on the documents, a minimum of 5 percent of each type of single tier and double tier lockers shall have a shelf located as noted above.
 4. Tier dividers: Full depth 16 gauge cold rolled steel securely welded on all four sides, to combine with tops, bottoms, sides, and intermediate partitions to create four-sided continuous door strike.
- C. Continuous Door Strike:
1. Tier dividers, tops and bottoms constructed to provide four-sided, continuous door strike for a secure, sanitary and intrusion-free locker while door is in closed position.
- D. Doors:
1. Doors are 16 gauge steel, formed outer panel with double bends on both sides and a single bend on top and bottom with 18 gauge steel formed stiffener panel.
 2. Door stiffener runs top to bottom on hinge side of door and is securely welded to outer door to form a reinforced channel for additional torque-free strength and sound reduction when closing door. (Inner panel not available on 12-inch-high box lockers.) Door stiffener to cover at least 40 percent of the door back.
- E. Door Ventilation:
1. Secur-N-Vent doors with three-dimensional vertical vents formed on fronts and backs of door providing 21 percent ventilation per square inch.
- F. Latching
1. Sentry III Single Point Latch
 - a. Eleven gauge unbreakable stationary latch welded to the locker frame extending through no more than 1-1/4 inches into locker opening.
 - b. Latch protrudes through flush-mounted, recessed stainless steel cup.
 - c. Capable of accepting padlock or built-in lock.
- G. Hinges:
1. 16 gauge continuous piano hinge on the right side of the opening.
 2. Hinges welded to door and riveted to locker frame with no fewer than 4 rivets per hinge.

H. Slope Tops:

1. Provide 18 gauge all welded slope top with 25 degree pitch, attached at factory with concealed fasteners. Slope top to be in addition to standard 16 gauge flat top.

I. Closed Base:

1. Provide 4 inch high, 14 gauge welded steel base enclosed on all four sides, securely welded to locker bottom.

J. Filler Panels: Manufacturer's standard fabricated from 18 gauge solid steel finished to match lockers.

K. Finish:

1. Complete locker unit to be thoroughly cleaned, phosphatized and sealed.
2. Finish to be baked pure TGIC polyester powder coat with a minimum 2-3 mil thickness.
3. Color of lockers shall be chosen from manufacturer's 27 standard colors.

2.03 LOCKER ACCESSORIES

A. Hooks:

1. Hooks to be heavy-duty forged steel with ball ends and zinc plated.
2. Provide two single wall hooks and one double ceiling hook in each locker opening 20 inches or taller.

B. Numbering

1. Furnish each locker with polished aluminum number plate with etched black numbers.
2. Locate number plate near center of each door.
3. Owner to furnish numbering sequence.

PART 3 EXECUTION

3.01 INSTALLATION

A. Wall Installation:

1. Securely anchor every locker to wall and/or floor before use.
2. Anchoring to be determined by conditions at time of installation.
3. The adjacent locker units by bolting at four points, two at top and two at bottom,

using 1/4-inch cadmium-plated bolts.

3.02 ADJUSTING

- A. General Requirements: Upon completion of installation, inspect lockers and adjust for proper door and locking mechanism operation.

3.03 CLEANING

- A. General Requirements:
 - 1. Clean interior and exposed exterior surfaces, removing debris, dust, dirt and foreign substances on exposed surfaces.
 - 2. Touch up scratches and abrasions to match original finish.
 - 3. Polish stainless steel and non-ferrous metal surfaces.
 - 4. Replace locker units that cannot be restored to factory-finished appearance.
 - 5. Use only materials and procedures recommended or furnished by locker manufacturer.

END OF SECTION

SECTION 10 73 26 – WALKWAY COVERINGS

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes: Design, fabrication and installation of welded extruded aluminum:
 - 1. Entry Canopies.
- B. Products Furnished but not Installed Under this Section: Column sleeves (Styrofoam blockouts) or anchor bolts (if required)

1.02 REFERENCES

- A. The Aluminum Association (AA):
 - 1. The Aluminum Design Manual, Specifications & Guidelines for Aluminum Structures.
- B. American Architectural Manufacturers Association (AAMA):
 - 1. AAMA 2604, Voluntary Specification, Performance Requirements and Test Procedures for High Performing Organic Coatings on Aluminum Extrusions and Panels.
- C. American Society of Civil Engineers (ASCE):
 - 1. ASCE 7, Minimum Design Loads for Buildings and Other Structures.
 - a. Refer to the applicable building code for the effective date.
- D. American Society for Testing and Materials (ASTM):
 - 1. ASTM B209, Specification for Aluminum and Aluminum- Alloy Sheet and Plate.
 - 2. ASTM B221, Specification for Aluminum and Aluminum- Alloy Extruded Bars, Rods, Wire, Profiles, and Tubes.
 - 3. ASTM C150, Specification for Portland Cement.
 - 4. ASTM C404, Specification for Aggregates for Masonry Grout.
- E. American Welding Society (AWS):
 - 1. ANSI/AWS D1.2, Structural Welding Code - Aluminum.

1.03 SYSTEM DESCRIPTION

- A. Design Requirements:
 - 1. Design Walkways in accordance with current The Aluminum Design Manual.

2. Comply with the wind requirements of ASCE 7.
 3. Provide an all-welded extruded aluminum system complete with internal drainage. Non-welded systems are not acceptable.
 4. Provide expansion joints to accommodate temperature changes of 120 degrees F. Provide expansion joints with no metal-to-metal contact.
 5. Refer to Structural Drawings for:
 - a. Wind speed.
 - b. Exposure.
 - c. Importance Factor.
- B. Performance Requirements:
1. Grout: Compressive strength of 2000 psi, minimum.

1.04 SUBMITTALS

- A. Product Data: Manufacturer's product information, specifications and installation instructions for:
1. Entry canopy components and accessories.
- B. Shop Drawings: Include plan dimensions, elevations and details.
- C. Samples:
1. Selection: Manufacturer's full range of colors for the finishes selected.
 2. Verification: 3-inch-square samples of each finish selected on the substrate specified.
- D. Design Data: Design calculations bearing the seal of a Registered Professional Engineer, licensed in the State of Texas. Design calculations shall state that the entry canopy design complies with the wind requirements of ASCE 7, the stability criteria of applicable building code, and all other governing criteria.

1.05 QUALITY ASSURANCE

- A. Manufacturer Qualifications: At least ten years of experience in the design, fabrication and erection of extruded aluminum entry canopy systems.
- B. Installer Qualifications: Have entry canopies installed by manufacturer; third-party installation is not acceptable.

PART 2 PRODUCTS

2.01 MANUFACTURERS

- A. The design is based on products fabricated by: AVAdek

1. Comparable products by the following manufacturers also will be acceptable:
 - a. Canopy Solutions.
 - b. Dittmer Architectural Aluminum.
2. Substitutions: Comparable products of other manufacturers will be considered under Section 01 60 00.

2.02 MATERIALS

- A. Aluminum Members: Extruded aluminum, ASTM B221, 6063 alloy, T6 temper.
- B. Fasteners: Aluminum, 18-8 stainless steel, or 300 series stainless steel.
- C. Protective Coating for Aluminum Columns Embedded in Concrete: Clear acrylic.
- D. Grout:
 1. Portland Cement: ASTM C150, Type I.
 2. Sand: ASTM C404.
 3. Water: Potable.
- E. Gaskets: Dry seal santoprene pressure type.
- F. Aluminum Flashing: ASTM B209, Type 3003 H14, 0.040-inch, minimum.

2.03 MIXES

- A. Grout: 1-part Portland cement to 3 parts sand; add water to produce a pouring consistency.

2.04 FABRICATION

- A. General:
 1. Shop Assembly: Assemble components in shop to greatest extent possible to minimize field assembly.
 2. Welding: In accordance with ANSI/AWS D1.2.
 3. Deck Construction: Fabricate from extruded modules that interlock in a self-flashing manner. Positively fasten interlocking joints at 8 inches on center creating a monolithic structural unit capable of developing the full strength of the sections. The fastenings must have minimum shear strength of 350 pounds each. Assemble deck with sufficient camber to offset dead load deflection.
- B. Columns: Provide radius-cornered tubular extrusions with cutout and internal diverter for drainage where indicated. Circular downspout opening in column not acceptable.
- C. Beams: Provide open-top tubular extrusion, top edges thickened for strength and designed to receive deck members in self-flashing manner. Provide structural ties in tops

of all beams.

- D. Deck: Extruded self-flashing sections interlocking into a composite unit. Provide welded plate closures at deck ends.
- E. Fascia: Manufacturer's standard shape. Provide fascia splices where continuous runs of fascia are jointed. Locate splices to be in line with bents and fasten in place on hidden or non-vertical surfaces.
- F. Flashing: Flashing shall be minimum 0.040 aluminum.
- G. Where noted on drawings provide downspouts at entry canopies. Size based on rain fall intensity.
- H. Factory Finishing: Finish designations prefixed by AA comply with system established by the AAMA for designating aluminum finishes.
 - 1. High performance Organic Coating Finish: AA-C12C42R1x (Chemical Finish: cleaned with inhibited chemicals; Chemical Finish: acid-chromate-fluoride-phosphate conversion coating; Organic Coating: as specified below). Prepare, pretreat, and apply coating to exposed metal surfaces to comply with coating and resin manufacturer's written instructions.
 - a. Fluoropolymer Two-Coat Coating System: Manufacturer's standard two-coat, thermocured system consisting of specially formulated inhibitive primer and fluoropolymer color topcoat containing not less than 70 percent Hylar polyvinylidene fluoride resin by weight; complying with AAMA 2604.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verification of Conditions: Verify that all concrete, masonry and roofing work in the vicinity is complete and cleaned.

3.02 ERECTION

- A. Erect protective cover true to line, level and plumb. Protect aluminum columns embedded in concrete with clear acrylic. Fill downspout columns with grout to the discharge level to prevent standing water. Install weep holes at top of concrete in non-draining columns to remove condensation.
- B. Provide hairline miters and fitted joints.

3.03 CLEANING

- A. Clean all protective cover components promptly after installation.

3.04 PROTECTION

- A. Protect materials during and after installation.

3.05 SCHEDULE

- A. Refer to drawings for size of members.

END OF SECTION

SECTION 10 90 00 – HIGH SECURITY ENTRY SYSTEM

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. High Security Entry System for:
 - 1. Hinged door key box.

1.02 SUBMITTALS

- A. Section 01 33 00 – Submittal Procedures.
- B. Product Data: Provide information and manufacturers installation instructions.
- C. Department Registration Forms: Provide local fire department copies of registration forms for each of the products listed.

1.03 QUALITY ASSURANCE

- A. Products listed in this section shall be UL listed.

1.04 DELIVERY, STORAGE AND PROTECTION

- A. Deliver to project site in shipping containers.

1.05 PROJECT CONDITIONS

- A. Coordinate High Security Entry System installation with locations noted on Drawings.
- B. Coordinate with local fire departments to get exact locations and key requirements.

PART 2 PRODUCTS

2.01 HIGH SECURITY ENTRY SYSTEM

- A. Manufacturer: Knox Company
- B. Products:
 - 1. Entry Box: Recessed mounted, hinged- door, 3272 with 3290 recessed mounting kit for masonry construction.
 - 2. For each entry system provide the fire department with appropriate keys and keywrenches.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verify that adjacent materials installation is complete.

3.02 INSTALLATION

- A. Install in accordance with manufacturer's instructions.

END OF SECTION

SECTION 12 24 13 – MANUAL WINDOW SHADES

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Manually operated, roll-up fabric interior window shades including mounting and operating hardware.

1.02 REFERENCES

- A. NFPA 701-99 - Fire Tests for Flame-Resistant Textiles and Films.

1.03 SUBMITTALS

- A. Submit under provisions of Section 01 33 00 - Submittal Procedures.
- B. Product Data: Manufacturer's data sheets on each product specified, including:
 - 1. Preparation instructions and recommendations.
 - 2. Installation and maintenance instructions.
 - 3. Styles, material descriptions, dimensions of individual components, profiles, features, finishes and operating instructions.
 - 4. Storage and handling requirements and recommendations.
 - 5. Mounting details and installation methods.
 - 6. Typical wiring diagrams including integration of motor controllers with building management system, audiovisual and lighting control systems as applicable.
- C. Shop Drawings: Plans, elevations, sections, product details, installation details, operational clearances, wiring diagrams and relationship to adjacent work.
- D. Window Treatment Schedule: For all roller shades. Use same room designations as indicated on the Drawings, field verified window dimensions, quantities, type of shade, controls, fabric and color, and include opening sizes and key to typical mounting details.
- E. Selection Samples: For each finish product specified, two complete sets of shade cloth options and aluminum finish color samples representing manufacturer's full range of available colors and patterns.
- F. Verification Samples: For each finish product specified, two complete sets of shade components, unassembled, demonstrating compliance with specified requirements. Shade fabric sample and aluminum finish sample as selected, representing actual product, color, and patterns. Mark face of material to indicate interior faces.
- G. Maintenance Data: Methods for maintaining roller shades, precautions regarding cleaning materials and methods, instructions for operating hardware and controls.
- H. Manufacturer's Certificates: Certify products meet or exceed specified requirements.

1.04 QUALITY ASSURANCE

- A. Manufacturer Qualifications: Obtain roller shades through one source from a single manufacturer with a minimum of twenty years of experience in manufacturing products comparable to those specified in this section.
- B. NFPA Flame-Test: Passes NFPA 701. Materials tested shall be identical to products proposed for use.
- C. Mock-Up: Provide a mock-up of one of each type roller shade assembly specified for evaluation of mounting, appearance and accessories.
 - 1. Locate mock-up in window(s) designated by Architect.
 - 2. Do not proceed with remaining work until mock-up is accepted by Architect.
 - 3. Mock-up may remain in place upon acceptance by Architect.

1.05 DELIVERY, STORAGE AND HANDLING

- A. Do not deliver window shades until building is enclosed and construction within spaces where shades will be installed is substantially complete.
- B. Deliver products in manufacturer's original, unopened, undamaged containers with labels intact.
- C. Label containers and shades according to Window Shade Schedule.
- D. Store products in manufacturer's unopened packaging until ready for installation.

1.06 SEQUENCING

- A. Ensure that locating templates and other information required for installation of products of this section are furnished to affected trades in time to prevent interruption of construction progress.
- B. Ensure that products of this section are supplied to affected trades in time to prevent interruption of construction progress.

1.07 PROJECT CONDITIONS

- A. Install roller shades after finish work and ambient temperature, humidity and ventilation conditions are maintained at levels recommended for project upon completion.

1.08 WARRANTY

- A. Hardware and Shade Fabric: Manufacturer's standard twenty-five year limited warranty.

1.09 FIELD MEASUREMENTS

- A. Verify field measurements prior to fabrication.

PART 2 PRODUCTS

2.01 MANUFACTURERS AND PRODUCTS

A. Basis of Design: Contract Documents are based on manufacturer and product named below to establish a Standard of Quality. Other acceptable manufacturers with products having equivalent characteristics may be considered, provided deviations are minor and do not change concept as expressed in Contract Documents as judged by Architect.

1. Basis of Design Selections:

- a. Manufacturer: Draper, Inc.
- b. Product: Manual FlexShade XD

B. Acceptable Manufacturers: Subject to compliance with requirements of Contract Documents, provide product by one of the manufacturers named below. If not named, submit as substitution according to Conditions of the Contract and appropriate Division 1 sections.

1. Manufacturer: MechoShade Systems.

2.02 MANUALLY OPERATED WINDOW SHADES

A. Manually Operated Window Shades with Independent Control: Manually operated, vertical roll-up, fabric window shade with components necessary for complete installation.

- 1. Centered bead chain exit allows for right- or left-hand operation without field modification.
- 2. Fabric spline attachment and new heavy-duty clutch design. Metal tube, with stainless steel bead chain clutch operator on right side, standard, as seen from facing the window inside the room. Left side operator available. Chain tension device included.
- 3. Operating Mechanism: Stainless steel bead chain clutch standard (ivory, grey, black, white or brown polyester available at no extra charge).
- 4. 1/8" steel brackets with reinforcement ribs. Brackets and clutch integrated rotational bearing for ease of operation and noise reduction. Minimum of 5 recessed rivets securing clutch to bracket, 7 on idler. One-piece machined steel primary post 9 mm/.354 diameter. Decorative endcap covers with mechanical attachment included.
- 5. Mounting: Wall or ceiling mounting available for brackets only.
- 6. Headbox Ceiling/Wall style: Aluminum fabrication with removable closure, endcaps and back and top cover piece:
 - a. Finish: Clear anodized.

2.03 FABRIC

- A. Light-Filtering Fabrics:
 - 1. SheerWeave Series PW3500 by Phifer: Vinyl-coated polyester yarn with manufacturer's standard anti-microbial protection woven into 2x2 basket-weave pattern.
 - a. PW3500 Refer to finish schedule
 - 2. Fire Rating: NFPA 701 TM#1(small scale)/NFPA 101 (Class A Rating)/NFPA 701-TM#2 large scale.
 - 3. Bacteria and Fungal Resistance: ASTM G21 and ASTM G22.
 - 4. Openness Factor: Refer to finish schedule
 - 5. Fabric Thickness: 0.036".
 - 6. Fabric Weight: 19.20 ounces per square yard.
 - 7. Color and pattern: As selected by Architect from manufacturer's standard range.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Do not begin installation until substrates have been properly prepared.
- B. If substrate preparation is the responsibility of another installer, notify Architect of unsatisfactory preparation before proceeding.

3.02 INSTALLATION

- A. Install in accordance with manufacturer's instructions.
- B. Install roller shades level, plumb, square and true. Allow proper clearances for window operation hardware.

3.03 TESTING AND DEMONSTRATION

- A. Demonstrate operation of shades to Owner's designated representatives.

3.04 PROTECTION

- A. Protect installed products until completion of project.
- B. Touch up, repair or replace damaged products before Substantial Completion.

3.05 SCHEDULES

- A. Refer to Drawings for shade types and locations.

END OF SECTION

SECTION 12 48 13 – ENTRANCE FLOOR MATS AND FRAMES

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Floor mat grid and frame assembly.

1.02 RELATED SECTIONS

- A. Section 03 30 00 – Cast-in-Place Concrete: Grouting frames into recess.

1.03 REFERENCES

- A. American Society for Testing and Materials (ASTM).
- B. The Aluminum Association.
- C. The Carpet and Rug Institute (CRI).
- D. The National Floor Safety Institute (NFSI).

1.04 SUBMITTALS

- A. Section 01 33 00 – Submittal Procedures: Procedures for submittals.
 - 1. Product Data: Data indicating mat characteristics, component dimensions, frame and dimensions.
 - 2. Shop Drawings: Indicate dimensions and details for recessed installation.
 - 3. Samples: Two 12 inch by 12 inch samples illustrating pattern, color, finish and frame.
 - 4. Assurance/Control Submittals:
 - a. Certificates: Manufacturer's certificate that products meet or exceed specified requirements.
- B. Section 01 70 00 – Execution and Closeout Requirements: Procedures for closeout submittals.
 - 1. Maintenance Data: Include cleaning instructions and stain removal procedures.

1.05 QUALITY ASSURANCE

- A. Flammability in accordance with ASTM E648, Class 1, Critical Radiant Flux, minimum 0.45 watts/m².
- B. Slip resistance in accordance with ASTM D2047-96, Coefficient of Friction, minimum 0.60 for accessible routes.'

- C. Standard rolling load performance to be 750 lb./wheel (load applied to a solid 5 inches by 2 inches wide polyurethane wheel, 1,000 passes without damage).
- D. Single-Source Responsibility: Obtain floor mats/grids and frames from one source of a single manufacturer.
- E. Utilize superior structural aluminum alloy 6105-T5 for rail components.

1.06 DELIVERY, STORAGE AND HANDLING

- A. Deliver materials to the project site ready for use and fabricated in as large sections and assemblies as practical, in unopened original factory packaging clearly labeled to identify manufacturer.

1.07 PROJECT CONDITIONS

- A. Field measurements: Check actual openings for mats/grids by accurate field measurements before fabrication. Record actual measurements on final Shop Drawings. Coordinate fabrication schedule with construction progress to avoid delay of work.
- B. For recess application coordinate frame installation with concrete construction to ensure recess and frame anchorage are accurate and that the base is level and flat. Defer frame installation until building enclosure is complete and related interior finish work is in progress.

PART 2 PRODUCTS

2.01 MANUFACTURERS

- A. Manufacturer: Construction Specialties.
- B. Subject to compliance with project requirements, manufacturer's offering Products which may be incorporated in the Work include the following:
 - 1. Mats, Incorporated, Braintree, MA.
- C. Section 01 60 00 – Product Requirements: Product options and substitutions. Substitutions: Permitted.

2.02 MATERIALS

- A. Aluminum – 6105-T5 for extrusions.
- B. Flexible and prime TPE extrusions.
- C. Tread insert options: Refer to Article 2.05.

2.03 FLOOR MATS/GRIDS

- A. Model and Description: G3 PediTred LP shall be extruded 6105-T5 aluminum alloy, with ½ inch deep multiple tread planks which are joined by an TPE hinge to comprise the overall grid length (traffic-direction). All material shall be perforated to allow drainage,

unless otherwise specified. Supplied in mill finish. Units must withstand 750 lb. wheel loads (load applied to a solid 5 inches by 2 inches wide polyurethane wheel, 1,000 passes without damage).

2.04 MAT/GRID FRAMES

- A. LB: Level Base Frame shall be a 3/4 inch deep recessed frame in 6063-T6 aluminum alloy with a 1/4 inch wide exposed surface. Black TPE trim shall be furnished as required, when standard 1 1/2 inches tread spacing cannot be maintained. Installer shall use recommended latex screed to ensure level base. Frame color shall be supplied in standard mill finish. Mill finish frames in contact with concrete to be primer coated.

2.05 TREAD INSERT OPTIONS

- A. HD MonoTuft HD™ carpet shall meet the Carpet and Rug Institute's standard for indoor air quality. Fibers shall include a minimum of 100, 12 mil monofilament fibers per square inch and colorfast, solution-dyed nylon. Available in one of 19 standard colors as offered by manufacturer. Each carpet fiber and monofilament shall be fusion-bonded to a rigid two-ply backing to prevent fraying and supplied in continuous splice-free lengths. Anti-static carpet fiber shall contain antimicrobial additive and be treated with Scotchgard® to reduce soiling. Carpet weight shall be 33-oz./yd².

PART 3 EXECUTION

3.01 EXAMINATION

- A. Section 01 70 00 – Execution and Closeout Requirements: Verification of existing conditions before starting work.
- B. Verification of Conditions: Verify that field measurements, surfaces, substrates and conditions are as required, and ready to receive Work.
 - 1. Field verify floor recess before fabricating mats.

3.02 INSTALLATION

- A. Vacuum clean floor where mat will be installed.
- B. Install mats and frames in accordance with manufacturer's published instructions in locations indicated on Drawings.
- C. Install mat frames in floor recess flush with finish floor after cleaning of finish flooring.
- D. Adhesive Attachment: Apply adhesive to perimeter of mat, fastening edges and corners securely.
- E. Coordinate top of mat/grid surfaces with bottom of doors that swing across to provide ample clearance between door and mat/grid.

3.03 CONSTRUCTION

- A. Site Tolerances:

1. Maximum Gap Formed at Recessed Frame from Mat Size: 1/4 inch.

3.04 PROTECTION

- A. Vacuum clean mat after installation and protect from traffic.

END OF SECTION

SECTION 12 93 00 - SITE FURNISHINGS

PART 1 GENERAL

1.01 RELATED DOCUMENTS

- A. Drawings and general provisions of the contract, including general and supplementary conditions and Division 01 specification sections, apply to this section.

1.02 SUMMARY

A. Section Includes:

1. Seating.
2. Trash & recycling receptacles.
3. Pet Waste Station.

B. Related Requirements:

1. Division 03 Section "Cast-in-Place Concrete" for installing pipe sleeves cast, installing anchor bolts cast in concrete footings.
2. Division 31 Section "Earth Moving" for excavation for installing concrete footings.

1.03 ACTION SUBMITTALS

- A. Product Data: For each type of product.

B. LEED Submittals:

1. Product data for Credit MR 4.1 and Credit MR 4.2: For products having recycled content, documentation indicating percentages by weight of post-consumer and pre-consumer recycled content. Include statement indicating cost for each product having recycled content.
2. Certificated for Credit MR 6, Credit MR 7: Chain of custody certificated indicating that wood components of the site furnishing comply with forest certification requirements. Include documentation that Manufacturer is certified for chain of custody by an FSC accredited certification body. Include statement indicating cost for each certified wood product.

- C. Samples: For each exposed product and for each color and texture specified.

- D. Product Schedule: For site furnishings, use same designations indicated on drawings.

1.04 INFORMATIONAL SUBMITTALS

- A. Material Certificates: For site furnishings:

1. Wood Preservative Treatment: Include certification by treating plant stating type of preservative solution and pressure process used, net amount of preservative retained, and compliance with applicable standards.

1.05 CLOSEOUT SUBMITTALS

- A. Maintenance Data: For site furnishings to include in maintenance manuals.

1.06 MAINTENANCE MATERIAL SUBMITTALS

- A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
 1. Trash Receptacle Inner Containers: Five (5) full size units for each size indicated.

PART 2 PRODUCTS

2.01 LUXEMBOURG TABLE & CHAIR

- A. As supplied by Fermob

1. Luxembourg Table

- a. Size: 36" square
- b. Finish: Powdercoated Metal
- c. Color: TBD
- d. Mounting option: Freestanding

2. Luxembourg Arm Chair

- a. Finish: Powdercoated Metal
- b. Color: TBD
- c. Mounting option: Freestanding

2.02 PARALLEL 42 BENCH

- A. As supplied by Landscape Forms

1. Parallel 42 Wedge 30 Unit

- a. Finish: Powdercoated Metal
- b. Color: TBD
- c. Mounting option: Surface Mounted

2. Parallel 42 Left 30 Unit
 - a. Finish: Powdercoated Metal
 - b. Color: TBD
 - c. Mounting option: Surface Mounted

3. Parallel 42 Right 30 Unit
 - a. Finish: Powdercoated Metal
 - b. Color: TBD
 - c. Mounting option: Surface Mounted

2.03 LOLLYGAGGER LOUNGE CHAIR
A. As supplied by LOLL

1. Lollygagger Lounge Chair
 - a. Color: TBD
 - b. Mounting option: Freestanding

2.04 METRIX TRASH & RECYCLING RECEPTACLE
A. As supplied by Anova Furnishings

1. Metrix Trash Receptacle
 - a. Finish: Powdercoated Metal
 - b. Color: TBD
 - c. Mounting option: Freestanding
2. Metrix Recycling Receptacle
 - a. Finish: Powdercoated Metal
 - b. Color: TBD
 - c. Mounting option: Freestanding
 - a. Mounting option: Surface Mounted

2.05 MATERIALS

- A. Aluminum: Alloy and temper recommended by aluminum producer and finisher for type of use and finish indicated; free of surface blemished and complying with the following:

1. Rolled or Cold-Finished Bars, Rods, and Wire: ASTM B 211.
 2. Excluded Bars, Rods, Wire, Profiles, and Tubes: ASTM B 211.
 3. Structural Pipe and Tube: ASTM R 429/B 429M.
 4. Sheet and Plate: ASTM B 209.
 5. Castings: ASTM B 26/B 26M.
- B. Steel and Iron: Free of surface blemishes and complying with the following:
1. Plates, Shapes, and Bars: ASTM A 36/A 36 M.
 2. Steel Pipe: Standard-weight steel pipe complying with ASTM A 53/A 53M, or electric resistance welded pipe complying with ASTM A 135/A 135M.
 3. Tubing: Cold-formed steel tubing complying with ASTM A 500/A 500M.
 4. Mechanical Tubing: Cold-rolled, electric resistance welded carbon or alloy steel tubing complying with ASTM A 512, or steel tubing fabricated from steel complying with ASTM A 1011/A 1011M and complying with dimensional tolerances in ASTM A 500/A 500M; zinc coated internally and externally.
 5. Sheet: Commercial steel sheet complying with ASTM A 1011/A 1011M.
 6. Perforated Metal: From steel sheet not less than 0.120" (3.0mm) nominal thickness; Manufacturer's standard perforation pattern.
 7. Expanded Metal: Carbon-steel sheets, deburred after expansion, and complying with ASTM F 1267.
 8. Malleable-iron Castings: ASTM A 47/a 47m, grade as recommended by fabricator for type of use intended.
 9. Gray-iron Castings: ASTM A 48/A 48M, Class 200.
- C. Stainless Steel: Free of surface blemishes and complying with the following:
1. Sheet, Strip, Plate, and Flat Bars: ASTM A 666.
 2. Pipe: Schedule 40 steel pipes complying with ASTM A 312/A 312M.
 3. Tubing: ASTM A 554.
- D. Wood: Surfaced smooth on four (4) sides with eased edges; kiln dried, free of knots, solid stock of species indicated.
1. Wood Species: Manufacturer's standard.

2. Certified Wood: Fabricate site furnishings with components produced from wood obtained from forests certified by an FSC accredited certification body to comply with FSC STD-01-001, "FSC Principles and Criteria for Forest Stewardship."
 3. Finish: Manufacturer's standard transparent wood preservative treatment and sealer.
- E. Fiberglass: Multiple laminations of glass fiber reinforced polyester resin with UV light stable, colorfast, non-fading, weather and stain resistant, colored polyester gel coat, and with Manufacturer's standard finish.
- F. Plastic: Color impregnated, color and UV light stabilized, and mold resistant.
1. Polyethylene: Fabricated from virgin plastic HDPE resin.
- G. Anchors, Fasteners, Fittings, and Hardware: Manufacturer's standard, corrosion resistant coated or non-corrodible materials appropriate for the type of materials that it abuts; commercial quality, tamperproof, vandal and theft resistant, concealed, recesses, and capped or plugged.
1. Angle Anchors: For inconspicuously bolting legs of site furnishings to on and below grade substrate; per Manufacturer's recommendation. Extend fasteners through pavers from concrete base when installed in a paver (brick, concrete, stone, etc.) surface.
- H. Non-shrink Non-metallic Grout: Premixed, factory-packaged, non-staining, non-corrosive, non-gaseous grout complying with ASTM C 1107/C 1107M; recommended in writing by Manufacturer, for exterior applications.
- I. Erosion Resistant Anchoring Cement: Factory packaged, non-shrink, non-staining, hydraulic controlled expansion cement formulation for mixing with potable water at project site to create pourable anchoring, patching, and grouting compound; resistant to erosion from water exposure without needing protection by a sealer or waterproof coating; recommended in writing by Manufacturer, for exterior applications.
- J. Retain "Galvanizing" paragraph below if ferrous components are used to fabricate site furnishings.
- K. Galvanizing: Where indicated for steel and iron components, provide the following protective zinc coating applied to components after fabrication.
1. Hot Dip Galvanizing: According to ASTM A 123/A 123M, ASTM A 153/A 153M, or ASTM A 924/A 924M.

2.06 WOOD PRESERVATIVE-TREATED MATERIALS

- A. Preservative Treatment: Pressure treat wood according to AWPA U1 and the following:
1. Use preservative chemicals acceptable to authorities having jurisdiction and containing no arsenic or chromium. Use chemical formulations that do not bleed through or otherwise adversely affect finishes. Do not use colorants to distinguish treated materials from untreated materials.

2. Kiln dry lumber and plywood after treatment to a maximum moisture content, respectively, of 19% and 15%. Do not use materials that are warped or do not comply with requirements for untreated materials.

2.07 FABRICATION

- A. Metal Components: Form to required shapes and sizes with true, consistent curves, lines, and angles. Separate metals from dissimilar materials to prevent electrolytic action.
- B. Welded Connections: Weld connections continuously. Weld solid members with cull length, full penetration welds and hollow members with circumference welds. At expose connections, finish surfaces smooth and blended so no roughness or unevenness shows after finishing and welded surface matched contours adjoining surfaces.
- C. Pipes and Tubes: Form simple and compound curves by bending members in jugs to produce uniform curvature for each repetitive configuration required; maintain cylindrical cross section of member throughout entire bend without buckling, twisting, cracking, or otherwise deforming exposed surfaces of handrail and railing components.
- D. Preservative-treated Wood Components: Complete fabrication of treated items before treatment if possible. If cut after treatment, apply field treatment complying with AWPA M\$ to cut surfaces.
- E. Exposed Surfaces: Polished, sanded, or otherwise finished; all surfaces smooth, free of burs, barbs, splinters, and sharpness; all edges and ends rolled, rounded, or capped.
- F. Factory Assembly: Assemble components in the factory greatest extent possible to minimize field assembly. Clearly mark units for assembly in the field.

2.08 GENERAL FINISH REQUIREMENTS

- A. Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance adjoining components are acceptable if they are within the range of approved samples and are assembled or installed to minimize contrast.

2.09 ALUMINUM FINISHES

- A. Baked Enamel, Powder-coat Finish: Manufacturer's standard, baked, polyester, powder-coat finish complying with finish Manufacturer's written instructions for surface preparation, including pre-treatment, application, baking, and minimum dry film thickness.

2.10 STEEL AND GALVANIZED STEEL FINISHES

- A. Baked Enamel, Powder-coat Finish: Manufacturer's standard, baked, polyester, powder-coat finish complying with finish Manufacturer's written instructions for surface preparation, including pre-treatment, application, baking, and minimum dry film thickness.

- B. PVC Finish: Manufacturer's standard, UV light stabilized. Mold-resistant, slip-resistant, matte textured, dipped or sprayed on, PVC plastisol finish, with flame retardant added; complying with coating Manufacturer's written instructions for pre-treatment, application, and minimum dry film thickness.

2.11 IRON FINISHES

- A. Baked Enamel, Powder-coat Finish: Manufacturer's standard, baked, polyester, powder-coat finish complying with finish Manufacturer's written instructions for surface preparation, including pre-treatment, application, baking, and minimum dry film thickness.

2.12 STAINLESS STEEL FINISHES

- A. Surface Preparation: Remove tool and die marks and stretch lines, or blend into finish.
- B. Polished finishes: Grind and polish surfaces to produce uniform finish, free of cross hatches.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Examine areas and conditions, with installer present, for compliance with requirements for correct and level finished grade, mounting surfaces, installation tolerances, and other conditions affecting performance of the work.
- B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.02 INSTALLATION, GENERAL

- A. Comply with Manufacturer's written installation instructions unless more stringent requirements are indicated. Complete field assembly of site furnishing where required.
- B. Unless otherwise indicated, install site furnishings after landscaping and paving have been completed.
- C. Install site furnishings level, plumb, true, and securely anchored at locations indicated on drawings.
- D. Post Setting: Set cast-in support posts in concrete footing with smooth top, shaped to shed water. Protect portion of posts above footing from concrete splatter. Verify that posts are set plumb or at correct angle and are aligned and at correct height and spacing. Hold posts in position during placement and finishing operation until concrete is sufficiently cured.
- E. Posts set into Voids in Concrete: Form or core drill-holes for installing posts in concrete to depth recommended in writing by Manufacturer of the site furnishings and 3/4" (19mm) larger than OD of post. Clean holes of loose material, insert posts, and fill annular space between

post and concrete with non-shrink, nonmetallic grout, mixed and placed to comply with anchoring material Manufacturer's written instructions, with top smoothed and shaped to shed water.

- F. Pipe Sleeves: Use steel pipe sleeves preset and anchored into concrete for installing posts. After posts have been inserted into sleeves, fill annular space between post and sleeve with non-shrink, non-metallic grout, mixed and placed to comply with anchoring material Manufacturer's written instructions, with top smoothed and shaped to shed water.

END OF SECTION 12 93 00

SECTION 13 31 23 - PRE-ENGINEERED SHADE STRUCTURES

PART 1 GENERAL

1.1 RELATED DOCUMENTS

- A. Drawings and general provisions of the Contract, including General Conditions and Division 1 Specification Sections apply to this section.

1.2 SUMMARY

- A. The shade structure contractor shall be responsible for the design, engineering, fabrication, supply, and installation (including foundations) of the work specified herein. The intent of this specification is to have only one single contractor be responsible for all the above functions.

1.3 REFERENCES

- A. Shade Structures must comply with the latest revision of applicable codes and regulations including IBC 2015.
- B. American Society for Testing Materials (ASTM)
- C. American Welding Society: Structural Welding Code AWS D1.1: Symbols for Welding and Nondestructive Testing AWS 2.3.
- D. International Accreditation Services (IAS)
- E. American Institute of Steel Construction (AISC): Specifications for the design, fabrication, and erection of structural steel.

1.4 SUBMITTALS

- A. Provide proof of installed reference sites with six structures for similar scope of project and installation that are engineered to IBC Specifications.
- B. Provide proof of a minimum of 6 permitted shade structure projects with the City of San Antonio, including Special Inspections and Permit Close-Out.
- C. Provide a minimum of 13 fabric samples to demonstrate fabric color range and powder color selections.
- D. Provide proof of all quality assurance items including:
 - 1. A list of at least three reference projects of similar type structures that have been installed in the last 10 years as described below in 2.1 General, Scope.
 - 2. Proof of general liability, professional liability, and umbrella insurance as per section 1.5 D.
 - 3. Proof of a minimum of \$25,000,000 aggregate bonding capacity as per Section 1.5 E.
 - 4. Proof of IAS Certification per Section 1.5 F.
 - 5. Proof of current status as an ISNetworld Member Contractor.
 - 6. Proof of a Corporate Safety Program along with an Injury & Illness Prevention Program.
 - 7. Proof of Corporate Quality Control Manual as per Section 1.5 H
 - 8. Proof of Maintenance Program and 3 reference projects where maintenance has been provided, where necessary, during the duration of the warranty.

1.5. QUALITY ASSURANCE

Fabrication and erection are limited to firms with proven experience in design and construction of fabric shade structures and such firms shall meet the following minimum requirements. No substitutions shall be allowed for the following:

- A. A single shade contractor shall design, engineer, manufacture, and erect the fabric shade structures and foundations. Contractor shall obtain permits through the local city agencies,

- including electrical permit where required, including special inspections, payment & performance bonds and close-out of permitted project with local agency.
- B. All bidders shall have at least 15 years' experience in the design, engineering, manufacturing, and installation of shade structures.
 - C. All bidders shall engineer to IBC 2015 requirements with similar scope.
 - D. All bidders shall be able to provide proof of a minimum of \$1,000,000 general/public liability insurance, \$3,000,000 professional liability (PL) insurance, and an additional \$10,000,000 umbrella/excess liability insurance.
 - E. All bidders shall be licensed and bonded with a minimum bonding capacity of \$6,000,000 and aggregate bonding capacity of \$25,000,000.
 - F. Steel manufacturer shall be accredited by IAS (International Accreditation Service) for Structural Steel Fabrication under UBC 97 & 2000 Section 1701.7 and IBC 2015 Section 1704.2.2.
 - G. Proof of current status as an ISNetworld Member Contractor.
 - H. The shade contractor shall have a Corporate Quality Control program and manual describing their complete quality assurance program.
 - I. All bidders must have an in-house warranty & service department and local office to assist in repairs and service calls within 48 hours.

1.7 WARRANTY

- A. The successful bidder shall provide a 12-month warranty on all labor and materials.
- B. A supplemental warranty from the manufacturer shall be provided for a period of 10 years on fabric and 10 years on the structural integrity of the steel from the date of substantial completion.
- C. The warranty shall not deprive the Owner of other rights under the provisions of the Contract Documents and will be in addition to and run concurrent with other warranties made by the Contractor under requirements of the Contract Documents.

PART 2 PRODUCTS

2.1 GENERAL

- 1. Scope:
Provide (4) Joined 3-Point Sails, measuring 15' x 15' x 15' each with 8' and 10' entry height per CON-JUL-056-21 (1000). Columns shall measure a minimum of HSS 8.625 x .322 and HSS 8.625 x 0.280. The framing shall support a combination of 4 fabric sails. No exceptions.
- A. The structures shall be manufactured by Shade Structures, Inc. dba USA SHADE & Fabric Structures, or approved equivalent and include the structural steel frame, fabric roof, steel cables, all fasteners, and installation. Project management and foundations will also be included.

Contact: Shade Structures, Inc.
Dba USA SHADE & Fabric Structures
2580 Esters Blvd, Suite 100
DFW Airport, TX 75261
Contact Name: Michelle Botha – Phone: 512-937-6430
mbotha@usa-shade.com

- B. To qualify as an approved equivalent, please submit product documentation, fabric samples and all quality assurance criteria as per Section 1.4 at least 10 days prior to bid date. Approved equals will be issued per addendum prior to bid date.
- C. The shade structure shall conform to the current adopted version of the IBC 2015 and local agency additions and amendments.
- D. All shade structures are engineered and designed to meet a minimum of 115 mph wind load, Exposure C, live load of 5 lbs/sf² and a 5 lbs/sf² snow load. When ASD Steel Design Method is used based on IBC 2015 Section 1605.3.1, the Dead + 0.75 of Live + 0.75 of Wind Load cases must be combined. NO EXCEPTIONS.
- E. Steel:
 - 1. All steel members of the shade structure shall be designed in strict accordance with the requirements of the "American Institute of Steel Construction" (AISC) Specifications and the "American Iron and Steel Institute" (AISI) Specifications for Cold Formed Members and manufactured in a IAS (International Accreditation Service) accredited facility for Structural Steel Fabrication as per IBC 2015 Section 1704.2.2.
 - 2. All connections shall have a maximum internal sleeving tolerance of .0625 inches using high tensile strength steel sections with a minimum sleeve length of 6 inches.
 - 3. All non-hollow structural steel members shall comply with ASTM A-36. All hollow structural steel members shall be cold formed, high strength steel and comply with ASTM A-500, Grade C. All steel plates shall comply with ASTM A-572, Grade 50. All galvanized steel tubing shall be triple coated for rust protection using an in-line electro-plating coat process. All galvanized steel tubing shall be internally coated with zinc and organic coatings to prevent corrosion.
- F. Welding:
 - 1. All shop-welded connections of the shade structure shall be designed and performed in strict accordance with the requirements of the "American Welding Society" (AWS) Specifications. Structural welds shall be made in compliance with the requirements of the "Prequalified" welded joints where applicable and by certified welders. No onsite or field welding shall be permitted.
 - 2. All full penetration welds shall be continuously inspected by an independent inspection agency and shall be tested to the requirement of IBC 2015 and local agency additions and amendments.
- G. Powder Coating:
 - 1. Galvanized steel tubing preparation prior to powder coating shall be executed in accordance to solvent cleaning SSPC-SP1. Solvent such as water, mineral spirits, xylol, toluol, which are to be used to remove foreign matter from the surface. A mechanical method prior to solvent cleaning prior to surface preparation shall be executed according to Power Tool Cleaning SSPC-SP3 and utilizing wire brushed abrasive wheels and needle gun, etc.
 - 2. Carbon structural steel tubing preparation prior to powder coating shall be executed in accordance to commercial blast cleaning SSPC-SP6 or NACE #3. A commercial blast cleaned surface, when viewed without magnification, shall be free of all visible oil, grease, dirt, mill scale, rust, coating, oxides, corrosion, products and other foreign material.
 - 3. Powder coating shall be sufficiently applied, with a minimum three mils thickness and cured at the recommended temperature to provide proper adhesion and stability to meet salt spray and adhesion tests as defined by the American Society of Testing Materials.
 - 4. Powder used in the powder coat process shall have the following characteristics:
 - a. Specific Gravity: 1.77 +/- 0.05 g/cm³
 - b. Coverage at 1.0 mils: 109sq.ft/lb/mil
 - c. Storage: 80° F
 - d. Interpron 800 HR is a series of high durability TGIC powder coatings designed for exterior exposure. Tested against the most severe specifications, Interpron

800 HR gives significantly improved gloss retention and resistance to color change.

- e. Rust Protection Powder Under Coat Primer will be required on all structures. POWDURA® Epoxy Powder Coating Z.R. Primer shall be applied in accordance with the manufacturers' specifications. Primer should be fused only and then top coated with the selected powder coat to ensure proper intercoat adhesion.

- H. Tension Cable: Steel cable is determined based on calculated engineering loads.
 - 1. For light and medium loads, 1/4" (nominal) galvanized 7 x 19 strand cable to be used.
 - 2. For heavy loads, 3/8" (nominal) galvanized 7 x 19 cable to be used.
- I. Fabric Roof Systems
 - 1. UV shade fabric is made of UV stabilized Shadesure® cloth as manufactured by MultiKnit Ltd and made of a UV stabilized high-density polyethylene mesh. Mesh shall be raschel knitted with monofilament and tape yarn filler to ensure that material will not unravel if cut. Panels to be 10ft. wide.
 - 2. Fabric Properties:
 - a. Life Expectancy: A minimum of 8 years continuous exposure to the sun
 - b. Fading: Minimum fading after 5 years (3 years for red)
 - c. Fabric Mass: 2.43-2.58 oz/sqft (190-200g/sm)
 - d. Fabric Width: 9.8425 (3m)
 - e. Roll Length: 164.04 (50m)
 - f. Roll Dimensions: 62.99"x16.5354" (160 cm x 42 cm)
 - g. Roll Weight: +/- 66 lbs (+/-30 kg)
 - h. Minimum Temperature: -13°F (-25° C)
 - i. Maximum Temperature: +176°F (80° C)
 - 3. Stitching & Thread:
 - a. All sewing threads are to be double stitched.
 - b. Thread shall be GORE Tenara Sewing Thread manufactured from 100% expanded PTFE (Teflon); mildew resistant exterior approved thread. Thread shall hold a 10-year warranty. Thread shall meet or exceed the following:
 - 1) Flexible temperature range
 - 2) Very low shrinkage factor
 - 3) Extremely high strength, durable in outdoor climates
 - 4) Resists flex and abrasion of fabric
 - 5) Unaffected by cleaning agents; acid rain, mildew, salt water and rot resistant, unaffected by most industrial pollutants
 - 6) Treated for prolonged exposure to the sun

2.2 SHIPPING AND HANDLING

- A. All steel surfaces touched by tie down straps are to be padded before final clinching. This can be accomplished by using carpet pads or factory manufactured padding.
- B. All dunnage must be padded before painted products are set in place. Smaller and loose pieces must be padded and totally separate from paint padding.
- C. Unloading: Lift forks to be covered with padding. All dunnage must be padded vertically and horizontally to prevent damage to painted surfaces. When unloading, take care to prevent tools and other hard surface items from making contact.

PART 3 EXECUTION

3.1 INSTALLATION

- A. Installation of shade structures shall be performed by manufacturer or manufacturer-approved contractor, which shall be bonded and holding a current contractor's license with the State of Texas Contractors State License Board. All installation personnel must have proven experience in the erection of tensioned fabric structures.
- B. The contractor installing the structure shall comply with manufactures instructions for assembly, installation, and erection per approved drawings.
- C. Concrete:
 - 1. Unless noted otherwise for footing and piers by General Contractor's Engineer, concrete specification for footings, piers, slabs, curbs and walkways shall meet a minimum 2,500 psi at 28-day strength.
 - 2. Concrete and foundations are to be inspected by independent 3rd Party Inspection Company on site with 30-day break test to follow in order to provide necessary documentation for permit close out with the City.
 - 3. Concrete work is executed in strict accordance with the latest American Concrete Institute Building Code (ACI 318-99).
 - 4. Slump 4" maximum.
 - 5. Whenever daily ambient temperatures are below 80 degrees Fahrenheit, the contractor may have mix accelerators and hot water added at the batch plant.
 - a. Temperature range between 75-80 degrees, 1% accelerator High Early (non-calcium)
 - b. Temperature range between 70-75 degrees, 2% accelerator High Early (non-calcium)
 - c. Temperature range below 70 degrees, 3% accelerator High Early (non-calcium)
 - 6. The contractor shall not pour any concrete when daily ambient temperature is below 55 degrees Fahrenheit.

Temperature Range	% Accelerator	Type Accelerator
75-80 degrees	1%	High Early (non-calcium)
70-75 degrees	2%	High Early (non-calcium)
Below 70 degrees	3%	High Early (non-calcium)

- D. Foundations:
 - 1. All Anchor Bolts set in new concrete shall be ASTM F-1554 GR 55
 - 2. All Anchor Bolts shall be Hot Dipped Galvanized
 - 3. Pier Footings
Structure 1 - Minimum footing size shall be 24" diameter x 9' depth and placed in accordance with/ and conform to manufacturers engineered specifications and drawings.

END OF SECTION 13 31 23

SECTION 21 00 01 – BASIC FIRE PROTECTION REQUIREMENTS

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Basic Fire Protection Requirements specifically applicable to Division 21 sections, in addition to Division 1 - General Requirements.

1.02 REFERENCES

- A. All references in Division 21 to codes, standards or other publications shall be the latest edition / version, unless noted otherwise.
- B. International Fire Code
- C. NFPA 13 – Standard for the Installation of Sprinkler Systems.
- D. NFPA 24 – Standard for the Installation of Private Fire Service Mains and Their Appurtenances.
- E. NFPA 25 – Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems.
- F. NFPA 70 – National Electrical Code.
- G. NFPA 72 – Fire Alarm and Signaling Code.
- H. NFPA 101 – Life Safety Code
- I. NFPA 241 – Standard for Safeguarding Construction, Alteration, and Demolition Operations.
- J. UL – Fire Equipment Directory.
- K. UL 199 – Automatic Sprinklers.

1.03 PLANS

- A. These specifications are accompanied by plans indicating typical layouts, pipe and equipment location, etc. The plans and these specifications are complimentary each to the other and what is called for by one shall be as binding as if called for by both. Should there be a conflict between Drawings and specifications regarding a material shown of work described or detailed then the material of work having the greater value shall be provided.
- B. The plans as prepared are in general diagrammatic. The Contractor shall carefully lay out his work at the site to conform to the architectural, mechanical, electrical and structural conditions to provide grading of piping, to avoid all obstructions and to conform to details of installation as shown on the plans and supplied by the manufacturers of the equipment to be installed, and thereby to provide an integrated satisfactorily operating installation. **The General Contractor must coordinate the work of all trades.** All necessary offsets in piping, fittings, ductwork, etc. required to avoid interferences between piping, equipment, structural and architectural work are not shown but shall be furnished and installed by the contractor without additional expense to the Owner.

- C. This project contains several different type of ceiling finishes, ceiling heights, elevation changes, high volumes, etc. The contractor shall coordinate all pipe routing to keep piping concealed above ceilings wherever possible. Where fire protection piping will be exposed in spaces with no ceilings, the piping shall be routed as high and close to structure as possible. The exact routing and location of exposed piping shall be reviewed by and acceptable to the Architect and Engineer. Exposed elevation change is not acceptable and shall be subject to removal, at the contractor's expense, unless coordinated with the A/E. The contractor shall carefully coordinate pipe routing and sprinkler head locations with all trades.
- D. These specifications and plans accompanying same are intended to cover systems which will not interfere with the design of the building, which will fit into the available spaces, and which will insure complete and satisfactory systems. Each contractor shall, therefore, carefully examine the plans and the building and shall be responsible for the proper fitting of his material and apparatus into the building.
- E. Contractor's attention is directed that all equipment he proposes to furnish shall fit into the spaces allocated for same on the plans. It shall be the Contractor's responsibility to furnish data to evidence that sufficient space can be provided for the installation of proposed equipment and that adequate access will exist for servicing and maintenance of equipment. Should changes become necessary during construction, the contractor shall make such necessary changes at his (the Contractor's) own expense.
- F. Exceptions and inconsistencies in plans and specifications shall be brought to the Architect's attention no later than five (5) days prior to the bid date. Otherwise, the Contractor shall be responsible for any and all changes and additions that may be necessary to accommodate his particular apparatus or equipment.

1.04 CHANGES

- A. Any changes from the plans necessary to make this work conform to the building as it is constructed, to make this work fit the work of other trades or to make this work conform to the rules of city and municipal bodies having jurisdiction shall be made by this contractor at no additional cost to the Owner. However, no changes shall be made from the work described on the plans and these specifications except on written order from the Architect.
- B. If any changes are required other than those mentioned above and the changes involve extra work on the part of the contractor, no charges for this extra work shall be allowed unless authorized in advance of the work by a written order from the Owner and/or Architect stating the charges to be made for the work.
- C. Proposed use of item or equipment other than that specified or indicated may require redesign of structure, partitions, foundations, piping, wiring, or other parts of mechanical, electrical, or architectural layout. Redesign, new drawings, and detailing required shall be prepared and submitted to Architect/Engineer for approval.
- D. Where approved deviation requires different quantity, size and arrangement of wiring, conduit, equipment, etc. from that specified or indicated, provide such items and all other additional equipment required by system at not additional cost to the Owner.

1.05 DELIVERY, STORAGE AND HANDLING

A. Protection:

1. All work, equipment and materials shall be protected at all times to prevent damage or breakage either in transit, storage, installation or testing. All openings shall be closed with caps or plugs during installation.
2. Equipment and material placed on the job site shall remain in the custody of the Contractor until phased acceptance, whether or not the owner has reimbursed the Contractor for the equipment and material. The Contractor is solely responsible for the protection of such equipment and material against any damage.
3. Damaged equipment or material shall be replaced with new as determined and directed by the Architect or Engineer. In particular, piping insulation which becomes saturated will be rejected and must be removed from the job site. Such repair or replacement shall be at no additional cost to the Owner.
4. Protect interiors of new equipment and piping systems against entry of foreign matter. Clean both inside and outside before painting or placing equipment in operation.
5. Existing equipment and piping being worked on by the Contractor shall be under the custody and responsibility of the Contractor and shall be protected as required for new work.

B. Cleanliness of Piping and Equipment Systems:

1. Exercise care in storage and handling of equipment and piping material to be incorporated in the work. Remove debris arising from cutting, threading and welding of piping.
2. Piping systems shall be flushed, blown or pigged as necessary to deliver clean systems.
3. Clean interior of all tanks prior to delivery for beneficial use by the Owner.
4. Contractor shall be fully responsible for all costs, damage, and delay arising from failure to provide clean systems.

1.06 SUBSTITUTIONS

- A. The materials, products and equipment described and specified establish a standard of quality, function, dimension and appearance to be met by any proposed substitutions.
- B. Reference Section 01 60 00 – Product Requirements.

1.07 SUBMITTALS

- A. Submit under provisions of Section 01 33 00.
- B. The Contractor shall furnish copies of the manufacturer's literature and Drawings describing all proposed equipment and materials indicated in the specifications. The proposed use of the exact equipment and materials specified shall not change this

requirement of including literature describing the proposed equipment. Manufactured items proposed for use, whether specified or proposed for substitution, shall be the current, catalogued product of the manufacturer, and replacement parts shall be available.

- C. Manufacturer's regular catalog sheets will not be acceptable under this requirement unless they indicate completely all of the specification requirements and submittal page labeling criteria stated above. Where drawings cover several sizes or types of construction, they shall clearly indicate the size or type of construction to be used on the project. In cases where several sizes of the same type of equipment are required to be furnished, the submittal shall include a schedule identifying each piece of equipment, complete with all capacity information needed to compare every submitted item with its respective specified item.
- D. Brochures shall contain a certification that the equipment or materials are suitable for conditions shown and specified; that the equipment or materials are believed to be in conformity with the plans and specifications, except as may be specifically described and that approval is recommended. The certification shall be signed by the Contractor. Brochures received not in conformity with these requirements will be returned for required actions. Any deviation from the requirements of the specifications shall be clearly noted and marked for the Engineer's consideration.
- E. Approval of the brochures, or any part of the contents therein, shall not eliminate responsibility for compliance with the plans and specifications, unless specific attention has been called in writing to proposed deviations at the time of transmittal of the brochures and such deviations have been approved, nor shall it eliminate the requirements or the responsibilities, if there are errors of any sort in the data submitted.
- F. Detailed coordination drawings showing proposed fire protection piping layout as well as HVAC ducts and diffusers, HVAC piping, plumbing piping, electrical conduit, light fixtures and other ceiling elements must be submitted for approval prior to proceeding with any installation.
- G. Contractor shall submit a copy of all permits and all inspection results from local authorities as well as result dates and notes from all test performed on the fire protection systems.

1.08 INTERFERENCES AND COOPERATION

- A. The plans are generally diagrammatic and the Contractor shall coordinate the work of the different trades so that interferences between piping, equipment, structural and architectural work will be avoided. Not all offsets in piping, ductwork, etc., are shown. The Contractor shall cooperate with the General Contractor and all other contractors to coordinate their work to avoid interferences and delays and arrange all parts of the work to harmonize in service and appearance with all other parts.
- B. The General Contractor shall coordinate the work of all trades. The various systems to be installed shall follow the normal, common sense priority of systems installation with the highest system to lowest system installation as follows:
 - 1. HVAC ductwork shall be installed up and against building (floor/roof) structural members.

2. Sanitary waste and storm drainage piping system shall begin horizontal routing as high as possible between structural members.
 3. Electrical conduit shall be installed up, and against building structure, running parallel with HVAC ductwork and offsetting up into structural bay (void) or below HVAC ductwork to obtain a change in direction or branch take-off.
 4. Domestic hot and cold water supply and hot water circulating return piping, and medical gas piping shall be installed beside and below the HVAC ductwork and electrical conduit.
 5. Fire sprinkler piping system shall be installed below all other systems and components. The fire sprinkler piping shall not conflict with the installation or removal of ceiling system components or tile. The fire sprinkler system piping layout and installation shall be coordinated by the fire sprinkler contractor and the General Contractor with all other trades performing work in the affected area, to avoid conflict with the installation or removal of any other systems components, or to prevent ready access to valves, equipment of the other trades. Do not install sprinkler piping until ductwork mains are in place.
- C. Provide an overhead coordination submittal per Section 01 30 00. The submittal shall include all structural, plumbing, mechanical, electrical, and fire protection components.

1.09 MATERIALS AND WORKMANSHIP

- A. All materials shall be new, of the quality specified and free of any defects. Manufacturer's names are listed to establish a standard of quality and construction.
- B. The Contractor will be responsible for transportation of his materials to the job and for their storage and protection until the final acceptance of the job.
- C. Contractor shall furnish all necessary scaffolding, tackle, tools and appurtenances of all kinds and all labor required for the safe and expeditious execution of his contract.

1.10 PERMITS AND INSPECTIONS

- A. The Contractor will be responsible for all permits and inspections required by law for the completion of his work. Cost of all permits and inspections shall be paid for by the Contractor. The Contractor shall obtain and pay for all certificates of approval which must be delivered to the Architect before final acceptance of the job. All materials and labor furnished by the Contractor shall be in strict accordance with the rules and requirements of the National Board of Fire Underwriters, state and municipal regulations and other authorities who may have lawful jurisdiction over the work being done. One (1) copy of all permits obtained under this contract and all inspections performed and/or certificates of acceptances, approval or beneficial occupancy received for this work, shall be forwarded to the Engineer.
- B. Each contractor shall be responsible for coordinating their work with the General Contractor and scheduling progress inspections through the General Contractor to allow for the following inspections to be performed without impeding the progress of construction. Generally, the Contractor shall plan for inspections to occur two (2) weeks prior to the scheduled concealment of work in the area of inspection.

1.11 EXAMINATION OF SITE

- A. All Contractors submitting proposals for this work shall first examine the site and all conditions thereon and therein. All proposals shall take into consideration conditions as may affect the work under this contract. They shall satisfy themselves as to existing grades and the actual formation, and soil conditions.
- B. Contractors shall verify all service locations, depths, sizes, etc. No information given on the plans shall relieve the Contractor of this responsibility.
- C. Before starting work, the Contractor shall verify all associated existing systems, pipe sizes, locations, and dimensions so that the new systems can be properly connected as indicated on the documents.

1.12 QUALITY ASSURANCE

- A. Perform Work in accordance with the codes listed on the drawings, the local authority having jurisdiction, the Owner's Insurance carrier and the Architect/Engineer. As the minimum standard for the level of quality, in all cases the greater quantity or better quality shall be the first consideration for the basis of an acceptable product or process. The local authority having jurisdiction, the Architect and the Engineer shall have the final authority on the approval and/or use of any product or process specified or submitted for substitution. The greater quality and/or value specified herein for the system(s) and various components and installation procedures shall take precedence over the minimum requirements of the herein before mentioned codes or that of NFPA 13, NFPA 14 or NFPA 24 in all instances.
- B. Equipment and Components: Bear UL and FM label or marking.
- C. Welding Materials and Procedures: Perform to ASME Code.
- D. Valves: Bear UL/FM label or marking. Provide manufacturer's name and pressure rating marked on valve body.
- E. Piping: All piping installed on this project shall bear the complete ASTM and Manufacturer's marking. Labeling and identification requirements as required by ASTM. All installed piping 3'-0" or greater in length shall be readily identifiable per ASTM labeling criteria. Piping not bearing this identification upon installation shall be removed and replaced by the correctly labeled piping. Piping shall not be re-stenciled after it is installed, to meet this requirement.

1.13 ARRANGEMENT AND INSTALLATION OF EQUIPMENT AND PIPING

- A. Coordinate location of piping, sleeves, inserts, hangers and equipment. Locate piping, sleeves, inserts, hangers and equipment clear of windows, doors, openings, light outlets, ductwork and other services and utilities. Prepare equipment layout drawings to coordinate proper location and personnel access of all facilities. Follow manufacturer's published recommendations for installation methods not otherwise specified.
- B. Operating Personnel Access and Observation Provisions: Select and arrange all equipment and systems to provide clear view and easy access, without use of portable ladders, for maintenance and operation of all devices including, but not limited to: all equipment items and valves. All gages and indicators shall be clearly visible by personnel

standing on the floor or on permanent platforms. Do not reduce or change maintenance and operating space and access provisions that are shown on the drawings.

- C. Equipment and Piping Support: Coordinate structural systems necessary for pipe and equipment support with pipe and equipment locations to permit proper installation.
- D. Location of pipe sleeves, trenches and chases shall be accurately coordinated with equipment and piping locations.
- E. Minor Piping: Generally, small diameter pipe runs from drips and drains and other services are not shown but must be provided.
- F. Install gages, valves and other devices with due regard for ease in reading or operating and maintaining said devices. Locate and position gages to be easily read by operator or staff standing on floor or walkway provided. Servicing shall not require dismantling adjacent equipment or pipe work.
- G. Work in Existing Building: Cut required openings through existing masonry and reinforced concrete using diamond core drills. Use of pneumatic hammer type drills, impact type electric drills, and hand or manual hammer type drills, will be permitted only with approval of the Owner. Locate openings that will least effect structural slabs, columns, ribs or beams. Refer to Cutting and Patching article in Part 3 of this section.

1.14 UNIONS

- A. No unions are to be placed in any pipe in a location which will be concealed or inaccessible after completion of the building unless furnished with an access panel either as shown on the Drawings or as specified herein. Unions must be installed on each side of all pieces of equipment such as heating units, pumps, etc., so that such equipment may be readily disconnected.

1.15 TEMPORARY PIPING AND EQUIPMENT

- A. The Contractor shall provide all required facilities in accordance with the requirements of phased construction and maintenance of service. All piping and equipment shall be properly supported, sloped to drain, operate without excessive stress, and shall be insulated where injury can occur to personnel by contact with operating facilities.
- B. When construction is complete, temporary facilities and piping shall be completely removed back to the nearest active distribution branch or main pipe line and any openings in structures sealed. Dead legs in potable water systems will not be allowed. Provide necessary blind flanges and caps to seal open piping remaining in service.

1.16 FIRE ALARM INTERFACE

- A. Ensure that all required fire protection system alarm devices are installed and connected as required to the fire alarm system; including but not limited to: flow switches, tamper switches and alarm notifications.

1.17 UTILITIES

- A. The Contractor shall arrange and pay for any necessary revisions to existing utility services, including meter deposits and connection fees to all serving utility companies and shall install utilities, where applicable.

1.18 INDOOR AIR QUALITY CONTROL:

- A. All Adhesives, sealants, paints, coatings applied within the weatherproofed interior of the building shall comply with applicable VOC thresholds of SCAQMD 1113 and 1168.

PART 2 PRODUCTS

2.01 FACTORY-ASSEMBLED PRODUCTS

- A. Provide maximum standardization of components to reduce spare part requirements.
- B. Manufacturers of equipment assemblies that include components made by others shall assume complete responsibility for final assembled unit.
 - 1. All components of an assembled unit need not be products of same manufacturer.
 - 2. Constituent parts that are alike shall be products of a single manufacturer.
 - 3. Components shall be compatible with each other and with the total assembly for intended service.
 - 4. Contractor shall guarantee performance of assemblies of components and shall repair or replace elements of the assemblies as required to deliver specified performance of the complete assembly.
- C. Components of equipment shall bear manufacturer's name and trademark, model number, serial number and performance data on a name plate securely affixed in a conspicuous place, or cast integral with, stamped or otherwise permanently marked upon the components of the equipment.
- D. Major items of equipment, which serve the same function, must be the same make and model. Exceptions will be permitted if performance requirements cannot be met.

2.02 COMPATIBILITY OF RELATED EQUIPMENT

- A. Equipment and materials installed shall be compatible in all respects with other items being furnished and with existing items so that the result will be a complete and fully operational system that conforms to contract requirements.

2.03 ESCUTCHEONS AND PLATES

- A. Where pipes pass through ceilings or walls in finished spaces, install sectional plates or escutcheons to cover the annular opening between pipe and sleeve. Solid plates with set screws shall be used where the sectional plates will not stay in place or are not available in the required size, or where other individual specification section(s) require one piece or greater quality escutcheons or plates.

- B. The annulus between pipe and walls or floors, shall be filled with Sonolastic NP unless fire wall or barrier then the approved UL listed fire assembly shall be used.
- C. Inside diameter of escutcheons shall fit around insulation and around pipe when not insulated; outside diameter shall cover sleeve. Secure escutcheons or plates to pipe or sleeve but not to insulation. All escutcheons shall be triple nickel-chromium plated brass, or Type 316L stainless steel.

2.04 INSULATION

- A. All insulation materials used inside the building on this project, including finishes and adhesives on the exterior surfaces of ducts, pipes and equipment shall have a flame spread rating of 25 or less and a smoke developed rating of 50 or less as determined by an independent testing laboratory in accordance with NFPA 255 as required by NFPA 90A, unless noted otherwise acceptable.

2.05 ASBESTOS

- A. Materials containing asbestos are not permitted.
- B. If any asbestos-containing material is discovered or suspected, the contractor shall immediately cease any and all work in that area. Cover the exposed material in plastic containment without disturbing the exposed material and notify the Architect and the Owner's representative.
- C. Certify in writing that neither the Contractor nor any of Contractor's subcontractors or suppliers will supply any materials that contain any asbestos in any form for this Project.

PART 3 EXECUTION

3.01 ACCESS PANELS

- A. All valves, drains, gauges, etc., must be accessible. The Contractor shall, wherever required to service his installation, coordinate size and location of access panels with General Contractor. Refer to Section 08 31 13 – Access Doors and Frames.

3.02 FIRESTOPPING

- A. Firestopping: Unused slots, sleeves and other penetrations in floors, walls or other general construction shall be closed and sealed with an approved firestopping material.
 - 1. Reference Section 07 84 00 – Firestopping for appropriate firestopping material required for each wall rating and penetration size and type.
 - 2. Floor slots and openings shall be closed with 16-gauge galvanized steel sheet supported on 1-inch by 1-inch by 1/8-inch structural angle drilled or supported with powder-driven studs into the building structure. Firestop with a layer of silicone elastomer not less than 1-inch thick which completely fills the opening. The top surface of the silicone elastomer shall be approximately 1 inch below the finished floor slab.
 - 3. Openings in walls shall be closed with 16-gauge galvanized steel sheet securely

attached at the midpoint of the wall thickness and firestopped on both sides of the steel sheet with not less than 1/8-inch thick layer of non-sagging silicone elastomer to fully cover the opening.

4. Single or multiple pipes passing through walls and floors shall have the annular space between pipes or between pipes and structure filled with silicone elastomer to provide a 3-hour rated firestop for floors and walls.
- B. The annulus between exposed pipe and walls or floors, in finished spaces shall be refilled, sealed and painted to match adjacent surfaces.

3.03 PAINTING

- A. Paint all exposed fire sprinkler pipe. Paint color shall be submitted and acceptable to the Architect and Engineer. Where the color is other than Red; then the pipe shall also be labeled.
- B. Surfaces to be painted and types of paint shall be as specified in the Architectural specifications. Refer to Section 09 90 00.
- C. All surfaces to be painted shall be thoroughly cleaned, all rust scraped off and all oil and grease removed before any paint is applied.
- D. Under no conditions shall paint be applied to sprinkler heads, escutcheons, or covers. If paint is so applied, replacement of the affected parts shall be required.
- E. Finishing paint coats shall not be applied until all the plastering or other structural building work is completed. Cloths shall be spread where necessary to prevent drops of paint, oil, etc. from defacing walls, floors, etc., and the Contractor shall be held responsible for all damage by neglect of such precautions. The finished conditions of the painting shall be subject to the approval of the Architect, who may require retouching or repainting of surfaces not properly finished.

3.04 CLOSE OUT DOCUMENTATION AND TESTING REPORTS

- A. Contractor shall provide Project Record Documents, Operation and Maintenance data and all product warranty data as specified in Section 01 70 00.
- B. Contractor shall provide copies of all fire protection system tests and certification reports for inclusion in project close out documents. Reports shall include, but shall not be limited to, the following:
1. Acceptance testing for various fire protection systems, as required by appropriate NFPA standard.
 2. Contractor's Material and Test Certificates.
 3. Final approval documentation from local Fire Department.
 4. Backflow prevention assembly certifications.
- C. Contractor shall provide As-Built Fire Protection Drawings, as hard copies and/or electronic format as required by Owner.

Del Valle Health and Wellness Center

Project No. 2070.00

Basic Fire Protection Requirements
Section 21 00 01.11 of 11

END OF SECTION

SECTION 21 05 00 – COMMON WORK RESULTS FOR FIRE SUPPRESSION

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Pipe, fittings and valves for fire suppression systems.
- B. Fire department connections.
- C. Piping specialties for fire suppression systems

1.02 RELATED SECTIONS

- A. Section 09 90 00 – Painting: Preparation and painting of fire protection piping systems.
- B. Section 21 00 01 - Basic Fire protection Requirements
- C. Section 21 05 53 – Fire Protection Identification.
- D. Section 21 13 13 – Wet Pipe Sprinkler Systems.
- E. Section 26 05 03 – Equipment Wiring Systems.
- F. Section 28 31 00 – Fire Detection and Alarm.

1.03 REFERENCES

- A. ASME Boiler and Pressure Vessel Code Section IX – Welding and Brazing Qualifications.
- B. ASME B16.1 – Cast Iron Pipe Flanges and Flanged Fittings, Class 25, 125, 250 and 800.
- C. ASME B16.3 – Malleable Iron Threaded Fittings, Class 150 and 300.
- D. ASME B16.4 – Cast Iron Threaded Fittings, Class 125 and 250.

1.04 SUBMITTALS FOR REVIEW

- A. Submit under provisions of Section 01 33 00 and Section 21 00 01.

- B. General: All new applications, all rework applications and all modifications to existing systems shall be submitted for approval as described herein.
- C. At start of project, perform current fire flow tests or secure current water pressure/flow capacity data from water utility. Do not rely on previous data or reports unless such were prepared with the site/city utilities being unchanged from current conditions and unless data was obtained within 6 months prior to system design.
- D. Product Data: Provide data on sprinkler heads, piping materials, joining methods, supports, valves, flow switches, tamper switches and all other components and accessories intended to be installed. Include manufacturers' catalog information, Code and Standards compliance, performance ratings, rough-in details, weights, finishes, support and connection requirements.
- E. Coordination Drawings: Submit piping and sprinkler head Layout Drawings that have been fully coordinated with other disciplines to avoid space conflicts. Prepare these Coordination Drawings prior to submittal of fire suppression Drawings for Fire Department approval.
- F. Shop Drawings:
 - 1. Submit detailed and accurate Shop Drawings electronically of entire systems prior to fabrication. Indicate pipe materials used, jointing methods, supports, floor and wall penetration seals. Indicate system controls, hydraulic reference points, detailed pipe layout, valves, hangers and supports, components and accessories.
 - 2. Hydraulic calculations: Submit flow test results and comprehensive hydraulic data sheets complying with NFPA 13.
 - 3. Where expanding existing systems, the submitted design drawings shall show a sufficient amount of the existing system as required, the minimum shall show back to cross main or feed main to clearly identifying how the new work connects to the existing system.
- G. Design Data: Submit Shop Drawings and design calculations signed and sealed by professional engineer, licensed by the State of Texas or a Responsible Managing Employee (RME), as defined in the Texas Insurance Code, Article 5.43-3§1C10, licensed by the State of Texas Fire Marshal Office for the fire protection system installed.
- H. Design (e.g. hydraulic calculations) shall include a minimum "safety factor" of 10% of the hydrant flow test static pressure or 10 psig (whichever is greater) to account for future variations in water supply pressure, deterioration of piping system and future renovations to system. Hydraulic calculations shall show inclusion of this "safety factor."
- I. Fire Suppression Submittals:
 - 1. Submit Drawings for approval by local Fire Department and Owner's insurance carrier after acceptance of Coordination Drawings by Owner and Engineer.
 - 2. Submit Drawings and calculations approved by local Fire Department for final approval by Owner and Engineer.

1.05 SUBMITTALS AT PROJECT CLOSEOUT

- A. Submit under provisions of Section 01 70 00 – Execution and Closeout Requirements.
- B. Project Record Documents: Record actual locations of sprinklers and all deviations of piping from approved shop drawings. Indicate sizes and types of sprinkler heads, all valve, drain and test locations and all system equipment or other components. Provide electronic copies of all system record documents and final hydraulic calculations.
- C. System Acceptance Forms: Provide appropriate Contractor's Material and Test Certificate(s), completed and signed, as required by Chapter 25 of NFPA 13.
- D. Provide certification of compliance from local authority having jurisdiction indicating approval of system acceptance test(s).
- E. System Certification: For any project subject to the Hospital Licensing Rules of the Texas State Department of Health Services, the Contractor shall provide a copy of a letter or certification from a professional engineer (P.E.) licensed in the State of Texas and experienced in fire sprinkler system installations, indicating that the fire sprinkler working plans, hydraulic calculations, system testing and field inspection of the new or modified sprinkler system is in compliance with the requirements of NFPA 13, Standard for the Installation of Sprinkler Systems.
- F. Provide test certifications form any Backflow Prevention Assemblies.
- G. Operation and Maintenance Data: Include components of system, servicing requirements, record drawings, inspection data, replacement part numbers and availability, and location and numbers of service depot. Provide a preventative maintenance schedule for all applicable equipment and systems. Also include a copy of NFPA 25 for the Owner's reference.
 - 1. This Project and the fulfillment of the Contractor's responsibilities will not be considered for "Substantial Completion" until the Owner's Operation and Maintenance Manuals (and, if required, the corrected copies) have been submitted to and approved by the Engineer; and, in turn submitted to the Owner; and, the Owner's facilities personnel have received the required instructional period on the operation and maintenance of the installed systems and equipment.
- H. Warranty: Submit manufacturer warranty and ensure forms have been completed in Owner's name and registered with manufacturer.
- I. Provide a final acceptance letter from the Owner's insurance provider.

1.06 QUALITY ASSURANCE

- A. Sprinkler and Standpipe Systems: Perform work to the International Building Code, NFPA 13 and 14 as modified herein, the local authority having jurisdiction, and the Architect/Engineer, and the requirements of the owner's insurance carrier. The greater quality and/or value specified herein for the system(s) and various components and installation procedures shall take precedence over the minimum requirements of NFPA, in all instances.
- B. Sprinkler Shop Drawings and hydraulic calculations are to be sealed by a Professional Engineer, knowledgeable in fire protection engineering or a Responsible Managing Employee (RME) licensed by the State of Texas Fire Marshal Office, before submitting

for review.

- C. Welding Materials and Procedures: Perform to ASME Code.
- D. Valves: Bear UL/FM label or marking. Provide manufacturer's name and pressure rating marked on valve body.
- E. Piping: All piping installed on this project shall bear the complete ASTM and manufacturer marking, labeling and identification requirements as required by ASTM. All installed piping 3'-0" or greater in length shall be readily identifiable per ASTM labeling criteria. Piping not bearing this identification upon installation shall be removed and replaced by the correctly labeled piping. Piping shall not be re-stenciled after it is installed to meet these criteria. Maintain one copy of each document on site.
- F. The system shall conform to applicable requirements of the Texas Administrative Code Title 28, Chapter 34.

1.07 REGULATORY REQUIREMENTS

- A. Sprinkler Systems: Conform work to NFPA 13.
- B. Service Mains: Conform to NFPA 24.
- C. Installation, identification and Testing: Conform to NFPA 25.
- D. FM Global standards and guidelines.
- E. Welding Materials and Procedures: Conform to ASME Code AWS D10.9.
- F. Valves: Bear UL FM label or marking. Provide manufacturer's name and pressure rating marked on valve body. UL or FM approved for fire protection service.
- G. Products Requiring Electrical Connection: Listed and classified as suitable for the purpose specified and indicated.
- H. Texas Administrative Code, Title 28, Chapter 34.

1.08 DELIVERY, STORAGE AND HANDLING

- A. Deliver, store, protect and handle products to site under provisions of Section 01 60 00.
- B. Deliver and store valves in shipping containers, with labeling in place. Provide temporary protective coating on cast iron and steel valves. Provide temporary end caps and closures on piping and fittings. Maintain in place until installation.
- C. Piping and piping systems shall not be allowed to be exposed to exterior weather or elements. Piping, fittings and valves stored outside shall be covered at all times and shall be stored on pallets or rack systems, above ground. Piping, fittings and valves stored inside shall be stored on pallets or racks and shall not be allowed to be strewn around the construction area. Cleanliness of the work area and safety of the construction personnel shall be the first consideration.

1.09 EXTRA MATERIALS

- A. Section 01 70 00 – Contract Closeout.

- B. Provide one valve stem packing for each size and type of valve installed.

PART 2 PRODUCTS

2.01 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.
- B. All piping, materials and equipment used in the installation of sprinkler and standpipe systems shall be new and listed as approved by the Underwriters' Laboratories, Inc., List of Inspected Fire Protection Equipment and Materials and the Factory Mutual Testing Laboratories List of Approved Equipment, Fire Protection Devices and Devices Involving Fire Hazard and shall be the latest design of the manufacturer.
- C. Pressure ratings of pipe, fittings, valves, gauges and all other water carrying appurtenances shall be suitable for the designed system pressures in which they are installed.
- D. The installing Contractor shall identify piping, fire department connections, valves and hydraulic design information in accordance with applicable NFPA Standards.

2.02 BELOW GRADE PIPING

- A. General: All materials shall comply with applicable NFPA, ASTM, AWWA, UL and FM standards. All valves shall be UL listed and FM approved for the fire protection service.
- B. Below-grade piping shall be one of the following:
 - 1. AWWA C151 cement mortar lined ductile iron water pipe with restrained push-on joints. All iron pipe, fittings and accessories shall be wrapped with standard 8 mil (minimum) low density polyethylene film or 4-mil (minimum) cross laminated high-density polyethylene conforming to AWWA C-105.
 - a. Push-on joints shall be in accordance with ANSI/ AWWA C111/A21.11 "Rubber-Gasket Joints for Ductile-Iron Pipe and Fittings." Restrained joint fittings and the restraining components shall be ductile iron in accordance with applicable requirements of ANSI/AWWA C110/A21.10 and/or C153/A21.53 with the exception of the manufacturer's proprietary design dimensions. Push-on joints for such fittings shall be in accordance with ANSI/AWWA C111/A21.11. Restrained joint pipe and fittings shall be U.S. Pipe's TR FLEX Pipe and Fittings or approved equal. Restraint of field cut pipe shall be provided with U.S. Pipe's TR FLEX GRIPPER Ring, TR FLEX Pipe field weldments or approved equal.
 - b. Restrained push-on joints for pipe and fittings shall be designed for a water working pressure of 350 psi for sizes 4 inches through 24 inches. For fire protection service, 4-inch through 12-inch pipe and fittings are listed by Underwriters Laboratories for 350 psi and are approved by Factory Mutual for 250 psi.
 - c. Cement mortar lining and seal coating for pipe and fittings, where applicable, shall be in accordance with ANSI/AWWA C104/A21.4.
 - d. Asphaltic outside coating shall be in accordance with ANSI/AWWA C151/A21.51 for pipe and ANSI/AWWA C110/A21.10 or ANSI/AWWA C153/ A21.53 for fittings. or

2. ANSI/AWWA C900-07, FM 1612 DR 18 PVC with bell and spigot type joints with elastomeric gaskets and metallic restraining casings and rings, 235 PSI pressure class. J.M. Eagle "Eagle Loc 900" or approved equal.
- C. Provide approved transition couplings/fittings as required from one piping material to another.
- D. Building service riser: Riser shall be composed of a single extended 90-degree fitting of fabricated 304 stainless steel tubing, maximum working pressure 200 psi. The fitting shall have a flanged connection on the inlet (building) side and a CIPS coupler on the inlet (underground) side. Riser shall be equivalent to Ames Fire & Waterworks Series IBR In-Building Riser.

2.03 ABOVE-GROUND PIPING

- A. Steel Pipe for Wet-Pipe Systems: Schedule 40 black steel pipe meeting ASTM A53 (Grade B, Type S or E); ASTM A135; or ASTM A795. All pipe shall be either seamless or electric resistance welded – furnace welded pipe will not be allowed. All pipe shall be UL listed or FM approved for fire protection service and the interior surface shall be coated to reduce microbiologically influenced corrosion (MIC). At contractor's option, piping larger than 2 inches may be Schedule 10 black steel pipe, meeting all of the above requirements.
 1. Steel Fittings: ASME B16.9, wrought steel, buttwelded; ASME B16.25, buttweld ends; ASTM A234, wrought carbon steel and alloy steel; ASME B16.5, steel flanges and fittings; ASME B16.11, forged steel socket welded and threaded.
 2. Cast Iron Fittings: ASME B16.1, flanges and flanged fittings; ASME B16.4, threaded fittings.
 3. Malleable Iron Fittings: ASME B16.3, threaded fittings ASTM A47.
 4. Mechanical Grooved Couplings: Malleable iron housing clamps to engage and lock, "C" shaped elastomeric sealing gasket, steel bolts, nuts, and washers.
 5. Mechanical Formed Fittings: Carbon steel housing with integral pipe stop and O-ring pocked and O-ring, uniformly compressed into permanent mechanical engagement onto pipe.

2.04 PIPE HANGERS AND SUPPORTS

- A. Conform to NFPA 13.
- B. Fire protection piping shall be substantially supported from the building structure as required by NFPA 13.
- C. Fire protection piping shall be supported independently of all other systems.
- D. Hangers for Pipe Sizes 1/2 to 1-1/2 inch: Malleable iron or Carbon steel, adjustable swivel, split ring.
- E. Hangers for Pipe Sizes 2 inches and Over: Carbon steel, adjustable, clevis.
- F. Multiple or Trapeze Hangers: Steel channels with welded spacers and hanger rods.

- G. Wall Support for Pipe Sizes to 3 inches: Cast iron hook.
- H. Wall Support for Pipe Sizes 4 inches and Over: Welded steel bracket and wrought steel clamp.
- I. Vertical Support: Steel riser clamp or Angle ring.
- J. Floor Support: Cast iron adjustable pipe saddle, lock nut, nipple, floor flange, and concrete pier or steel support.
- K. Copper Pipe Support: Carbon steel ring, adjustable, copper plated.

2.05 VALVES

- A. Similar types of valves shall be the product of one manufacturer; i.e., all butterfly valves shall be of the same manufacturer, all ball valves shall be of the same manufacturer, etc.
- B. All valves used to control the flow of water to and within standpipe and sprinkler systems shall be listed indicating type complete with electric supervisory switches. Coordinate wiring with the electrical Contractor.

2.06 GATE VALVES

- A. Up to and Including 2 Inches: UL listed, FM approved, complying with AWWA C550 and NSF 61 approved, bronze body, bronze trim, rising stem, handwheel, inside screw, double wedge or disc, threaded ends.
- B. Over 2 Inches: UL listed, FM approved, complying with AWWA C550 and NSF 61 approved, iron body, bronze trim, non-rising stem, handwheel, double wedge, flanged, grooved or mechanical joint ends.
- C. Underground application: UL listed, FM approved, 250 PSI WWP flanged iron body non-rising stem gate valve with square operating nut. bolted bonnet and resilient wedge. The body and bonnet shall be coated with fusion bonded epoxy both interior and exterior, complying with AWWA C550 and be NSF 61 approved.
 - 1. Provide solid bar, carbon steel, valve stem extension. Provide ductile iron bonnet box and cover; bonnet box extension and 316 S.S. centering ring

2.07 GLOBE OR ANGLE VALVES

- A. Up to 2 Inches: UL listed and FM approved Bronze body, bronze trim, rising stem and handwheel, inside screw, renewable composition disc, screwed ends, with back seating capacity repackable under pressure.
- B. Over 2 Inches: UL listed, FM approved Iron body, bronze trim, rising stem, handwheel, OS&Y, plug-type disc, flanged ends, renewable seat and disc.

2.08 BALL VALVES

- A. Up to and Including 2 Inches: UL listed, FM approved Iron Bronze three-piece body, stainless steel ball, Teflon seats and stuffing box ring, with integral, factory-mounted tamper switch, threaded ends with union.

- B. Over 2 Inches: UL listed, FM approved cast iron or ductile iron body, stainless steel ball, Teflon seat and stuffing box seals, with integral factory-mounted tamper switch, and threaded or grooved ends.

2.09 BUTTERFLY VALVES

- A. Over 2 Inches: Ductile iron body conforming to ASTM A395 with polyamide coating, ductile iron disc, UL listed, FM approved with EPDM encapsulated rubber seal conforming to ASTM D2000, Type 416 stainless steel stem and gear operator with handwheel and indicator flag. Valves shall be furnished with integral supervisory switch rated for 1/2 amp at 120-volt DC and 5 amps at 120-volt AC.

2.10 CHECK VALVES

- A. Manufacturers: UL listed, FM approved.
- B. Up to and Including 2 Inches: Bronze swing disc, screwed ends.
- C. Over 2 Inches: Iron body, bronze trim, swing disc, renewable disc and seat, flanged ends.

2.11 DRAIN VALVES

- A. Manufacturers: UL listed, FM approved.
- B. Bronze compression stop with hose thread nipple and cap.
- C. Brass ball valve with cap and chain, 3/4-inch hose thread.

2.12 POST INDICATOR AND VALVE

- A. Valve shall be UL listed, FM approved, 250 PSI WWP flanged iron body non-rising stem gate valve with indicator post pattern, bolted bonnet and resilient wedge. The body and bonnet shall be coated with fusion bonded epoxy both interior and exterior, complying with AWWA C550 and be NSF 61 approved.
- B. Post Indicator: UL listed, FM approved, vertical type, cast iron body with operating wrench, extension rod, view windows (for "OPEN" and "SHUT" signage), and adjustable cast iron barrel of length required for depth of burial of valve.
- C. Wall Post Indicator: UL listed, FM approved, horizontal type, cast iron body with hand wheel, view windows (for "OPEN" and "SHUT" signage) and 12" wide wall flange.

2.13 BACKFLOW PREVENTERS

- A. Provide one of the following double check valve backflow prevention assemblies on the fire water service entry, unless local municipality requires a reduced pressure type backflow preventer. Double check valve assembly shall be UL listed, FM approved and ASSE 1015 listed.
- B. Where installed inside building, backflow prevention assembly shall be equal to Watts Series 757 or 757N with two independent check modules within a single type 304 schedule 40 stainless steel housing with four test cocks and grooved butterfly shutoff valves with integral tamper switches. Assembly shall be available for either horizontal or vertical installation.

- C. Where installed outside building or where required by AHJ to monitor unauthorized use of water, provide double check detector assembly equal to Watts Series 757DCDA or 757NDCDA with two independent check modules within a single type 304 schedule 40 stainless steel housing with four test cocks and grooved butterfly shutoff valves with integral tamper switches. The assembly shall also include a bypass line with meter, double check backflow assembly and required test cocks. The overall assembly shall be available for either horizontal or vertical installation.

2.14 FIRE DEPARTMENT CONNECTIONS

- A. Provide a fire department connection as required by NFPA and the local Fire Department, at the location indicated on the Drawings.
- B. Each fire department connection shall consist of 2-1/2-inch inlets with clappers compatible with equipment utilized by the local Fire Department and equipped with UL listed Knox caps with swivel guards (Knox model 3140 or approved equal, keyed for the local Fire Department). Provide adequate number of inlets to meet sprinkler and/or standpipe system design flow, based on a maximum of 250 GPM per inlet connection.
- C. Wall-mounted Fire Department Connections shall be flush mounted type with ductile iron body and polished brass plate and snoots with pin lug hose thread inlets, equal to Potter-Roemer 5100-5400 Series.
- D. Free standing Fire Department Connections shall have either a cast brass or red polyester coated ductile iron body, with 18" long polished brass cover sleeve and cast brass identification base plate, equal to Potter-Roemer 5761-5792 Series.
- E. Each fire department connection shall be labeled as required by the local Fire Department with raised letters reading "AUTOMATIC SPRINKLER" or "STANDPIPE".
- F. Each fire department connection shall be mounted not be less than 2 feet and not more than 3 feet 6 inches in elevation, measured from the ground level to the centerline of the inlets.
- G. Provide signage as required by NFPA 13 and NFPA 14, and any additional signage specifically required by the local fire department.

2.15 OUTSIDE ALARM BELL

- A. UL listed and FM approved vibrating type electric bell for fire signaling to receive signal from Fire Alarm System with 120-volt single phase power requirement, 10" size, for outdoor use, red powder coating with weatherproof back box, 94 dB at 10 feet.

2.16 WATER FLOW ALARM SWITCH

- A. Provide, where indicated on the drawings and where required by NFPA 13., Provide field adjustable vane type waterflow switch UL listed and FM approved, Flow switch shall be provided with delay, adjustable up to 90 seconds. See Division 28 for electrical signal connection by others to these flow switches.

2.17 SPRINKLER SYSTEM INSPECTOR'S Test Assembly

- A. NFPA 13 compliant UL Listed and FM approved sprinkler system inspector's test assembly, consisting of sight glass, tamper resistant test orifice, test and drain ball valve, rated for 300 psi.

2.18 SUPERVISORY SWITCHES

- A. UL Listed and FM approved unit for monitoring the open position of fire protection valves, red in color, tamper proof cover, two double throw double pole micro-switches, NEMA 3R enclosure, Coordinate with Division 28 for power requirements.
- B. UL Listed and FM approved supervisory actuated low/high pressure switch for low differential dry and preaction valves, designed to detect an increase and/or decrease from normal system pressure in automatic fire sprinkler systems. Unit shall consist of two factory set switches. The low switch is set to activate at approximately 10 psi on a decrease in pressure, and the high switch is set to activate at approximately 20 psi on an increase in pressure. Unit shall have a die-cast cover with textured red powder coat finish, NEMA 4X enclosure, SPDT switch contacts. Coordinate with Division 28 for power requirements.

2.19 PRESSURE SWITCHES

- A. UL Listed and FM approved for use on fire protection systems, pressure type flow switch, activated by any flow of water equal to or in excess of the discharge of one sprinkler head, bellows activated, maximum service pressure rating of 300 psi, adjustable range of 4-20 psi, (2) SPDT contacts, 24 VDC power requirement, 1/2" male NPT, NEMA 4 rating,

2.20 PRESSURE GAUGES

- A. UL Listed and FM approved for use on fire protection systems, 0-300 psi pressure range, phosphor bronze bourdon tube, polycarbonate one-piece ring and crystal, 3-1/2" dial, 1/4" brass connection.

PART 3 EXECUTION

3.01 PREPARATION

- A. Ream pipe and tube ends. Remove burrs. Bevel plain end ferrous pipe.
- B. Remove scale and foreign material, from inside and outside, before assembly.
- C. Prepare piping connections to equipment with flanges or unions.
- D. Systems shall be flushed until the system is clean of any foreign matter.

3.02 INSTALLATION

- A. Install piping in accordance with NFPA 13 for sprinkler systems; NFPA 14 for standpipe and hose systems; and NFPA 24 for service mains.
- B. Route piping in orderly manner, plumb and parallel to building structure and concealed above ceilings where possible. Locate concealed valves, switches and alarm connections in accessible location, and coordinate size and location of access panels/doors with General Contractor.
- C. Install piping to conserve building space, to not interfere with use of space and other work. Coordinate location of sprinkler piping with access requirements of above ceiling equipment (i.e. mechanical VAV boxes, fan coils, etc.).
- D. Group piping whenever practical at common elevations.
- E. Sleeve pipes passing through partitions, walls and floors.

- F. Install piping to allow for expansion and contraction without stressing pipe, joints or connected equipment.
- G. Pipe Hangers and Supports:
 - 1. Install in accordance with NFPA 13 and NFPA 14.
 - 2. Install hangers to provide minimum 1/2-inch space between finished covering and adjacent work.
 - 3. Place hangers within 12 inches of each horizontal elbow.
 - 4. Use hangers with 1-1/2-inch minimum vertical adjustment. Design hangers for pipe movement without disengagement of supported pipe.
 - 5. Support vertical piping at every floor. Support riser piping independently of connected horizontal piping.
 - 6. Where several pipes can be installed in parallel and at same elevation, provide multiple or trapeze hangers.
 - 7. Provide copper-plated hangers and supports for copper piping, sheet lead packing between hanger or support and piping.
 - 8. Prime coat exposed steel hangers and supports. Refer to Section 09 90 00. Hangers and supports located in crawl spaces, pipe shafts and suspended ceiling spaces are not considered exposed.
- H. Slope piping and arrange systems to drain at low points. Use eccentric reducers to maintain top of pipe level.
- I. Prepare pipe, fittings, supports, and accessories for finish painting. Where pipe support members are welded to structural building framing, scrape, brush clean, and apply one coat of zinc rich primer to welding. Refer to Section 09 90 00.
- J. Do not penetrate building structural members unless indicated otherwise on Contract Drawings.
- K. Provide steel sleeves when penetrating footings, floors and walls.
- L. Penetrations through fire rated walls, floors and partitions shall be sealed to provide a U.L. rating equal to or greater than the wall, floor or partition
- M. When installing more than one piping system material, ensure system components are compatible and joined to ensure the integrity of the system. Provide necessary joining fittings. Ensure flanges, union and couplings for servicing are consistently provided.
- N. Die-cut threaded joints with full cut standard taper pipe threads with red lead and linseed oil or other non-toxic joint compound applied to male threads only.
- O. Provide gate or ball valves for shut-off or isolating service.
- P. Provide UL listed caps for concealed sprinkler heads to match architectural and interior ceiling finishes.

- Q. Provide drain valves at main shut-off valves, low points of piping and apparatus. Extend drain to floor sink/floor drain.
- R. Install valves with stems upright, not inverted. All valves shall be located such that the removal of their bonnets is possible. Valves placed in horizontal lines shall be installed with their valve stems inclined at an angle of a minimum of 30 degrees above the horizontal position. Valves shall be installed as nearly as possible to the locations indicated in the Construction Drawings. Any change in valve location must be so indicated on the Record Drawings. Remove protective coatings after installation.
- S. Heat generated by welding or soldering procedures shall not be transmitted to valves, groove couplings, or any other components installed within the piping system that may be damaged due to high temperatures. Contractor shall take all precautions necessary and allow heated piping to cool to ambient temperature before attachment.
- T. All screw joints shall be made with taper threads properly cut. Joints shall be made tight with Teflon tape or non-toxic joint compound applied to the pipe threads only and not to fittings. When threads are cut on pipes, the ends shall be carefully reamed to remove any burrs. Before installing pipe that has been cut and threaded, the lengths of pipe shall be upended and hammered to remove all shavings and foreign material.
- U. Inspector's test valves shall be installed for each sprinkler control valve assembly.
- V. Do not route piping in the following rooms with the exceptions of solely supplying sprinkler coverage in the area and a sidewall sprinkler head is not practical.
 - 1. IT Computer rooms (i.e. IDF, MDF, Data Rooms)
 - 2. Electrical Rooms.
- W. Do not route sprinkler piping directly over Electrical equipment (i.e. electrical panels, Substations, switchboards, motor control centers, emergency generators, bus duct, transformer).
- X. Paint all exposed sprinkler piping as specified in Section 21 05 00.

3.03 INSTALLATION OF FIRE DEPARTMENT CONNECTIONS

- A. Installation of Fire Department Connections shall all requirements of NFPA and of the local Fire Department.
- B. Fire department connections shall be located not less than 18 inches nor more than 48 inches above the level of adjoining ground sidewalk or grade surface.
- C. Fire department connections shall be located within 100 feet of the nearest fire hydrant unless otherwise approved by the local fire department.
- D. Each fire department connection shall be designated by a sign reading "STANDPIPE" or "AUTOSPKR" or both depending on system served. For manual standpipe systems, signage shall also indicate the pressure required to deliver system demand and whether the standpipe is wet or dry.
- E. Locate fire department connection with sufficient clearance from walls, obstructions, or adjacent fire department connectors to allow full swing of fire department wrench handle

and so that hose lines can be attached to inlets without interference from nearby objects.

3.04 INSTALLATION OF BACKFLOW PREVENTION DEVICES

- A. Backflow prevention devices and assemblies shall be installed in compliance with American Water Works Association Manual M-14 "Backflow Prevention," and the following:
1. Devices and assemblies shall be located as shown on plans.
 2. The highest part of any device or assembly shall not be installed over 5 feet above the finish floor. There shall be a minimum of 12 inches clearance above the device/assembly.
 3. The lowest part of any backflow preventer assembly shall be installed a minimum of 12 inches above finish floor.
 4. The service side of any device/assembly shall have a minimum clearance of 24 inches from the outermost dimension.
 5. The non-service side of a backflow assembly shall have a minimum clearance of 4 inches from the outermost dimension.
 6. All backflow and/or backsiphonage assemblies/devices shall be tested in accordance with the rules and regulations of Texas Commission on Environmental Quality and the utility supplying the domestic water before substantial completion inspection is requested.
 7. Final reports shall be submitted to local code/inspection authorities and to A/E and utility prior to scheduling Substantial Completion reviews by the A/E.
 8. Persons performing the test on backflow prevention assemblies/devices shall meet the following requirements:
 - a. Licensed by the Texas Commission on Environmental Quality as a Backflow Prevention Assembly Technician, and
 - b. If required by the utility supplying the water, registered with the utility for testing backflow preventer assemblies.
 - c. Testing of backflow preventer assemblies serving fire protection systems shall be performed by a person or organization with a current certificate of registration from the State Fire Marshal as an independent fire protection sprinkler contractor (Registered Firm) under the direct supervision of a licensed Responsible Managing Employee (RME) as defined by Texas Insurance Code (TIC), Chapter 6003 (formerly Article 5.43-3), Fire Protection Sprinkler System Service and Installation and the Texas Administrative Code Title 28, Chapter 34, Subchapter G – Fire Sprinkler Rules.

3.05 TESTING

- A. Each system installed under this contract shall be cleaned and tested to appropriate NFPA Standards for each particular application.
- B. Refer to appropriate sprinkler system and/or standpipe system specification section for additional system acceptance and testing requirements.

- C. Testing shall also include any additional requirements from the authority having jurisdiction and the Owner's insurance underwriter.
- D. Coordinate system testing with Fire alarm contractor and general contractor.

END OF SECTION

SECTION 21 05 53 – IDENTIFICATION FOR FIRE PROTECTION PIPING AND EQUIPMENT

PART 1 GENERAL

1.01 SUMMARY

A. Section Includes:

1. Equipment markers.
2. Valve tags.
3. Valve schedules.
4. Pipe markers.
5. Ceiling tacks.
6. Signs.
7. Detectable Underground Warning Tape.

B. Related Sections:

1. Section 09 90 00 - Painting and Coating: Execution requirements for painting specified by this section.

1.02 REFERENCES

A. American Society of Mechanical Engineers:

1. ASME A13.1 – Scheme for the Identification of Piping Systems.

B. American National Standards Institute:

1. ANSI Z535.1 – Safety Color Standard.
2. ANSI Z535.2 – Environmental and Facility Safety Signs.

C. National Fire Protection Association:

1. NFPA 13.
2. NFPA 20

1.03 SUBMITTALS

- A. Section 01 33 00 - Submittal Procedures:** Submittal procedures.
- B. Product Data:** Submit manufacturer's catalog literature for each product required.
- C. Shop Drawings:** Submit list of wording, symbols, letter size, and color coding for mechanical identification. Submit a valve chart and schedule, including valve tag number, location, function and valve manufacturer's name and model number.
- D. Manufacturer's Installation Instructions:** Indicate installation instructions, special procedures, and installation.

1.04 CLOSEOUT SUBMITTALS

- A. Section 01 70 00 - Execution and Closeout Requirements: Closeout procedures.
- B. Project Record Documents: Record actual locations of tagged valves; include valve tag numbers.

1.05 QUALITY ASSURANCE

- A. Conform to ASME A13.1 and ANSI Z535.1 for color scheme for identification of piping systems and accessories.
- B. Conform to ASME A13.1 for length of field and letter height for pipe markers.
- C. Conform to ANSI Z535.1 and ANSI Z535.2 for emergency operating information and warning signs.

1.06 QUALIFICATIONS

- A. Manufacturer: Company specializing in manufacturing products specified in this section with minimum three years of experience.
- B. Installer: Company specializing in performing Work of this section with minimum three years of experience.

PART 2 PRODUCTS

2.01 PIPE MARKERS

- A. General: Conform to ASME A13.1 for background and letter colors, length of color field and letter height.
- B. Self-Adhesive Pipe Markers: Flexible, indoor/outdoor grade vinyl with factory-applied pressure-sensitive adhesive. Provide with minimum 1-1/2 inch wide banding tape.
- C. Mechanically Applied Pipe Markers:
 - 1. For pipes with an overall diameter up to 6 inches, including insulation, provide semi-rigid plastic wrap around pipe marker that extends 360 degrees around the pipe at each marker location. The semi-rigid marker should include the legend and a directional flow arrow. The marker shall be supplied as a pre-tensioned device and be equipped with a 1/2 inch strip of adhesive on the inside to further secure the marker in a permanent position on vertical locations.
 - 2. For pipes with an overall diameter greater than 6 inches, including insulation, provide a semi-rigid plastic strap-on pipe marker with a height no less than 3 times the letter height. The marker shall include a legend and a directional flow arrow. Markers to be installed indoors shall be supplied with no less than two nylon straps to secure the marker in place. Markers to be installed outdoors shall be supplied with stainless steel or aluminum strapping.

2.02 DIRECTIONAL ARROWS

- A. Flow Direction: Provide flow directional arrows either as part of pipe markers, banding tape or separately, attached to pipes.
 - 1. Conform to requirements for markers.
 - 2. Size to conform to ANSI A13.1 (1 inch wide minimum).

2.03 DETECTABLE UNDERGROUND WARNING TAPE

- A. Description: Polyethylene tape resistant to acids, alkalis and other destructive soil components with metallic core for detection and location of piping with metal detector. Tape shall be a minimum of 6 inches wide with a minimum thickness of 5 mils. Utilize manufacturer's standard legends to identify water lines, pipe lines, gas lines, fuel lines, steam lines and sewer lines. Provide a continuous printed message with bold black lettering similar to "Caution Buried Water Line Below". Tape color and lettering shall be unaffected by moisture and other substances contained in the backfill material. The tape color shall conform to the American Public Works Association Uniform Color Code.

2.04 CEILING TACKS

- A. Description: Steel with 3/4 inch diameter color coded head.
- B. Color code as follows:
 - 1. Red: Fire protection valves or equipment.

2.05 PLASTIC EQUIPMENT MARKERS

- A. General: Provide laminated plastic equipment markers for all scheduled items of fire protection equipment installed indoors.
- B. Size: Size laminated plastic markers not less than one inch in height and three inches in length with engraved lettering white on black not less than 1/4 inch in height. For larger pieces of equipment, size markers 1-1/2 inch in height by 4-1/2 inches long, of 3/32 inch laminated plastic melamine with white on black lettering engraved not less than 1/16 inch deep and 1/2 inch high.
- C. Attachment: Attach nameplates with rivets, stainless steel screws or bolts. On equipment such as tanks and pumps which cannot be drilled or pierced, attach nameplates with brass chains and "S" hooks.
- D. For fire protection equipment installed above ceiling, provide 3/4 inch by 2-1/2 inches laminate tags attached with rivets to the ceiling grid below.

2.06 ALUMINUM EQUIPMENT MARKERS

- A. General: Provide engraved anodized aluminum equipment markers for all scheduled items of plumbing equipment installed outdoors.
- B. Size: Size engraved aluminum markers not less than 1 inch in height and 3 inches in length with engraved lettering white on black background not less than 5/8 inch in height. For larger pieces of equipment, size markers 3 inches in height by 6 inches long, with lettering not less than 1 inch in height.
- C. Attachment: Attach nameplates with rivets, stainless steel screws or bolts. On equipment

such as tanks and pumps which cannot be drilled or pierced, attach nameplates with stainless steel chains and "S" hooks.

2.07 VALVE TAGS

- A. Materials: Provide indoor valve tags of solid brass with stamped or engraved lettering or numbers. Provide outdoor valve tags of aluminum with stamped or engraved lettering or numbers.
 - 1. Fill lettering and numbers with black paint.
 - 2. Lettering shall be not less than 1/4 inch in height.
 - 3. Numbers shall be not less than 1/2 inch in height.
- B. Attachment: For valve tags in mechanical rooms, provide with brass jack chain and "S" hook attachment. For all other indoor valve tags, provide with brass beaded chain attachment. For all outdoor valve tags, provide with stainless steel jack chain and "S" hook attachment.

2.08 ENGRAVED PLASTIC LAMINATE SIGNS

- A. General: Where indicated in other sections of the specifications, provide engraved instruction signs, warning signs, operational instructions or other signs designated.
- B. Emergency Operating Signs: For emergency operating instructions, provide engraved, laminate, melamine plastic, white on red, not less than 1/8 inch thick.
 - 1. Provide concise written instructions on the emergency operation of the device.
 - 2. Letters shall be not less than 5/16 inch in height, engraved 1/16 inch deep in block capital letters.
- C. Information and Warning Signs: Provide general information and warning signs of laminated, melamine plastic, not less than 1/8 inch thick, with white engraved lettering on black, with letters not less than 1/4 inch in height, block capitals.
- D. Attachment: Attach signs directly to the equipment with rivets, bolts or screws, if possible. Otherwise, attach signs with angle brackets, U-bolts, or metal plates held in place to piping with stainless steel draw-bands.
 - 1. Attachment with adhesives will not be permitted.
 - 2. Locate signs not less than 4 feet nor more than 6 feet above the operating floor, directly visible from an operating aisle.
 - 3. Locate signs to preclude damage during maintenance and repair or by operating traffic.

2.09 VALVE SCHEDULES AND FRAMES

- A. General: Provide valve schedules for all valves provided by Division 2.
- B. Schedules: Provide typed or machine printed schedules, one item per line, double spaced.

1. Printing shall be black on 8-1/2-inch by 11-inch white paper. Paper shall be waterproof or laminated after printing.
2. For each valve, list the valve number, location, size and use or operating function.
3. Support schedules in full extruded aluminum frames with removable, non-yellowing, clear plastic faces.
4. Screw or bolt schedules to equipment room walls where directed.
5. Coordinate valve numbers with valve tags so that no two valves or scheduled devices have the same number.

PART 3 EXECUTION

3.01 GENERAL

- A. Degrease and clean surfaces to receive adhesive for identification materials.
- B. Install identifying devices after completion of coverings and painting.
- C. Install labels with sufficient adhesive for permanent adhesion. For unfinished canvas covering, apply paint primer before applying labels.

3.02 CONCEALED VALVES AND EQUIPMENT

- A. Equipment Above Ceilings: Provide valve tagging and identification to equipment located above ceilings, such as valves and other items before the ceilings are installed.
- B. Finished Surfaces: Where identification is to be provided on surfaces which require insulation, painting and finishing, install identification after covering and painting is complete.
- C. Provide ceiling tacks to locate valves or equipment above T-bar type panel ceilings. Locate in corner of panel closest to equipment.
- D. Provide plastic nameplates adhered to the ceiling grid to locate valves, equipment, or dampers above T-bar type panel ceilings. Locate in corner of panel closest to equipment. Label with tag of equipment.

3.03 PIPING SYSTEM IDENTIFICATION

- A. Install pipe markers on all piping systems and include arrows to show the normal direction of flow. Where flow can be in both directions, arrows in both directions shall be displayed.
- B. Identify piping exposed to view and concealed by accessible ceilings, including hard ceilings provided with access panels. Identify piping outdoors, in crawlspaces, on roof, above grade and within parking structures. Only piping located within walls or inaccessible areas need not be identified.
- C. Locate pipe markers as follows:

1. Every 15 feet on straight runs.
 2. At each valve and control device.
 3. At each branch or take-off. Provide flow arrows on the branch pipe as well as on the main on both sides of the branch.
 4. At any change in piping direction.
 5. Above and below every floor or roof penetration.
 6. On either side of every wall or partition. Ensure there is a minimum of one marker per pipe in every room.
 7. On either side of large obstructions, ductwork or equipment that piping passes above.
 8. At 5-foot intervals where piping is obscured by close proximity to walls or other pipes.
 9. Provide only one label per unit drain connection for condensate drain piping on roof.
- D. Install pipe markers so they are visible and legible from a normal standing position.
- E. Secure each end of self-adhesive pipe markers with a full wrap of banding tape of the same background color. Banding tape shall overlap itself a minimum of 3 inches.
- F. Provide mechanically applied pipe markers for all piping in mechanical rooms and outdoors.
- G. Install detectable underground warning tape 12 inches below finished grade, directly above buried pipe. If piping is buried more than 36 inches below finished grade, then provide an additional continuous length of tape buried 12 inches above the piping.

3.04 VALVE IDENTIFICATION

- A. General: Provide a valve tag on every valve, cock and control device in each piping system. Exclude check valves and valves within factory-fabricated equipment units. List each tagged valve in valve schedule for each piping system. In existing buildings, coordinate valve tags and schedules such that no valve numbers are duplicated.
1. Tagging Schedule: Comply with requirements of "Valve Tags" and "Valve Schedules and Frames" paragraph.
- B. Install valve schedule frames and schedules in machine rooms where indicated or where directed.
- C. Mark all sprinkler system valves in accordance with NFPA 13, and Division 21 Section "Wet Pipe Sprinkler Systems," "Dry Pipe Sprinkler Systems," or "Pre-Action Sprinkler Systems" or other as appropriate

- D. Identify Sprinkler Riser trim in accordance with NFPA 13, and Division 21 Section "Wet Pipe Sprinkler Systems," "Dry Pipe Sprinkler Systems," or "Pre-Action Sprinkler Systems" or other as appropriate.
- E. Fire Protection Valve and Trim Signage: Equipment identification signs used for indoor equipment shall be minimum 6 inches wide by 2 inches high with enamel baked finish on minimum 18 gauge steel or 0.020 inch aluminum with red letters on a white background or white letters on red background. All text shall be a minimum 1" lettering.
- F. Fire Alarm System and Device Components: Identify fire alarm equipment devices by means of 3/32 inch (3 mm) thick red laminated phenolic nameplate with white core. Engrave fire alarm panel identification using a minimum size of 1 inch (25 mm) character height, Helvetica style font. Fire Alarm device numbers shall be a minimum of 3/16 inch (5 mm) size and fire alarm zone numbers shall be 1/4 inch (7 mm) size. Attach nameplates with No. 4-36 RH nickel plated brass machine screws. Device numbers may be adhered with glue or equivalent.

3.05 FIRE PROTECTION EQUIPMENT IDENTIFICATION

- A. General: Install equipment markers and identification on or near each major item of fire protection equipment. Provide signs for the following general categories of equipment and operational devices:
 - 1. Main alarm and operating valves.
 - 2. Meters and gauges.
 - 3. Pumps, air compressors and motor-driven units.
 - 4. Tanks and pressure vessels.
 - 5. Fire Department Connections
 - 6. Standpipe valves and cabinets
- B. Text of Signs: In addition to name of identified unit, provide lettering to distinguish between multiple units, inform operator of operational requirements, indicate safety and emergency precautions, and warn of hazards and improper operations.
- C. Major components of equipment shall have the manufacturer's name, address, type or style, model or serial number, catalog number, date of installation, installing Contractor's name and address, and the contract number provided on a new plate permanently affixed to the item or equipment. Nameplates shall be etched metal or plastic, permanently attached by screws to panels or adjacent walls.

3.06 COLOR AND IDENTIFICATION SCHEDULE

A. Provide all pipe labels and lettering of colors listed below:

<u>FLUID SERVICE TYPE</u>	<u>PIPE MARKER LEGEND</u>	<u>PIPE MARKER BACKGROUND / LETTERING COLOR</u>	<u>VALVE TAG LETTERING</u>
Fire Protection	FIRE PROTECTION WATER	Red/White	FP

END OF SECTION

PART 1 - GENERAL

1.1 SCOPE

SECTION 21 13 13 – WET-PIPE SPRINKLER SYSTEMS

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Wet-pipe sprinkler system.
- B. System design, installation, and certification.
- C. Sprinkler heads.
- D. Piping Specialties.
- E. Fire department connections.

1.02 RELATED SECTIONS

- A. Section 21 00 01 – Basic Fire Protection Requirements
- B. Section 21 05 00 – Common Work Results for Fire Suppression.
- C. Section 21 05 53 – Identification for Fire Protection Piping.
- D. Section 21 12 00 - Fire Suppression Standpipes.
- E. Section 26 05 03 – Equipment Wiring Systems
- F. Section 28 31 00 – Fire Detection and Alarm.

 - 2. NFPA 24 – Standard for the Installation of Private Fire Service Mains and Their Appurtenances.
 - 3. NFPA 25 – Standard for the Inspection, Testing and Maintenance of Water-

Based Fire Protection Systems.

4. NFPA 70 – National Electrical Code.
 5. NFPA 72 - National Fire Alarm and Signaling Code
- C. Underwriter’s Laboratories (UL):
1. UL – Fire Equipment Directory.
 2. UL 199 – Automatic Sprinklers.

1.04 SYSTEM DESCRIPTION

- A. The Sprinkler system shall provide coverage for building areas noted on Drawings. If the building is more than 52,000 square feet on any single floor, the system shall be divided into separate systems with multiple risers and alarm valves and shall be laid out accordingly.
- B. Provide hydraulically designed system(s) to meet NFPA 13 requirements for each occupancy classification, as indicated on Drawings.
- C. Determine volume and pressure of incoming water supply from water flow test data. Revise design when test data available prior to submittals.
- D. Interface system with building fire and smoke alarm system.
- E. Provide fire department connections as indicated on Drawings.

1.05 SUBMITTALS FOR REVIEW

- A. Submit under provisions of Section 01 33 00 and Section 21 00 01.
- B. Submittals shall include all items listed in Section 21 05 00, including but not limited to: fire flow test data, product data, coordination drawings, shop drawings and local Fire Department approval.

1.06 SUBMITTALS AT PROJECT CLOSEOUT

- A. Submit under provisions of Section 01 70 00 – Execution and Closeout Requirements.
- B. Submittals shall include all items listed in Section 21 05 00, including but not limited to Project Record Documents, System Certification forms, Operation and Maintenance data and warranty forms.

1.07 QUALITY ASSURANCE

- A. Perform work to the local adopted building and fire codes (as listed on sheet FP1.1), NFPA 13, 24 and 25 as modified herein, the local authority having jurisdiction, FM Global standards (where applicable) and the Architect/Engineer. The greater quality and/or value specified herein for the system(s) and various components and installation procedures shall take precedence over the minimum requirements of NFPA, in all instances.
- B. All work shall be supervised by a minimum NICET II certified individual or higher as may

be required by the local AHJ. Certification shall be for above grade fire suppression installation.

- C. Sprinkler Shop Drawings and hydraulic calculations are to be sealed by a Professional Engineer, knowledgeable in fire protection engineering or a Responsible Managing Employee (RME) licensed by the State of Texas Fire Marshal Office, before submitting for review.
- D. Welding Materials and Procedures: Perform to ASME Code.
- E. Valves: Bear UL/FM label or marking. Provide manufacturer's name and pressure rating marked on valve body.
- F. Piping: All piping installed on this project shall bear the complete ASTM and manufacturer marking, labeling and identification requirements as required by ASTM. All installed piping 3'-0" or greater in length shall be readily identifiable per ASTM labeling criteria. Piping not bearing this identification upon installation shall be removed and replaced by the correctly labeled piping. Piping shall not be re-stenciled after it is installed to meet these criteria.
- G. The system shall also conform to applicable requirements of the Texas Administrative Code Title 28, Chapter 34.

1.08 QUALIFICATIONS

- A. The work shall be performed by a person or organization with a current certificate of registration from the State Fire Marshal as an independent fire protection sprinkler contractor (Registered Firm). This contractor shall be fully responsible for all design to meet project requirements, including items exceeding those specifically illustrated or mentioned in the contract documents.
- B. The work shall be performed under the supervision of a licensed Responsible Managing Employee (RME) as defined by Texas Insurance Code (TIC), Chapter, Fire Protection Sprinkler System Service and Installation and the Texas Administrative Code Title 28, Chapter 34, Subchapter G – Fire Sprinkler Rules.
- C. Manufacturer Qualifications: Company specializing in manufacturing the Products specified in this section with minimum three years of documented experience.
- D. Installer Qualifications: Company specializing in performing Work specified in this section with minimum three years of documented experience.
- E. Although Contractor is responsible for design of system; sizes, routing and equipment shown on drawings and specifications shall be considered as minimum requirements, even if they exceed NFPA, FM and AHJ requirements. Contractor is reminded that other sections of specifications also apply to this work (i.e., refer to "Related Sections" above) and contractor shall comply with these sections even if they exceed NFPA, FM, and AHJ requirements.
- F. The system design and installation shall in all respects conform to the latest adopted editions of applicable NFPA, Building Code and Fire Code requirements, and any local modifications and/or amendments thereto. Where latest adopted editions vary between code authorities having jurisdiction (AHJ's) over this project, system shall meet the most stringent requirements. These requirements include, but not necessarily be limited to:
 - 1. NFPA 13 - Standard for the Installation of Sprinkler Systems.

2. NFPA 24 - Standard for the Installation of Private Fire Service Mains and Their Appurtenances.
3. NFPA 72 – National Fire Alarm and Signaling Code

1.09 DELIVERY, STORAGE AND PROTECTION

- A. Section 01 60 00 – Product Requirements: Transport, handle, store and protect products.
- B. Store products in shipping containers and maintain in place until installation. Provide temporary inlet and outlet caps. Maintain caps in place until installation.
- C. Utilize manufacturer supplied sprinkler caps, covers and bulb protectors. Remove all caps prior to placing system(s) in service.

1.10 WARRANTY

- A. Section 01 70 00 – Execution and Closeout Requirements: Product warranties and product bonds.
- B. Furnish one-year manufacturer warranty for system components.

1.11 EXTRA MATERIALS

- A. Section 01 70 00 – Execution and Closeout Requirements.
- B. Furnish, equip and install spare sprinkler cabinet(s) in accordance with provisions of NFPA 13. Locate near main system riser assembly or as indicated on Drawings.

PART 2 PRODUCTS

2.01 MANUFACTURERS

- A. Acceptable Manufacturers:
 1. Grinnell
 2. Reliable Automatic Sprinkler Co.
 3. Tyco Fire Products
 4. Viking
- B. Section 01 60 00 – Product Requirements: Product options and substitutions. Substitutions.

2.02 SPRINKLER HEADS

- A. Unless otherwise specified or indicated on the drawings, sprinkler heads shall be regular automatic closed type spray heads with temperature ratings as required by National Fire Protection Association Standard No. 13.
 1. Where feasible, all sprinkler heads shall be quick-response type.

2. Finished Ceilings: Provide concealed ceiling sprinklers with factory finished (no field painting) cover plate, color to match ceiling finish. (Exception: Provide chrome plated or alternate color cover plates where directed by Architect).
 3. Unfinished Areas without Ceilings: Provide bronze upright. Protect sprinkler heads against mechanical injury with standard guards where required.
 4. Sidewall heads: Recessed horizontal sidewall type heads with white enamel finish and matching push on escutcheon plate may be utilized, where indicated on drawings.
- B. An approved protective guard in accordance with NFPA 13 Section 6.2.8 shall be installed on each sprinkler head located in rooms/areas where there is a potential to receive damage or where the head is less than 7 feet above the floor level. Sprinkler heads guards shall be listed for use with the sprinklers on which they are installed.
- C. The use of UL listed and FM approved flexible type head assemblies is permitted. Flex type head assembly shall consist of 304 stainless steel braided hose with zinc plated steel 1" NPT male threaded nipple, factory tested at 400 psi, complete with one piece head securing bracket assembly, tamper resistant screws. The drop shall include a UL approved braided hose with a bend radius to 2" to allow for proper installation in confined spaces.

2.03 PIPING SPECIALTIES

- A. Wet Pipe Sprinkler Alarm Valve: Check type valve with divided seat ring, rubber-faced clapper to automatically actuate water motor alarm and electric alarm, with pressure retard chamber and variable pressure trim; with test and drain valve.
- B. Riser Manifold Assembly: Factory assembled unit of painted ductile iron body with brass and galvanized trim, containing a dedicated water flow detector switch with two sets of electrical contacts; a pressure gauge with three-way isolation valve; a built-in drain port with a test and drain valve assembly; and a pressure relief kit. Entire assembly shall be UL Listed and FM approved as a unit for installation in either horizontal or vertical position and shall have cast on lettering to identify manifold pipe size, flow direction, and gauge and drain outlets.
- C. Floor Control Assembly: Factory assembled unit of stainless steel or painted ductile iron body with brass and galvanized trim, containing a dedicated water flow detector switch with two sets of electrical contacts; a pressure gauge with three-way isolation valve; and a built-in drain port with a test and drain valve assembly. Entire assembly shall be UL Listed and FM approved as a unit for installation in either horizontal or vertical position and shall have cast on lettering to identify manifold pipe size, flow direction, and gauge and drain outlets.
- D. Fire Department Connections: Refer to Section 21 05 00.
- E. Backflow Preventer Assembly: Refer to Section 21 05 00.
- F. Electric Alarm and Water Motor Alarm: Refer to Section 21 05 00.
- G. Water Flow Switches and Supervisory (Tamper) Switches: Refer to Section 21 05 00.

PART 3 EXECUTION

3.01 INSTALLATION

- A. Install in accordance with NFPA 13, and in accordance with local Fire Department requirements.
- B. Install equipment in accordance with manufacturer's instructions.
- C. Locate outside alarm gong on building wall as indicated.
- D. Place pipe runs to minimize obstruction to other work.
- E. Center sprinklers in ceiling tile in one direction and provide piping offsets as required with location in other direction variable, dependent upon spacing and coordination with ceiling elements.
- F. Apply cover to ensure concealed sprinklers, cover plates, and sprinkler escutcheons do not receive field paint finish. Remove after painting. Replace painted sprinklers.
- G. Install guards on sprinklers where indicated.
- H. Locate drains and inspectors test as indicated on drawings or in a location approved by the Architect/Engineer.
- I. Flush entire piping system of foreign matter.
- J. Hydrostatically test entire new piping system per NFPA 13, as noted below.
- K. Provide both a Hydraulic Design Information Sign and a General Information Sign near each systems control riser. Signs shall be of permanently marked weatherproof material and shall include all information outlined in NFPA 13.
- L. Paint all exposed sprinkler piping as specified in Section 21 05 00.
- M. Under no conditions shall paint be applied to sprinkler heads, escutcheons, or covers. If paint is so applied, replacement of the affected parts shall be required.

3.02 INTERFACE WITH OTHER PRODUCTS

- A. Ensure required devices are installed and connected as required to fire alarm system.

3.03 CLEANING

- A. Section 01 70 00 – Execution and Closeout Requirements: Final cleaning.
- B. Flush entire system of foreign matter.

3.04 TESTING

- A. The installing contractor shall do the following:
 - 1. Notify the Fire Marshal, any other authority having jurisdiction and the Owner's authorized representative of the time and date testing will be performed.

2. Perform all acceptance tests required by Chapter 25 of NFPA 13; including hydrostatic tests, main drain test, system operational tests, backflow prevention assembly test and pressure reducing valve tests.
3. Complete and sign the appropriate Contractor's Material and Test Certificate, and forward Certificate(s) to the authority having jurisdiction.
4. The contractor shall coordinate with the Owner's insurance provider for a system inspection and approval and for the completion of the Contractor's Material Test Certificate (CMTC).

3.05 OCCUPANCY CLASSIFICATIONS

<u>Location</u>	<u>Occupancy Classification</u>
Institutional	Light Hazard
Educational	Light Hazard
Offices	Light Hazard
Janitor Closets	Ordinary Hazard, Group 1
Mechanical Rooms	Ordinary Hazard, Group 1
Electrical Rooms, with Dry Type Transformers	Ordinary Hazard, Group 1
Electrical Rooms, with Liquid-Filled Transformers	Ordinary Hazard, Group 2
Miscellaneous Storage Rooms (with storage height up to 12')	Utilize the design criteria and appropriate protection criteria and density curves of NFPA 13, Chapter 13.

END OF SECTION

SECTION 22 00 01 – BASIC PLUMBING REQUIREMENTS

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Basic Plumbing Requirements specifically applicable to each Division 22 Section, in addition to Division 1 - General Requirements.

1.02 REFERENCES

- A. All references in Division 22 to codes, standards or other publications shall be the latest edition/version, unless noted otherwise.

1.03 PLANS

- A. These specifications are accompanied by plans indicating typical layouts, pipe and equipment location, etc. The plans and these specifications are complimentary each to the other and what is called for by one shall be as binding as if called for by both. Should there be a conflict between drawings and specifications regarding a material shown of work described or detailed then the material of work having the greater value shall be provided.
- B. The plans as prepared are in general diagrammatic. The contractor shall carefully lay out his work at the site to conform to the architectural, mechanical, electrical and structural conditions to provide grading of piping, to avoid all obstructions and to conform to details of installation as shown on the plans and supplied by the manufacturers of the equipment to be installed, and thereby to provide an integrated satisfactorily operating installation. **The General Contractor must coordinate the work of all trades.** All necessary offsets in piping, fittings, ductwork, etc. required to avoid interferences between piping, equipment, structural and architectural work are not shown but shall be furnished and installed by the contractor without additional expense to the Owner.
- C. These specifications and plans accompanying same are intended to cover systems which will not interfere with the design of the building, which will fit into the available spaces, and which will insure complete and satisfactory systems. Each contractor shall, therefore, carefully examine the plans and the building and shall be responsible for the proper fitting of his material and apparatus into the building.
- D. The size of plumbing equipment indicated on the plans is based on the dimensions of a particular manufacturer. While other manufacturers may be acceptable, it is the responsibility of the Contractor to determine if the equipment he proposes to furnish will fit in the space with the manufacturer's recommended clearances allocated for same on the plans. It shall be the Contractor's responsibility to furnish data to evidence that sufficient space can be provided for the installation of proposed equipment and that adequate access will exist for servicing and maintenance of equipment. Should changes become necessary during construction, the contractor shall make such necessary changes at his (the Contractor's) own expense.
- E. Exceptions and inconsistencies in plans and specifications shall be brought to the Architect's attention no later than ten (10) days prior to the bid date, unless specified otherwise in Division 1. Otherwise, the Contractor shall be responsible for any and all changes and additions that may be necessary to accommodate his particular apparatus

or equipment.

1.04 CHANGES

- A. Any changes from the plans necessary to make this work conform to the building as it is constructed, to make this work fit the work of other trades or to make this work conform to the rules of city and municipal bodies having jurisdiction shall be made by this contractor at no additional cost to the Owner. However, no changes shall be made from the work described on the plans and these specifications except on written order from the Architect.
- B. If any changes are required other than those mentioned above and the changes involve extra work on the part of the contractor, no charges for this extra work shall be allowed unless authorized in advance of the work by a written order from the Owner and/or Architect stating the charges to be made for the work.
- C. Proposed use of item or equipment other than that specified or indicated may require redesign of structure, partitions, foundations, piping, wiring, or other parts of mechanical, electrical, or architectural layout. Redesign, new drawings, and detailing required shall be prepared and submitted to Architect/Engineer for approval.
- D. Where approved deviation requires different quantity, size and arrangement of wiring, conduit, equipment, etc. from that specified or indicated; provide such items and all other additional equipment required by system at no additional cost to the Owner.

1.05 DELIVERY, STORAGE AND HANDLING

- A. Protection:
 - 1. All work, equipment and materials shall be protected at all times to prevent damage or breakage either in transit, storage, installation or testing. All openings shall be closed with caps or plugs during installation.
 - 2. Equipment and material placed on the job site shall remain in the custody of the Contractor until phased acceptance, whether or not the owner has reimbursed the Contractor for the equipment and material. The Contractor is solely responsible for the protection of such equipment and material against any damage.
 - 3. Damaged equipment or material shall be replaced with new as determined and directed by the Architect or Engineer. In particular, piping insulation which becomes saturated will be rejected and must be removed from the job site. Such repair or replacement shall be at no additional cost to the Owner.
 - 4. Protect interiors of new equipment and piping systems against entry of foreign matter. Clean both inside and outside before painting or placing equipment in operation.
 - 5. Existing equipment and piping being worked on by the Contractor shall be under the custody and responsibility of the Contractor and shall be protected as required for new work.
- B. Cleanliness of Piping and Equipment Systems:

1. Exercise care in storage and handling of equipment and piping material to be incorporated in the work. Remove debris arising from cutting, threading and welding of piping.
2. Piping systems shall be flushed, blown or pigged as necessary to deliver clean systems.
3. Clean interior of all tanks prior to delivery for beneficial use by the Owner.
4. Boilers shall be left clean following final internal inspection by the inspector.
5. Contractor shall be fully responsible for all costs, damage, and delay arising from failure to provide clean systems.

1.06 SUBSTITUTIONS

- A. The materials, products and equipment described and specified establish a standard of quality, function, dimension and appearance to be met by any proposed substitutions.
- B. Reference Section 01 60 00 – Product Requirements.
- C. Substitution requests are only required where specific manufacturers are listed or scheduled.

1.07 SUBMITTALS

- A. Submit under provisions of Section 01 33 00.
- B. The Contractor shall furnish copies of the manufacturer's literature and drawings describing all proposed equipment and materials indicated in the specifications. The proposed use of the exact equipment and materials specified shall not change this requirement of including literature describing the proposed equipment. Manufactured items proposed for use, whether specified or proposed for substitution, shall be the current, catalogued product of the manufacturer, and replacement parts shall be available.
- C. Manufacturer's regular catalog sheets will not be acceptable under this requirement unless they indicate completely all of the specification requirements. Where drawings cover several sizes or types of construction they shall clearly indicate the size or type of construction to be used on the project. In cases where several sizes of the same type of equipment are required to be furnished, the submittal shall include a schedule identifying each piece of equipment, complete with all capacity information needed to compare every submitted item with its respective specified item. **Annotate all submittal data to indicate exact model, size, and type submitted.**
- D. Brochures shall contain a certification that the equipment or materials are suitable for conditions shown and specified; that the equipment or materials are believed to be in conformity with the plans and specifications, except as may be specifically described and that approval is recommended. The certification shall be signed by the Contractor. Brochures received not in conformity with these requirements will be returned for required actions. Any deviation from the requirements of the specifications shall be clearly noted and marked for the Engineer's consideration.
- E. Approval of the brochures, or any part of the contents therein, shall not eliminate

responsibility for compliance with the plans and specifications, unless specific attention has been called in writing to proposed deviations at the time of transmittal of the brochures and such deviations have been approved, nor shall it eliminate the requirements or the responsibilities, if there are errors of any sort in the data submitted.

1.08 INTERFERENCES AND COOPERATION

- A. The plans are generally diagrammatic and the Contractor shall coordinate the work of the different trades so that interferences between piping, equipment, structural and architectural work will be avoided. Not all offsets in piping, ductwork, etc., are shown. The Contractor shall cooperate with the General Contractor and all other contractors to coordinate their work to avoid interferences and delays and arrange all parts of the work to harmonize in service and appearance with all other parts.
- B. The General Contractor shall coordinate the work of all trades. The various systems to be installed shall follow the normal, common sense priority of systems installation with the highest system to lowest system installation as follows:
1. HVAC ductwork shall be installed up and against building (floor/roof) structural members.
 2. Sanitary waste and storm drainage piping system shall begin horizontal routing as high as possible between structural members, offsetting vertically only to avoid conflict with structure or to drop below HVAC ductwork where offset is unavoidable.
 3. Electrical conduit shall be installed up, and against building structure, running parallel with HVAC ductwork and offsetting up into structural bay (void) or below HVAC ductwork to obtain a change in direction or branch take-off. Electrical conduit installation shall not control or dictate the routing or installation of the HVAC ductwork storm drain piping or sanitary waste and vent piping.
 4. Domestic water piping (hot water, cold water and hot water return), medical gas piping and HVAC piping shall be installed beside and below the HVAC ductwork and electrical conduit. Preferred installation shall be on trapeze, wall brackets, or racked on vertical channel on the wall above the ceiling line. The completed installation shall not conflict with the installation or removal of ceiling system components or tile. All main and branch take-off isolation valves, strainers, sensors and other plumbing equipment shall be readily identifiable and accessible from a standing position on a step ladder, no more than 18 inches above ceilings.
 5. Fire sprinkler piping system shall be installed below all other systems and components, unless noted otherwise or as coordinated with all other trades. The fire sprinkler piping shall not conflict with the installation or removal of ceiling system components or tile. The fire sprinkler system piping layout and installation shall be coordinated by the fire sprinkler contractor and the General Contractor with all other trades performing work in the affected area, to avoid conflict with the installation or removal of any other systems components, or to prevent ready access to valves, equipment of the other trades. Do not install sprinkler piping until ductwork mains are in place.
- C. Provide an overhead coordination submittal per Section 01 30 00. The submittal shall include all structural, plumbing, mechanical, electrical, and fire protection components.

1.09 MATERIALS AND WORKMANSHIP

- A. All materials shall be new, of the quality specified and free of any defects. Manufacturer's names are listed to establish a standard of quality and construction.
- B. The Contractor will be responsible for transportation of his materials to the job and for their storage and protection until the final acceptance of the job.
- C. Contractor shall furnish all necessary scaffolding, tackle, tools and appurtenances of all kinds and all labor required for the safe and expeditious execution of his contract.

1.10 PERMITS AND INSPECTIONS

- A. The Contractor will be responsible for all permits and inspections required by law for the completion of his work. Cost of all permits and inspections shall be paid for by the Contractor. The Contractor shall obtain and pay for all certificates of approval which must be delivered to the Architect before final acceptance of the job. All materials and labor furnished by the Contractor shall be in strict accordance with the rules and requirements of the National Board of Fire Underwriters, state and municipal regulations and other authorities who may have lawful jurisdiction over the work being done.
- B. Each contractor shall be responsible for coordinating their work with the General Contractor and scheduling AHJ required inspections through the General Contractor to allow inspections to be performed without impeding the progress of construction. Generally, the Contractor shall plan for inspections to occur two (2) weeks prior to the scheduled concealment of work in the area of inspection.

1.11 ENGINEERING DESIGN TEAM OBSERVATIONS

- A. Each contractor shall be responsible for coordinating their work with the General Contractor and scheduling progress observations through the General Contractor to allow for the following observations to be performed without impeding the progress of construction. Generally the Contractor shall plan for observations to occur two (2) weeks prior to the scheduled concealment of work in the area of observation.
- B. In general, observations for this project shall include but not be limited to:
 - 1. Exterior Below Grade: Site utilities and services.
 - 2. Interior Below Grade: Utilities, services and systems.
 - 3. Rough Wall: All utilities, services and systems in-place including wall studs, cross bracing, supports, etc. (No sheetrock or insulation).
 - 4. Corrected Rough Wall: (Before Sheetrock).
 - 5. Above Ceiling: All utilities, services and systems in place, labeling on exposed piping (No insulation on piping systems. Ceiling grid/channels may be installed but no sheetrock or ceiling tile).
 - 6. Above Ceiling Final: All utilities, services and systems complete including hangers, insulation, and labeling (ceiling grid and/or channel may be in place but no sheetrock or ceiling tile shall be installed).

7. Substantial Completion: All surfaces complete, fixtures installed and trim-out complete.
8. Final: Cleaned and ready for occupancy.

1.12 EXAMINATION OF SITE

- A. All Contractors submitting proposals for this work shall first examine the site and all conditions thereon and therein. All proposals shall take into consideration conditions as may affect the work under this contract. They shall satisfy themselves as to existing grades and the actual formation, and soil conditions.
- B. Contractors shall verify all service locations, depths, sizes, etc. No information given on the plans shall relieve the Contractor of this responsibility.
- C. Before starting work, the Contractor shall verify all associated existing systems, pipe sizes, locations, and dimensions so that the new systems can be properly connected as indicated on the documents.

1.13 QUALITY ASSURANCE

- A. Perform Work in accordance with all codes listed on the drawing sheets, the local authority having jurisdiction (AHJ), and the Architect/Engineer. As the minimum standard for the level of quality, in all cases the greater quantity or better quality shall be the first consideration for the basis of an acceptable product or process. The local authority having jurisdiction, the Architect and the Engineer shall have the final authority on the approval and/or use of any product or process specified or submitted for substitution. The greater quality and/or value specified herein for the system(s) and various components and installation procedures shall take precedence over the minimum requirements of the herein before mentioned codes.
- B. Equipment and Components: Bear UL, ASME, ANSI and/or NSF label or marking, as specified in appropriate Section.
- C. Valves: Provide manufacturer's name and pressure rating marked on valve body.
- D. Piping: All piping installed on this project shall bear the complete ASTM and Manufacturer's marking. Labeling and identification requirements as required by ASTM. All installed piping 5'-0" or greater in length shall be readily identifiable per ASTM labeling criteria. Piping not bearing this identification upon installation shall be removed and replaced by the correctly labeled piping. Piping shall not be re-stenciled after it is installed, to meet this requirement.
- E. Lead free components: All wetted surfaces of piping, fittings, valves and other products in contact with the potable water system shall be certified as lead free, as per current requirements of NSF/ANSI 61 and/or NSF/ANSI 372.
- F. Welding Materials and Procedures: Perform to ASME Code.

1.14 CONTROLS

- A. Where “automatic controls” are called for in the plans and specifications, all the control instruments, such as motorized valves, etc., shall be provided by the Contractor. The Drawings may show some power connections to controls equipment; however, if more power is required, then the Contractor shall provide this power.

1.15 UNIONS

- A. No unions are to be placed in any pipe in a location which will be concealed or inaccessible after completion of the building unless furnished with an access panel either as shown on the drawings or as specified herein. Unions must be installed on each side of all pieces of equipment such as water heaters, water softeners, thermostatic mixing valves, flow regulators, pumps, etc., so that such equipment may be readily disconnected in location that equipment can be disconnected and removed.

1.16 ARRANGEMENT AND INSTALLATION OF EQUIPMENT AND PIPING

- A. Coordinate location of piping, sleeves, inserts, hangers, ductwork and equipment. Locate piping, sleeves, inserts, hangers and equipment clear of windows, doors, openings, light outlets, and other services and utilities. Prepare equipment layout drawings to coordinate proper location and personnel access of all facilities. Follow manufacturer's published recommendations for installation methods not otherwise specified.
- B. Operating Personnel Access and Observation Provisions: Select and arrange all equipment and systems to provide clear view and easy access, without use of portable ladders, for maintenance and operation of all devices including, but not limited to: all equipment items, valves, filters, strainers, transmitters, sensors, control devices. All gages and indicators shall be clearly visible by personnel standing on the floor or on permanent platforms. Do not reduce or change maintenance and operating space and access provisions that are shown on the drawings.
- C. Equipment and Piping Support: Coordinate structural systems necessary for pipe and equipment support with pipe and equipment locations to permit proper installation.
- D. Location of pipe sleeves, trenches and chases shall be accurately coordinated with equipment and piping locations.
- E. Minor Piping: Generally, small diameter pipe runs from drips and drains, water cooling, and other service are not shown but must be provided.
- F. Electrical and Pneumatic Interconnection of Controls and Instruments: This is generally not shown but must be provided. This includes interconnections of sensors, transmitters, transducers, control devices, control and instrumentation panels, instruments and computer workstations. Comply with NFPA-70.
- G. Install gages, thermometers, valves and other devices with due regard for ease in reading or operating and maintaining said devices. Locate and position thermometers and gages to be easily read by operator or staff standing on floor or walkway provided. Servicing shall not require dismantling adjacent equipment or pipe work.
- H. Work in Existing Building: Cut required openings through existing masonry and reinforced concrete using diamond core drills. Use of pneumatic hammer type drills, impact type electric drills, and hand or manual hammer type drills, will be permitted only with approval of the Owner. Locate openings that will least effect structural slabs, columns, ribs or beams. Refer to Cutting and Patching article in Part 3 of this section.

1.17 TEMPORARY PIPING AND EQUIPMENT

- A. Continuity of operation of existing facilities may require temporary installation or relocation of equipment and piping. Temporary equipment or pipe installation or relocation shall be provided to maintain continuity of operation of existing facilities, when required by the phasing or called for specifically on the plans.
- B. The Contractor shall provide all required facilities in accordance with the requirements of phased construction and maintenance of service. All piping and equipment shall be properly supported, sloped to drain, operate without excessive stress, and shall be insulated where injury can occur to personnel by contact with operating facilities.
- C. When construction is complete, temporary facilities and piping shall be completely removed back to the nearest active distribution branch or main pipe line and any openings in structures sealed. Dead legs in potable water systems will not be allowed. Provide necessary blind flanges and caps to seal open piping remaining in service.

1.18 UTILITIES

- A. The Contractor shall coordinate work and arrange and pay for any necessary revisions to existing utility services, including meter deposits and connection fees to all serving utility companies and shall install utilities, where applicable.
- B. The Contractor shall be responsible for all costs associated with the extension of utilities to the Building, including but not limited to natural gas, domestic water, sanitary sewage and storm drain piping.
- C. The Contractor shall be responsible for gathering all information required by the connecting utility service provider (i.e. drawings, load information, completing and submitting required forms, etc.) The contractor may utilize the design team to obtain information, however, the contractor is responsible for submitting all required documentation to the utility provider. This includes, but is not limited to, new gas service, medium pressure gas request forms, water meter sizing forms, etc.).
- D. The Contractor shall provide the utility service provider a date that the utility connection is needed. This date shall be coordinated with the utility service provider to take into consideration the design time and mobilization.

1.21 INDOOR AIR QUALITY CONTROL:

- A. All Adhesives, sealants, paints, coatings applied within the weatherproofed interior of the building shall comply with applicable VOC thresholds of SCAQMD 1113 and 1168.

PART 2 PRODUCTS

2.01 FACTORY-ASSEMBLED PRODUCTS

- A. Provide maximum standardization of components to reduce spare part requirements.
- B. Manufacturers of equipment assemblies that include components made by others shall assume complete responsibility for final assembled unit.
 - 1. All components of an assembled unit need not be products of same

manufacturer.

2. Constituent parts that are alike shall be products of a single manufacturer.
 3. Components shall be compatible with each other and with the total assembly for intended service.
 4. Contractor shall guarantee performance of assemblies of components, and shall repair or replace elements of the assemblies as required to deliver specified performance of the complete assembly.
- C. Components of equipment shall bear manufacturer's name and trademark, model number, serial number and performance data on a name plate securely affixed in a conspicuous place, or cast integral with, stamped or otherwise permanently marked upon the components of the equipment.
- D. Major items of equipment, which serve the same function, must be the same make and model. Exceptions will be permitted if performance requirements cannot be met.

2.02 COMPATIBILITY OF RELATED EQUIPMENT

- A. Equipment and materials installed shall be compatible in all respects with other items being furnished and with existing items so that the result will be a complete and fully operational system that conforms to contract requirements.

2.03 ESCUTCHEONS AND PLATES

- A. Where pipes pass through ceilings (any type: i.e. lay-in, gypsum, etc.) or walls in finished spaces, install sectional plates or escutcheons to cover the annular opening between pipe and sleeve. Solid plates with set screws shall be used where the sectional plates will not stay in place or are not available in the required size, or where other individual specification section(s) require one piece or greater quality escutcheons or plates.
- B. Inside diameter of escutcheons shall fit around insulation and around pipe when not insulated; outside diameter shall cover sleeve. Secure escutcheons or plates to pipe or sleeve but not to insulation. All escutcheons shall be triple nickel-chromium plated brass, or type 316L stainless steel.

2.04 INSULATION

- A. All insulation materials used inside the building on this project, including finishes and adhesives on the exterior surfaces of ducts, pipes and equipment shall have a flame spread rating of 25 or less and a smoke developed rating of 50 or less as determined by an independent testing laboratory in accordance with NFPA 255 as required by NFPA 90A, unless noted otherwise acceptable.

2.05 SOLENOID VALVES

- A. All solenoid valves used in piping systems shall be the slow acting type.

2.06 ASBESTOS

- A. Materials containing asbestos are not permitted.

- B. If any asbestos-containing material is discovered or suspected, the contractor shall immediately cease any and all work in that area. Cover the exposed material in plastic containment without disturbing the exposed material and notify the Architect and the Owner's representative.
- C. Certify in writing that neither the Contractor nor any of Contractor's subcontractors or suppliers will supply any materials that contain any asbestos in any form for this Project.

PART 3 EXECUTION

3.01 ACCESS PANELS

- A. All valves, traps, drains, cleanouts, equipment, etc., must be accessible. The Contractor shall, wherever required to service his installation, coordinate size and location of access panels with General Contractor. Refer to Section 08 31 13 – Access Doors and Frames.

3.02 FIRESTOPPING

- A. Firestopping: Unused slots, sleeves and other penetrations in floors, walls or other general construction shall be closed and sealed with an approved firestopping material.
 - 1. Reference Section 07 84 00 – Firestopping for appropriate firestopping material and method of installation required for each wall rating and penetration size and type to comply with the appropriate UL listing.
 - 2. Floor slots and openings shall be closed with 16 gauge galvanized steel sheet supported on 1-inch by 1-inch by 1/8-inch structural angle drilled or supported with powder-driven studs into the building structure. Firestop with a layer of silicone elastomer not less than 1-inch thick which completely fills the opening. The top surface of the silicone elastomer shall be approximately 1-inch below the finished floor slab.
 - 3. Openings in walls shall be closed with 16 gauge galvanized steel sheet securely attached at the midpoint of the wall thickness and firestopped on both sides of the steel sheet with not less than 1/8-inch thick layer of non-sagging silicone elastomer to fully cover the opening.
 - 4. Single or multiple pipes passing through walls and floors shall have the annular space between pipes or between pipes and structure filled with silicone elastomer to provide a rated firestop (rated to match the assembly) for floors and walls.
- B. The annulus between exposed pipe and walls or floors in finished spaces shall be refilled, sealed and painted to match adjacent surfaces.
- C. Future Slots: Cap ends of sleeve and mark as future.

3.03 PAINTING

- A. Types of paint shall be as specified in the Architectural specifications. Surfaces to be painted are identified in Section 09 90 00 and on the drawings. All exposed gas piping shall be painted as noted in Section 22 11 23.
- B. All surfaces to be painted shall be thoroughly cleaned, all rust scraped off and all oil and

grease removed before any paint is applied.

- C. Finishing paint coats shall not be applied until all the work is completed. Cloths shall be spread where necessary to prevent drops of paint, oil, etc. from defacing walls, floors, etc., and the Contractor shall be held responsible for all damage by neglect of such precautions. The finished conditions of the painting shall be subject to the approval of the
- D. Architect, who may require retouching or repainting of surfaces not properly finished.

3.04 PRODUCTS NOT FURNISHED BUT INSTALLED UNDER DIVISION 22.

- A. Rough-in for and make final connection to Owner furnished fixtures and equipment requiring plumbing services.
- B. Rough-in for and make final connection to fixtures and equipment furnished under other divisions of these Contract Specifications requiring plumbing services.

3.05 EXCAVATING AND BACKFILLING

- A. The Contractor shall do all excavating and backfilling necessary for the installation of the work, including shoring, bailing and pumping to maintain his trenches and keep them in dry condition until the work in question has been tested and approved.
- B. Care shall be taken that piping is properly and uniformly graded and that trench beds are well rammed and that ground under pipelines is firm and secure before piping is laid. All trenches must be backfilled with clean sand, four inches under pipe, rammed down, soaked with water and made solid. All surplus material shall be removed and carted away.
- C. The Contractors will be responsible for resurfacing all areas after trenches have been backfilled.
- D. The Contractor is directed to comply with all OSHA Requirements and State Requirements regarding trench safety.
- E. Perform all work with the highest regard to safety and in accordance with U.S. 29 CFR 1926 "Safety and Health Regulations for Construction". Special attention shall be directed to Subpart P – Excavations. Refer also to 230010.1.12 – Safety.

1. Safety Precautions and Programs

- a. In excavations that are four (4) feet or more in depth, means of egress shall be provided by stairway, ladder, ramp or other safe means so as to require no more than twenty-five (25) feet of lateral travel for employees.
- b. In addition, on projects in which trench excavation will have a depth of five feet or more, the Contractor, and all of their subcontractors, shall comply with all requirements of 29 CFR 1926 Subpart P 652 "Safety and Health Regulations for Construction – Excavations" and all Appendices related thereto.
- c. Before commencing any trench excavation that will be five (5) feet deep or deeper, provide Owner, through A/E, with detailed plans and specifications regarding the safety systems to be utilized. Said plans and specifications shall include a certification from a registered professional engineer indicating full compliance with the 29 CFR 1926 Subpart P --

- Excavations.
- d. Contractor shall ascertain, prior to proposal, whether or not such conditions prevail and services are needed, and shall include cost of same in proposal.
- 2. All shoring and bracing shall be designed so that it is effective to the bottom of the excavation. Sheeting, sheet piling, bracing, shoring, trench boxes, and other methods of protection, including sloping, shall be based upon the condition and nature of the materials to be retained, and by loads (including surcharge) imparted to the sides of excavation by equipment and stored materials.
 - 3. Store excavated or other materials a minimum of two feet (2') from the edge of any excavation. Retain such materials to prevent their falling or sliding into the excavation, and to prevent excessive pressure on the sides of the excavation.
 - 4. Maintain sides and slopes of excavations in a safe condition by scaling, benching or barricading.
 - 5. Take other precautions via shoring and bracing to prevent slides or cave-ins. Take special precautions when trenches are located adjacent to backfilled excavations, or subjected to vibrations from railroads, highway traffic, operation of machines, etc.
- F. Verify locations of all existing utilities in the area prior to start of excavation (gas, electrical, water, sanitary, storm, telephone, cable TV, optical cable, etc.). Coordinate with utility companies as required.
- 1. Excavation within four feet (4') of existing utilities shall be done by hand digging only.
- G. Where conditions require concrete or other materials to be placed against undisturbed earth surfaces, any loosened or disturbed materials shall be removed from such surfaces.
- H. Trenching
- 1. Trenches shall be large enough to permit handling of pipe and accessories and making connections. For cast iron pipe installation, trench bottom width shall exceed bell or coupling diameters by at least twelve inches (12").
 - 2. Trenches in rock, soil containing rocks larger than two (2) inches in any dimension, and other non-uniform materials, shall be four (4) inches minimum and twelve inches (12") maximum below the bottom of the pipe to provide for a bedding course.
- I. Preparation of Trench Bottom
- 1. If the excavation is carried below the finished flow line grade of the pipe in order to remove unsuitable material or for any other reason, the trench shall be course bedded to within six inches (6") of the finished flow line grade of the pipe bottom with compacted load-bearing backfill. A bedding course as specified below shall then be placed over the load-bearing backfill.
 - 2. Trenches shall be dry when the trench bottom is prepared. A continuous trough

with compacted bedding course shall be prepared to receive the bottom quadrant of the pipe barrel. Remove loose or disturbed material and bring the trench bottom up to grade with bedding material as follows:

- a. For active soils where metallic piping is used, washed pea gravel with material no larger than 1/2 inch in largest dimension shall be utilized. Provide a Bentonite plug in the trench at the building perimeter where site drainage or other conditions could permit water intrusion into the trench under the building. Bentonite plug to extend 2 ft. on either side of the perimeter grade beam. (Sand bedding material may be substituted beyond ten (10) feet from building line only.)
 - b. NOTE: Confirm soil conditions prior to trenching. In general, soils with a plasticity index (PI) over 10 at depths to be encountered are considered active. Refer to Geotechnical Report included in project Specifications for PI value and additional information.
3. In addition, for bell joint pipe, excavation for the bell or coupling shall be so that the pipe will bear on the trench bottom along the entire length of the barrel.
 4. Prepare the trench bottom carefully so that when placed in its final position, the pipe will be true to line and grade and uniformly supported.

J. Laying Pipe

1. All pipe shall be clean at the time it is placed in the line. Open ends of pipe sections already in place shall be tightly plugged to prevent the entrance of trench water, mud, dirt, etc.
2. Keep trench bottom free of frost, frozen earth or standing water at the time of pipe laying and jointing.

K. Compaction

1. Where compaction is indicated by specifications, accomplish same with vibratory or rammer type compactor, minimum of two full width passes.
2. Compaction below slabs, roads, flatwork, or other construction elements shall be performed to the requirements of compaction for those elements. Coordinate with general construction trades and other Division's specifications.

L. Backfilling

1. Clean trenches and backfill material of any organic material, roots, trash, lumber, other debris and frozen material prior to backfilling. Backfill material shall contain no organic material, roots, trash, lumber, other debris or frozen material. Backfill material under slabs inside building shall match adjacent materials and be of density acceptable to the A/E.
2. Backfilling by means of sluicing or flooding with water is not permitted. Backfill shall not be placed on frozen ground.
3. Partially backfill immediately after the pipe is laid (unless other methods for anchoring pipe are provided). Leave joints exposed for hydrostatic testing. Water shall not be permitted to rise in unbackfilled trenches after pipe has been placed.

4. Whenever timber or other sheeting is driven to a depth below the elevation of the top of the pipe, that portion of the sheeting below a point four feet above the elevation of the top of the pipe shall not be disturbed or removed.
 5. Pipe layer backfill (bedding material under the bottom quadrant of the pipe, around sides, and up to a point one foot above the top of the pipe) shall be: sand or select material containing rocks no larger than 1/2 inch in greatest dimension (sand only shall be used with all plastic piping systems or plastic jacketed piping systems); except that pipe layer backfill below slabs in active soils shall be washed pea gravel of 1/2 inch minus dimensions. Backfill below slabs may utilize flowable fill.
 6. Backfill material shall be placed and compacted in six inch (6") layers. Backfill shall be brought up evenly on both sides of the pipe simultaneously to avoid damage or displacement from unbalanced loading.
 7. Joints shall not be covered with backfill until pressure and leak testing is completed.
 8. Backfill to grade (above pipe layer).
 - a. Active Soils: Where active soils are encountered backfill to grade within ten (10) feet of building line shall be uncompacted washed pea gravel to match the pipe layer backfill specified above.
- M. The Contractor shall also comply with requirements set forth in Division 31 Drawings and Specifications.

3.06 RIGGING

- A. Design is based on application of available equipment. Openings in building structures are planned to accommodate design scheme.
- B. Alternative methods of equipment delivery may be offered by Contractor and will be considered by Government under specified restrictions of phasing and maintenance of service as well as structural integrity of the building.
- C. Close all openings in the building when not required for rigging operations to maintain proper environment in the facility for Owner operation and maintenance of service.
- D. Contractor shall provide all facilities required to deliver specified equipment and place on foundations. Attachments to structures for rigging purposes and support of equipment on structures shall be Contractor's full responsibility.
- E. Contractor shall check all clearances, weight limitations and shall offer a rigging plan designed by a Registered Professional Engineer. All modifications to structures, including reinforcement thereof, shall be at Contractor's cost, time and responsibility.
- F. Restore building to original condition upon completion of rigging work.

3.07 CLOSE OUT DOCUMENTATION AND TESTING REPORTS

- A. Contractor shall provide Project Record Documents, Operation and Maintenance data

and all product warranty data as specified in Section 01 70 00.

- B. Contractor shall also provide copies of all plumbing system test and certification reports for inclusion in project close out documents. Reports shall include, but shall not be limited to, the following:
1. Piping system pressure test reports (per Sections 22 11 00, 22 11 23, 22 13 00 and 22 14 00),
 2. Domestic water disinfection tests (per Section 22 11 00),
 3. Backflow prevention assembly certifications (per Section 22 11 00),
 4. Domestic hot water systems tests (per Section 22 11 00),
 5. Medical Gas system verification tests (per Section 22 60 13).

END OF SECTION

SECTION 22 05 29 – HANGERS AND SUPPORTS FOR PLUMBING PIPING AND EQUIPMENT

PART 1 GENERAL

1.01 SUMMARY

- A. Perform all Work required to provide and install supports, hangers, anchors, sleeves and bases for all plumbing piping, equipment, system components and accessories, indicated by the Contract Documents with all supplementary items necessary for complete, code compliant and approved installation.
- B. Section Includes:
 - 1. Pipe hangers and supports.
 - 2. Accessories.
 - 3. Flashing.
 - 4. Sleeves.
 - 5. Mechanical sleeve seals.
 - 6. Formed steel channel.
 - 7. Equipment bases (housekeeping pads).
- C. Related Sections:
 - 1. Section 03 10 00 – Concrete Forming and Accessories: Execution requirements for placement of inserts and sleeves in concrete forms specified by this section.
 - 2. Section 03 30 00 – Cast-In-Place Concrete: Execution requirements for placement of concrete housekeeping pads specified by this section.
 - 3. Section 07 84 00 – Firestopping: Product requirements for firestopping for placement by this section.
 - 4. Section 07 90 00 – Joint Protection: Product requirements for sealant materials for placement by this section.
 - 5. Section 22 00 01 – General Plumbing Requirements.
 - 6. Section 22 05 48 – Vibration Controls for Plumbing Piping and Equipment.
 - 7. Section 22 11 00 – Facility Water Distribution: Execution requirements for placement of hangers and supports specified by this section.
 - 8. Section 22 13 00 – Facility Sanitary Sewerage: Execution requirements for placement of hangers and supports specified by this section.
 - 9. Section 22 14 00 – Facility Storm Drainage: Execution requirements for placement of hangers and supports specified by this section.
 - 10. Section 22 17 00 – Facility Natural Gas Piping: Execution requirements for

placement of hangers and supports specified by this section

1.03 DEFINITIONS

- A. Firestopping (Through-Penetration Protection System): Sealing or stuffing material or assembly placed in spaces between and penetrations through building materials to arrest movement of fire, smoke, heat, and hot gases through fire rated construction.

1.04 SUBMITTALS

- A. Section 01 33 00 – Submittal Procedures: Submittal procedures.
- B. Product Data: Submit manufacturers catalog data including load capacity of hangers and supports.
- C. Design Data: Indicate load carrying capacity of trapeze, multiple pipe, and riser support hangers. Indicate calculations used to determine load carrying capacity of trapeze, multiple pipe, and riser support hangers.
- D. Shop Drawings: Indicate system layout with location including critical dimensions, sizes, and pipe hanger and support locations and detail of trapeze hangers.
- E. Manufacturer's Installation Instruction: Submit special procedures and assembly of hanger and support components.
- F. UL/FM assembly sheets or WH assembly sheets for fire rated penetrations.

1.05 QUALIFICATIONS

- A. Manufacturer: Company specializing in manufacturing Products specified in this section with minimum three (3) years of documented experience.
- B. Installer: Company specializing in performing Work of this section with minimum 3 years of documented experience.

1.06 DELIVERY, STORAGE AND HANDLING

- A. Section 01 60 00 – Product Requirements: Requirements for transporting, handling, storing and protecting products.
- B. Accept materials on site in original factory packaging, labeled with manufacturer's identification.
- C. Protect from weather and construction traffic, dirt, water, chemical, and damage, by storing in original packaging.

1.07 ENVIRONMENTAL REQUIREMENTS

- A. Section 01 60 00 – Product Requirements: Environmental conditions affecting products on site.

1.08 FIELD MEASUREMENTS

- A. Verify field measurements prior to fabrication.

- B. Contractor shall review all drawings, including structural drawings, for details regarding pipe supports, housekeeping pads, anchors, hangers, and guides.

1.09 WARRANTY

- A. Section 01 70 00 – Execution and Closeout Requirements: Product warranties and product bonds.

PART 2 PRODUCTS

2.01 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.
- B. Refer to individual system and equipment Specification Sections for additional support requirements. Comply with MSS SP-69 for support selections and applications that are not addressed within these Specifications.
- C. Utilize hangers and supports to support systems under all conditions of operation, allowing free expansion and contraction, and to prevent excessive stresses from being introduced into the structure, piping or connected equipment.
- D. All pipe supports shall be of the type and arrangement to prevent excessive deflection, to avoid excessive bending stresses between supports, and to eliminate transmission of vibration.
- E. Design hangers to impede disengagement by movement of supported pipe.
- F. Install building attachments within concrete slabs or attach to structural steel. Space attachments within maximum piping span length indicated in MSS SP-69. Install additional attachments at concentrated loads, including valves, flanges, guides, strainers, and expansion joints, and at changes in direction of piping.
- G. Wire or perforated strap iron will not be acceptable as hanger material.
- H. Hanger rods shall be threaded on both ends, threaded one end, or continuous threaded, complete with adjusting and lock nuts.
- I. Fasteners requiring explosive powder (shooting) or pneumatic-driven actuation will not be acceptable under any circumstances.
- J. Nail drive anchors, plastic anchors or plastic expansion shields will not be permitted under any circumstances.
- K. Each hanger shall be properly sized to fit the supported pipe or fit the outside of the insulation on lines, hangers shall not penetrate insulation. Hangers shall bear on the outside of the insulation, which shall be protected by support shields as specified. For piping larger than 2", protect insulation from crushing by means of a section of rigid insulation to be installed at hanger points. Refer to Section 22 07 00.

- L. Hangers and clamps supporting and contacting individual non-insulated brass or copper lines shall be copper or copper plated. Support individual non-insulated brass or copper lines 4 inches and smaller with adjustable swivel ring hangers. Where non-insulated brass or copper lines are supported on trapeze hangers or channels, the pipes shall be isolated from these supports with approved flexible elastomeric/thermoplastic isolation cushion material to completely encircle the piping and avoid contact with the channel or clamp. Plastic tape is not acceptable.
- M. Hangers and clamps supporting and contacting plastic piping shall be in accordance with the piping manufacturer's published recommendations and shall be factory coated or padded to prevent damage to piping.
- N. Field fabricated supports shall be constructed from ASTM A36/A36M, steel shapes selected for loads being supported. Weld steel according to AWS D-1.
- O. Provide adjustable spring type hangers/isolators on all pipe hangers on the first 15 feet of pipe entering the building and where piping offsets vertically from one floor level to another.
- P. Provide adjustable spring type vibration isolation hangers for piping connected to isolated equipment (i.e. pumps, etc.). Refer to Section 22 05 48.
- Q. Finishes:
 - 1. All ferrous hangers, rods, inserts, clamps, stanchions, and brackets on piping within interior non-corrosive environments, shall be dipped in Zinc Chromate Primer before installation. Rods may be galvanized, or cadmium plated after threading, in lieu of dipping zinc chromate.
 - 2. All hangers and supports exposed to the weather, including roofs and building crawl space areas, shall be galvanized or manufactured from materials that will not rust or corrode due to moisture. All hangers and supports located within corrosive environments shall be constructed from or coated with materials manufactured for installation within the particular environment.
- R. Trapezes: Where multiple lines are run horizontally at the same elevation and grade, they may be supported on manufactured channel, suspended on rods or pipes. Trapeze members including suspension rods shall be properly sized for the quantity, diameters, and loaded weight of the lines they are to support.
- S. Vertical Piping:
 - 3. Supports for vertical riser piping in concealed areas shall utilize double bolt riser clamps, with each end having equal bearing on the building structure at each floor level.
 - 4. Supports for vertical riser piping at floor levels in exposed areas (such as fire protection standpipe in stairwells) shall be attached to the underside of the penetrated structure utilizing drilled anchors, two hanger rods (sized as specified), and socket clamp with washers.
 - 5. Two-hole rigid pipe clamps or four-hole socket clamps with washers may be used to support pipe directly from adequate structural members where floor-to-floor distance exceeds required vertical support spacing and lines are not subject to expansion and contraction.

- T. Fixture and Equipment Service Piping:
1. Piping at local connections to plumbing fixtures and equipment shall be supported to prevent the weight of the piping from being transmitted to fixtures and equipment.
 2. Makeshift, field-devised methods of plumbing pipe support, such as with the use of scrap framing materials, are not allowed. Support and positioning of piping shall be by means of engineered methods that comply with IAPMO PS 42-96. These shall be Holdrite support systems, BASSET or Owner-approved equivalent.
 3. Supports within chases and partitions shall be corrosion resistant metal plate, clamps, angles or channels, and aligned with structure in the vertical or horizontal position. Plastic supports are not allowed unless approved by Owner.
 4. Horizontal supports within chases and partitions that are attached to studs shall be attached at both ends. Drywall shall not be relied upon to support the piping.
 5. Supports for plumbing fixture water service piping within chases and partitions may be attached to cast iron drain and vent pipe with approved brackets and pipe clamps.
 6. Piping exposed on the face of drywall shall be supported with corrosion resistant metal channels that are attached to wall studs. Drywall shall not be relied upon to support the piping.
 7. Piping supported from the floor shall utilize corrosion resistant metal channels or brackets that are anchored to the floor slab.

2.02 PIPE HANGERS AND SUPPORTS

- A. Plumbing Piping – DWV / Storm Drain:
1. Conform to ASTM F708, MSS SP58, MSS SP69, MSS SP89.
 2. Hangers for Pipe Sizes 1/2 to 1-1/2 inch: Malleable iron or Carbon steel, adjustable swivel, split ring.
 3. Hangers for Pipe Sizes 2 inches and Larger: Carbon steel, adjustable, clevis.
 4. Multiple or Trapeze Hangers: Steel channels with welded spacers and hanger rods.
 5. Wall Support for Pipe Sizes 3 inches and Smaller: Cast iron hook.
 6. Wall Support for Pipe Sizes 4 inches and Larger: Welded steel bracket and wrought steel clamp.
 7. Vertical Support: Steel riser clamp.
 8. Floor Support: Cast iron adjustable pipe saddle, lock nut, nipple, floor flange, and concrete pier or steel support.
 9. Copper Pipe Support: Copper-plated, carbon-steel adjustable, ring.
 10. Crawl Space: Hangers and accessories shall be hot-dipped galvanized.
- B. Plumbing Piping – Water, Natural Gas, Medical Gases.

1. Conform to ASTM F708, MSS SP58, MSS SP69, MSS SP89.
2. Hangers for Pipe Sizes 1/2 to 1-1/2 inch: Malleable iron or Carbon steel, adjustable swivel, split ring.
3. Hangers for Cold Pipe Sizes 2 inches and Larger: Carbon steel, adjustable, clevis.
4. Hangers for Hot Pipe Sizes 2 to 4 inches: Carbon steel, adjustable, clevis.
5. Hangers for Hot Pipe Sizes 6 inches and Larger: Adjustable steel yoke, cast iron roll, double hanger.
6. Multiple or Trapeze Hangers: Steel channels with welded spacers and hanger rods.
7. Multiple or Trapeze Hangers for Hot Pipe Sizes 6 inches and Larger: Steel channels with welded spacers and hanger rods, cast iron roll.
8. Wall Support for Pipe Sizes 3 inches and Smaller: Cast iron hook.
9. Wall Support for Pipe Sizes 4 inches and Larger: Welded steel bracket and wrought steel clamp.
10. Wall Support for Hot Pipe Sizes 6 inches and Larger: Welded steel bracket and wrought steel clamp with adjustable steel yoke and cast iron roll.
11. Vertical Support: Steel riser clamp at every floor.
12. Floor Support for Cold Pipe: Cast iron adjustable pipe saddle, lock nut, nipple, floor flange, and concrete pier or steel support.
13. Floor Support for Hot Pipe Sizes 4 inches and Smaller: Cast iron adjustable pipe saddle, lock nut, nipple, floor flange, and concrete pier or steel support.
14. Floor Support for Hot Pipe Sizes 6 inches and Larger: Adjustable cast iron roll and stand, steel screws, and concrete pier or steel support.
15. Copper Pipe Support: Copper-plated, Carbon-steel ring. Provide non-metallic coatings or inserts on attachments for electrolytic protection where attachments are in direct contact with copper piping.

2.03 ACCESSORIES

- A. Hanger Rods: Galvanized mild steel; threaded both ends, threaded on one end, or continuous threaded.
- B. Pipe Shields: Provide pipe shields at each support location of insulated piping in accordance with insulation manufacturer's published recommendations. Install MSS SP-58, Type 39 protection shields, if insulation without vapor barrier is indicated. Install MSS SP-58, Type 40 protective shields on cold piping with vapor barrier. Refer to Section 22 07 00 for additional data on insulation shields.
- C. Concrete Inserts:
 1. Cast in place concrete inserts shall comply with MSS SP 69, U.L. and F.M. standards and shall be sized to suit threaded hanger rods.

2. Inserts shall have malleable iron case with galvanized steel shell and expander plug for threaded connection with lateral adjustment, top slot for reinforcing rods, lugs for attaching to forms; size inserts to suit threaded hanger rods.
 3. Suitable concrete inserts for pipe and equipment hangers shall be set and properly located for all pipe and equipment to be suspended from concrete construction. If the inserts are later found not to be in the proper location for the placement of hangers, then drilled anchors shall be installed. Drilled anchors in concrete or masonry shall be submitted for the approval.
 4. Manufactured inserts for metal deck construction shall have legs custom fit to rest in form valleys.
 5. Shop fabricated inserts shall be submitted and approved by Owner prior to installation.
 6. Inserts shall be of a type that will not interfere with structural reinforcing and that will not displace excessive amounts of structural concrete.
- D. Power-actuated fasteners (shooting) will not be acceptable under any circumstances.
- E. Note: Under no circumstances will the use of plastic anchors or plastic expansion shields be permitted for any purpose whatsoever.

2.04 FLASHING

- A. Metal Flashing: 20 gage thick galvanized steel.
- B. Metal Counterflashing: 20 gage thick galvanized steel.
- C. Lead Flashing:
 1. Waterproofing: 5 lb./sq. ft sheet lead.
 2. Soundproofing: 1 lb./sq. ft sheet lead.
- D. Flexible Flashing: Compatible with roofing.
- E. Caps: Steel, 22 gage minimum; 16 gage at fire resistant elements.

2.05 SLEEVES

- A. Sleeves for Pipes Through Non-Fire Rated Floors: 18 gage thick galvanized steel.
- B. Sleeves for Pipes Through Non-Fire Rated Beams, Walls, Footings, and Potentially Wet Floors: Steel pipe or 18 gage thick galvanized steel.
- C. Sealant: Refer to Section 07 90 00.
- D. Provide UL/FM or Warnock Hersey approved assembly for sleeves through fire rated floors or walls.

2.06 MECHANICAL SLEEVE SEALS

- A. Product Description: Modular mechanical type, consisting of interlocking synthetic rubber links shaped to continuously fill annular space between object and sleeve, connected with bolts and pressure plates causing rubber sealing elements to expand when tightened, providing watertight seal and electrical insulation.

2.07 FORMED STEEL CHANNEL

- A. Product Description: Galvanized 12-gauge roll formed ASTM A1011 SS Grade 33 structural steel channel, 1-5/8 inch by 1-5/8-inch minimum strut or stronger as required. with holes 1-1/2 inches on center.

2.08 EQUIPMENT BASES (HOUSEKEEPING PADS)

- A. Provide minimum 3-1/2-inch reinforced concrete pads with chamfered corners and equipment bases for all outdoor equipment on grade, floor mounted equipment in main central plant area, mechanical rooms, areas with floors below grade, penthouse equipment rooms, and where shown on Drawings.
- B. Refer to Section 03 30 00 for concrete requirements.
- C. Housekeeping pads shall extend minimum of 6 inches on all sides beyond the limits of the mounted equipment unless otherwise noted.
- D. Provide galvanized anchor bolts for all equipment placed on concrete pads or on concrete slabs of the size and number recommended by the equipment manufacturer.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Section 01 30 00 – Administrative Requirements: Verification of existing conditions before starting work.
- B. Verify openings are ready to receive sleeves.

3.02 PREPARATION

- A. Do not drill or cut structural members, unless written permission is obtained from the Structural Engineer.
- B. All auxiliary steel required for supports, anchors, guides, etc. shall be provided by the Contractor unless specifically indicated to be provided by others.
- C. All supports shall be of type and arrangement to prevent excessive deflection, to avoid excessive bending stresses between supports, and to eliminate transmission of vibration.
- D. Contractor shall be responsible for structural integrity of all supports, anchors, guides, etc. All structural hanging materials shall have a minimum safety factor of 5 built in.

3.03 INSTALLATION – GENERAL

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having

jurisdiction.

- B. Application, sizing and installation of piping, supports, anchors and sleeves shall be in accordance with manufacturer's printed installation instructions.
- C. All supports shall be designed and installed to avoid interference with other piping, hangers, ducts, electrical conduit, supports, building structures, equipment, etc. All piping shall be installed with due regard to expansion and contraction and the type of hanger method of support, location of support, etc. shall be governed in part by this Specification.
- D. Install hanger so that rod is vertical under operating conditions.
- E. Provide for vertical adjustments after erection and during commissioning, where feasible, to ensure pipe is at design elevation and slope.
- F. Install hangers and supports to allow controlled thermal movement of piping systems, permitting freedom of movement between pipe anchors, and to facilitate action of expansion joints, expansion loops, expansion bends, and similar units.
- G. Supports hangers, anchors, and guides shall be fastened to the structure only at such points where the structure is capable of restraining the forces in the piping system.
- H. The load and spacing on each hanger and/or insert shall not exceed the safe allowable load for any component of the support system, including any concrete that holds the inserts. Reinforcement at inserts shall be provided as required to develop the strength required. Contractor shall be responsible for engaging a structural engineer as required for design and review at support systems.
- I. Do not hang pipe or any plumbing item directly from a metal deck or locate on the bottom chord of any truss or joist unless approved by the Structural Engineer of Record.
- J. Piping supports shall be independent from ductwork supports and fire protection piping supports or supports for other trade. Combining supports is not permitted.
- K. All supports shall be designed and installed to avoid interference with other piping, hangers, ducts, electrical conduit, supports, building structures, equipment, etc.
- L. All piping supports shall be designed and installed to allow the insulation to be continuous through the hangers.
- M. Adjustable clevis hangers shall be supported at rods with a nut above and below the hanger.
- N. All hanger rods shall be trimmed neatly so that 1 inch of excess hanger rod protrudes beyond the hanger nut. In the event a rod is intentionally but temporarily left excessively long (for sloped or insulated lines for example), the Contractor shall take appropriate measures to protect the pipe or other materials from damage.
- O. Install hangers to provide minimum ½ inch space between finished covering and adjacent structures, materials, etc.

3.04 INSTALLATION – PIPE HANGERS AND SUPPORTS

- A. Install in accordance with ASME 31.9, ASTM F708, MSS SP 69 and MSS SP 89.
- B. Support horizontal piping as scheduled at end of this section.
- C. Install hangers with minimum 1/2 inch space between finished covering and adjacent work.
- D. Locate hangers within 12 inches of each horizontal elbow.
- E. Use hangers with 1-1/2 inch minimum vertical adjustment.
- F. Support horizontal cast iron pipe adjacent to each hub, with 5 feet maximum spacing between hangers.
- G. Support vertical piping at every floor and at maximum 10' on center. Support vertical cast iron pipe at each floor and at each hub.
- H. Where piping is installed in parallel and at same elevation, provide multiple pipe or trapeze hangers.
- I. Support riser piping independently of connected horizontal piping.
- J. Provide non-metallic coatings or inserts on attachments for electrolytic protection where attachments are in direct contact with copper piping.
- K. Design hangers for pipe movement without disengagement of supported pipe.
- L. Prime coat exposed steel hangers and supports. Refer to Section 09 90 00. Hangers and supports located in crawl spaces, pipe shafts, and suspended ceiling spaces are not considered exposed.
- M. Provide clearance in hangers and from structure and other equipment for installation of insulation. Refer to Section 22 07 00.
- N. Insulated piping larger than 2" diameter shall be supported with inserts of the same thickness as the insulation, or with other approved methods. Refer also to Section 22 07 00 – Piping Systems Insulation.
- O. Supports, hangers, anchors, and guides shall be fastened to the structure only at such points where the structure is capable of restraining the forces in the piping system.
- P. Cast iron soil pipe 6 inches and smaller shall be supported at each joint, within 18 inches of joint. Cast iron soil pipe 8 inches and larger shall be supported on both sides of each joint when horizontal run exceeds five (5) feet.
- Q. Vent through roof pipe: Support vertical pipe through roof with riser clamp and vertical support members attached to structure. Support of pipe through roof shall not bear the weight on the no-hub coupling.
- R. Horizontal supports within chases and partitions that are attached to studs shall be attached at both ends. Supports shall not exceed four feet in length.

3.05 INSTALLATION – ATTACHMENT TO STRUCTURE

- A. Hangers shall be attached to the structure as follows.
1. Poured-In-Place Concrete: Where pipes and equipment are supported under poured in place concrete construction, each hanger rod shall be fitted with a nut at its upper end, which nut shall be set into an Underwriters Laboratories, Inc. listed universal concrete insert placed in the form work before concrete is poured. Where inserts are placed in the bottom faces of concrete joists which are too narrow to provide adequate strength of concrete to hold the insert properly or where a larger insert would require displacement of the bottom joist steel, the hanger rod shall be suspended from the center of a horizontal angle iron, channel iron, I-beam, etc. spanning across two adjacent joists. The horizontal support shall be bolted to nonadjustable concrete inserts of the "spot" type, of physical size small enough to avoid the bottom joist steel.
 2. Pre-Cast Tee Structural Concrete: Hanger supports, anchors, etc. required for mechanical systems attached to the precast, double tee, structural concrete system are to be installed in accord with approved shop Drawings only. Holes required for hanger rods shall be core drilled in the "flange" of the double tee only; impact type tools are not allowed under any circumstances. Core drilling in the "stem" portions of the double tee is not allowed. Holes core drilled through the "flange" for hanger rods shall be no greater than 1/4" larger than the diameter of the hanger rod. Hanger rods shall be supported by means of bearing plates of size and shape acceptable to the Architect/Engineer, with welded double nuts on the hanger rod above the bearing plate. Cinch anchors, lead shields, expansion bolts, and studs driven by explosion charges are not allowed under any circumstances in the lower 15" of each stem and in the "shadow" of the stem on the top side of the "double tees".
 3. Steel Bar Joists: Where pipes and loads are supported under bar joists, hanger rods may be run through the space between the bottom angles and secured with a washer and two nuts. Where larger lines are supported beneath bar joists, hanger rods shall be secured to angle irons of adequate size; each angle shall span across two or more joists as required to distribute the weight properly and shall be welded to the joists or otherwise permanently fixed thereto.
 4. Steel Beams: Where pipes and loads are supported under steel beams, approved type beam clamps shall be used.
 5. Wood Framing: Where pipes and loads are supported from wood framing, hanger rods shall be attached to framing with side beam brackets or angle clips.
- B. Concrete Inserts.
1. Install inserts for placement in concrete forms.
 2. Install inserts for suspending hangers from reinforced concrete slabs and sides of reinforced concrete beams.
 3. Provide hooked rod to concrete reinforcement section for inserts carrying pipe 4 inches and larger.
 4. Where concrete slabs form finished ceiling, locate inserts flush with slab surface.
- C. Where inserts are omitted, drill through concrete slab from below and provide through-

bolt with recessed square steel plate and nut recessed into and grouted flush with slab.

3.06 INSTALLATION – FLASHING

- A. Provide flexible flashing and metal counterflashing where piping penetrates weather or waterproofed walls, floors, and roofs.
- B. Flash vent and soil pipes projecting 3 inches minimum above finished roof surface with lead worked 1 inch minimum into hub, 8 inches minimum clear on sides with 24 x 24 inches sheet size. For pipes through outside walls, turn flanges back into wall and caulk, metal counter-flash, and seal.
- C. Flash floor drains in floors with topping over finished areas with lead, 10 inches clear on sides with minimum 36 x 36 inch sheet size. Fasten flashing to drain clamp device.
- D. Seal all drains watertight to adjacent materials.
- E. Adjust storm collars tight to pipe with bolts; caulk around top edge. Use storm collars above roof jacks. Screw vertical flange section to face of curb.
- F. Coordinate all roof flashing with requirements of Division 07.

3.07 INSTALLATION – SLEEVES

- A. Exterior watertight entries: Seal with mechanical sleeve seals.
- B. Set sleeves in position in forms. Provide reinforcing around sleeves.
- C. Size sleeves large enough to allow for movement due to expansion and contraction. Provide for continuous insulation wrapping.
- D. Extend sleeves through floors 2 inches above finished floor level. Caulk sleeves.
- E. Where piping penetrates floor, ceiling, or wall, close off space between pipe and adjacent work with stuffing insulation and caulk airtight. Provide close fitting metal collar or escutcheon covers at both sides of penetration.
- F. Install chrome plated steel or stainless-steel escutcheons at finished surfaces.
- G. Where installed in fire rated wall, floors, etc., install in accordance with UL/FM or Warnock Hersey fire rated assembly instructions.
- H. Install sleeves for all piping passing through penetrations in floors, partitions, roofs, and walls. All penetrations shall pass through sleeves.
- I. For sleeves that will have sleeve-seal system installed, select sleeves of size large enough to provide 1-inch annular clear space between piping and concrete slabs and walls. Sleeves are not required for core-drilled holes.
- J. Install sleeves in concrete floors, concrete roof slabs, and concrete walls as new slabs and walls are constructed.
 - 1. Permanent sleeves are not required for holes in slabs formed by molded-PE or -

PP sleeves.

2. Cut sleeves to length for mounting flush with both surfaces. Exception: Extend sleeves installed in floors of mechanical equipment areas or other wet areas 2 inches above finished floor level.
 3. Using grout, seal the space outside of sleeves in slabs and walls without sleeve-seal system.
- K. Install sleeves for pipes passing through interior partitions.
1. Cut sleeves to length for mounting flush with both surfaces.
 2. Install sleeves that are large enough to provide 1/4-inch annular clear space between sleeve and pipe or pipe insulation.
 3. Seal annular space between sleeve and piping or piping insulation; use joint sealants appropriate for size, depth, and location of joint. Comply with requirements for sealants specified in Division 07 Section "Joint Sealants"

3.08 INSTALLATION – EQUIPMENT BASES AND SUPPORTS

- A. Provide concrete housekeeping pads, per requirements in Part 2 of this section.
- B. Install anchor bolts, and accessories for mounting and anchoring equipment. Foundation bolts shall be placed in the forms when the concrete is poured, the bolts being correctly located by means of templates. Each bolt shall be set in a sleeve of sufficient size to provide ½ inch clearance around bolt.
- C. Construct supports of steel members or formed steel channel. Brace and fasten with flanges bolted to structure.
- D. Provide rigid anchors for pipes after vibration isolation components are installed.

3.09 FIELD QUALITY CONTROL

- A. Section 01 40 00 – Quality Requirements, 01 70 00 – Execution and Closeout Requirements: Field inspecting, testing, adjusting, and balancing.

3.10 CLEANING

- A. Section 01 70 00 – Execution and Closeout Requirements: Requirements for cleaning.
- B. Clean adjacent surfaces of firestopping materials.

3.11 PROTECTION OF FINISHED WORK

- A. Section 01 70 00 – Execution and Closeout Requirements: Requirements for protecting finished Work.
- B. Protect adjacent surfaces from damage by material installation.

3.12 SCHEDULE

PIPE HANGER SPACING		
PIPE MATERIAL	MAXIMUM HANGER SPACING (Feet)	MIN. HANGER ROD DIAMETER (Inches)
Cast Iron, up to 2 inches	5	3/8
Cast Iron, 3 inches	5	1/2
Cast Iron, 4 inches	5	5/8
Cast Iron, 6 thru 8 inches	5	3/4
Cast Iron, 10 thru 12 inches	5	7/8
Copper Tube, 1-1/4 inches and smaller	6	3/8
Copper Tube, 1-1/2 thru 2-1/2 inches	8	1/2
Copper Tube, 3 inches and larger	10	5/8
PVC (All Sizes)	4	3/8
Steel Pipe, 1-1/2 inches and smaller	8	3/8
Steel Pipe, 2 thru 3 inches	10	1/2
Steel Pipe, 4 inches and larger	12	5/8

Support all vertical piping at each floor level and at maximum 10 feet spacing.

Support all cast iron piping at each floor level and at each hub or at each coupling on hubless pipe.

END OF SECTION

SECTION 22 05 53 – IDENTIFICATION FOR PLUMBING PIPING AND EQUIPMENT

PART 1 GENERAL

1.01 SUMMARY

A. Section Includes:

1. Equipment markers.
2. Valve tags.
3. Valve schedules.
4. Pipe markers.
5. Ceiling tacks.
6. Signs.
7. Detectable Underground Warning Tape.

B. Related Sections:

1. Section 09 90 00 - Painting and Coating: Execution requirements for painting specified by this section.

1.02 REFERENCES

A. American Society of Mechanical Engineers:

1. ASME A13.1 – Scheme for the Identification of Piping Systems.

B. American National Standards Institute:

1. ANSI Z535.1 – Safety Color Standard.
2. ANSI Z535.2 – Environmental and Facility Safety Signs.

C. National Fire Protection Association:

1. NFPA 99 – Health Care Facilities Code.

1.03 SUBMITTALS

A. Section 01 33 00 - Submittal Procedures: Submittal procedures.

B. Product Data: Submit manufacturer's catalog literature for each product required.

C. Shop Drawings: Submit list of wording, symbols, letter size, and color coding for mechanical identification. Submit a valve chart and schedule, including valve tag number, location, function and valve manufacturer's name and model number.

D. Manufacturer's Installation Instructions: Indicate installation instructions, special

procedures, and installation.

1.04 CLOSEOUT SUBMITTALS

- A. Section 01 70 00 - Execution and Closeout Requirements: Closeout procedures.
- B. Project Record Documents: Record actual locations of tagged valves; include valve tag numbers.

1.05 QUALITY ASSURANCE

- A. Conform to ASME A13.1 and ANSI Z535.1 for color scheme for identification of piping systems and accessories.
- B. Conform to ASME A13.1 for length of field and letter height for pipe markers.
- C. Conform to ANSI Z535.1 and ANSI Z535.2 for emergency operating information and warning signs.

1.06 QUALIFICATIONS

- A. Manufacturer: Company specializing in manufacturing products specified in this section with minimum three years of experience.
- B. Installer: Company specializing in performing Work of this section with minimum three years of experience.

PART 2 PRODUCTS

2.01 PIPE MARKERS

- A. General: Conform to ASME A13.1 for background and letter colors, length of color field and letter height.
- B. Self-Adhesive Pipe Markers: Flexible, indoor/outdoor grade vinyl with factory-applied pressure-sensitive adhesive. Provide with minimum 1-1/2 inch wide banding tape.
- C. Mechanically Applied Pipe Markers:
 - 1. For pipes with an overall diameter up to 6 inches, including insulation, provide semi-rigid plastic wrap around pipe marker that extends 360 degrees around the pipe at each marker location. The semi-rigid marker should include the legend and a directional flow arrow. Pipe size shall also be on label of all insulated pipes. The marker shall be supplied as a pre-tensioned device and be equipped with a 1/2 inch strip of adhesive on the inside to further secure the marker in a permanent position on vertical locations.
 - 2. For pipes with an overall diameter greater than 6 inches, including insulation, provide a semi-rigid plastic strap-on pipe marker with a height no less than 3 times the letter height. The marker shall include a legend and a directional flow arrow. Pipe size shall also be on label of all insulated pipes. Markers to be installed indoors shall be supplied with no less than two nylon straps to secure the marker

in place. Markers to be installed outdoors shall be supplied with stainless steel or aluminum strapping.

2.02 DIRECTIONAL ARROWS

- A. Flow Direction: Provide flow directional arrows either as part of pipe markers, banding tape or separately, attached to pipes.
 - 1. Conform to requirements for markers.
 - 2. Size to conform to ANSI A13.1 (1 inch wide minimum).

2.03 DETECTABLE UNDERGROUND WARNING TAPE

- A. Description: Polyethylene tape resistant to acids, alkalis and other destructive soil components with metallic core for detection and location of piping with metal detector. Tape shall be a minimum of 6 inches wide with a minimum thickness of 5 mils. Utilize manufacturer's standard legends to identify water lines, pipe lines, gas lines, fuel lines, steam lines and sewer lines. Provide a continuous printed message with bold black lettering similar to "Caution Buried Water Line Below." Tape color and lettering shall be unaffected by moisture and other substances contained in the backfill material. The tape color shall conform to the American Public Works Association Uniform Color Code.

2.04 CEILING TACKS

- A. Description: Steel with 3/4 inch diameter color coded head.
- B. Color code as follows:
 - 1. Green: Plumbing valves.

2.05 PLASTIC EQUIPMENT MARKERS

- A. General: Provide laminated plastic equipment markers for all scheduled items of plumbing equipment installed indoors.
- B. Size: Size laminated plastic markers not less than one inch in height and three inches in length with engraved lettering white on black not less than 1/4 inch in height. For larger pieces of equipment, size markers 1-1/2 inch in height by 4-1/2 inches long, of 3/32 inch laminated plastic melamine with white on black lettering engraved not less than 1/16 inch deep and 1/2 inch high.
- C. Attachment: Attach nameplates with rivets, stainless steel screws or bolts. On equipment such as tanks and pumps which cannot be drilled or pierced, attach nameplates with brass chains and "S" hooks.
- D. For plumbing equipment installed above ceiling, provide 3/4 inch by 2-1/2 inches laminate tags attached with rivets to the ceiling grid below.

2.06 ALUMINUM EQUIPMENT MARKERS

- A. General: Provide engraved anodized aluminum equipment markers for all scheduled items

of plumbing equipment installed outdoors.

- B. Size: Size engraved aluminum markers not less than 1 inch in height and 3 inches in length with engraved lettering white on black background not less than 5/8 inch in height. For larger pieces of equipment, size markers 3 inches in height by 6 inches long, with lettering not less than 1 inch in height.
- C. Attachment: Attach nameplates with rivets, stainless steel screws or bolts. On equipment such as tanks and pumps which cannot be drilled or pierced, attach nameplates with stainless steel chains and "S" hooks.

2.07 VALVE TAGS

- A. Materials: Provide indoor valve tags of solid brass with stamped or engraved lettering or numbers. Provide outdoor valve tags of aluminum with stamped or engraved lettering or numbers.
 - 1. Fill lettering and numbers with black paint.
 - 2. Lettering shall be not less than 1/4 inch in height.
 - 3. Numbers shall be not less than 1/2 inch in height.
- B. Attachment: For valve tags in mechanical rooms, provide with brass jack chain and "S" hook attachment. For all other indoor valve tags, provide with brass beaded chain attachment. For all outdoor valve tags, provide with stainless steel jack chain and "S" hook attachment.

2.08 ENGRAVED PLASTIC LAMINATE SIGNS

- A. General: Where indicated in other sections of the specifications, provide engraved instruction signs, warning signs, operational instructions or other signs designated.
- B. Emergency Operating Signs: For emergency operating instructions, provide engraved, laminate, melamine plastic, white on red, not less than 1/8 inch thick.
 - 1. Provide concise written instructions on the emergency operation of the device.
 - 2. Letters shall be not less than 5/16 inch in height, engraved 1/16 inch deep in block capital letters.
- C. Information and Warning Signs: Provide general information and warning signs of laminated, melamine plastic, not less than 1/8 inch thick, with white engraved lettering on black, with letters not less than 1/4 inch in height, block capitals.
- D. Attachment: Attach signs directly to the equipment with rivets, bolts or screws, if possible. Otherwise, attach signs with angle brackets, U-bolts, or metal plates held in place to piping with stainless steel draw-bands.
 - 1. Attachment with adhesives will not be permitted.
 - 2. Locate signs not less than 4 feet nor more than 6 feet above the operating floor,

directly visible from an operating aisle.

3. Locate signs to preclude damage during maintenance and repair or by operating traffic.

2.09 VALVE SCHEDULES AND FRAMES

- A. General: Provide valve schedules for all valves provided by Division 22.
- B. Schedules: Provide typed or machine printed schedules, one item per line, double spaced.
 1. Printing shall be black on 8-1/2-inch by 11-inch white paper. Paper shall be waterproof or laminated after printing.
 2. For each valve, list the valve number, location, size and use or operating function.
 3. Support schedules in full extruded aluminum frames with removable, non-yellowing, clear plastic faces.
 4. Screw or bolt schedules to equipment room walls where directed.
 5. Coordinate valve numbers with valve tags so that no two valves or scheduled devices have the same number.

PART 3 EXECUTION

3.01 GENERAL

- A. Degrease and clean surfaces to receive adhesive for identification materials.
- B. Install identifying devices after completion of coverings and painting.
- C. Install labels with sufficient adhesive for permanent adhesion. For unfinished canvas covering, apply paint primer before applying labels.

3.02 CONCEALED VALVES AND EQUIPMENT

- A. Equipment Above Ceilings: Provide valve tagging and identification to equipment located above ceilings, such as valves, trap primers and other items before the ceilings are installed.
- B. Finished Surfaces: Where identification is to be provided on surfaces which require insulation, painting and finishing, install identification after covering and painting is complete.
- C. Provide ceiling tacks to locate valves or equipment above T-bar type panel ceilings. Locate in corner of panel closest to equipment.
- D. Provide plastic nameplates adhered to the ceiling grid to locate valves, equipment, or dampers above T-bar type panel ceilings. Locate in corner of panel closest to equipment. Label with tag of equipment.

3.03 PIPING SYSTEM IDENTIFICATION

- A. Install pipe markers on all piping systems and include arrows to show the normal direction of flow. Where flow can be in both directions, arrows in both directions shall be displayed.
- B. Identify piping exposed to view and concealed by accessible ceilings, including hard ceilings provided with access panels. Identify piping outdoors, in crawlspaces, on roof, above grade and within parking structures. Only piping located within walls or inaccessible areas need not be identified.
- C. Identify the temperature of domestic hot water piping systems, i.e. "140°F HOT WATER."
- D. Locate pipe markers as follows:
 - 1. Every 15 feet on straight runs.
 - 2. At each valve and control device.
 - 3. At each branch or take-off. Provide flow arrows on the branch pipe as well as on the main on both sides of the branch.
 - 4. At any change in piping direction.
 - 5. Above and below every floor or roof penetration.
 - 6. On either side of every wall or partition. Ensure there is a minimum of one marker per pipe in every room.
 - 7. On either side of large obstructions, ductwork or equipment that piping passes above.
 - 8. At 5-foot intervals where piping is obscured by close proximity to walls or other pipes.
 - 9. Provide only one label per unit drain connection for condensate drain piping on roof.
- E. Install pipe markers so they are visible and legible from a normal standing position.
- F. Secure each end of self-adhesive pipe markers with a full wrap of banding tape of the same background color. Banding tape shall overlap itself a minimum of 3 inches.
- G. Provide mechanically applied pipe markers for all piping in mechanical rooms and outdoors.
- H. Install detectable underground warning tape 12 inches below finished grade, directly above buried pipe. If piping is buried more than 36 inches below finished grade, then provide an additional continuous length of tape buried 12 inches above the piping.

3.04 VALVE IDENTIFICATION

- A. General: Provide a valve tag on every valve, cock and control device in each piping system.

Exclude check valves, valves within factory-fabricated equipment units, plumbing fixture faucets, convenience and lawn-watering hose bibs and shut-off valves at plumbing fixtures. List each tagged valve in valve schedule for each piping system. In existing buildings, coordinate valve tags and schedules such that no valve numbers are duplicated.

1. Tagging Schedule: Comply with requirements of "Valve Tags" and "Valve Schedules and Frames" paragraph.
- B. Install valve schedule frames and schedules in machine rooms where indicated or where directed.

3.05 PLUMBING EQUIPMENT IDENTIFICATION

- A. General: Install equipment markers on or near each major item of plumbing equipment. Provide signs for the following general categories of equipment and operational devices:
1. Main control and operating valves.
 2. Meters and gauges.
 3. Fuel-burning units including boilers and water heaters.
 4. Pumps, compressors and motor-driven units.
 5. Heat exchangers.
 6. Primary balancing valves.
 7. Packaged booster pump units.
 8. Tanks and pressure vessels.
 9. Filters and water treatment systems.
- B. Text of Signs: In addition to name of identified unit, provide lettering to distinguish between multiple units, inform operator of operational requirements, indicate safety and emergency precautions, and warn of hazards and improper operations.
- C. Major components of equipment shall have the manufacturer's name, address, type or style, model or serial number, catalog number, date of installation, installing Contractor's name and address, and the contract number provided on a new plate permanently affixed to the item or equipment. Nameplates shall be etched metal or plastic, permanently attached by screws to panels or adjacent walls.

3.06 COLOR AND IDENTIFICATION SCHEDULE

A. Provide all pipe labels and lettering of colors listed below.

<u>FLUID SERVICE TYPE</u>	<u>PIPE MARKER LEGEND</u>	<u>PIPE MARKER BACKGROUND / LETTERING COLOR</u>	<u>VALVE TAG LETTERING</u>
Domestic Cold Water	COLD WATER	Green / White	CW
Domestic Hot Water - 115°F	115°F HOT WATER	Green / White	HW
Domestic Hot Water Recirculation - 115°F	115°F HOT WATER RETURN	Green / White	HWC
Sanitary Waste	SANITARY WASTE	Green / White	
Sanitary Vent	SANITARY VENT	Green / White	
Storm or Roof Drain	STORM DRAIN	Green / White	
Natural Gas	NATURAL GAS	Yellow / Black	GAS

B. For medical gas piping, provide pipe labels and lettering of colors of color listed below:

<u>FLUID SERVICE TYPE</u>	<u>PIPE MARKER LEGEND</u>	<u>PIPE MARKER BACKGROUND / LETTERING COLOR</u>	<u>VALVE TAG LETTERING</u>
Oxygen	OXYGEN	Green / White	O2
Non-Medical Vacuum	NON MEDICAL VACUUM	White & Black Stripe / Black	VAC
Non-Medical Air	NON MEDICAL AIR	White & Yellow Stripe / Black	AIR
Nitrous Oxide	NITROUS OXIDE	Blue / White	N2O

END OF SECTION

SECTION 22 07 00 – PLUMBING INSULATION

PART 1 GENERAL

1.01 SUMMARY

A. Section Includes:

1. Adhesives, mastics and sealants.
2. Piping – Glass Fiber.
3. Piping – Jackets.
4. Cellular Foam.
5. Insulation Shields and Inserts.
6. Plenum wrap.

B. Related Sections:

1. Section 07 84 00 – Firestopping: Product requirements for firestopping for placement by this section.
2. Section 09 90 00 – Painting and Coating: Execution requirements for painting insulation jackets and covering specified by this section.
3. Section 22 05 29 – Hangers and Supports for Plumbing Piping and Equipment: Product and Execution requirements for inserts at hanger locations.
4. Section 22 05 53 – Identification for Plumbing Piping and Equipment.

1.02 REFERENCES

A. ASTM International:

1. ASTM A167 – Standard Specification for Stainless and Heat-Resisting Chromium-Nickel Steel Plate, Sheet, and Strip.
2. ASTM B209 – Standard Specification for Aluminum and Aluminum-Alloy Sheet and Plate.
3. ASTM C177 – Standard Test Method for Steady-State Heat Flux Measurements and Thermal Transmission Properties by Means of the Guarded-Hot-Plate Apparatus.
4. ASTM C195 – Standard Specification for Mineral Fiber Thermal Insulating Cement.
5. ASTM C449/C449M – Standard Specification for Mineral Fiber Hydraulic-Setting Thermal Insulating and Finishing Cement.
6. ASTM C518 – Standard Test Method for Steady-State Heat Flux Measurements and Thermal Transmission Properties by Means of the Heat Flow Meter

Apparatus.

7. ASTM C533 – Standard Specification for Calcium Silicate Block and Pipe Thermal Insulation.
8. ASTM C534 – Standard Specification for Preformed Flexible Elastomeric Cellular Thermal Insulation in Sheet and Tubular Form.
9. ASTM C547 – Standard Specification for Mineral Fiber Pipe Insulation.
10. ASTM C552 – Standard Specification for Cellular Glass Thermal Insulation.
11. ASTM C553 – Standard Specification for Mineral Fiber Blanket Thermal Insulation for Commercial and Industrial Applications.
12. ASTM C591 – Standard Specification for Unfaced Preformed Rigid Cellular Polyisocyanurate Thermal Insulation.
13. ASTM C592 – Standard Specification for Mineral Fiber Blanket Insulation and Blanket-Type Pipe Insulation (Metal-Mesh Covered) (Industrial Type).
14. ASTM C610 – Standard Specification for Molded Expanded Perlite Block and Pipe Thermal Insulation.
15. ASTM C612 – Standard Specification for Mineral Fiber Block and Board Thermal Insulation.
16. ASTM C795 – Standard Specification for Thermal Insulation for Use in Contact with Austenitic Stainless Steel.
17. ASTM C921 – Standard Practice for Determining the Properties of Jacketing Materials for Thermal Insulation.
18. ASTM C1126 – Standard Specification for Faced or Unfaced Rigid Cellular Phenolic Thermal Insulation.
19. ASTM C1136 – Standard Specification for Flexible, Low Permeance Vapor Retarders for Thermal Insulation.
20. ASTM D1784 – Standard Specification for Rigid Poly (Vinyl Chloride) (PVC) Compounds and Chlorinated Poly (Vinyl Chloride) (CPVC) Compounds.
21. ASTM E84 – Standard Test Method for Surface Burning Characteristics of Building Materials.
22. ASTM E96 – Standard Test Methods for Water Vapor Transmission of Materials.
23. ASTM E162 – Standard Test Method for Surface Flammability of Materials Using a Radiant Heat Energy Source.
24. ASTM G21 – Standard Practice for Determining Resistance of Synthetic Polymeric Materials to Fungi.

B. Greenguard Environmental Institute:

1. GEI - Greenguard Certification Standards for Low-Emitting Products.

- C. South Coast Air Quality Management District:
 - 1. SCAQMD Rule 1168 – Adhesive and Sealant Applications, including all amendments through October 2017
 - a. PVC welding: Maximum VOC content 510 g/L.
 - b. Adhesive primer for plastic: Maximum VOC content 550 g/L.
 - c. Contact adhesive: Maximum VOC content 80 g/L.
 - d. Fiberglass adhesive: Maximum VOC content 80 g/L.
 - e. Insulation joint sealant: Maximum VOC content 420 g/L.
 - f. Other: Maximum VOC content 420 g/L.
- D. Green Seal Standard GS-11
 - 1. GS-11 – Paints and Coatings (flat insulation coatings); Edition 3.2, October 2015.
 - a. Vapor Barrier Coatings: Maximum VOC content 50 g/L.
 - b. Weather Barrier Mastics: Maximum VOC content 50 g/L.
 - c. Lagging Adhesive/Coating: Maximum VOC content 50 g/L.

1.03 SUBMITTALS

- A. Section 01 33 00 – Submittal Procedures: Submittal procedures.
- B. Product Data: Submit manufacturers published literature for each type of insulation. Data shall include product description, thermal characteristics, moisture absorption rating, flame spread and smoke developed ratings for each product.
- C. Submittal shall include a schedule indicating the following for each type of insulation:
 - 1. Pipe system
 - 2. Location (interior, exterior, mechanical room, etc.)
 - 3. Insulation and jacketing material
 - 4. Fitting insulation and jacketing material
 - 5. Pipe size range
 - 6. Insulation thickness
- D. Manufacturer's Installation Instructions: Submit manufacturers published literature indicating proper installation procedures.

1.04 QUALIFICATIONS

- A. Manufacturer: Company specializing in manufacturing products specified in this section with minimum three years experience.
- B. Applicator: Company specializing in performing Work of this section with minimum three years experience.

1.05 DELIVERY, STORAGE, AND HANDLING

- A. Section 01 60 00 – Product Requirements: Requirements for transporting, handling, storing, and protecting products.
- B. Accept materials on site in original factory packaging, labeled with manufacturer's identification, including product density and thickness.
- C. Protect insulation from weather and construction traffic, dirt, water, chemical, and damage, by storing in original wrapping.

1.06 ENVIRONMENTAL REQUIREMENTS

- A. Section 01 60 00 – Product Requirements: Environmental conditions affecting products on site.
- B. Install insulation only when ambient temperature and humidity conditions are within range recommended by manufacturer.
- C. Maintain temperature during and after installation for minimum period of 24 hours.

1.07 FIELD MEASUREMENTS

- A. Verify field measurements prior to fabrication.

PART 2 PRODUCTS

2.01 ADHESIVES, MASTICS AND SEALANTS

- A. All adhesives, mastics and sealants utilized for pipe insulation shall have a maximum VOC content as specified in Part 1 of this Section

2.02 PIPING – GLASS FIBER

- A. Insulation: ASTM C547; rigid molded, non-combustible.
 - 1. 'K' value: ASTM C335, 0.24 at 75°F.
 - 2. Service Temperature: -20°F. to 300°F.
 - 3. Maximum Moisture Absorption: 0.2% by volume.
 - 4. Maximum Flame Spread: ASTM F84:25.
 - 5. Density: 2.5 lbs./cu.ft., minimum.
 - 6. Maximum Smoke Developed: ASTM E84:50.
- B. Vapor Barrier Jacket
 - 1. ASTM C921, white kraft paper reinforced with glass fiber yarn and bonded to aluminized film.
 - 2. Water Vapor Permeability: ASTM E96; 0.02 perms-inches.
 - 3. Secure with self sealing longitudinal laps and butt strips.

4. Secure with outward clinch expanding staples and vapor barrier mastic.
- C. Tie Wire: 18 gage stainless steel with twisted ends on maximum 12 inch centers.
- D. Vapor Barrier Lap Adhesive
 1. Compatible with insulation.
- E. Insulating Cement/Mastic
 1. ASTM C195; hydraulic setting on mineral wool.
- F. Fibrous Glass Fabric
 1. Cloth: Untreated; 9 oz/sq. yd. weight.
 2. Blanket: 1.0 lb./cu. ft. density.
- G. Indoor Vapor Barrier Finish
 1. Vinyl emulsion type acrylic, compatible with insulation, white color.

2.03 PIPING – JACKETS

- A. PVC Plastic
 1. Jacket: ASTM C921, One piece molded type fitting covers and sheet material, off white color.
 - a. Service Temperature: -40°F. to 150°F.
 - b. Water Vapor Permeability: ASTM E96; 0.002 perms-inches.
 - c. Maximum Flame Spread: ASTM E84; 25.
 - d. Maximum Smoke Developed: ASTM E84; 50.
 - e. Thickness: 20 mil.
 - f. Connections: Brush on welding adhesive.
 2. Covering Adhesive Mastic
 - a. Compatible with insulation.
- B. Aluminum Jacket: ASTM B209.
 1. Thickness: 0.016 inch.
 2. Finish: Smooth.
 3. Joining: Longitudinal slip joints and 2 inch laps.
 4. Fittings: 0.016 mm thick die shaped fitting covers with factory attached protective liner.
 5. Metal Jacket Bands: 3/8 inch wide; 0.015 inch thick aluminum.

2.04 CELLULAR FOAM

- A. Insulation: ASTM C534; flexible, cellular elastomeric, molded or sheet.
 - 1. 'K' Value: ASTM C177 or C518; 0.27 at 75°F.
 - 2. Service Temperature: -40°F. to 220 degrees F.
 - 3. Maximum Moisture Absorption: ASTM D1056; 1.0% by volume.
 - 4. Water Vapor Permeability: ASTM E96; 0.20 perms-inches.
 - 5. Maximum Flame Spread: ASTM E84; 25.
 - 6. Maximum Smoke Developed: ASTM E84; 50.
 - 7. Connection: Waterproof vapor barrier adhesive.
- B. Elastomeric Foam Adhesive
 - 1. Air dried, contact adhesive, compatible with insulation.

2.05 INSULATION SHIELDS AND INSERTS

- A. Insulation Shields:
 - 1. Application: All insulated piping, except for below grade direct buried piping.
 - 2. Shields shall be made of galvanized steel or made of black iron painted on both sides with a minimum two coats of aluminum paint. Minimum metal shield sizes shall be as listed within the following table. Provide thicker/longer shields where recommended by insulation manufacturer's published product installation data:

Nominal IPS (inches)	Minimum Metal Thickness (gage)	Minimum Length (inches)
1/2 to 1-1/4	18	12
1-1/2 to 2	16	12
2-1/2 to 8	14	18
10	12	24

- 3. Provide MSS SP-58, Type 39 protection saddles, if insulation without vapor barrier is indicated. Install MSS SP-58, Type 40 protective shields on cold piping with vapor barrier.
 - 4. Depending on the type of pipe support design, stainless steel bands or aluminum bands may be required to keep shield material next to the jacketing material.
 - a. Insulation Bands: 3/4 inch wide; 0.007 inch thick galvanized steel when exposed to interior environment, 0.010 inch thick stainless steel or 0.015 inch thick aluminum when exposed to humid interior environment or outside environment.
 - b. Metal Jacket Bands: 3/8 inch wide; 0.015 inch thick aluminum or 0.010 inch thick stainless steel to match jacket.
- B. Insulation Inserts:

1. Application: All insulated piping larger than 2-inch diameter, except for below grade direct buried piping.
2. Inserts for shields shall be manufactured of corrosion resistant insulating material; cellular glass, phenolic or polyisocyanurate, of minimum 5.0 lb/cu. ft. density, suitable for the planned temperature range.
3. Inserts shall be the same thickness and contour as the adjacent insulation and shall be at least as long as the metal shield.
4. Factory fabricated inserts with integral galvanized pipe shields will be acceptable.

2.07 PLENUM WRAP

- A High-temperature fiber blanket thermal insulation encapsulated in fiber glass-reinforced aluminized foil. Plenum wrap shall be a nominal 6 PCF and have a nominal 1/2" thickness. The fiber blanket shall have a continuous use limit in excess of 1832°F. Flame Spread Index and Smoke Developed Index of the foil encapsulated blanket shall be 25/50, respectively.
- B Min. 3/4 in. wide Scotch® Filament Tape 898 (or equivalent),
- C 3M™ FSK Facing Tape 3320 (or equivalent),
- D Min. 1/2 in. wide x min. 0.015 in. thick carbon steel or stainless steel banding material with steel banding clips or 16 gauge steel tie wire as alternate for banding, banding tensioner, crimping tool, and banding cutter.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Section 01 30 00 – Administrative Requirements: Coordination and project conditions.
- B. Verify piping and equipment has been tested before applying insulation materials.
- C. Verify surfaces are clean and dry, with foreign material removed.

3.02 COMMON INSULATION REQUIREMENTS

- A. Insulation shall not be installed until all testing and inspection of pipe, vessel, etc. has been completed and approved by Engineer/Owner's representative.
- B. Replace insulation damaged by either moisture or other means. Insulation which has been wet, whether dried or not, is considered damaged. Make repairs where condensation is caused by improper installation of insulation. Also replace any materials damaged by the condensation.
- C. Install insulation materials, accessories, and finishes with smooth, straight, and even surfaces; free of voids throughout the length of equipment, ducts and fittings, and piping including fittings, valves, and specialties.

- D. Install insulation materials, forms, vapor barriers or retarders, jackets, and thicknesses required for each item of equipment, duct system, and pipe system as specified in insulation system schedules.
- E. Install accessories compatible with insulation materials and suitable for the service. Install accessories that do not corrode, soften, or otherwise attack insulation or jacket in either wet or dry state.
- F. Install insulation with longitudinal seams at top and bottom of horizontal runs.
- G. Install multiple layers of insulation with longitudinal and end seams staggered.
- H. Do not weld brackets, clips, or other attachment devices to piping, fittings, and specialties.
- I. Keep insulation materials dry during application and finishing.
- J. Install insulation with tight longitudinal seams and end joints. Bond seams and joints with adhesive recommended by insulation material manufacturer.
- K. Install insulation with least number of joints practical.
- L. Install insulation continuously through hangers and sleeves and around anchor attachments.
- M. Where penetrating fire and/or smoke rated walls, partitions, barriers, or floors, provide UL-approved pipe and duct penetration assemblies that maintain the rating of the penetrated wall, partition, barrier, or floor.
- N. Insulation on all pipes conveying liquids below the ambient temperature is required to have a continuous vapor barrier. On all insulation with a vapor barrier, seal the joints, duct wrap seams, vapor retarder (ASJ) film seams and penetrations in insulation at hangers, supports, anchors, and other projections with a vapor-barrier coating/mastic as specified in the individual insulation sections.
 - 1. For insulation application where vapor barriers are indicated, extend insulation on anchor legs from point of attachment to supported item to point of attachment to structure. Taper and seal ends at attachment to structure with vapor-barrier coating/mastic.
 - 2. Install insert materials and install insulation to tightly join the insert. Seal insulation to insulation inserts with adhesive or sealing compound recommended by insulation material manufacturer.
 - 3. Cover inserts with jacket material matching adjacent pipe insulation. Install shields over jacket, arranged to protect jacket from tear or puncture by hanger, support, and shield.
- O. Apply adhesives, mastics, and sealants at manufacturer's recommended coverage rate and wet and dry film thicknesses.

3.03 PAINTING OF INSULATION

- A. Where indicated on the construction documents, paint piping insulation in exposed areas, not including mechanical and equipment rooms. Do not paint insulation located in return air plenums.

- B. Prior to painting, wipe insulation jacket clean with a mild cleaning solution that will not leave a residue and allow to dry completely. Paint jacket with water based (latex) paint in accordance with manufacturer's recommendations and as required in the specification Section 09 90 00 Painting and Coating.

3.04 INSTALLATION – PIPE INSULATION

- A. Install materials in accordance with manufacturer's instructions.
- B. Exposed Piping: Locate insulation and cover seams in least visible locations.
- C. Insulated pipes conveying fluids below ambient temperature: Insulate entire system including fittings, valves, unions, flanges, strainers, flexible connections, and expansion joints.
- D. Insulated pipes conveying fluids below ambient temperature:
 - 1. Furnish factory-applied or field-applied vapor retarder jackets. Secure factory-applied jackets with pressure sensitive adhesive self-sealing longitudinal laps and butt strips. Secure field-applied jackets with outward clinch expanding staples and seal staple penetrations with vapor retarder mastic.
 - 2. Insulate fittings, joints, and valves with molded insulation of like material and thickness as adjacent pipe. Finish with glass cloth and vapor retarder adhesive or PVC fitting covers.
- E. Insulated pipes conveying fluids above ambient temperature:
 - 1. Furnish factory-applied or field-applied standard jackets. Secure with outward clinch expanding staples or pressure sensitive adhesive system on standard factory-applied jacket and butt strips or both.
 - 2. Insulate fittings, joints, and valves with insulation of like material and thickness as adjoining pipe. Finish with glass cloth and adhesive or PVC fitting covers.
- F. Provide neck extensions or extended stems for valves installed in insulated lines. Refer to Section 22 11 00.
- G. Insulation Shields and Inserts:
 - 1. Application: Provide shields for all insulated piping, except for below grade direct buried piping. Provide insulation inserts for all piping or equipment larger than 2-inch diameter.
 - 2. Shields: Install between pipe hangers, pipe supports or pipe hanger rolls and inserts.
 - 3. Insert location: Install between support shield and piping and under finish jacket.
- H. Continue insulation through penetrations of building assemblies or portions of assemblies having fire resistance rating of one hour or less. Provide intumescent firestopping when continuing insulation through assembly. Finish at supports, protrusions, and interruptions. Refer to Section 07 84 00 for penetrations of assemblies with fire resistance rating greater than one hour.
- I. Pipe Exposed in Mechanical Equipment Rooms or Finished Spaces (less than 10 feet above finished floor): Finish with PVC jacket and fitting covers or aluminum jacket.

- J. Exterior Applications: Provide vapor retarder jacket. Insulate fittings, joints, and valves with insulation of like material and thickness as adjoining pipe, and finish with glass mesh reinforced vapor retarder cement. Cover with aluminum jacket with seams located at 3 or 9 o'clock position on side of horizontal piping with overlap facing down to shed water or on bottom side of horizontal equipment.
- K. Heat Traced Piping: Insulate fittings, joints, and valves with insulation of like material, thickness, and finish as adjoining pipe. Size insulation large enough to enclose pipe and heat tracer. Cover with aluminum jacket with seams located at 3 or 9 o'clock position on side of horizontal piping with overlap facing down to shed water.
 - 1. Refer to Section 22 11 00 for heat tracing.

3.05 INSTALLATION – PLENUM WRAP

- A. Install a plenum wrap insulation system on all plastic piping within a return air plenum that carries a flame spread rating over 25 or a smoke developed rating over 50, when tested in accordance with ASTM E84.
- B. The plenum wrap system shall be installed by a qualified contractor in accordance with the manufacturer's instructions.
- C. Cut the plenum wrap to a length sufficient to wrap completely around the perimeter of the pipe with an overlap of at least 1".
- D. Aluminum foil tape shall be utilized to seal cut edges of the blanket.
- E. Secure the blanket in place temporarily with glass filament tape, until banding or tie wire is in place.
- F. Install the next adjacent section of wrap with a minimum longitudinal overlap of 1"/
- G. Provide steel banding or tie wire around entire perimeter of insulated pipe at maximum 11" centers and 1/2" from each blanket edge. Tighten the banding or tie wire to hold wrap firmly in place without cutting or damaging the wrap.

3.06 PIPING – GLASS FIBER INSULATION SCHEDULE

	PIPING SYSTEMS	PIPE SIZE		THICKNESS
		Inches	Inches	
A.	Domestic Water:			
	Hot Water (105° to 140°F)	1-1/4" & smaller		1"
		1-1/2" & larger	1-1/2"	
	Hot Water (141° to 180°F)	1-1/4" & smaller		1-1/2"
		1-1/2" & larger	2"	
	Hot Water Return/Circulating	1-1/4" & smaller		1"
		1-1/2" & larger		1-1/2"
	Cold Water	ALL		1/2"
B.	Storm Drain:			
	Horizontal piping from roof drains and overflow drains (including underside of drain bodies)	ALL		1"

3.07 PIPING – CELLULAR FOAM INSULATION SCHEDULE

A.	Sanitary Drain:			
	Above floor piping receiving condensate from AC equipment. (Insulate drain body, trap, trap arm, tailpiece, and 20 ft of pipe vertical and horizontal and/or when it ties into the main.)	ALL		1"

END OF SECTION

PART 1 - GENERAL

1.1 SCOPE

- A. See Specification 01 9113 General Commissioning Requirements.

SECTION 22 11 00 – FACILITY WATER DISTRIBUTION

PART 1 GENERAL

1.01 SUMMARY

A. Section Includes:

1. Domestic water piping, below grade.
2. Domestic water piping, above grade.
3. Unions and flanges.
4. Valves.
5. Pipe hangers and supports.
6. Pressure gauges and taps.
7. Thermometers.
8. Flow control valves.
9. Relief valves.
10. Strainers.
11. Hose bibs and hydrants.
12. Water meters.
13. Recessed valve box.
14. Backflow preventers.
15. Water hammer arrestors.
16. Thermostatic mixing valves.
17. Diaphragm-type compression tanks.
18. In-line circulator pumps.
19. Di-electric connections.
20. Trap primers.
21. Thermowells.

B. Related Sections:

1. Section 03 30 00 – Cast-In-Place Concrete: Execution requirements for placement of concrete house keeping pads specified by this section.
2. Section 07 84 00 – Firestopping: Product requirements for firestopping for placement by this section.
3. Section 08 31 13 – Access Doors and Frames: Product requirements for access doors for placement by this section.
4. Section 22 00 01 – General Plumbing Requirements.
5. Section 22 05 29 – Hangers and Supports for Plumbing Piping and Equipment: Product requirements for pipe hangers and supports for placement by this section.
6. Section 22 05 53 – Identification for Plumbing Piping and Equipment: Product requirements for pipe identification and valve tags for placement by this section.
7. Section 22 07 00 – Plumbing Insulation: Product and execution requirements for pipe insulation.
8. Section 26 05 03 – Equipment Wiring Connections: Execution requirements for electric connections to equipment specified by this section.

1.03 SUBMITTALS

- A. Section 01 33 00 – Submittal Procedures: Submittal procedures.
- B. Product Data:
1. Piping: Submit data on pipe materials, fittings and accessories. Submit manufacturer's catalog information and pipe joining methods: Solder, primer and glue, brazing, etc.
 2. Valves: Submit manufacturer's catalog information with valve data and ratings for each service.
 3. Hangers and Supports: Submit manufacturer's catalog information including load capacity.
 4. Domestic Water Specialties: Submit manufacturer's catalog information, component sizes, rough-in requirements, service sizes, and finishes.
 5. Pumps: Submit pump type, capacity, certified pump curves showing pump performance characteristics with pump and system operating point plotted. Include NPSH curve when applicable. Include electrical characteristics and connection requirements.
- C. Manufacturer's Installation Instructions: Submit installation instructions for pumps, valves and accessories.
- D. Manufacturer's Certificate: Certify products meet or exceed specified requirements.

- E. Shop Drawings of water system.

1.04 CLOSEOUT SUBMITTALS

- A. Section 01 70 00 – Execution and Closeout Requirements: Closeout procedures.
- B. Project Record Documents: Record actual locations of valves and equipment.
- C. Operation and Maintenance Data: Submit spare parts list, exploded assembly views and recommended maintenance intervals.
- D. Record actual locations of valves, etc. and prepare valve charts.
- E. Test reports and inspection certification for all systems listed herein.
- F. Provide a certificate of completion detailing the domestic water system chlorination procedure and all laboratory test results.
- G. Submit location of access panels which vary from quantities or locations indicated on Contract Drawings.
- H. Provide full written description of manufacturer's warranty.
- I. Backflow preventer test report.

1.05 QUALIFICATIONS

- A. Manufacturer: Company specializing in manufacturing products specified in this section with minimum three years of documented experience.
- B. Installer: Company specializing in performing Work of this section with minimum three years of documented experience.
- C. Backflow prevention assembly tester shall be licensed by the State of Texas.

1.06 QUALITY ASSURANCE

- A. All work shall be in accordance with Texas Commission on Environmental Quality (TCEQ) Chapter 290 – Public Drinking Water.
- B. All piping materials shall be manufactured and tested according to applicable ANSI, ASTM, ASME, AWWA and CISPI standards.
- C. Unless otherwise noted, all piping materials shall be domestically manufactured in the USA.
- D. Piping Systems Materials:
 - 1. Note: Piping systems shall use consistent materials throughout each system. Materials for each piping system shall not be "mixed". Exception: where required due to above/below grade conditions; allowed due to inside building/outside building conditions; or where indicated by drawings or specifications.

2. Note: Lead containing solders shall not be used at any place in any system.
 3. All domestic water piping, fittings, valves and appurtenances shall be certified to ANSI/NSF 61.
- E. Manufacturer's name and pressure rating shall be permanently marked on valve body.
- F. The Contractor shall notify the manufacturer's representative prior to installing any copper press fittings. The Contractor shall obtain the representative's guidance in any unfamiliar installation procedures. The manufacturer's representative of copper press fittings shall conduct periodic inspections of the installation and shall report in writing to the Contractor and Owner of any observed deviations from manufacturer's recommended installation practices.
- G. Manufacturer Qualifications: Company shall have minimum three years documented experience specializing in manufacturing the products specified in this section.
- H. All grooved joint couplings, fittings, flanges, valves, and specialties of the same type shall be the products of a single manufacturer. Grooving tools shall be of the same manufacturer as the grooved components.
- I. Installer Qualifications:
1. Company shall have minimum three years documented experience specializing in performing the work of this section.
 2. Installation of plumbing systems shall be performed by individuals licensed by the Texas State Board of Plumbing Examiners as a Journeyman or Master Plumber. Installation may be performed by Apprentice Plumbers provided they are registered with the Texas State Board of Plumbing examiners and under direct supervision of a licensed plumber. All installation shall be supervised by a licensed Master Plumber.
 3. All installers of copper press fittings shall be trained by the fitting manufacturer's appointed representative. Written notification of training shall be submitted to Owner prior to any installation.

1.07 DELIVERY, STORAGE AND HANDLING

- A. Section 01 60 00 – Product Requirements: Product storage and handling requirements.
- B. Accept valves and equipment on site in shipping containers with labeling in place. Inspect for damage.
- C. Provide temporary protective coating on cast iron and steel valves.
- D. Provide temporary end caps and closures on piping and fittings. Maintain in place until installation.
- E. Protect piping systems from entry of foreign materials by temporary covers, completing sections of the Work, and isolating parts of completed system.

- F. Store piping and equipment in a safe place, dry, enclosed, under cover in a well-ventilated area.

1.08 ENVIRONMENTAL REQUIREMENTS

- A. Section 01 60 00 – Product Requirements.
- B. Do not install underground piping when bedding is wet or frozen.

1.09 FIELD MEASUREMENTS

- A. Verify field measurements prior to fabrication.

1.10 WARRANTY

- A. Section 01 70 00 – Execution and Closeout Requirements: Product warranties and product bonds.
- B. Furnish 1-year manufacturer warranty for domestic water piping.

1.11 EXTRA MATERIALS

- A. Section 01 70 00 – Execution and Closeout Requirements: Spare parts and maintenance products.
- B. Furnish 1 packing kit for each size valve, 1 loose key for outside hose bibs, service kits for 1 pump seal for each pump model.

PART 2 PRODUCTS

2.01 DOMESTIC WATER PIPING – BELOW GRADE

- A. Copper Tubing: ASTM B88, Type K, annealed.
 - 1. Fittings: ASME B16.18, cast copper, or ASME B16.22, wrought copper.
 - 2. Joints: Brazed, AWS A5.8, lead free, BCuP silver/phosphorus/copper alloy with melting range 1190 to 1480 degrees F.
- B. Copper Tubing: ASTM B42, annealed.
 - 1. Fittings: ASME B16.18 cast copper alloy or ASME B16.22 wrought copper and bronze.
 - 2. Joints: Solder, lead free, ASTM B32, 95-5 tin-antimony, or tin and silver, with melting range 430 to 535 degrees F. or Braze, AWS A5.8 lead free, BCuP silver/phosphorus/copper alloy with melting range 1190 to 1480 degrees F.
- C. Buried pressurized piping sizes 2" and smaller shall be type "K" soft copper. No joints shall be allowed below slab.
- D. Building service riser: Riser shall be composed of a single extended 90-degree fitting of

fabricated 304 stainless steel tubing, maximum working pressure 200 psi. The fitting shall have a flanged connection on the inlet (building) side and a CIPS coupler on the inlet (underground) side. Riser shall be equivalent to Ames Fire & Waterworks Series IBR In-Building Riser.

2.02 DOMESTIC WATER PIPING – ABOVE GRADE

- A. Copper Tubing: ASTM B88, Type L, hard drawn.
1. Fittings: ASME B16.18, cast copper alloy or ASME B16.22, wrought copper and bronze.
 2. Joints: Solder, lead free, ASTM B32, 95-5 tin-antimony, or tin and silver, with melting range 430 to 535 degrees F. or Braze, AWS A5.8 BCuP silver/phosphorus/copper alloy with melting range 1190 to 1480 degrees F.
 3. Thread fitting: Pipe joint compound shall be lead free, non-toxic, low VOC and ANSI/NSF6/compliant. Temperature service range 10°F to 300°F.
 4. Press fittings: At contractor's option, copper piping 2 inch and smaller may be joined using copper or copper alloy press fittings with factory installed sealing elements of EPDM material.
- B. Polypropylene Piping: At contractor's option, polypropylene piping meeting requirements of Section 22 11 17 may be utilized for above ground domestic water piping.
- C. Buried pressurized piping sizes 2" and smaller shall be type "K" soft copper. No joints shall be allowed below slab.
- D. Building service riser: Riser shall be composed of a single extended 90-degree fitting of fabricated 304 stainless steel tubing, maximum working pressure 200 psi. The fitting shall have a flanged connection on the inlet (building) side and a CIPS coupler on the inlet (underground) side. Riser shall be equivalent to Ames Fire & Waterworks Series IBR In-Building Riser.

2.03 UNIONS AND FLANGES

- A. Unions for Pipe 2 inches and Smaller:
1. Ferrous Piping: Class 150, malleable iron, threaded.
 2. Copper Piping: Class 150, bronze unions with [soldered] [brazed joints].
 3. Dielectric Connections: Union with galvanized or plated steel threaded end, copper solder end, water impervious isolation barrier.
- B. Flanges for Pipe 2-1/2 inches and Larger:
1. Ferrous Piping: Class 150, forged steel, slip-on flanges.
 2. Copper Piping: Class 150, slip-on bronze flanges.

2.04 GATE VALVES

- A. 2 inches and Smaller: MSS SP 80, Class 125, bronze body, ASTM B584, bronze trim, non-rising stem, hand-wheel, inside screw, solid wedge disc.
- B. 2-1/2 inches and Larger: MSS SP 70, Class 125, ductile iron body, stainless steel and bronze trim, bolted bonnet, non-rising stem, hand-wheel, outside screw and yoke or square operating nut (for underground applications), resilient solid wedge disc with bronze seat rings, and flanged ends.
 - 1. Furnish chain-wheel operators for valves 6 inches and larger mounted over 8 feet above floor.
 - 2. Underground valves provide valve stem extension. Provide bonnet box and louver; bonnet box extension and S.S. centering ring.

2.05 GLOBE VALVES

- A. 2 inches and Smaller: MSS SP 80, Class 125, bronze body, bronze trim, threaded bonnet, hand wheel, Buna-N composition discs.

2.06 BALL VALVES

- A. 2 inches and Smaller: MSS SP 110, Class 150, bronze, two-piece body, chrome-plated bronze ball, full port, Teflon seats, blow-out proof stem, locking lever handle with balancing stops.
- B. Neck Extensions: Provide valves with extended round stem/necks where valves are installed in piping to be insulated. Stem/necks must permit operation of valve without damage to the insulation vapor barrier system. Nibco Nibseal or equal.

2.07 BUTTERFLY VALVES

- A. 2 inches and Larger: MSS SP 67, Class 150, AWWA C-504, Lead Free.
 - 1. Body: Ductile iron, lug ends, stainless steel stem, extended neck.
 - 2. Disc: stainless steel.
 - 3. Seat: Resilient replaceable Buna N.
 - 4. Handle and Operator: 10 position lever handle.

2.08 CHECK VALVES

- A. Horizontal Swing Check Valves:
 - 1. 2 inches and Smaller: MSS SP 80, Class 150, bronze body and cap, bronze seat, Buna-N disc.
 - 2. 2-1/2 inches and Larger: MSS SP 71, Class 125, cast iron body, bolted cap, bronze or cast-iron disc, renewable disc seal and seat, flanged ends.

B. Spring Loaded Check Valves:

1. 2 inches and Smaller: MSS SP 80, Class 250, bronze body, in-line spring lift check, silent closing, Buna-N disc, integral seat.
2. 2-1/2 inches and Larger: MSS SP 71, Class 125, wafer style, cast iron body, bronze seat, center guided bronze disc, stainless steel spring and screws, flanged ends.

2.09 PRESSURE GAUGES AND TAPS

- A. Gauges shall comply with ASME B40.1, Grade 2A, and have ± 0.5 percent of full-scale accuracy, with type 304 stainless steel or aluminum case, bronze wetted parts and brass socket. Dial face shall be 3½" diameter where installed within eight feet of floor level and 6" diameter where installed higher than eight feet above floor level. Dial face shall be aluminum with white background, black graduations and black markings. Pointer shall be adjustable with black finish. Provide remote read-out gauges for isolated or hard to access monitoring points.
- B. Units of measure shall be in pounds per square inch (psi). The proper range shall be selected so that the average operating pressure falls approximately in the middle of the scale selected.
- C. All pressure gauges shall be equipped with brass or stainless-steel needle valves and pressure snubbers.
- D. Pressure Gauge Taps:
 1. Needle Valve: Brass or stainless steel, 1/4-inch NPT for minimum 300 psi.
 2. Ball Valve: Brass or stainless steel 1/4-inch NPT for 250 psi.
 3. Pulsation Damper: Pressure snubber, brass or stainless steel with 1/4-inch (6 mm) NPT connections.

2.10 STEM TYPE THERMOMETERS

- A. Thermometers shall be vapor or liquid actuated, direct-mounted, universal adjustable angle dial type with stainless steel or cured polyester powder coated cast aluminum case, stainless steel friction ring and glass window. Dial face shall be white with black figures; pointer shall be friction adjustable type. Movement shall be brass with bronze bushings. Bourdon tube shall be phosphor bronze with a brass socket.
- B. Thermometer range shall be 30 - 240° Fahrenheit and have an accuracy of ± 1 scale division.
- C. Dial face shall be 4½" diameter where installed within eight feet of floor level and 6" diameter where installed higher than eight feet above floor level. Provide remote read-out gauges for isolated or hard to access monitoring points.
- D. Provide a brass or stainless steel separable thermowell for each thermometer.

- E. Thermometers shall have a sensing bulb with an insertion length of roughly half of the pipe diameter; minimum insertion length shall be 2". Thermometers installed on tanks shall have a minimum insertion length of 5".
- F. Where insulation thickness exceeds 2", provide proper bulb length and an extension neck thermowell at least 2" long.

2.11 FLOW CONTROL VALVES

- A. Construction: Class 150, Brass or bronze body, temperature and pressure test plug on inlet, combination blow-down or back-flush drain.
- B. Calibration: Control flow within 5 percent of selected rating, over operating pressure range of 10 times minimum pressure required for control, maximum minimum pressure 5 psi.

2.12 RELIEF VALVES

- A. Pressure Relief:
 - 1. ANSI Z21.22 certified, bronze body, teflon seat, steel stem and springs, automatic, direct pressure actuated.
- B. Temperature and Pressure Relief:
 - 1. ANSI Z21.22 certified, bronze body, teflon seat, stainless steel stem and springs, automatic, direct pressure actuated, temperature relief maximum 210 degrees F, capacity ASME certified and labeled.

2.13 STRAINERS

- A. 2 inch and Smaller: Threaded brass body for 175 psi CWP, Y pattern with 1/32 inch stainless steel perforated screen.
- B. 2-1/2 inch to 4 inch: Class 125, flanged iron body, Y pattern with 1/16-inch stainless steel perforated screen.
- C. 5 inch and Larger: Class 125, flanged iron body, basket pattern with 1/8-inch stainless steel perforated screen.

2.14 HOSE BIBS AND HYDRANTS

- A. Manufacturers:
 - 1. Chicago.
 - 2. T&S.
 - 3. MIFAB.
 - 4. Zurn.

- B. Refer to Plumbing Miscellaneous Schedule on Project Drawings.

2.15 WATER METERS

- A. The water meters shall utilize velocity-type flow measurement, evenly distributed past impeller in measuring chamber to register totalized flow. Register assembly shall be removable under line pressure. Meters shall be furnished with permanently sealed registers (indicating flow in U.S. gallons), polymer basket strainer and direct magnetic drive.
- B. Meters shall fully conform to AWWA standard C-780 and shall NSF/ANSI Standard 61 certified with no lead main case.
- C. The water meters shall be rated for use at maximum temperature of 120 degrees F and at a maximum working pressure of 150 psig. Cold water meters shall be 3/4 inch and rated for a continuous flow of 20 gpm. Hot water meters shall be 5/8 inch and rated for a continuous flow of 15 gpm.
- D. Meters shall be equivalent to Master Meter "Bottom Load Multi-Jet" Meters.

2.16 BACKFLOW PREVENTERS

- A. All potable water systems shall be installed to prevent contamination from non-potable liquids, solids or gases through cross connection or any other connection to the system. Provide backflow prevention devices to serve all connections to non-potable water systems.
- B. Provide vacuum breakers for all elements or systems requiring vacuum breakers for code, function, and/or protection of equipment/systems. These locations shall include, but not necessarily be limited to service/janitor/mop sinks, etc.
- C. All backflow prevention devices and assemblies shall be tested and listed by University of Southern California Foundation for Cross Connection Control and Hydraulic Research (USC FCCC&HR) or other agency approved by Texas Commission on Environmental Quality (TCEQ).
- D. Backflow preventer types. Provide the correct backflow preventer for each hazard.
 - 1. Double check valve type backflow preventer valve assemblies shall prevent the reverse flow of polluted water from entering into the potable water supply. Double check valve backflow prevention devices shall be used at low hazard sources of contamination where no potential health risks exists.
 - 2. Reduced pressure zone (RPZ) type backflow preventer valve assemblies shall prevent the reverse flow of polluted water from entering into the potable water supply due to backsiphonage and or backpressure. Reduced pressure zone backflow prevention devices shall be used at high hazard sources of contamination where a potential health risk exists and for containment at the water service entrance.
- E. Reduced Pressure Backflow Preventers:

1. Comply with ASSE 1013.
 2. Bronze body, with bronze internal parts and stainless-steel springs.
 3. Two independently operating, spring loaded check valves; diaphragm type differential pressure relief valve located between check valves; third check valve opening under back pressure in case of diaphragm failure; non-threaded vent outlet; assembled with two gate valves, strainer, and four test cocks.
- F. Double Check Valve Assemblies: Comply with ASSE 1012; Bronze body with corrosion resistant internal parts and stainless-steel springs; two independently operating check valves with intermediate atmospheric vent.

2.17 WATER HAMMER ARRESTORS

- A. ASSE 1010: Copper construction, piston type sized in accordance with PDI WH-201.
- B. Pre-charged suitable for operation in temperature range -100 to 300 degrees F and maximum 150 psi working pressure.
1. Bellows Type
 2. Piston Operated

2.18 THERMOSTATIC MIXING VALVES

- A. Mechanical Mixing Valve:
1. Valve: Chrome-plated cast brass body, stainless steel or copper alloy bellows, integral temperature adjustment. ASSE 1017 listed.
 2. Capacity: Refer to Plumbing Equipment Schedule on project Drawings.
 3. Accessories:
 - a. Check valve on inlets.
 - b. Volume control shut-off valve on outlet.
 - c. Stem thermometer on outlet and inlets.
 - d. Strainer stop checks on inlets.
- B. Point of use mixing valve. Thermostatic mixing valve shall have body of brass or bronze with paraffin based thermal actuation. Valve shall be complete with integral checks with screens, and an adjustment cap with locking feature. Valve shall be ASSE Standard 1070 listed and shall maintain control down to 0.5 gpm. Valve shall maintain a mixed water temperature from 80° to 120°F ± 3°F. Set to deliver 110°F (unless indicated otherwise). Valve shall be capable of controlling mixed temperature while hot supply temperature ranges from 120°F to 180°F and withstand a maximum pressure of 150 psi. The minimum required differential between entering cold and hot water and mixed water shall be 15°F or lower.

2.19 DIAPHRAGM-TYPE COMPRESSION TANKS

- A. Manufacturers and Capacity: Refer to plumbing schedules.
- B. Construction: Welded steel, tested and stamped in accordance with ASME Section VIII; supplied with National Board Form U-1, rated for working pressure of 125 psig, with flexible EPDM diaphragm sealed into tank, and steel legs or saddles.

2.20 IN-LINE CIRCULATOR PUMPS

- A. Casing: Bronze rated for 125 psig working pressure with stainless steel rotor assembly.
- B. Impeller: Bronze.
- C. Shaft: Alloy steel with integral thrust collar and two, oil lubricated bronze sleeve bearings.
- D. Seal: Carbon rotating against stationary ceramic seat.
- E. Drive: Flexible coupling.
- F. Performance: Refer to Plumbing Equipment Schedule on project Drawings.

2.21 DIELECTRIC CONNECTION

- A. Provide Dielectric isolation between dissimilar metal piping. NOTE: Brass/bronze valves shall not be acceptable for dielectric isolation under this specification.
- B. Two-inch connections may be either dielectric union or isolating flange as required.
- C. Two and one-half inch and larger connections shall incorporate isolating flange kits. Flanges copper pipe shall consist of Class 150 cast copper alloy companion flange with flat face
- D. General Requirements: Assembly of copper alloy and ferrous materials with separating nonconductive insulating material. Include end connections compatible with pipes to be joined.
- E. Dielectric waterway fittings shall have a copper-silicon casting or a zinc electroplated steel pipe body with high temperature stabilized polyolefin polymer liner; manufactured by Victaulic, Style 647 or PPP, Inc. Series 19000, or Owner approved equal by Anvil.
- F. Dielectric unions shall be rated at 250 psi, ground-joint type with inert, non-corrosive thermoplastic sleeve. End connection materials shall be compatible with respective piping materials; manufactured by EPCO Sales, Inc or Watts. Provide models to suit applicable transitions.
- G. Dielectric flanges shall be rated at 175 psi, have nylon bolt isolators and dielectric gasket. Materials shall be compatible with respective piping materials; manufactured by EPCO Sales, Inc or Watts. Provide models to suit applicable transitions.
- H. Flange insulation kit contain one "E: full face Trojan style insulation gasket manufactured from Nema grade G-10 glass reinforced epoxy retainer with a Nitrile seal, two insulation washers manufactured from Neman grade G-10, two steel (SEA zinc plated steel) back-up washers and one Nema Grade G-10 sleeve for each bolt.

I. Dielectric Nipples:

1. Manufacturer's: Subject to compliance with requirements.
2. Grinnell Mechanical Products.
3. Precision Plumbing Products, Inc.
4. Victaulic Company.

a. Description:

- 1) Standard: IAPMO PS 66
- 2) Electroplated steel nipple, complying with ASTM F1545
- 3) : 300 psig at 250 deg.F
- 4) End connection: Male Thread or grooved.
- 5) Lining: Inert and non-corrosive, propylene.

2.22 TRAP PRIMER ASSEMBLIES

A. Trap Priming devices that rely upon line pressure differential for activation are not allowed.

B. Electronic Trap Primers

1. Electronic trap primers shall provide 10 second water injection to traps every twenty-four hours, complete with galvanized steel box and cover, copper inlet connection, brass ball type stop valve, slow closing 24 VAC solenoid valve with integral strainer, 120-24 VAC transformer, brass atmospheric vacuum breaker, and copper waterway. Refer to schedules on drawings for specifics for each device.

C. Sink or Lavatory Tailpiece Type Trap Primers

1. Provide polished chrome plated cast bronze p-trap with ground joint outlet, threaded wall tube, slip joint nuts, washers and escutcheons, 1/2" polished chrome plated bronze primer tube with compression fitting connection at wall. Assembly shall be Jay R. Smith Model 2698, Precision Plumbing Products LTP-1500 or approved equal of a referenced acceptable manufacture. This type of device shall not serve more than one trap.

D. Vacuum Breaker Trap Primer for use with exposed Flushometers:

1. Priming assembly shall consist of one piece, chrome plated flush connection, water deflector to control the amount of water diverted from the flush 3/8" elbow and flex-bend tube connection from vacuum breaker to wall, diverter wall flange and fittings, chrome plated wall flange and fitting to connect 1/2" NPT pipe, high back pressure vacuum breaker; one-piece bottom hex coupling nut. Basis of design: Sloan Model VBF-72-A1. This type of device shall not serve more than one trap.

2.23 THERMOWELLS

- A. Provide thermowells where indicated on the drawings and where temperature measurement is needed for service or troubleshooting. Locations for thermowells shall include, but not be limited to: hot water return. Thermowells shall be matched with thermometers to be used as far as bore and depth. Thermowells shall be sized so that they will penetrate not less than 25 percent nor more than 50 percent of the pipe diameter in which it is installed.
- B. Where possible, install thermowells in tee fittings where changes in flow directions occur.
- C. Contractor may substitute extended length stainless steel pressure/temperature test ports with integral checks ("Pete's Plugs") for thermowells or where required due to small pipe size (2" or below). Provide with dual seal core inserts of Nordel, rated 0F to 350F. Test port base/pipe connection size shall be 1/2", except that 1/4" may be substituted for pipe sizes 1" and below.
- D. In all cases, ensure installation allows for easy insertion and removal of temperature and pressure probes/instrumentation.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Section 01 30 00 – Administrative Requirements: Coordination and project conditions.
- B. Verify excavations are to required grade, dry and not over-excavated.

3.02 PREPARATION

- A. Ream pipe and tube ends. Remove burrs. Bevel plain end ferrous pipe.
- B. Remove scale and dirt, on inside and outside, before assembly.

3.03 INSTALLATION – THERMOMETERS AND GAUGES

- A. Install one pressure gauge for each pump, locate taps before strainers and on suction and discharge of pump; pipe to gauge.
- B. Install gauge taps in piping
- C. Install pressure gauges with pulsation dampers. Provide needle valve or ball valve to isolate each gauge.
- D. Install thermometers in piping systems in sockets in short couplings. Enlarge pipes smaller than 2-1/2 inches for installation of thermometer sockets. Allow clearance from insulation.
- E. Provide instruments with scale ranges selected according to service with largest appropriate scale.
- F. Install gauges and thermometers in locations where they are easily read from normal operating level. Install vertical to 45 degrees off vertical.

- G. Adjust gauges and thermometers to final angle, clean windows and lenses, and calibrate to zero.

3.04 INSTALLATION – HANGERS AND SUPPORTS

- A. Install hangers and supports in accordance with Section 22 05 29. Provide non-metallic coatings or inserts on attachments for electrolytic protection where attachments are in direct contact with copper piping.

3.05 INSTALLATION – BURIED PIPING SYSTEMS

- A. Verify connection to utility piping system size, location and invert are as indicated on Drawings.
- B. Establish elevations of buried piping with not less than 24 inches of cover (36 inches below paved areas).
- C. Establish minimum separation from sanitary sewer piping in accordance with applicable plumbing code.
- D. Remove scale and dirt on inside of piping before assembly.
- E. Excavate pipe trench in accordance with Section 22 00 01.
- F. Install pipe to elevation as indicated on Drawings.
- G. Place bedding material at trench bottom to provide uniform bedding for piping, level bedding materials in one continuous layer not exceeding 4 inches compacted depth; compact to 95 percent maximum density.
- H. Install pipe on prepared bedding.
- I. Route pipe in straight line.
- J. Install pipe to allow for expansion and contraction without stressing pipe or joints.
- K. Install shutoff and drain valves at locations indicated on Drawings.
- L. Install plastic ribbon tape continuous buried 9 inches above pipe line.
- M. Install trace wire continuous over top of plastic pipe buried 9 inches above pipe line.
- N. Pipe Cover and Backfilling:
 - 1. Backfill trench in accordance with Section 22 00 01.
 - 2. Maintain optimum moisture content of fill material to attain required compaction density.
 - 3. Evenly and continuously backfill remaining trench depth in uniform layers with backfill material.

4. Do not use wheeled or tracked vehicles for tamping.

3.06 INSTALLATION – ABOVE GROUND PIPING

- A. Install non-conducting dielectric connections wherever jointing dissimilar metals.
- B. Route piping in orderly manner and maintain gradient. Route parallel and perpendicular to walls.
- C. Install piping to maintain headroom without interfering with use of space or taking more space than necessary.
- D. Group piping whenever practical at common elevations.
- E. Slope piping and arrange systems to drain at low points.
- F. Install piping to allow for expansion and contraction without stressing pipe, joints, or connected equipment.
- G. Provide clearance in hangers and from structure and other equipment for installation of insulation and access to valves and fittings. Refer to Section 22 07 00.
- H. Provide access where valves and fittings are not accessible. Coordinate size and location of access doors with Section 08 31 13.
- I. Where pipe support members are welded to structural building framing, scrape, brush clean, and apply one coat of zinc rich primer to welding.
- J. Provide support for utility meters in accordance with requirements of utility companies.
- K. Prepare exposed, unfinished pipe, fittings, supports, and accessories ready for finish painting. Refer to Section 09 90 00.
- L. Install domestic water piping in accordance with ASME B31.9.
- M. Sleeve pipes passing through partitions, walls and floors. Refer to Section 22 05 29.
- N. Install unions downstream of valves and at equipment or apparatus connections.
- O. Install valves with stems upright or horizontal, not inverted.
- P. Install brass male adapters each side of valves in copper piped system. Solder adapters to pipe.
- Q. Install gate, ball or butterfly valves for shut-off and to isolate equipment, part of systems, or vertical risers.
- R. Install ball valves for throttling, bypass, or manual flow control services.
- S. Provide lug end butterfly valves adjacent to equipment when functioning to isolate equipment.

- T. Provide spring loaded check valves on discharge of water pumps.
- U. Provide flow controls in water circulating systems.
- V. Install potable water protection devices on plumbing lines where contamination of domestic water may occur; on boiler feed water lines, janitor rooms, fire sprinkler systems, premise isolation, irrigation systems, flush valves, interior and exterior hose bibs.
- W. Pipe relief from valves, back-flow preventers and drains to nearest floor drain.
- X. Install water hammer arrestors complete with accessible isolation valve on hot and cold-water supply piping to each fixture or group of fixtures.
- Y. Utilize slow closing valves only. Do not install or allow quick closing valves.

3.07 PIPE JOINTS

- A. Welded: Beveling, spacing and other details shall conform to ASME B31.9 and AWS B2.1.
- B. Threaded: Treads shall conform to ASME B1.20. Joint compound shall be applied to male threads only and joints shall be made up so no more than three threads show. Coat exposed threads on steel pipe with joint compound for corrosion protection.
- C. Soldered: Solder joints shall be made in accordance with ASTM B828. The temperature of the joint during soldering shall not be raised above the maximum temperature limitation of the flux.
- D. Press Fittings:
 - 1. The installer of copper press type fittings shall be a factory qualified installer, licensed within the jurisdiction and familiar with the installation of the specific copper press joint system being utilized.
 - 2. Copper press fittings shall be installed using the proper tool, actuator, jaws and ring as instructed by the press fitting manufacturer.
 - 3. Copper and copper alloy press connections shall be made in accordance with the manufacturer's installation instructions.
 - 4. The tubing shall be fully inserted into the fitting and the tubing marked at the shoulder of the fitting. The fitting alignment shall be checked against the mark to assure the tubing is fully engaged in the fitting. The joints shall be pressed using the tool(s) approved by the manufacturer.

3.08 INSTALLATION – PUMPS

- A. Provide pumps to operate at specified system fluid temperatures without vapor binding and cavitation, are non-overloading in parallel or individual operation, and operate within 25 percent of midpoint of published maximum efficiency curve.

- B. Install long radius reducing elbows or reducers between pump and piping. Support piping adjacent to pump so no weight is carried on pump casings.
- C. Provide line sized shut-off valve and strainer on pump suction, and line sized soft seat check valve, balancing valve, and shut-off valve on pump discharge.
- D. Provide air cock and drain connection on horizontal pump casings.
- E. Provide drains for bases and seals.
- F. Check, align and certify alignment of base mounted pumps prior to start-up.
- G. Lubricate pumps before start-up.
- H. Contractor shall install pumps and packaged pumping systems in accordance with the manufacturer's instructions. All base mounted pumps to be aligned upon receipt at jobsite, during installation, and after system fill. Contractor shall level and grout each pump according to the manufacturer recommendations to insure proper alignment prior to operation.
- I. Pipe connections to pumps shall be made in such a manner so as not to exert any stress on pump housings. If necessary to meet this requirement, provide additional pipe supports and flex connectors.
- J. Pumps shall NOT be run dry to check rotation.
- K. Provide resilient rubber isolators for piping hangers and stanchions for the first two support locations in suction and discharge piping.
- L. Ensure pumps operate at specified or intended system fluid temperatures without vapor binding and cavitation, are non-overloading in parallel or individual operation, and operate within 25 percent of midpoint of published maximum efficiency curve.

3.09 INSTALLATION – SERVICE CONNECTIONS

- A. Provide 18-gauge galvanized sheet metal sleeve around service main to 6 inch above floor and 6 feet minimum below grade. Size for minimum of 2 inches of loose batt insulation stuffing.

3.10 BACKFLOW PREVENTORS

- A. Backflow prevention devices and assemblies shall be installed in compliance with American Water Works Association Manual M-14 "Backflow Prevention," and the following:
 - 1. Devices and assemblies shall be located as shown on plans.
 - 2. The highest part of any device or assembly shall not be installed over 5 feet above the finish floor. There shall be a minimum of 12 inches clearance above the device/assembly.
 - 3. The lowest part of any double check backflow preventer assembly shall be

installed a minimum of 12 inches above finish floor.

4. The service side of any device/assembly shall have a minimum clearance of 24 inches from the outermost dimension.
5. The non-service side of a double check backflow assembly shall have a minimum clearance of 4 inches from the outermost dimension.
6. All backflow and/or back siphonage assemblies/devices shall be tested in accordance with the rules and regulations of Texas Commission on Environmental Quality and the utility supplying the domestic water before substantial completion inspection is requested.
7. Final reports shall be submitted to local code/inspection authorities and to A/E and utility prior to scheduling Substantial Completion reviews by the A/E.
8. Persons performing the test on backflow and/or back siphonage assemblies/devices shall meet the following requirements:
 - a. Licensed by the Texas Commission on Environmental Quality as a Backflow Prevention Assembly Technician, and
 - b. If required by the utility supplying the water, registered with the utility for testing backflow preventer assemblies.
 - c. Testing of backflow preventer assemblies serving fire protection systems shall be performed by a person or organization with a current certificate of registration from the State Fire Marshal as an independent fire protection sprinkler contractor (Registered Firm) under the direct supervision of a licensed Responsible Managing Employee (RME) as defined by Texas Insurance Code (TIC), Chapter 6003 (formerly Article 5.43-3), Fire Protection Sprinkler System Service and Installation and the Texas Administrative Code Title 28, Chapter 34, Subchapter G – Fire Sprinkler Rules.

3.11 WATER-HAMMER ARRESTORS

- A. Provide water hammer arrestors as shown on the plans and as necessary to prevent water hammer from occurring. As a minimum, provide as follows.
 1. A minimum of one arrestor shall be installed for each fixture header serving up to three fixtures. A minimum of two arrestors shall be installed for each fixture header serving four to seven fixtures. A minimum of three shall be installed for each fixture header serving eight or more fixtures.
 2. Note: "Header" refers to horizontal pipe from which adjacent fixtures are directly connected without intervening horizontal or vertical runs or offsets.
 3. Provide permanently sealed air chamber type water-hammer arrestor at all water closet locations.
 4. Provide an arrestor for each single fixture with a quick closing valve (e.g. single lever handles; wrist blades, push/pull faucets, self-closing faucets, flush valves, solenoid valves, etc.).

5. NOTE: Washing machines and other solenoid operated equipment shall have arrestor (not air chamber) provided for each piece of equipment/fixture.
6. Air chambers are not acceptable under any circumstance.
7. Where indicated, provide water hammer arrestors integral to the fixture (lavatory, sink etc.) supplies equal to Precision Plumbing Products "Mini-Angle Stop". Provide all washing machine and icemaker connections with water hammer arrestors integral to the connection box.

3.12 FIELD QUALITY CONTROL

- A. Section 01 40 00 – Quality Requirements and 01 70 00 – Execution and Closeout Requirements: Field inspecting, testing, adjusting and balancing.

3.13 CLEANING AND DISINFECTION

- A. Domestic Water Piping: Domestic cold water and hot water piping shall be thoroughly flushed, cleaned and disinfected in accordance with the appropriate procedure described in the latest edition of ANSI/AWWA C651 or as described in this section. Cold and hot domestic water piping shall be thoroughly flushed with potable water to remove all foreign particles. The piping shall then be sterilized by filling the systems with a solution of chlorine containing 50 PPM of chlorine this solution shall stay in the piping for a minimum period of 24 hours; or the piping shall be filled with a solution of chlorine containing 200PPM of chlorine and this solution shall stay in the piping for a minimum of 3 hours. During which time all valves shall be opened and closed several times in order that all parts of the valve shall be in contact with the solution. After the sterilization period, the system shall be drained and flushed with clean potable water until the residual chlorine content is not greater than 0.2 PPM.
- B. Bacteriological test shall be performed by a third-party testing lab hired by the contractor. SUBMIT testing lab qualification for review and approval by the Owner and A/E. The testing lab shall not have less than five (5) years experience with water testing.
- C. The above procedure shall be performed prior to final connections to utility or existing piping systems in the building to assure no chlorine or other contamination migrates into systems.
- D. Within one-week (7 days) days after cleaning is completed, submit written report signed by supervising craftsman and contractor principal certifying cleaning and sterilization was conducted as specified.
- E. Take samples no sooner than 24 hours after flushing, from at minimum of 10 percent of outlets and from water entry, and analyze in accordance with AWWA C651.
- F. The cleaning and disinfection of water lines shall not be done sooner than 3 weeks prior to owner occupancy. If it has been more than 3 weeks then the contractor shall, at his own expense, clean and disinfect the pipe again not sooner than 3 weeks before owner occupancy.

3.14 TESTING

- A. Each system installed under this contract shall be cleaned and tested to appropriate plumbing code for each particular application.
- B. Testing shall also include any additional requirements from the authority having jurisdiction.
- C. Equipment, material, power, and labor necessary for the cleaning, flushing, sterilization, inspection and testing of systems covered within this Specification Section shall be furnished by the Plumbing Contractor. All testing and inspection procedures shall be in accordance with Division 01 and Special Condition requirements of this Contract.
- D. For any requested inspection, the Contractor shall complete prior inspections and tests to ensure that items are ready for inspection and acceptance by the Owner and/or Architect/Engineer. The Contractor shall be responsible for any and all costs incurred by Owner and/or Owner representatives, including consultants, resulting from a review or inspection that was scheduled prematurely.
- E. The Contractor shall conduct the tests and the Owner's Construction Inspector will witness and approve the results.
- F. Verify systems are complete, flushed and clean prior to testing. Isolate all equipment subject to damage from test pressure. Test and inspect for leaks and defects in new piping and parts of existing piping that have been altered, extended, or repaired. Piping being tested shall not leak nor show any loss in test pressure for duration specified.
- G. Leave piping uninsulated, uncovered and unconcealed until it has been tested and approved. Where any portion of piping system must be concealed before completion of entire system, the portion shall be tested separately as specified for the entire system prior to concealment. Contractor shall expose all untested covered or concealed piping.
- H. In cases of minor installation and repairs where specified water and/or air test procedures are deemed impractical, Contractor shall obtain written approval from Owner's Representative to perform alternate testing and inspection procedures. Alternate testing and inspection procedures for minor installation and repairs shall include visual evaluation of installed components by Owner's Representative during a simulation of use.
- I. The water utilized for tests shall be obtained from a potable source of supply.
- J. Prepare testing reports. If testing is performed in segments, submit separate report for each segment, complete with diagram or clear description of applicable portion of piping. After inspection has been approved or portions thereof, certify in writing the time, date, name and title of the persons reviewing the test. This shall also include the description of what portion of the system has been approved. Obtain approval signature by Owner's Representative. A complete record shall be maintained of all testing that has been approved, and shall be made available at the job Site. Upon completion of the work, all records and certifications approving testing requirements shall be submitted to the Owner's Representative before final payment is made.
- K. Gauges used for testing shall have increments as follows:
 - 1. Tests requiring a pressure of 10 psi or less shall utilize a testing gauge having increments of 0.10 psi or less.

2. Tests requiring a pressure of greater than 10 psi but less than or equal to 100 psi shall utilize a testing gauge having increments of 1 psi or less.
 3. Tests requiring a pressure of greater than 100 psi shall utilize a testing gauge having increments of 2 psi or less.
- L. Separately test above and below ground piping.
- M. Do not introduce test water into piping systems when exposure to freezing temperatures is possible.
- N. Do not introduce test water into sections of piping located above existing sensitive areas and/or equipment that may be damaged or contaminated by water leakage. Coordinate with Owner's Representative to determine areas and/or equipment considered as being sensitive.
- O. Defective work or material shall be reworked and replaced, and inspection and test repeated. Repairs shall be made with new materials. Pipe dope, caulking, tape, dresser couplings, etc., shall not be used to correct deficiencies.
- P. The Contractor shall be responsible for cleaning up any leakage during flushing, testing, repairing and disinfecting to the original condition any building parts subjected to spills or leakage.
- Q. All backflow and/or back siphonage assemblies/devices shall be tested in accordance with the rules and regulations of Texas Commission on Environmental Quality and the utility supplying the domestic water before substantial completion inspection is requested.
1. Final reports shall be submitted to local code/inspection authorities and to A/E and utility prior to scheduling Substantial Completion reviews by the A/E.
 2. Persons performing the test on backflow and/or back siphonage assemblies/devices shall meet the following requirements:
 - a. Licensed by the Texas Commission on Environmental Quality as a Backflow Prevention Assembly Technician, and
 - b. If required by the utility supplying the water, registered with the utility for testing backflow preventer assemblies.
- R. Domestic hot water system:
1. Test Remote fixtures to determine hot water is available within 30 seconds. Provide a report and a drawing indicated fixtures tested and the duration of time to provide 110 °F.
 2. Record temperature at each return pump.
- S. Pressure test all water piping in accordance with the applicable plumbing code and local AHJ.
- T. All testing of pumps shall be by owner representative and a report shall be provided.

- U. Equipment, material, power, and labor necessary for the cleaning, flushing, sterilization, inspection and testing of systems covered within this Specification Section shall be furnished by the Plumbing Contractor. All testing and inspection procedures shall be in accordance with Division 01 and Special Condition requirements of this Contract.
- V. For any requested inspection, the Contractor shall complete prior inspections and tests to ensure that items are ready for inspection and acceptance by the Owner and/or Architect/Engineer. The Contractor shall be responsible for any and all costs incurred by Owner and/or Owner representatives, including consultants, resulting from a review or inspection that was scheduled prematurely.

END OF SECTION

SECTION 22 13 00 – FACILITY SANITARY SEWERAGE

PART 1 GENERAL

1.01 SUMMARY

A. Section Includes:

1. Sanitary sewer and vent piping – below grade.
2. Sanitary sewer and vent piping – above grade.
3. Floor drains, Area Drains and Floor sinks.
4. Cleanouts.

B. Related Sections:

1. Section 03 30 00 – Cast-In-Place Concrete: Execution requirements for placement of concrete specified by this section.
2. Section 07 84 00 – Firestopping: Product requirements for firestopping for placement by this section.
3. Section 08 32 13 – Access Doors and Frames: Product requirements for access doors for placement by this section.
4. Section 09 90 00 – Painting and Coating: Product and execution requirements for painting specified by this section.
5. Section 22 00 01 – Basic Plumbing Requirements.
6. Section 22 05 29 – Hangers and Supports for Plumbing Piping and Equipment: Product requirements for pipe hangers and supports and firestopping for placement by this section.

1.03 SUBMITTALS

- A. Refer to Section 01 33 00 for Submittal procedures.
- B. Shop Drawings: Indicate dimensions, weights, and placement of openings and holes for sewage-ejectors, and manholes.
- C. Product Data:
1. Piping: Submit data on pipe materials, fittings, and accessories. Submit manufacturers catalog information.
 2. Valves: Submit manufacturers catalog information with valve data and ratings for each service.
 3. Hangers and Supports: Submit manufacturers catalog information including load capacity.
 4. Sanitary Drainage Specialties: Submit manufacturers catalog information, component sizes, rough-in requirements, service sizes, and finishes.

- 5. Pumps: Submit pump type, capacity, certified pump curves showing pump performance characteristics with pump and system operating point plotted. Include NPSH curve when applicable. Include electrical characteristics and connection requirements.
 - D. Manufacturer's Installation Instructions: Submit installation instructions for material and equipment.
 - E. Manufacturer's Certificate: Certify products meet or exceed specified requirements.
- 1.04 CLOSEOUT SUBMITTALS
- A. Section 01 70 00 – Execution and Closeout Requirements: Closeout procedures.
 - B. Project Record Documents: Record actual locations of equipment and clean-outs.
 - C. Operation and Maintenance Data: Submit frequency of treatment required for interceptors. Include, spare parts lists, exploded assembly views for pumps and equipment.
- 1.05 QUALIFICATIONS
- A. Manufacturer: Company specializing in manufacturing products specified in this section with minimum three years documented experience.
 - B. Installer: Company specializing in performing Work of this section with minimum three years documented experience.
- 1.06 DELIVERY, STORAGE AND HANDLING
- A. Section 01 60 00 – Product Requirements: Product storage and handling requirements.
 - B. Protect piping systems from entry of foreign materials by temporary covers, completing sections of the Work, and isolating parts of completed system.
- 1.07 ENVIRONMENTAL REQUIREMENTS
- A. Section 01 60 00 – Product Requirements.
 - B. Do not install underground piping when bedding is wet or frozen.
- 1.08 FIELD MEASUREMENTS
- A. Verify field measurements prior to fabrication.
- 1.09 WARRANTY
- A. Section 01 70 00 – Execution and Closeout Requirements: Product warranties and product bonds.
 - B. Furnish one-year manufacturer warranty for material.
- 1.10 EXTRA MATERIALS

- A. Section 01 70 00 – Execution and Closeout Requirements: Spare parts and maintenance products.
- B. Furnish one set of pump seals.

PART 2 PRODUCTS

2.01 SANITARY SEWER AND VENT PIPING – BELOW GRADE

- A. All cast iron soil, waste and vent pipe and fittings shall conform to the requirements of CISPI Standard 301, ASTM A888 or ASTM A74. All cast iron pipe and fittings shall be marked with the collective trademark of the Cast Iron Soil Pipe Institute and shall be listed by NSF International. Acceptable manufacturers of cast iron soil pipe and fittings are AB&I, Charlotte Pipe and Tyler Pipe.
- B. Cast Iron Soil Pipe: ASTM A74, service weight, bell and spigot ends.
 - 1. Fittings: Cast iron, ASTM A74.
 - 2. Joints: Hub-and-spigot with compression gaskets conforming to the requirements of ASTM C-564 and ASTM C-1563.
- C. Cast Iron Pipe: CISPI 301, hub-less, service weight.
 - 1. Fittings: Cast iron, CISPI 301.
 - 2. Joints: Hubless pipe and fittings shall be joined by No-Hub couplings conforming to CISPI Standard 310 and listed by NSF International.
 - 3. Below grade piping shall be joined by super duty shielded stainless steel couplings with rubber sleeves and stainless-steel bands and tightening devices, conforming to ASTM C564; equivalent to Husky SD 4000.
- D. PVC Pipe: ASTM D1785, Schedule 40, polyvinyl chloride (PVC) material, bell and spigot style solvent sealed joints.
 - 1. Fittings: PVC, ASTM D2665, Schedule 40.
 - 2. Joints: ASTM F656, Lo-VOC (SCAQMD 116/316A) Purple Primer; ASTM D2855; solvent weld with ASTM D2564 solvent cement.

2.02 SANITARY SEWER AND VENT PIPING – ABOVE GRADE

- A. All cast iron soil, waste and vent pipe and fittings shall conform to the requirements of CISPI Standard 301, ASTM A888 or ASTM A74. All cast iron pipe and fittings shall be marked with the collective trademark of the Cast Iron Soil Pipe Institute and shall be listed by NSF International. Acceptable manufacturers of cast iron soil pipe and fittings are AB&I, Charlotte Pipe and Tyler Pipe.
- B. Cast Iron Pipe: ASTM A74, service weight.
 - 1. Fittings: Cast iron, ASTM A74.

2. Joints: Hub-and-spigot with compression gaskets conforming to the requirements of ASTM C-564 and ASTM C-1563.
- C. Cast Iron Pipe: CISPI 301, hub-less, service weight.
1. Fittings: Cast iron, CISPI 301.
 2. Joints: Hubless pipe and fittings shall be joined by No-Hub couplings conforming to CISPI Standard 310 and listed by NSF International.
 - a. Above grade waste piping shall be joined by heavy-duty shielded stainless-steel couplings with rubber sleeves and stainless-steel bands and tightening devices, conforming to ASTM C564; equivalent to Tyler Wide Body, Mission Rubber Co. Heavyweight, Fernco Heavy Duty or Husky HD 2000.
 - b. Above grade vent piping shall be joined by standard duty shielded stainless steel couplings with rubber sleeves and stainless-steel bands and tightening devices, conforming to ASTM C564; as manufactured by Tyler Pipe, Mission Rubber Co. or ANACO.
- D. PVC Pipe: ASTM D1785, Schedule 40, polyvinyl chloride (PVC) material, bell and spigot style solvent sealed joints.
1. Fittings: PVC, ASTM D2665, Schedule 40.
 2. Joints: ASTM D2855; solvent weld with ASTM D2564 solvent cement.

2.03 FLOOR DRAINS, AREA DRAINS AND FLOOR SINKS

- A. Refer to Plumbing Equipment Schedule on Drawings.

2.04 CLEANOUTS

- A. Refer to Plumbing Equipment Schedule on Drawings.
- B. Exterior Surfaced Areas: Round cast nickel bronze access frame and non-skid cover.
- C. Exterior Unsurfaced Areas: Line type with lacquered cast iron body and round epoxy coated cover with gasket.
- D. Interior Finished Floor Areas: Galvanized cast iron body with anchor flange, reversible clamping collar, threaded top assembly, and round scored cover with gasket in service areas and round depressed cover with gasket to accept floor finish in finished floor areas.
- E. Interior Finished Wall Areas: Line type with lacquered cast iron body and round epoxy coated cover with gasket, and round stainless-steel access cover secured with machine screw.
- F. Interior Unfinished Accessible Areas: Calked or threaded type.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Section 01 30 00 – Administrative Requirements: Coordination and project conditions.
- B. Verify excavations are to required grade, dry, and not over-excavated.

3.02 PREPARATION

- A. Ream pipe and tube ends. Remove burrs. Bevel plain end ferrous pipe.
- B. Remove scale and dirt, on inside and outside, before assembly.
- C. Prepare piping connections to equipment with flanges or unions.
- D. Keep open ends of pipe free from scale and dirt. Protect open ends with temporary plugs or caps.

3.03 INSTALLATION – HANGERS AND SUPPORTS

- A. Install hangers and supports in accordance with Section 22 05 29:

3.04 INSTALLATION – BURIED PIPING SYSTEMS

- A. Verify connection to site utility piping system; size, location, and invert are as indicated on Drawings.
- B. Establish elevations of buried piping with not less than 1.5 ft of cover.
- C. Establish minimum separation of other services piping in accordance with Plumbing Code.
- D. Remove scale and dirt on inside of piping before assembly.
- E. Excavate pipe trench in accordance with Section 22 00 01 and Division 31 specifications.
- F. Install pipe to elevation as indicated on Drawings.
- G. Place bedding material at trench bottom to provide uniform bedding for piping.
- H. Place bedding materials in one continuous layer not exceeding six inches compacted depth; compact to 95 percent maximum density.
- I. Install pipe on prepared bedding.
- J. Route pipe in straight line.
- K. Install plastic ribbon tape continuous over top of pipe, 9 inches above pipe line.
- L. Install trace wire continuous over top of plastic pipe buried 9 inches above pipe line.
- M. Pipe Cover and Backfilling:
 - 1. Install underground Thermoplastic piping soil and waste drainage piping according to ASTM D 2321.

2. Backfill trench in accordance with Section 22 00 01 and Division 31 specifications.
3. Maintain optimum moisture content of fill material to attain required compaction density.
4. After hydrostatic test, evenly backfill entire trench width by hand placing backfill material and hand tamping in 6 inches compacted layers to 12 inches minimum cover over top of jacket. Compact to 95 percent maximum density.
5. Evenly and continuously backfill remaining trench depth in uniform layers with backfill material.
6. Do not use wheeled or tracked vehicles for tamping.

3.05 INSTALLATION – ABOVE-GROUND PIPING

- A. Establish invert elevations, slopes for drainage to 1/8 inch per foot minimum. Maintain gradients.
- B. Extend cleanouts to finished floor or wall surface. Lubricate threaded cleanout plugs with mixture of graphite and linseed oil. Provide clearances at cleanout for snaking drainage system.
- C. Encase exterior cleanouts in concrete flush with grade.
- D. Install floor cleanouts at elevation to accommodate finished floor.
- E. Provide non-conducting dielectric connections wherever jointing dissimilar metals.
- F. Route piping in orderly manner and maintain gradient. Route parallel and perpendicular to walls.
- G. Install piping to maintain headroom. Do not spread piping, conserve space.
- H. Group piping whenever practical at common elevations.
- I. Support cast iron drainage piping at every joint.
- J. Install piping to allow for expansion and contraction without stressing pipe, joints or connected equipment.
- K. Provide clearance in hangers and from structure and other equipment for installation of insulation. Refer to Section 22 07 00.
- L. Provide access where valves and fittings are not accessible. Coordinate size and location of access doors with Section 08 31 13.
- M. Install piping penetrating roofed areas to maintain integrity of roof assembly.
- N. Where pipe support members are welded to structural building framing, scrape, brush clean and apply one coat of zinc rich primer to welding.

- O. Prepare exposed, unfinished pipe, fittings, supports and accessories ready for finish painting. Refer to Section 09 90 00.
- P. Install bell and spigot pipe with bell end upstream.
- Q. Sleeve pipes passing through partitions, walls and floors. Refer to Section 07 84 00.
- R. Install firestopping at fire rated construction perimeters and openings containing penetrating sleeves and piping. Refer to Section 07 84 00.

3.06 DRAINS, CLEANOUTS AND SIMILAR COMPONENTS

- A. Extreme care shall be used to set the top elevation of floor drains and floor sinks to meet the low point elevation of the finished floor. Final mounting elevation of floor drain strainers, floor sink grates, cleanouts tops, etc. shall be flush with finished floor.
- B. Coordinate with General Contractor to ensure floor is sloped to floor drain and/or floor sink locations for a minimum of 2-foot radius from the floor drain.
- C. Provide floor drains and/or floor sinks complete with trap primer connections, piping, and trap primer assemblies.
- D. Exterior cleanouts, single or double, shall be set in reinforced concrete (minimum 18 inches by 18 inches by 6 inches thick or as indicated on Drawings) at finished grade level. Provide countersunk brass cleanout plugs in cast iron ferrules. PVC plugs shall not be acceptable. Exception: Where cleanouts are located in architectural flatwork (sidewalks, patios, etc.), cleanouts shall be floor cleanout style as indicated on drawing schedules.
- E. Floor drains and/or floor sinks in mechanical rooms:
 - 1. Ensure that all floor drains and/or floor sinks in mechanical rooms are provided with maximum size (e.g., diameter) strainers. In addition, where multiple drains pipe to a floor drain provide a 3-1/2 inch by 8-1/4 inch by 3-1/2 inch high elongated funnel.
 - 2. In addition, where multiple drains pipe to a floor drain, provide a 12-inch diameter by 3 inches (approximately) high schedule 40 black steel pipe segment to serve as a splash guard. Mount splash guard with approximately 1/16-inch gap between bottom of guard and floor to allow drainage to floor drain beneath splash guard.
 - 3. Coordinate funnel/splash guard installation with Mechanical Contractor for proper condensate drain piping heights.
- F. Drains located in shower areas, restrooms, Kitchens and other wet areas with water proofing membrane.
 - 1. During slab pour provide an oversized concrete blocking for drain locations. The intent is to be provide the ability to properly level the drain and obtain the correct height of drain for floor finishes, as needed, after the slab
 - 2. Confirm water proof membrane type and floor drain are compatible.

3. Properly protect drain openings to prevent and liquid water proofing membrane or epoxy from entering the drainage system.

G. Drain Locations in Stained concrete.

1. Coordinate drain height and drain location with slab height. Install drain in accordance with the direction of the stained concrete provider.

3.07 PLASTIC PIPE AND JOINT FABRICATION

- A. Cut plastic pipe with pipe cutters using a cutting wheel specifically designed for plastic pipe.
- B. Remove all burrs, chips, filings, etc. from both the I.D. and O.D. of the pipe before joining. Use a knife, deburring tool, or a half-pound coarse file to remove all burrs.
- C. Bevel all pipe ends to minimize the chances of wiping the solvent cement from the I.D. of the fitting as the pipe is socketed. Use a beveling tool designed to bevel pipe at a 10° to 15° angle and a depth of 1/16" to 3/32".
- D. Using a clean, dry, cotton rag, wipe away all loose dirt and moisture from the I.D. and O.D. of the pipe end and the I.D. of the fitting. Do not solvent weld wet surfaces.
- E. Apply primer to the pipe surface in the same manner, making sure that the length of pipe evenly brushed is at least equal to the fitting socket depth.
- F. For checking penetration, scratch or scrape away the primed surface until a few thousandths of an inch can be so removed. Repeat applications of primer to either or both surfaces as necessary. In cold weather, allow more time for proper penetration.
- G. Cover the outer pipe surface literally with solvent cement for a length at least equal to that of the fitting socket depth.
- H. Continue alternate application to the fitting socket with a medium layer of solvent cement. Avoid puddling in the socket. On belled end pipe, do not coat beyond the socket depth or allow cement to run beyond the bell.
- I. Apply a second coat of cement to the pipe. Cement layers must be without voids and sufficient to fill any gaps in the joints.
- J. Immediately upon finishing cement application and before it starts to set, insert the pipe to the full socket depth while rotating the pipe or fitting 1/4 turn to ensure complete and even distribution of the cement. Hold joint together for a minimum of 10 to 15 seconds to make sure that pipe does not move back out of the socket.
- K. Immediately after joining and before joint is set, gently place joint onto a level surface, and wipe off all excess cement from the circumference of the joint.
- L. Do not perform joining operations if ambient temperature is below 40 F. Allow a minimum of 72 hours of joint drying time before subjecting joints to any appreciable internal pressure.

3.08 DRAIN PIPE AND FITTINGS

- A. Offsets and Fittings.

1. Use reduction fittings to connect two pipes of different diameter.
 2. Change directions by appropriate use of 45-degree wyes, long-sweep quarter-bends, and sixth-, eighth-, and sixteenth-bends. Sanitary tees may be used on vertical stacks. Use long sweeps at the base of risers.
 3. Provide a separate trap at each fixture, unless a trap is built into the fixture. Provide a Deep Seal trap at each floor drain and hub drain. Place traps so that the discharge from any fixture will pass through only one trap before reaching a building drain.
 4. For sets of fixtures installed in 4-inch walls, provide a separate waste and vent line for each fixture (do not interconnect in wall). Connect the waste lines underfloor and the vent lines above the ceiling. Maintain structural and aesthetic integrity of walls.
 5. Do not route any piping above electrical control panels and related electrical equipment. Prior to installation of any piping, determine the actual space requirements and the location of all electrical panels and related electrical equipment. Make all offsets and adjustments as required.
 6. Discharge from the oil separator to a floor drain with a funnel to maintain an indirect connection to the sanitary sewer.
- B. Floor Drains. Provide all required floor drains complete with drain lines and vent lines as required by the section on Drains, Hydrants and Cleanouts.
- C. Cleanouts.
1. Provide drainage lines with properly specified cleanouts. Provide all as required by the section on drains, hydrants and cleanouts.

3.09 VENT PIPING

- A. Make vent connections to vent stacks with inverted wye fittings. Extend full-size vents through the roof to at least 6-inches above the roof.
- B. Coordinate location of vent penetrations with roofing trades; flashing to be done by roofer.
- C. Offset all vents located near building edge such that no vent through roof piping is located within 5-feet from the building edge (measured from building line not building eave). Make offsets in roof structure space.
- D. Terminate vent through roof not less than 15-feet away from any shaft, window or outside air intake openings.
- E. All vent and vent branch pipes shall be graded and connected to drip back to sanitary waste piping by gravity.

3.10 ROUGH-IN AND FINAL CONNECTIONS

- A. Make rough-in and final connection of all services to all fixtures requiring plumbing connections. Contractor shall be responsible for installing fixtures at locations shown on the Architectural drawings and providing all service connections at required locations.

- B. Rough-in and final connection of services to all equipment shall be installed in accordance with the latest edition of the manufacturer's rough-in measurements manual. Contractor shall obtain all such documents.
- C. Use threaded sanitary tapped tee pipe fittings for p-trap connections at walls.
- D. Provide service connections to all plumbing fixtures specified and to all equipment furnished by others.
- E. Install all piping and associated equipment in accordance to manufacturer's recommendations using recommended tools.
- F. Provide all fittings and appurtenances required for a complete and working system.

3.11 COORDINATION

- A. Making adjustments to field conditions is considered a part of the work required. Do not use contract drawings accompanying these specifications for rough-in locations but only for pipe sizing and general routing.
- B. Contractor shall examine and familiarize himself with the Architectural, Structural, Electrical and Mechanical Drawings to be knowledgeable of all plumbing connections required and space limitations.
- C. The Drawings are diagrammatic and are not intended to show all the fittings required. Contractor shall include in his bid, costs for items of material and labor which are not specifically called for in drawings or specifications, but which are required to make plumbing installation. Contractor shall make any necessary changes to avoid beams, footings, columns, piers, vents, ducts, equipment or other obstructions.
- D. In any case where a pipe shown on a plan sheet differs from that shown on a riser, schematic or detail, use the larger of the two sizes shown.

3.12 FIELD QUALITY CONTROL

- A. Section 01 40 00 – Quality Requirements and Section 01 70 00 – Execution and Closeout Requirements: Field inspecting, testing, adjusting and balancing.
- B. Test sanitary waste, grease waste, chemical resistant waste and vent piping system in accordance with applicable code and local authority having jurisdiction.
- C. Testing:
 - 1. After each section of the sanitary waste, acid waste and grease waste systems have been set within project area, all outlets shall be temporarily "plugged up", except as are required for testing as described herein. Each section of piping shall be tested to a level of at least 10 feet above the pipe being tested. The pipes being tested shall be filled with water to a verifiable and visible level as described above and be allowed to remain so for a minimum of 2 hours. If after 2 hours the level of the water has been lowered by leakage, the leaks must be found and stopped, and the water level shall again be raised to the level described, and the test repeated until, after a 2-hour retention period, there shall be no perceptible lowering of the water level in the system being tested.
 - 2. Should the completion of these tests leave any reasonable question of a doubt

relative to the integrity of the installation, additional tests or measures shall be performed to demonstrate the reliability of these systems to the complete satisfaction of the Owner's duly authorized representative. Such tests shall be conducted and completed before any joints in plumbing are concealed or made inaccessible.

- D. Protect piping and drains during remainder of construction period to avoid clogging with dirt and debris and to prevent damage from traffic and construction work of other trades.
- E. Place temporary caps or plugs in ends of uncompleted piping and when work stops at the end of each day.

END OF SECTION

SECTION 22 14 00 – FACILITY STORM DRAINAGE

PART 1 GENERAL

1.01 SUMMARY

A. Section Includes:

1. Storm water piping buried below grade.
2. Storm water piping above grade.
3. Roof drains, area drains, planter drains and canopy drains.
4. Cleanouts.

B. Related Sections:

1. Section 03 30 00 - Cast-In-Place Concrete: Execution requirements for placement of concrete specified by this section.
2. Section 07 84 00 - Firestopping: Product requirements for firestopping for placement by this section.
3. Section 08 31 13 - Access Doors and Frames: Product requirements for access doors for placement by this section.
4. Section 09 90 00 - Painting and Coating: Execution requirements for painting material specified by this section.
5. Section 22 00 01 – Basic Plumbing Requirements.
6. Section 22 05 29 - Hangers and Supports for Plumbing Piping and Equipment: Product requirements for pipe hangers and supports and firestopping for placement by this section.
7. Section 22 05 53 - Identification for Plumbing Piping and Equipment: Product requirements for pipe identification for placement by this section.
8. Section 22 07 00 - Plumbing Insulation: Product and execution requirements for pipe insulation.
9. Section 26 05 03 - Equipment Wiring Connections: Execution requirements for electric connections to equipment specified by this section.
10. Division 31 sections for excavation, trench and backfill required by this section.

1.03 SUBMITTALS

- A. Refer to Section 01 33 00 for Submittal procedures.
- B. Shop Drawings: Indicate dimensions, weights, and placement of openings and holes for sump-pumps, catch basins and manholes.
- C. Product Data:
 1. Piping: Submit data on pipe materials, fittings, and accessories. Submit manufacturers catalog information.
 2. Storm Drainage Specialties: Submit manufacturers catalog information, component sizes, rough-in requirements, service sizes, and finishes.
 3. Pumps: Submit pump type, capacity, certified pump curves showing pump performance characteristics with pump and system operating point plotted. Include NPSH curve when applicable. Include electrical characteristics and connection requirements.
- D. Manufacturer's Installation Instructions: Submit installation instructions for material and equipment.
- E. Manufacturer's Certificate: Certify products meet or exceed specified requirements.

1.04 CLOSEOUT SUBMITTALS

- A. Section 01 70 00 - Execution and Closeout Requirements: Closeout procedures.
- B. Project Record Documents: Record actual locations of equipment and clean-outs.
- C. Operation and Maintenance Data: Submit spare parts lists, exploded assembly views for pumps and equipment.

1.05 QUALIFICATIONS

- A. Manufacturer: Company specializing in manufacturing products specified in this section with minimum three years documented experience.
- B. Installer: Company specializing in performing Work of this section with minimum three years documented experience.

1.06 DELIVERY, STORAGE, AND HANDLING

- A. Section 01 60 00 - Product Requirements: Product storage and handling requirements.
- B. Protect piping systems from entry of foreign materials by temporary covers, completing sections of the Work, and isolating parts of completed system.

1.07 ENVIRONMENTAL REQUIREMENTS

- A. Section 01 60 00 - Product Requirements.
- B. Do not install underground piping when bedding is wet or frozen.

1.08 FIELD MEASUREMENTS

- A. Verify field measurements prior to fabrication.

1.09 WARRANTY

- A. Section 01 70 00 - Execution and Closeout Requirements: Product warranties and product bonds.
- B. Furnish one-year manufacturer warranty for sump pumps.

1.10 EXTRA MATERIALS

- A. Section 01 70 00 - Execution and Closeout Requirements: Spare parts and maintenance products.
- B. Furnish one set of pump seals.

PART 2 PRODUCTS

2.01 STORM WATER PIPING, BELOW GRADE

- A. All cast iron soil, waste and vent pipe and fittings shall conform to the requirements of CISPI Standard 301, ASTM A888 or ASTM A74. All cast iron pipe and fittings shall be marked with the collective trademark of the Cast Iron Soil Pipe Institute and shall be listed by NSF International. Acceptable manufacturers of cast iron soil pipe and fittings are AB&I, Charlotte Pipe and Tyler Pipe.
- B. Cast Iron Soil Pipe: ASTM A74, service weight, bell and spigot ends.
 - 1. Fittings: Cast iron, ASTM A74.
 - 2. Joints: Hub-and-spigot with compression gaskets conforming to the requirements of ASTM C564 and ASTM C1563.
- C. Cast Iron Pipe: CISPI 301, hub-less, service weight.
 - 1. Fittings: Cast iron, CISPI 301.
 - 2. Joints: Hubless pipe and fittings shall be joined by No-Hub couplings conforming to CISPI Standard 310 and listed by NSF International.
 - 3. Below-grade storm drain piping shall be joined by super duty shielded stainless steel couplings with rubber sleeves and stainless-steel bands and tightening devices, conforming to ASTM C564; equivalent to Husky SD 4000.
- D. PVC Pipe: ASTM D1785, Schedule 40, polyvinyl chloride (PVC) material, bell and spigot

style solvent sealed joints.

1. Fittings: PVC, ASTM D2665, Schedule 40.
2. Joints: ASTM D2855; solvent weld with ASTM D2564 solvent cement.

2.02 STORM WATER PIPING, ABOVE GRADE

- A. All cast iron soil, waste and vent pipe and fittings shall conform to the requirements of CISPI Standard 301, ASTM A888 or ASTM A74. All cast iron pipe and fittings shall be marked with the collective trademark of the Cast Iron Soil Pipe Institute and shall be listed by NSF International. Acceptable manufacturers of cast iron soil pipe and fittings are AB&I, Charlotte Pipe and Tyler Pipe.
- B. Cast Iron Soil Pipe: ASTM A74, service weight, bell and spigot ends.
 1. Fittings: Cast iron, ASTM A74.
 2. Joints: Hub-and-spigot with compression gaskets conforming to the requirements of ASTM C564 and ASTM C1563.
- C. Cast Iron Pipe: CISPI 301, hub-less, service weight.
 1. Fittings: Cast iron, CISPI 301.
 2. Joints: Hubless pipe and fittings shall be joined by No-Hub couplings conforming to CISPI Standard 310 and listed by NSF International.
 3. Above-grade storm drain piping shall be joined by heavy duty shielded stainless steel couplings with rubber sleeves and stainless-steel bands and tightening devices, conforming to ASTM C564; equivalent to Tyler Wide Body, Mission Rubber Co. Heavyweight, Fernco Heavy Duty or Husky HD 2000.
 4. Provide No-hub fitting thrust restraint at each change of direction. Restraints shall consist of galvanized steel pipe riser clamps on both sides of fitting connected with minimum 1/2" galvanized steel threaded rods and necessary hardware or engineered no-hub fitting restraints equal to Holdrite #117 series.
- D. D1785, Schedule 40, polyvinyl chloride (PVC) material, bell and spigot style solvent sealed joints.
 1. Fittings: PVC, ASTM D2466, Schedule 40.
 2. Joints: ASTM D2855; solvent weld with ASTM D2564 solvent cement.

2.03 ROOF DRAINS, AREA DRAINS, PLANTER DRAINS AND CANOPY DRAINS

- A. Refer to Plumbing Equipment Schedule on Drawings.

2.04 CLEANOUTS

- A. Refer to Plumbing Equipment Schedule on Drawings.

- B. Exterior Surfaced Areas: Round cast nickel bronze access frame and non-skid cover.
- C. Exterior Unsurfaced Areas: Line type with lacquered cast iron body and round epoxy coated cover with gasket.
- D. Interior Finished Floor Areas: Galvanized cast iron body with anchor flange, reversible clamping collar, threaded top assembly, and round scored cover with gasket in service areas and round depressed cover with gasket to accept floor finish in finished floor areas.
- E. Interior Finished Wall Areas: Line type with lacquered cast iron body and round epoxy coated cover with gasket, and round stainless-steel access cover secured with machine screw.
- F. Interior Unfinished Accessible Areas: Caulked or threaded type. Provide bolted stack cleanouts on vertical rainwater leaders.

2.05 SEDIMENT INTERCEPTORS

- A. Refer to Plumbing Equipment Schedule on Drawings.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Section 01 30 00 - Administrative Requirements: Coordination and project conditions.
- B. Verify excavations are to required grade, dry, and not over-excavated.

3.02 PREPARATION

- A. Ream pipe and tube ends. Remove burrs. Bevel plain end ferrous pipe.
- B. Remove scale and dirt, on inside and outside, before assembly.
- C. Prepare piping connections to equipment with flanges or unions.
- D. Keep open ends of pipe free from scale and dirt. Protect open ends with temporary plugs or caps.

3.03 INSTALLATION - HANGERS AND SUPPORTS

- A. Install hangers and supports in accordance with Section 22 05 29.

3.04 INSTALLATION - BURIED PIPING SYSTEMS

- A. Verify connection to site utility piping system, size, location, and invert are as indicated on Drawings.
- B. Establish elevations of buried piping with not less than one ft of cover.
- C. Establish minimum separation from other services piping in accordance with applicable Plumbing code.

- D. Remove scale and dirt on inside of piping before assembly.
- E. Excavate pipe trench in accordance with Section 22 00 01 and Division 31 specifications.
- F. Install pipe to elevation as indicated on Drawings.
- G. Place bedding material at trench bottom to provide uniform bedding for piping.
- H. Place bedding materials in one continuous layer not exceeding six inches compacted depth; compact to 95 percent maximum density.
- I. Install pipe on prepared bedding.
- J. Route pipe in straight line.
- K. Install plastic ribbon tape continuous over top of pipe 9 inches above pipe line.
- L. Install trace wire continuous over top of plastic pipe buried 9 inches above pipe line.
- M. Pipe Cover and Backfilling:
 - 1. Install underground Thermoplastic piping soil and waste drainage piping according to ASTM D 2321.
 - 2. Backfill trench in accordance with Section 22 00 01 and Division 31 specifications.
 - 3. Maintain optimum moisture content of fill material to attain required compaction density.
 - 4. After hydrostatic test, evenly backfill entire trench width by hand placing backfill material and hand tamping in 6 inches compacted layers to 12 inches minimum cover over top of jacket. Compact to 95 percent maximum density.
 - 5. Evenly and continuously backfill remaining trench depth in uniform layers with backfill material.
 - 6. Do not use wheeled or tracked vehicles for tamping.

3.05 INSTALLATION - ABOVE GROUND PIPING

- A. Establish invert elevations, slopes for drainage to 1/8 inch per foot minimum. Maintain gradients.
- B. Extend cleanouts to finished floor or wall surface. Lubricate threaded cleanout plugs with mixture of graphite and linseed oil. Provide clearance at cleanout for snaking drainage system.
- C. Encase exterior cleanouts in concrete flush with grade.
- D. Install floor cleanouts at elevation to accommodate finished floor.
- E. Install non-conducting dielectric connections wherever jointing dissimilar metals.

- F. Route piping in orderly manner and maintain gradient. Route parallel and perpendicular to walls.
- G. Install piping to maintain headroom. Group piping to conserve space.
- H. Group piping whenever practical at common elevations.
- I. Support cast iron drainage piping at every joint.
- J. Install piping to allow for expansion and contraction without stressing pipe, joints, or connected equipment.
- K. Provide clearance in hangers and from structure and other equipment for installation of insulation. Refer to Section 22 07 00.
- L. Provide access where valves and fittings are not accessible. Coordinate size and location of access doors with Section 08 31 13.
- M. Install piping penetrating roofed areas to maintain integrity of roof assembly.
- N. Where pipe support members are welded to structural building framing, scrape, brush clean, and apply one coat of zinc rich primer to welding.
- O. Prepare exposed, unfinished pipe, fittings, supports, and accessories ready for finish painting. Refer to Section 09 90 00.
- P. Install bell and spigot pipe with bell end upstream.
- Q. Sleeve pipes passing through partitions, walls and floors. Refer to Section 22 05 29.
- R. Insulate all horizontal storm drain piping (both primary and overflow pipe) and all roof drain bodies. Refer to Section 22 07 00.
- S. Install firestopping at fire rated construction perimeters and openings containing penetrating sleeves and piping. Refer to Section 07 84 00.
- T. Provide No-hub fitting thrust restraint at the following locations at each change of direction (horizontal or vertical) and/or each branch connection in above grade storm drain piping (both primary and emergency overflow).

3.06 PLASTIC PIPE AND JOINT FABRICATION

- A. Cut plastic pipe with pipe cutters using a cutting wheel specifically designed for plastic pipe.
- B. Remove all burrs, chips, filings, etc. from both the I.D. and O.D. of the pipe before joining. Use a knife, deburring tool, or a half-pound coarse file to remove all burrs.
- C. Bevel all pipe ends to minimize the chances of wiping the solvent cement from the I.D. of the fitting as the pipe is socketed. Use a beveling tool designed to bevel pipe at a 10° to 15° angle and a depth of 1/16" to 3/32".
- D. Using a clean, dry, cotton rag, wipe away all loose dirt and moisture from the I.D. and O.D. of the pipe end and the I.D. of the fitting. Do not solvent weld wet surfaces.

- E. Apply primer to the pipe surface in the same manner, making sure that the length of pipe evenly brushed is at least equal to the fitting socket depth.
- F. For checking penetration, scratch or scrape away the primed surface until a few thousandths of an inch can be so removed. Repeat applications of primer to either or both surfaces as necessary. In cold weather, allow more time for proper penetration.
- G. Cover the outer pipe surface literally with solvent cement for a length at least equal to that of the fitting socket depth.
- H. Continue alternate application to the fitting socket with a medium layer of solvent cement. Avoid puddling in the socket. On belled end pipe, do not coat beyond the socket depth or allow cement to run beyond the bell.
- I. Apply a second coat of cement to the pipe. Cement layers must be without voids and sufficient to fill any gaps in the joints.
- J. Immediately upon finishing cement application and before it starts to set, insert the pipe to the full socket depth while rotating the pipe or fitting 1/4 turn to ensure complete and even distribution of the cement. Hold joint together for a minimum of 10 to 15 seconds to make sure that pipe does not move back out of the socket.
- K. Immediately after joining and before joint is set, gently place joint onto a level surface, and wipe off all excess cement from the circumference of the joint.
 - a. Do not perform joining operations if ambient temperature is below 40 F. Allow a minimum of 72 hours of joint drying time before subjecting joints to any appreciable internal pressure.

3.07 FIELD QUALITY CONTROL

- A. Section 01 40 00 – Quality Requirements and Section 01 70 00 – Execution and Closeout Requirements: Field inspecting, testing, adjusting and balancing.
- B. Test storm drainage piping system in accordance with applicable code and local authority having jurisdiction.
- C. Testing:
 - 1. After each section of the storm drainage systems have been set within project area, all outlets shall be temporarily "plugged up", except as are required for testing as described herein. Each section of piping shall be tested to a level of at least 10 feet above the pipe being tested. The pipes being tested shall be filled with water to a verifiable and visible level as described above and be allowed to remain so for a minimum of 2 hours. If after 2 hours the level of the water has been lowered by leakage, the leaks must be found and stopped, and the water level shall again be raised to the level described, and the test repeated until, after a 2-hour retention period, there shall be no perceptible lowering of the water level in the system being tested.
 - 2. Should the completion of these tests leave any reasonable question of a doubt relative to the integrity of the installation, additional tests or measures shall be performed to demonstrate the reliability of these systems to the complete satisfaction of the Owner's duly authorized representative. Such tests shall be conducted and completed before any joints in plumbing are concealed or made

inaccessible.

- D. Protect piping and drains during remainder of construction period to avoid clogging with dirt and debris and to prevent damage from traffic and construction work of other trades.
- E. Place temporary caps or plugs in ends of uncompleted piping and when work stops at the end of each day.

END OF SECTION

SECTION 22 17 00 – FACILITY NATURAL GAS PIPING

PART 1 GENERAL

1.01 SUMMARY

A. Section Includes:

1. Natural gas piping below grade.
2. Natural gas piping above grade.
3. Unions and flanges.
4. Valves.
5. Pipe hangers and supports.
6. Strainers.
7. Natural gas pressure regulators.
8. Natural gas pressure relief valves.
9. Underground pipe markers.
10. Bedding and cover materials.

B. Related Sections:

1. Section 05 12 00 – Structural Steel Framing: Product requirements for touch-up painting of structural steel.
2. Section 05 21 00 – Steel Joist Framing: Product requirements for touch-up painting of steel joists.
3. Section 07 84 00 – Firestopping: Product requirements for firestopping for placement by this section.
4. Section 08 31 13 – Access Doors and Frames: Access doors for concealed valves and accessories.
5. Section 09 90 00 – Painting and Coating: Product requirements for painting for placement by this section.
6. Section 22 00 01 – Basic Plumbing Requirements.
7. Section 22 05 29 – Hangers and Supports for Plumbing Piping and Equipment: Product requirements for pipe hangers and supports [and firestopping] for placement by this section.

8. Section 22 05 53 – Identification for Plumbing Piping and Equipment: Product requirements for valve and pipe identification for placement by this section.
9. Section 33 51 00 – Natural-Gas Distribution: Product and execution requirements for site natural gas distribution systems.

1.03 SYSTEM DESCRIPTION

- A. Where more than one piping system material is specified, provide compatible system components and joints. Use non-conducting dielectric connections when joining dissimilar metals in systems.
- B. Provide flanges, unions, or couplings at locations requiring servicing. Use unions, flanges, or couplings downstream of valves and at equipment connections. Do not use direct welded or threaded connections to valves, equipment.
- C. Provide pipe hangers and supports in accordance with ASME B31.9, ASTM F708, MSS SP 58, MSS SP 69, and MSS SP 89.
- D. Use plug or ball valves for shut-off and to isolate equipment, part of systems, or vertical risers.

1.04 SUBMITTALS

- A. Section 01 33 00 – Submittal Procedures.

- B. Product Data:
 - 1. Piping: Submit data on pipe materials, fittings, and accessories. Submit manufacturers catalog information.
 - 2. Valves: Submit manufacturers catalog information with valve data and ratings for each service.
 - 3. Piping Specialties: Submit manufacturers catalog information including capacity, rough-in requirements, and service sizes for the following:
 - a. Strainers.
 - b. Natural gas pressure regulators.
 - c. Natural gas pressure relief valves.
- C. Test Reports: Indicate results of piping system pressure test.
- D. Welders Certificates: Certify welders employed on the Work, verifying AWS qualification within previous 12 months.
- E. Provide a table of all regulators which indicate, Mark, size, spring size and/or color, pressure, area of equipment served.

1.05 CLOSEOUT SUBMITTALS

- A. Section 01 70 00 – Execution and Closeout Requirements: Closeout procedures.
- B. Project Record Documents: Record actual locations of valves, piping system, and system components.
- C. Operation and Maintenance Data: Submit for valves and gas pressure regulators installation instructions, spare parts lists, and exploded assembly views.

1.06 QUALITY ASSURANCE

- A. Perform natural gas Work in accordance with NFPA 54 and International Fuel Gas Code.
- B. Perform work in accordance with International Fuel Gas Code and local gas company requirements.
- C. Perform Work in accordance with ASME B31.9 code for installation of piping systems and ASME Section IX for welding materials and procedures.
- D. Perform Work in accordance with authority having jurisdiction and AWS D1.1 for welding hanger and support attachments to building structure.
- E. Furnish shutoff valves complying with ASME B16.33 or ANSI Z21.15.

1.07 QUALIFICATIONS

- A. Manufacturer: Company specializing in manufacturing products specified in this section with minimum three years of documented experience.

- B. Installer: Company specializing in performing Work of this section with minimum three years of documented experience.
- C. Technicians performing fusion process shall be currently certified by the Texas Railroad Commission and shall **submit a resume showing experience on comparable fusion procedures within the last twelve (12) months.**

1.08 DELIVERY, STORAGE AND HANDLING

- A. Section 01 60 00 – Product Requirements: Product storage and handling requirements.
- B. Accept valves on site in shipping containers with labeling in place. Inspect for damage.
- C. Protect piping and fittings from soil and debris with temporary end caps and closures. Maintain in place until installation. Furnish temporary protective coating on cast iron and steel valves.

1.09 ENVIRONMENTAL REQUIREMENTS

- A. Section 01 60 00 – Product Requirements.
- B. Do not install underground piping when bedding is wet or frozen.

1.10 FIELD MEASUREMENTS

- A. Verify field measurements prior to fabrication.

1.11 COORDINATION

- A. Section 01 30 00 – Administrative Requirements: Requirements for coordination.
- B. Coordinate trenching, excavating, bedding and backfilling of buried piping systems with requirements of Section 31 23 33.

1.12 WARRANTY

- A. Section 01 70 00 – Execution and Closeout Requirements: Product warranties and product bonds.
- B. Furnish 1-year manufacturer warranty for valves excluding packing.

1.13 EXTRA MATERIALS

- A. Section 01 70 00 – Execution and Closeout Requirements: Spare parts and maintenance products.
- B. Furnish two packing kits for each type and size valve.

PART 2 PRODUCTS

2.01 NATURAL GAS PIPING – BELOW GRADE

- A. Steel Pipe: ASTM A53/A53M Schedule 40 black.
 - 1. Fittings: ASTM A234/A234M forged steel welding type.
 - 2. Joints: ASME B31.9, welded.
 - 3. Jacket: AWWA C105 polyethylene jacket or double layer, half-lapped 10 mil polyethylene tape.
- B. Polyethylene Pipe: ASTM D2513, PE24061/SDR 11.5
 - 1. Fittings: ASTM D2513; Butt fusion complying with ASTM-D3261 or socket fusion complying with ASTM-D2683.
 - 2. Joints: Fusion welded.
 - 3. Transitions from polyethylene to steel pipe shall be by factory fabricated transition fitting (i.e. Central Double "O" Seal or equal) or transition riser (Central Plastics Part No. 600 Series or equal). Minimum horizontal dimension for transition riser shall be 30 inches. Anodeless service riser may be used when interior carrier pipe complies with the specifications for the location of the pipe.

2.02 NATURAL GAS PIPING – ABOVE GRADE

- A. Steel Pipe: ASTM A53/A53M Schedule 40 black.
 - 1. Fittings: ASME B16.3, malleable iron, or ASTM A234/A234M forged steel welding type.
 - 2. Joints: Threaded for pipe 2 inches and smaller; welded for pipe 2-1/2 inches and larger.

2.03 UNIONS AND FLANGES

- A. Unions for Pipe 2 inches and Smaller:
 - 1. Ferrous Piping: Class 150, malleable iron, threaded.
 - 2. Copper Piping: Class 150, bronze unions with [soldered] [brazed joints].
 - 3. Dielectric Connections: Union with galvanized or plated steel threaded end, copper solder end, water impervious isolation barrier.
- B. Flanges for Pipe 2-1/2 inches and Larger:
 - 1. Ferrous Piping: Class 150, forged steel, slip-on flanges.
 - 2. Copper Piping: Class 150, slip-on bronze flanges.
 - 3. Gaskets: 1/16 inches thick preformed neoprene gaskets.

2.04 BALL VALVES

- A. 1/4 inch to 1 inch: MSS SP 110, Class 125, two-piece, threaded ends, bronze body, chrome-plated bronze ball, reinforced teflon seats, anti-static device, blow-out proof stem, lever handle, UL 842 listed for flammable liquids and LPG, full port.
- B. 1-1/4 inch to 3 inch: MSS SP 110, Class 125, two piece, threaded ends, bronze body, chrome-plated bronze ball, reinforced teflon seats, anti-static device, blow-out proof stem, lever handle, UL 842 listed for flammable liquids and LPG, conventional port.

2.05 PLUG VALVES

- A. 2 inches and Smaller: MSS SP 78, Class 150, semi-steel construction, round port, full pipe area, pressure lubricated, Teflon packing, threaded ends. Furnish one plug valve wrench for every ten plug-valves with minimum of one wrench.
- B. 2-1/2 inches and Larger: MSS SP 78, Class 150, semi-steel construction, round port, full pipe area, pressure lubricated, Teflon packing, flanged ends. Furnish wrench-operated.

2.06 STRAINERS

- A. 2 inch and Smaller: Screwed brass or iron body for 175 psig working pressure, Y pattern with 1/32-inch stainless steel perforated screen.
- B. 2-1/2 inch to 4 inch: Flanged iron body for 175 psig working pressure, Y pattern with 3/64 inch stainless steel perforated screen.

2.07 NATURAL GAS PRESSURE REGULATORS

- A. Product Description: Spring loaded, general purpose, self-operating service regulator including internal relief type diaphragm assembly and vent valve. Diaphragm case can be rotated 360 degrees in relation to body.
 - 1. Temperatures: minus 20 degrees F to 150 degrees F.
 - 2. Body: Cast iron.
 - 3. Spring case, lower diaphragm casing, union ring, seat ring and disk holder: Aluminum.
 - 4. Disk, diaphragm, and O-ring: Nitrile.
 - 5. Maximum inlet pressure: 150 psig.
 - 6. Furnish sizes 2 inches and smaller with threaded ends. Furnish sizes 2-1/2 inches and larger with flanged ends.

2.08 NATURAL GAS PRESSURE RELIEF VALVES

- A. Product Description: Spring loaded type relief valve.
 - 1. Body: Aluminum.
 - 2. Diaphragm: Nitrile.

3. Orifice: Aluminum.
4. Maximum operating temperature: 150 degrees F.
5. Inlet Connections: Threaded.
6. Outlet or Vent Connection: Same size as inlet connection.

2.09 UNDERGROUND PIPE MARKERS

- A. Plastic Ribbon Tape: Yellow colored, continuously printed, minimum 6 inches wide by 4 mil thick, manufactured for direct burial service.
- B. Trace Wire: Magnetic detectable conductor, yellow colored plastic covering, imprinted with "Natural Gas Service" in large letters.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Section 01 30 00 – Administrative Requirements: Coordination and project conditions.
- B. Verify excavations are to required grade, dry, and not over-excavated.

3.02 PREPARATION

- A. Ream pipe and tube ends. Remove burrs. Bevel plain end ferrous pipe.
- B. Remove scale and dirt, on inside and outside, before assembly.
- C. Prepare piping connections to equipment with flanges or unions.

3.03 INSTALLATION – INSERTS

- A. Provide inserts for placement in concrete forms.
- B. Provide inserts for suspending hangers from reinforced concrete slabs and sides of reinforced concrete beams.
- C. Provide hooked rod to concrete reinforcement section for inserts carrying pipe 4 inches and larger.
- D. Where concrete slabs form finished ceiling, locate inserts flush with slab surface.
- E. Where inserts are omitted, drill through concrete slab from below and provide through-bolt with recessed square steel plate and nut recessed into and grouted flush with slab.

3.04 INSTALLATION – PIPE HANGERS AND SUPPORTS

- A. Install pipe hangers and supports in accordance with Section 23 05 29.

3.05 INSTALLATION – BURIED PIPING SYSTEMS

- A. Install natural gas piping in accordance with NFPA 54 and International Fuel Gas Code.
- B. Verify connection to existing piping system size, location and invert are as indicated on Drawings.
- C. Establish elevations of buried piping with not less than 18 inches of cover, unless noted otherwise on plans.
- D. Establish minimum separation from other services piping in accordance with International Fuel Gas Code and NFPA 54.
- E. Remove scale and dirt on inside of piping before assembly.
- F. Excavate pipe trench in accordance with Section 22 00 01.
- G. Place bedding material at trench bottom to provide uniform bedding for piping, level bedding materials in one continuous layer not exceeding 4 inches compacted depth; compact to 95 percent maximum density.
- H. Install pipe on prepared bedding.
- I. Route pipe in straight line.
- J. Install pipe to allow for expansion and contraction without stressing pipe or joints.
- K. Metal Pipe: Install plastic ribbon tape continuous over top of metal pipe buried 6 inches below finish grade, above pipe line.
- L. Plastic Pipe: Install plastic ribbon tape continuous over top of plastic pipe buried 6 inches below finish grade, above pipe line. Tracer wire shall be spirally wrapped around the pipe (minimum of one revolution for every three feet of pipe).
- M. Pipe Cover and Backfilling:
 - 1. Backfill trench in accordance with Section 22 00 01.
 - 2. Maintain optimum moisture content of fill material to attain required compaction density.
 - 3. After hydrostatic test, evenly backfill entire trench width by hand placing backfill material and hand tamping in 6 inches compacted layers to 12 inches minimum cover over top of jacket. Compact to 95 percent maximum density.
 - 4. Evenly and continuously backfill remaining trench depth in uniform layers with backfill material.
 - 5. Do not use wheeled or tracked vehicles for tamping.
- N. Connections made between plastic piping and metallic piping shall be made only with transition fittings categorized as Category I in accordance with ASTM D2513.
- O. All branch connections shall be made using tees.

3.06 INSTALLATION – ABOVE-GROUND PIPING SYSTEMS

- A. Install natural gas piping in accordance with NFPA 54 and International Fuel Gas Code.
- B. Provide non-conducting dielectric connections wherever jointing dissimilar metals.
- C. Route piping in orderly manner and maintain gradient.
- D. Install piping to conserve building space and not interfere with use of space.
- E. Group piping whenever practical at common elevations.
- F. Install piping to allow for expansion and contraction without stressing pipe, joints, or connected equipment.
- G. Sleeve pipe passing through partitions, walls and floors. Refer to Section 22 05 29.
- H. Install firestopping at fire rated construction perimeters and openings containing penetrating sleeves and piping. Refer to Section 07 84 00.
- I. Provide clearance for access to valves and fittings.
- J. Provide access where valves and fittings are not exposed. Coordinate size and location of access doors with Section 08 31 13.
- K. Where pipe support members are welded to structural building framing, scrape, brush clean, weld, and apply one coat of zinc rich primer. Refer to Section 05 12 00.
- L. Provide support for utility meters in accordance with requirements of utility company.
- M. Install vent piping from gas pressure reducing valves to outdoors and terminate in weatherproof hood.
- N. Provide sediment trap at all equipment connections. Trap length shall be 6 inches minimum, 10 inches maximum. The cap at the bottom end shall be a minimum 4 inches above any surface. The cap shall be threaded and accessible.
- O. Prepare pipe, fittings, supports, and accessories not pre-finished, ready for finish painting. Refer to Section 09 90 00.
- P. Install identification on piping systems including underground piping. Refer to Section 22 05 53.
- Q. Install valves with stems upright or horizontal, not inverted.
- R. Protect piping systems from entry of foreign materials by temporary covers, completing sections of the Work, and isolating parts of completed system.
- S. Install medium pressure gas pressure regulator with tee fitting between regulator and upstream shutoff valve. Cap or plug one opening of tee fitting.
- T. Install gas pressure regulator with tee fitting not less than 10 pipe diameters down stream

of regulator. Cap or plug one opening of tee fitting.

- U. Install gas pressure regulator with independent vent full size opening on regulator and terminate outdoors.
- V. Pipe on the roof shall be a minimum of 10 inches above the roof.
- W. Provide roof supports and penetration: Refer to Section 22 05 29.

3.07 SERVICE CONNECTIONS

- A. Coordinate with local gas utility company and pay all fees required to provide new gas service complete with gas meter and regulators. Gas service distribution piping to have initial minimum pressure as noted on Drawings.
- B. Install service regulator adjacent to building wall in specified location.
- C. Install pressure regulating valve and riser pipe to prevent undue stress upon service pipe. For plastic service pipe, use steel pipe riser from below ground to regulator.
- D. Install regulator vent with rain and insect proof opening, terminating away from building openings.
- E. Install gas pressure regulator with tee fitting between regulator and upstream shutoff valve. Cap or plug one opening of tee fitting.
- F. Install gas pressure regulator with tee fitting not less than 10 pipe diameters downstream of regulator. Cap or plug one opening of tee fitting.
- G. Branch saddle or service saddles with tapping tee are allowable at taps on existing mains.

3.08 FIELD QUALITY CONTROL

- A. Section 01 40 00 – Quality Requirements: Field inspecting, testing, adjusting and balancing.
- B. Pressure test natural gas piping in accordance with NFPA 54.
- C. Inspect, test and purge gas piping in accordance with NFPA 54 and the local gas company requirements.
- D. When pressure tests do not meet specified requirements, remove defective work, replace and retest.

3.09 PAINT

- A. Prepare pipe, fittings, supports, and accessories not pre-finished, ready for finish painting. Refer to Section 09 90 00. All exposed gas piping shall be painted safety yellow, unless noted otherwise in Section 09 90 00.

END OF SECTION

SECTION 22 34 00 – FUEL-FIRED DOMESTIC WATER HEATERS

PART 1 GENERAL

1.01 SUMMARY

A. Section Includes:

1. Commercial gas-fired water heaters.

B. Related Sections:

1. Section 03 30 00 - Cast-In-Place Concrete: Execution requirements for concrete housekeeping pads specified by this section.
2. Section 22 07 00 - Plumbing Insulation: Field applied insulation for domestic water heaters.
3. Section: 22 11 00 - Facility Water Distribution: Supply connections to domestic water heaters.
4. Section 22 17 00 - Facility Natural-Gas Piping: Execution requirements for gas piping connections specified by this section.
5. Section 26 05 03 - Equipment Wiring Connections: Execution requirements for electric connections specified by this section.

1.02 REFERENCES

3. ASME Section VIII - Boiler and Pressure Vessel Code - Pressure Vessels.

D. International Association of Plumbing and Mechanical Officials:

1. Uniform Plumbing Code

E. International Code Council:

1. International Fuel Gas Code.
2. International Energy Conservation Code.

3. International Plumbing Code
- F. National Fire Protection Association:
4. NFPA 31 - Standard for the Installation of Oil-Burning Equipment.
 5. NFPA 54 - National Fuel Gas Code.
 6. NFPA 58 - Liquefied Petroleum Gas Code.
- G. United States Department of Energy:
7. DOE 10 CFR - Uniform Test Method for Measuring the Energy Consumption of Furnaces.

1.03 SUBMITTALS

- A. Section 01 33 00 - Submittal Procedures: Submittal procedures.
- B. Shop Drawings: Indicate heat exchanger dimensions, size of taps, and performance data. Indicate dimensions of tanks, tank lining methods, anchors, attachments, lifting points, taps, and drains.
- C. Product Data: Submit dimensioned drawings of water heaters indicating components and connections to other equipment and piping. Submit data of flue and intake piping and condensate neutralization components. Indicate electrical power requirements and characteristics and connection locations.
- D. Manufacturer's Installation Instructions: Submit mounting and support requirements.
- E. Manufacturer's Certificate: Certify products meet or exceed specified requirements.

1.04 CLOSEOUT SUBMITTALS

- A. Section 01 70 00 - Execution and Closeout Requirements: Closeout procedures.
- B. Operation and Maintenance Data: Submit replacement part numbers and availability.

1.05 QUALITY ASSURANCE

- A. Water Heater Performance Requirements: Equipment efficiency not less than prescribed by ASHRAE 90.1 when tested in accordance ANSI Z21.10.3.
- B. Perform all Work in accordance with local code authority and in accordance with manufacturer's installation instructions.
- C. Where heaters are classified as Boilers by the Texas Department of Licensing and Regulation (TDLR), installation shall meet all requirements of the Texas Boiler Rules. Coordinate with TDLR for inspection of completed Boiler installation and for Certificate of Operation prior to completion of project.

1.06 QUALIFICATIONS

- A. Manufacturer: Company specializing in manufacturing products specified in this section with minimum three years documented experience.
- B. Installer: Company specializing in performing Work of this section with minimum three years documented experience.

1.07 DELIVERY, STORAGE, AND HANDLING

- A. Section 01 60 00 - Product Requirements: Products storage and handling requirements.
- B. Accept water heaters on site in original labeled cartons. Inspect for damage.
- C. Protect tanks with temporary inlet and outlet caps. Maintain caps in place until installation.

1.08 FIELD MEASUREMENTS

- A. Verify field measurements prior to fabrication.

1.09 WARRANTY

- A. Section 01 70 00 - Execution and Closeout Requirements: Product warranties and product bonds.
- B. Furnish three-year manufacturer warranty for domestic water heaters packaged water heating systems.

1.10 EXTRA MATERIALS

- A. Section 01 70 00 - Execution and Closeout Requirements: Spare parts and maintenance products.

PART 2 PRODUCTS

2.01 TANKLESS GAS FIRED WATER HEATERS

- A. Tankless gas fired water heaters shall be of the high efficiency condensing type. Capacities, etc. shall be as scheduled on the drawings. Heaters shall be CSA listed, exceed the energy efficiency requirements of ASHRAE 90.1b-2007, and shall comply with SCAQMD Rule 1146.2 Ultra-Low NOx Standards.
- B. Heaters shall be constructed with materials complying with the applicable Sections of NSF 61 and with ANSI 61-G and NSF 372 for lead free brass.
- C. The pressure rating shall be 125 psig minimum.
- D. Heaters, shall be a copper coil integral fin and tube construction with quick release brass or bronze waterways. Heaters shall be factory assembled and tested. The primary heat exchanger shall be constructed of HRS35 grade copper. The secondary heat exchanger shall be constructed of Type 316L stainless steel.
- E. The heater(s) shall be controlled by an onboard solid-state printed circuit board monitoring incoming and outgoing temperatures with factory installed thermistors,

sensing and controlling flow rate to set point temperature, controlling both air and gas mixture inputs to maintain thermal combustion efficiency. The heater(s) shall also consist of inline fusing, a spark ignition and sensor system, aluminized stainless steel burners, an air-fuel ratio sensor, a hi-limit temperature switch, modulating and proportional gas valves, a freeze protection sensor with ceramic heating blocks, and an overheat cutoff fuse.

- F. Heaters shall include a remote wall mount temperature controller with diagnostics for troubleshooting.
- G. Provide with the following accessories:
 - 1. Heavy duty forged brass Webstone EXP E3 Compact Isolator valves, that include valves and connections for draining and flushing of the heater, and ASME pressure relief valve sized for the heater capacity. Valves shall be constructed of lead free brass in accordance with ANSI 61-G and NSF 372.
 - 2. Pipe cover matching heater cabinet materials and finishes.
- H. Heater shall be compatible with recirculation pump.
- I. Acceptable Manufacturers:
 - 1. A.O. Smith
 - 2. Takagi
 - 3. Rinnai

2.02 CONDENSATE NEUTRALIZERS

- A. For Use with Commercial Boilers up to 199 MBtu/hr
- B. Clear Tube for Visual Inspection
- C. Integrated Unions with O-Rings
- D. Calcite and Magnesium Oxide Media
- E. Recharge Kits Sold Separately
- F. Includes PVC Adapters
- G. Includes Mounting Brackets for 2" Tube Style

PART 3 EXECUTION

3.01 GENERAL

- A. Install piping, etc. to allow easy removal of water heaters.
- B. Provide Condensate neutralization kit on discharge pipe form flue.
- C. Nameplate as required by and by Section 221000).

- D. Provide factory start-up for gas-fired water heaters. Start-up shall include performance tests of thermal efficiency and flue gas analysis. **Provide written report to A/E and include in Records for Owner.**

END OF SECTION

SECTION 22 40 00 – PLUMBING FIXTURES

PART 1 GENERAL

1.01 SUMMARY

A. Section Includes:

1. Water closets.
2. Urinals.
3. Lavatories.
4. Sinks.
5. Service sinks.
6. Electric water coolers.
7. Showers.

B. Related Sections:

1. Section 07 90 00 – Joint Protection: Product requirements for caulking between fixtures and building components for placement by this section.
2. Section 22 00 01 – General Plumbing Requirements.
3. Section 22 11 00 – Facility Water Distribution: Supply connections to plumbing fixtures.
4. Section 22 13 00 – Facility Sanitary Sewerage: Waste connections to plumbing fixtures.
5. Section 26 05 03 – Equipment Wiring Connections: Execution requirements for electric connections to sensor valves and faucets specified by this section.

- H. Texas Administrative Code, Title 30, Part 1, Chapter 290, Subchapter G - Water Saving Performance Standards.
- I. Refer also to plumbing drawing P1.1 for applicable codes.

1.03 SUBMITTALS

- A. Section 01 33 00 – Submittal Procedures: Submittal procedures.
 1. Submittal shall have all options and all intended included items clearly identified on submittal.
- B. Product Data: Submit catalog illustrations of fixtures, sizes, rough-in dimensions, utility sizes, trim and finishes.
- C. Manufacturer's Installation Instructions: Submit installation methods and procedures.
- D. Manufacturer's Certificate: Certify products meet or exceed specified requirements.
- E. Record Documents:
 1. Provide full written description of manufacturer's warranty.
 2. Manufacturer's installation instructions.
- F. Operation and Maintenance Data:
 1. Include installation instructions, exploded assembly views, servicing requirements, inspection data, installation instructions, spare parts lists, replacement part numbers and availability, location and contact numbers of service depot, for all plumbing specialties installed.

G. Section 01 60 00 – Product Requirements; Substitution Request.

1. Prior to submitting a product or a manufacturer that is not the basis of design or listed as an approved equal; the contractor and/or the vendor shall submit a substitution request.

1.04 CLOSEOUT SUBMITTALS

- A. Section 01 70 00 – Execution and Closeout Requirements: Closeout procedures.
- B. Operation and Maintenance Data: Submit fixture, trim, exploded view and replacement parts lists. Provide contact number and location of supplier.

1.05 QUALITY ASSURANCE

- A. Provide products requiring electrical connections listed and classified by Underwriters Laboratories Inc. as suitable for purpose specified and indicated.
- B. Fixtures, trim, accessories and carriers of any one type shall be by the same manufacturer throughout.
- C. All fixtures and trim shall be new, institutional/commercial quality and free from mars, chips, scratches, blemishes or any defects.

1.06 QUALIFICATIONS

- A. Manufacturer: Company specializing in manufacturing products specified in this section with minimum three years documented experience.
- B. Installer: Company specializing in performing Work of this section with minimum three years documented experience.

1.07 DELIVERY, STORAGE AND HANDLING

- A. Section 01 60 00 – Product Requirements: Product storage and handling requirements.
- B. Accept fixtures on site in factory packaging. Inspect for damage
- C. Equipment, fixtures and appurtenances shall not be allowed to be exposed to exterior weather or elements. Equipment, fixtures and appurtenances stored outside shall be covered by a weather-proof covering at all times and shall be stored on pallets or rack systems above the ground. Equipment, fixtures and appurtenances stored inside shall be covered to protect same from construction debris and activities and shall be stored on pallets or rack systems above the floor. Equipment, fixtures and appurtenances shall not be allowed to be stored within the construction area in a disorderly fashion. Cleanliness of the work area and safety of the construction personnel shall be the first consideration.
- D. Protect installed fixtures from damage by securing areas and by leaving factory packaging in place to protect fixtures and prevent use.
- E. Do not allow use of installed fixtures or trim, other than testing during construction phase of the project.

1.08 WARRANTY

- A. Section 01 70 00 – Execution and Closeout Requirements: Product warranties and product bonds.
- B. Furnish 1-year manufacturer warranty for plumbing fixtures. Warranty shall not begin until acceptance by Owner.

1.09 EXTRA MATERIALS

- A. Section 01 70 00 – Execution and Closeout Requirements: Spare parts and maintenance products.

PART 2 PRODUCTS

2.01 GENERAL

- A. The Contractor shall provide plumbing fixtures where indicated on the Drawings. These plumbing fixtures shall be standard products of manufacturers scheduled or listed on Drawings. Where one manufacturer is scheduled or listed on Drawings, the intent is not to limit competition or to write a closed specification, but rather to set a standard of quality. Refer to Section 01 60 00 for product options and substitution procedures. The fixtures shall be free from marks or chips and shall be new, first quality and shall be furnished with sufficient supports in order to adequately hang each and every unit.
- B. The space between fixtures and masonry walls shall be grouted with White General Electric Silicone flexible grout. The space between fixtures and sheetrock or wood panel walls shall not be grouted but the fixture shall fit flat against the wall surface with no more than 1/16" gap.
- C. All faucets, fittings, supply stops and similar devices shall be of one manufacturer unless otherwise specified. All water faucets and valve bodies shall be cast brass with a minimum copper content of 85%. They shall contain standardized interchangeable operating units constructed of a removable and replaceable unit containing all parts subject to wear. All water faucets shall contain an adjustable internal volume control unit. All exposed parts shall be chromium plated.
- D. All accessible fixtures shall meet the requirements of ADA, ANSI A117.1, ANSI Z124.2 and the State of Texas Accessibility Standards (TAS). The Contractor shall confirm locations with the Architectural drawings.
- E. Provide ADA/TAS compliant molded insulation on exposed water and drain components (piping, stops, etc.) beneath ADA accessible lavatories and sinks. Insulation shall be designed to allow removal and re-installation for pipe servicing. Insulation to be molded vinyl with added cushion and thermal resistance.
- F. Provide water hammer arrestors at all quick closing valves such as water closets, sensor faucets, knee or foot operated fixtures, etc.
- G. Coordinate special blocking, other wall supports, floor bracing or other structural bracing with General Contractor.
- H. Point of use thermostatic mixing valves located under sinks and lavatories shall be

secured to the wall with a mounting bracket and located under the sink. Supply hoses shall be ordered to the correct length. Excess supply hose shall be removed; wrapping excess supply tubing around other trim is not allowed.

- I. Any condensate connection to the tail piece shall be done with chrome plated brass or copper piping and held tight to the wall. Exposed Rubber hose will not be allowed. Coordinate with mechanical contractor.
- J. All fixtures and equipment shall be lead free and shall be assembled and manufactured with lead free solders in accordance with NSF-61-G and NSF 372.

2.02 FITTINGS AND PIPES

- A. Fittings and piping shall be brass and, wherever exposed, shall be polished chrome-plated. Provide tight fitting wall or floor escutcheons of chrome-plated brass wherever pipes pass through floors, walls or ceilings.
- B. Furnish and install all required water, waste, soil and vent connections to all plumbing fixtures, together with all fittings, supports, fastening devices, cocks, valves, traps, etc., leaving all in complete working order.
- C. Supplies for all lavatories, sinks, tank type water closets and drinking fountains shall be loose key angle stops with female inlets and shall include wall flanges, and O.D. flexible risers with bullnose or flared end outlets. All components to be chrome plated. In all cases, all piping, tubing, fittings, and faucets shall be installed using a mechanical non-slip connection, such as bullnose, flared, flanged, ferrule or threaded fittings. Fittings requiring a friction fit using slip-on or gasketed connections are not acceptable.
- D. Provide water hammers arrestors as indicated on the drawings and/or at all locations with quick closing valves such as water closets, automatic fixtures, knee operated or foot operated fixtures, ice makers, washer boxes, water softeners, etc.

2.03 PLUMBING FIXTURES

- A. Refer to Plumbing Fixture Schedules on the Plumbing drawings for basis of design fixtures and acceptable manufacturers offering equivalent products.
- B. All vitreous china shall be white unless noted otherwise
- C. Lavatory and sink faucets in patient care areas shall have a minimum of 5-inches clearance from the spout of the faucet to the rim of the sink per DSHS Licensing standards.
- D. Fixtures shall have flow control devices to limit flow of water to a maximum rate in accordance with local code or in accordance with the schedules for projects that require a more stringent water use criteria.

2.04 FLUSH VALVE WATER CLOSETS

- A. Water Closets:
 - 1. Complies with ASME A112.19.2

2. Tested by an independent MaP-approved laboratory, MaP tested and rated for a minimum of 350 grams or greater.
 3. The bowl shall be rated for a maximum of 1.26GPF unless noted otherwise.
- B. Exposed Flush Valve:
1. Complies with ASME A112.18.1 and ASME A122.19.2.
 2. Rated for a maximum 1.28-gallon flush volume unless noted otherwise. Flushvalve shall match the rating of the water closet.
 3. ADA compliant non-hold open handle, solid non-spinning escutcheon, comply with IAPMO/ANSI 2124.5-2013
 4. Water closet and urinal flush valves shall be chrome plated brass when exposed.
 5. All electronic flush valves shall be provided with manual override activators. Exception: Flush valves located within specimen collecting toilet rooms shall be hard wired without manual override.
- C. Seat:
1. Water closets seats shall be commercial/institutional grade, white in color, have open front and Self-sustaining check hinges with non-corrosive 300 series stainless steel posts and pintles
- D. Wall-Mounted Carrier: ASME A112.6.1; adjustable cast iron frame, integral drain hub and vent, adjustable spud, lugs for floor and wall attachment, provide optional foot support, threaded fixture studs with nuts and washers.
- E. Water closet bowl gaskets shall be neoprene, felt gaskets and wax rings are not permitted.
- F. Bolts and fasteners shall be non-corrosive stainless steel 300 series.

2.05 WALL-HUNG URINALS

- A. Urinal:
1. Acceptable manufacturers offering equivalent products.
 - a. Kohler.
 - b. American Standard.
 - c. Zurn.
 2. ASME A112.19.2; floor-mounted, siphon jet vitreous china closet bowl, with elongated rim, 1-1/2-inch top spud, china bolt caps.
- B. Exposed Flush Valve:
1. Acceptable manufacturers offering equivalent products.

- a. American Standard.
 - b. Zurn.
 - c. Sloan.
2. ASME A112.18.1; exposed chrome-plated, diaphragm type with oscillating handle, escutcheon, seat bumper, integral screwdriver stop and vacuum breaker; maximum 1.6 gallon flush volume.
- C. Wall-Mounted Carrier: ASME A112.6.1; cast iron and steel frame with tubular legs, lugs for floor and wall attachment, threaded fixture studs for fixture hanger, bearing studs.

2.06 LAVATORIES

- A. Vitreous China Wall Hung Basin:
1. Acceptable manufacturers offering equivalent products.
 - a. Kohler.
 - b. American Standard.
 - c. Zurn.
 2. ASME A112.19.2; vitreous china wall-hung lavatory with 4-inch-high back, rectangular basin with splash lip, front overflow, and soap depression.
- B. Supply Fitting:
1. Manufacturer: As scheduled.
 2. Other acceptable manufacturers offering equivalent products.
 - a. Chicago.
 - b. T & S Brass.
 - c. Delta.
 3. ASME A112.18.1; chrome-plated supply fitting.
- C. Accessories:
1. Chrome plated 17-gage brass P-trap and arm with escutcheon.
 2. Offset waste with perforated open strainer.
 3. Screwdriver stops.
 4. Flexible supplies – Braiden 304 stainless steel; heavy duty plated brass nuts sized appropriately. No more than 3 inches of slack permitted.
- D. Wall-Mounted Carrier: ASME A112.6.1; cast iron and steel frame with tubular legs, lugs for floor and wall attachment, [threaded studs for fixture hanger,] [concealed arm supports,] bearing plate and studs.
- E. Counter-Mounted Basin:

1. Acceptable manufacturers offering equivalent products.
 - a. Kohler.
 - b. American Standard.
 - c. Zurn.
2. ASME A112.19.2; vitreous china wall-hung lavatory with 4-inch-high back, rectangular basin with splash lip, front overflow, and soap depression.

F. Supply Fitting:

1. Manufacturer: As scheduled.
2. Other acceptable manufacturers offering equivalent products.
 - a. Chicago.
 - b. T & S Brass.
 - c. Delta.
3. ASME A112.18.1; chrome plated supply fitting.

G. Accessories:

1. Chrome-plated 17 gage brass P-trap and arm with escutcheon.
2. Offset waste with perforated open strainer.
3. Screwdriver stops.
4. Flexible supplies – Braiden 304 stainless steel; heavy duty plated brass nuts sized appropriately. No more than 3 inches of slack permitted.

2.07 SINKS

A. Bowl:

1. Manufacturer: As Scheduled.
2. Other acceptable manufacturers offering equivalent products.
 - a. JUST.
 - b. Bradley.
 - c. Kohler.
3. ASME A112.19.3; 18-gage thick, Type 302 stainless steel, self-rimming and undercoated, with 1-1/2-inch chromed brass drain 3-1/2 inch crumb cup and tailpiece, ledge back drilled for trim.

B. Trim:

1. Manufacturer: As scheduled.

2. Other acceptable manufacturers offering equivalent products.
 - a. Chicago.
 - b. T & S Brass.
 - c. Delta.
3. Accessories: Chrome-plated 17-gage brass P-trap and arm with escutcheon, screwdriver stop, flexible supplies.

2.08 SHOWERS

A. Individual Wall Showers

1. Manufacturers: As Scheduled.
2. Construction: Shower panel is type 304 stainless steel polished to a #4 finish. All other exposed parts are stainless steel or chrome-plated brass. Valve bodies are brass casting. Supply inlets are flexible stainless-steel hoses.
3. Flow Control: A 2.0 GPM flow control is standard. (Actual flow may vary, but will not exceed 2.5 GPM Max.)
4. Shower Panel: Constructed of 18-gauge stainless steel polished to a #4 finish with stainless steel soap tray mounted to panel. Shower panel top and bottom covers are sloped, and constructed of 16-gauge stainless steel. Provide vertical shroud for supply piping.
5. Shower Head: Standard fixed direction adjustable spray showerhead with pressure balancing mixing valve.
6. Supply Inlets: Supply inlets are flexible, stainless steel hoses with 1/2 NPT connections. Inlets are accessible through the back of the shower or through knockouts in the top and bottom covers.

2.09 ELECTRIC WATER COOLERS

A. Fountain:

1. Manufacturer: As Scheduled.
2. Other acceptable manufacturers offering equivalent products.
 - a. Haws.
 - b. Elkay.
 - c. Halsey Taylor.
 - d. Oasis.

2.10 SERVICE SINKS

A. Bowl:

1. Manufacturer: As scheduled.
 2. Other acceptable manufacturers offering equivalent products.
 - a. Stern Williams.
 - b. Fiat.
 - c. American Standard.
- B. Trim:
1. Manufacturer: As Scheduled.
 2. Other acceptable manufacturers offering equivalent products.
 - a. American Standard.
 - b. T & S Brass.
 - c. Chicago.
 3. ASME A112.18.1 exposed wall type supply with lever handles, spout wall brace, vacuum breaker, hose end spout, strainers, eccentric adjustable inlets, integral screwdriver stops with covering caps and adjustable threaded wall flanges.
- C. Accessories:
1. 5 feet of 1/2 inch diameter plain end reinforced rubber hose.
 2. Hose clamp hanger.
 3. Mop hanger for min of 5 mops.

2.11 EMERGENCY EYE AND FACE WASH

- A. Manufacturers:
1. Bradley Corp.
 2. Haws Drinking Faucet Co.
 3. Guardian.

2.12 LAVATORY INSULATION KIT

- A. Manufacturers: As scheduled
1. Truebro.
 2. Substitutions: Permitted.
- B. Product Description: Where Lavatories are noted to be insulated for ADA compliance, furnish the following: Safety Covers conforming to ANSI A177.1 and consisting of insulation kit of molded closed cell vinyl construction, 3/16-inch thick, white color, for insulating tailpiece, P-trap, valves, and supply piping. Furnish with weep hole and angle

valve access covers.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Section 01 30 00 – Administrative Requirements: Coordination and project conditions.
- B. Verify walls and floor finishes are prepared and ready for installation of fixtures.
- C. Verify electric power is available and of correct characteristics.
- D. Confirm millwork is constructed with adequate provision for installation of counter top lavatories and sinks.

3.02 PREPARATION

- A. Rough-in fixture piping connections in accordance with minimum sizes indicated in fixture rough-in schedule for particular fixtures.

3.03 INSTALLATION

- A. Install each fixture with trap, easily removable for servicing and cleaning.
- B. Provide chrome plated rigid or flexible supplies to fixtures with loose key stops, reducers, and escutcheons.
- C. Install components level and plumb.
- D. Install and secure fixtures in place with wall carriers and bolts.
- E. Seal fixtures to wall and floor surfaces with sealant as specified in Section 09 90 00, color to match fixture.
- F. Solidly attach water closets to floor with lag screws. Lead flashing is not intended hold fixture in place.
- G. For ADA accessible water closets, install flush valve with handle to wide side of stall.

3.04 INTERFACE WITH OTHER PRODUCTS

- A. Review millwork Shop Drawings. Confirm location and size of fixtures and openings before rough in and installation.

3.05 ADJUSTING

- A. Section 01 70 00 – Execution and Closeout Requirements: Testing, adjusting and balancing.
- B. Adjust stops or valves for intended water flow rate to fixtures without splashing, noise, or overflow.

3.06 CLEANING

- A. Section 01 70 00 – Execution and Closeout Requirements: Final cleaning.
- B. Clean plumbing fixtures and equipment.

3.07 PROTECTION OF INSTALLED CONSTRUCTION

- A. Section 01 70 00 – Execution and Closeout Requirements: Protecting installed construction.
- B. Do not permit use of fixtures before final acceptance.

3.08 SCHEDULES – REFER TO PLUMBING DRAWINGS

- A. Fixture Mounting Heights:
 - 1. Water Closet:
 - a. Standard: 15 inches to top of bowl rim.
 - b. Accessible: 18 inches to top of seat.
 - 2. Water Closet Flush Valves:
 - a. Standard: 11 inches min. above bowl rim.
 - b. Recessed: 10 inches min. above bowl rim.
 - 3. Urinal:
 - a. Standard: 22 inches to top of bowl rim.
 - b. Accessible: 17 inches to top of bowl rim.
 - 4. Urinal Flush Valves:
 - a. Standard: 48 inches max. above finished floor.
 - b. Accessible: 44 inches max. above finished floor.
 - 5. Lavatory:
 - a. Standard: 31 inches to top of basin rim.
 - b. Accessible: 34 inches to top of basin rim.
 - 6. Drinking Fountain:
 - a. Standard: 40 inches to top of basin rim.
 - b. Accessible: 36 inches to top of spout.
 - 7. Shower Heads:
 - a. Adult Male: 69.5 inches to bottom of head.
 - b. Adult Female: 64.5 inches to bottom of head.
 - c. Child: 58.5 inches to bottom of head.

8. Emergency Shower: Standard: TAS compliant.

END OF SECTION

SECTION 22 60 13 – MEDICAL GAS AND VACUUM SYSTEMS

PART 1 GENERAL

1.01 SUMMARY

A. Section Includes:

1. Medical gas piping.
2. Valves.
3. Pipe hangers and supports.
4. Piping Specialties.
5. Oral evacuation pumps.
6. Gas cylinder manifold.
7. Labeling and identification.
8. Installer performed tests.
9. System verification tests.

B. Related Sections:

1. Section 03 30 00 – Cast-In-Place Concrete: Execution requirements for equipment bases specified by this section.
2. Section 07 84 00 – Firestopping: Product requirements for firestopping for placement by this section.
3. Section 08 71 00 – Door Hardware: Keying requirements for padlocks.
4. Section 22 05 03 – Pipes and Tubes for Plumbing Piping and Equipment: Product and installation requirements for piping materials applying to various system types.
5. Section 22 05 53 – Identification for Plumbing Piping and Equipment: Product requirements for underground pipe and valve identification for placement by this section.
6. Section 22 07 00 – Plumbing Insulation: Product and execution requirements for pipe insulation.
7. Section 22 11 00 – Facility Water Distribution: Product requirements for backflow preventers for placement by this section.
8. Section 26 05 03 – Equipment Wiring Connections: Execution requirements for electric connections specified by this section.

9. Section 31 23 17 – Trenching: Execution requirements for trenching required by this section.
10. Section 31 23 23 – Fill: Requirements for backfill to be placed by this section.

3. AWS D1.1 – Structural Welding Code – Steel.

D. ASTM International:

1. ASTM A269 – Standard Specification for Seamless and Welded Austenitic Stainless-Steel Tubing for General Service.
2. ASTM A395/A395M – Standard Specification for Ferritic Ductile Iron Pressure-Retaining Castings for Use at Elevated Temperatures.
3. ASTM A403/A403M – Standard Specification for Wrought Austenitic Stainless Steel Piping Fittings.
4. ASTM A536 – Standard Specification for Ductile Iron Castings.
5. ASTM A666 – Standard Specification for Annealed or Cold-Worked Austenitic Stainless-Steel Sheet, Strip, Plate, and Flat Bar.
6. ASTM B32 – Standard Specification for Solder Metal.

7. ASTM B88 – Standard Specification for Seamless Copper Water Tube.
 8. ASTM B280 – Standard Specification for Seamless Copper Tube for Air Conditioning and Refrigeration Field Service.
 9. ASTM B819 – Standard Specification for Seamless Copper Tube for Medical Gas Systems.
 10. ASTM B828 – Standard Practice for Making Capillary Joints by Soldering of Copper and Copper Alloy Tube and Fittings.
 11. ASTM D1784 – Standard Specification for Rigid Poly (Vinyl Chloride) (PVC) Compounds and Chlorinated Poly (Vinyl Chloride) (CPVC) Compounds.
 12. ASTM D1785 – Standard Specification for Poly (Vinyl Chloride) (PVC) Plastic Pipe, Schedules 40, 80, and 120.
 13. ASTM D2464 – Standard Specification for Threaded Poly (Vinyl Chloride) (PVC) Plastic Pipe Fittings, Schedule 80.
 14. ASTM D2466 – Standard Specification for Poly (Vinyl Chloride) (PVC) Plastic Pipe Fittings, Schedule 40.
 15. ASTM D2467 – Standard Specification for Poly (Vinyl Chloride) (PVC) Plastic Pipe Fittings, Schedule 80.
 16. ASTM D2564 – Standard Specification for Solvent Cements for Poly (Vinyl Chloride) (PVC) Plastic Piping Systems.
 17. ASTM D2855 – Standard Practice for Making Solvent-Cemented Joints with Poly (Vinyl Chloride) (PVC) Pipe and Fittings.
 18. ASTM F1476 – Standard Specification for Performance of Gasketed Mechanical
 19. Couplings for Use in Piping Applications.
- E. Compressed Gas Association:
1. CGA G-4.1 – Cleaning Equipment for Oxygen Service.
 2. CGA C-7 – Guide to the Preparation for Cautionary Labeling and Marking for Compressed Gas Containers.
 3. CGA V-1 – Standard for Compressed Gas Cylinder Valve Outlet and Inlet Connections.
 4. CGA V-5 – Diameter-Index Safety System (Non-Interchangeable Low-Pressure Connections for Medical Gas Applications).
- F. Manufacturers Standardization Society of the Valve and Fittings Industry:
1. MSS SP 58 – Pipe Hangers and Supports – Materials, Design and Manufacturer.

2. MSS SP 67 – Butterfly Valves.
 3. MSS SP 69 – Pipe Hangers and Supports – Selection and Application.
 4. MSS SP 73 – Brazed Joints for Wrought and Cast Copper Alloy Solder Joint Pressure Fittings.
 5. MSS SP 110 – Ball Valves Threaded, Socket-Welding, Solder Joint, Grooved and Flared Ends.
- G. National Electrical Manufacturers Association:
1. NEMA 250 – Enclosures for Electrical Equipment (1000 Volts Maximum).
- H. National Fire Protection Association:
1. NFPA 99 – Health Care Facilities.
- I. Underwriters Laboratories Inc.:
1. Electrical Construction Equipment.

1.03 SYSTEM DESCRIPTION

A. Definitions

1. The following definitions are taken from NFPA 99, Chapter 3 Definitions. Retain in project specification or use to help edit the specification.
 - a. Category 2 Medical Piped Gas and Vacuum Systems: Systems where interruption would place patients at manageable risk.

B. Piping Systems:

1. Category 2 positive pressure medical gas system piping.
2. Category 2 medical-surgical vacuum system piping.
3. Air compressor intake piping.
4. Vacuum pump exhaust piping.
5. Category 2 underground protector piping.
6. Medical air compressor service piping.
7. Relief valve vent piping.

C. Equipment:

1. Valve cabinets.

1.04 SUBMITTALS

- A. Section 01 33 00 – Submittal Procedures: Requirements for submittals.
- B. Shop Drawings:
 - 1. Indicate piping system schematic with electrical and connection requirements general assembly of components, mounting and installation details.
 - 2. Indicate general layout of control and alarm panels.
 - 3. Indicate detailed medical wall assembly drawings.
- B. Product Data:
 - 1. Piping: Submit data on pipe materials, fittings, and accessories.
 - 2. Valves: Submit manufacturer's catalog information with valve data and ratings for each service.
 - 3. Hangers and Supports: Submit manufacturer's catalog information including load capacity.
 - 4. System Components: Submit manufacturer's catalog information including capacity, component sizes, rough-in requirements, and service sizes. When applicable, include electrical characteristics and connection requirements.
 - 5. Compressors: Submit type, capacity and performance characteristics. Include electrical characteristics and connection requirements.
 - 6. Vacuum Pumps: Submit type, capacity and performance characteristics. Include electrical characteristics and connection requirements.
- C. Component Data:
 - 1. Valve Boxes and Area Alarms: Provide table listing location of valves, area alarm; sizes and quantity of valves, area served.
 - 2. Master Alarm and Area Alarm: Provide table listing equipment or area served and all alarm points and gases.
- D. Qualifications Data: Submit documentation verifying qualifications for the following:
 - 1. Brazers and brazing procedures.
 - 2. Welders and welding procedures.
 - 3. Medical gas and vacuum system installer.
 - 4. System verifier.
- D. Samples: Submit one of each outlet and each valve, when requested.
- E. Manufacturer's Installation Instructions: Submit hoisting and setting requirements, starting procedures.

- F. Manufacturer's Certificate:
 - 1. Certify products meet or exceed specified requirements.
 - 2. Certify piping materials comply with CGA G-4.1 cleaning requirements.
- C. Manufacturer's Field Reports: Indicate systems are complete, zone valves installed, and alarm systems functional.
- D. Installer's Test Reports:
 - 1. Submit documentation indicating completion of Installer Performed Tests.
 - 2. Submit list of each test and when test was completed.
 - 3. Include documentation required by NFPA 99.
- E. Verifier's Test Reports:
 - 1. Submit testing and inspection report of System Verification Tests.
 - 2. Submit list of each test and when test was completed.
 - 3. Include documentation required by NFPA 99.

1.05 CLOSEOUT SUBMITTALS

- A. Section 01 70 00 – Execution and Closeout Requirements: Requirements for submittals.
- B. Project Record Documents: Record actual locations of equipment piping, valves, outlets and components.
- C. Operation and Maintenance Data: Submit assembly views, lubrication instructions, replacement part numbers and availability.

1.06 QUALITY ASSURANCE

- A. Furnish piping, valves, pipe fittings, outlets and other piping components cleaned for oxygen service by manufacturer in accordance with CGA G-4.1.
- B. Furnish documentation certifying installed piping materials comply with CGA G-4.1 cleaning requirements.
- C. Perform Work in accordance with NFPA 99 for installation of piping systems and ASME Section IX and AWS B2.2 for brazing materials and procedures.
- D. Perform Work in accordance with authority having jurisdiction and AWS D1.1 for welding hanger and support attachments to building structure.
- E. Perform Work in accordance with State of Texas Hospital Licensing Standards.
- F. Maintain one copy of each document on site.

1.07 QUALIFICATIONS

- A. Manufacturer: Company specializing in manufacturing products specified in this section with minimum three years of documented experience.
- B. Installer: Company specializing in performing work of this section with minimum three years of documented experience.
 - 1. ASSE Standard 6010 qualified to install medical gas and vacuum systems.
- C. Brazers and Brazing Procedures: ASME Section IX or AWS B2.2 qualified within previous 12 months for medical gas and vacuum systems.
- D. Welders and Welding Procedures: AWS D1.1 qualified within previous 12 months for medical gas and vacuum systems.
- E. System Verifier: Company specializing in performing medical gas system verification with minimum three years documented experience.
 - 1. ASSE Standard 6030 qualified and independent of system installer.

1.08 MOCK-UP

- A. Section 01 40 00 – Quality Requirements: Mock-up requirements.
- B. Construct mockup of outlets for each type of medical gas in typical patient head wall unit, when requested or indicated on Drawings.
- C. Incorporate accepted mock-up as part of Work or remove as directed by Architect/Engineer.

1.09 PRE-INSTALLATION MEETINGS

- A. Section 01 30 00 – Administrative Requirements: Pre-installation meeting.
- B. When required, convene minimum one week prior to commencing work of this section.
- C. When required, convene additional meetings minimum one week prior to commencing the following:
 - 1. Installer performed tests.
 - 2. System verification tests.

1.10 DELIVERY, STORAGE AND HANDLING

- A. Section 01 60 00 – Product Requirements: Requirements for transporting, handling, storing and protecting products.
- B. Accept equipment on site in factory fabricated containers with shipping skids and plastic pipe end protectors in place. Inspect for damage.
- C. Furnish temporary end caps and closures on piping and fittings. Maintain in place until

installation.

- D. Protect piping from entry of foreign materials by temporary covers, completing sections of the Work, and isolating parts of completed system.

1.11 WARRANTY

- A. Section 01 70 00 – Execution and Closeout Requirements: Requirements for warranties.
- B. Furnish five-year manufacturer warranty for pumps, compressors, refrigerated dryers and valves excluding packing.

1.12 MAINTENANCE SERVICE

- A. Section 01 70 00 – Execution and Closeout Requirements: Requirements for maintenance service.
- B. Furnish service and maintenance of equipment and system for one year from Date of Substantial Completion.
- C. Examine equipment and system components monthly. Clean, adjust and lubricate equipment.
- D. Calibrate dew point alarms annually.
- E. Include systematic examination, adjustment and lubrication of equipment. Repair or replace parts in accordance with manufacturer's operating and maintenance data. Use parts produced by manufacturer of original equipment.
- F. Perform work without removing equipment, system or components from service during building normal occupied hours or during maintenance period scheduled in advance with Owner.
- G. Provide emergency call back service at all hours for this maintenance period.
- H. Maintain locally, near Project location, adequate stock of parts for replacement or emergency purposes. Have personnel available to ensure fulfillment of this maintenance service, without unreasonable loss of time.
- I. Perform maintenance work using competent and qualified personnel under supervision of manufacturer or original installer.
- J. Do not assign or transfer maintenance service to agent or subcontractor without prior written consent of Owner.

PART 2 PRODUCTS

2.01 CATEGORY 1 AND 2 POSITIVE PRESSURE MEDICAL GAS SYSTEM PIPING

- A. Piping All Sizes, Below Gauge Pressure of 185 psig:

3. Copper Tubing: ASTM B819, Type L, drawn. Furnish piping identified with manufacturer's markings.

- B. Piping 2-1/2 inches and Smaller, Above Gauge Pressure of 185 psi:
 - 1. Copper Tubing: ASTM B819, Type L, drawn. Furnish piping identified with manufacturer's markings.
- C. Piping 3 inches and Larger, Above Gauge Pressure of 185 psi:
 - 1. Copper Tubing: ASTM B819, Type K, drawn. Furnish piping identified with manufacturer's markings.
- D. Fittings: ASME B16.22, wrought copper and bronze or MSS SP 73 wrought and cast copper.
- E. Joints: Braze, AWS A5.8 BCuP silver/phosphorus/copper alloy with melting temperature range 1190 to 1480 degrees F.

2.02 CATEGORY 1 AND 2 MEDICAL-SURGICAL VACUUM SYSTEM PIPING

- A. Copper Tubing: ASTM B88, ASTM B280 or ASTM B819, Type L, drawn.
 - 1. Fittings: ASME B16.18 cast copper alloy or ASME B16.22, wrought copper and bronze.
 - 2. Tee Connections: Mechanically extracted collars with notched and dimpled branch tube.
 - 3. Joints: Braze, AWS A5.8 BCuP silver/phosphorus/copper alloy with melting temperature range 1190 to 1480 degrees F.

2.03 CATEGORY 1 AND 2 UNDERGROUND PROTECTOR PIPING

- A. PVC Pipe: ASTM D1785, Schedule 80, polyvinyl chloride (PVC) material.
 - 1. Fittings: ASTM D2467, Schedule 80, PVC. Use only long radius elbows.
 - 2. Joints: ASTM D2855, solvent weld with ASTM D2564 solvent cement.

2.04 RELIEF VALVE VENT PIPING

- A. Copper Tubing: ASTM B88, ASTM B280 or ASTM B819, Type L, annealed. Furnish piping identified with manufacturer's markings.
 - 1. Fittings: ASME B16.22, wrought copper and bronze or MSS SP 73 wrought and cast copper.
 - 2. Joints: Braze, AWS A5.8 BCuP silver/phosphorus/copper alloy with melting temperature range 1190 to 1480 degrees F.

2.05 UNIONS AND FLANGES

- A. Unions for Pipe 2 inches and Smaller:
 - 1. Copper Piping: Class 150, bronze unions with [soldered] [brazed joints].

2. Dielectric Connections: Union with galvanized or plated steel threaded end, copper solder end, water impervious isolation barrier.
 3. PVC Piping: PVC.
- B. Flanges for Pipe 2-1/2 inches and Larger:
1. Copper Piping: Class 150, slip-on bronze flanges.
 2. PVC Piping: PVC flanges.
 3. Gaskets: 1/16-inch-thick preformed neoprene gaskets.
- C. PVC Pipe Materials: For connections to equipment and valves with threaded connections, furnish solvent-weld socket to screwed joint adapters and unions, or ASTM D2464, Schedule 80, threaded, PVC pipe.

2.06 BALL VALVES

- A. Manufacturers:
1. Beacon Medaes Products.
 2. Allied Health Care.
 3. Amico Corporation.
 4. Crane Valve, North America.
 5. Hammond Valve.
 6. Milwaukee Valve Company.
 7. NIBCO, Inc.
 8. Stockham Valves & Fittings.
 9. Substitutions: Section 01 60 00 – Product Requirements.
- B. [BA-1] 2 inches and Smaller: MSS SP 110, 600 psi non-shock working pressure, bronze, three-piece body, chrome-plated brass or bronze ball, full port, Teflon seats, blow-out proof stem, solder ends with extensions for brazing, [lever handle] [locking lever handle] [extended lever handle].
1. Furnish valves cleaned for oxygen service in accordance with CGA G-4.1 by manufacturer and labeled, sealed, and packed for shipping.
- C. BA-2 – 2 inches and Smaller: MSS SP 110, Class 150, bronze, three-piece body, Type 316 stainless steel ball, full port, Teflon seats, blow-out proof stem, solder or threaded ends, locking lever handle.
- D. Locks: Furnish padlock with keyway matching [existing keying system.] [cylinders specified in Section 08 71 00.]

2.07 BUTTERFLY VALVES

A. Manufacturers:

1. Crane Valve, North America.
2. Hammond Valve.
3. Milwaukee Valve Company.
4. NIBCO, Inc.
5. Stockham Valves & Fittings.
6. Substitutions: Section 01 60 00 – Product Requirements.

B. [BF-1] 2-1/2 inches and Larger: MSS SP 67, [Class 150] [Class 200] [Class 250] [_____].

1. Body: Cast or ductile iron, [wafer] [lug] [or] [grooved] ends, stainless steel stem, extended neck.
2. Disc: [Nickel-plated ductile iron] [Aluminum bronze] [Elastomer coated ductile iron] [Chrome-plated ductile iron] [or] [stainless steel].
3. Seat: Resilient replaceable [EPDM] [Buna N] [neoprene Viton].

C. [BF-2] 2 inches through 10 inches: 150 psi at 73 degrees F water temperature, maximum service temperature: 140 degrees F, [one-] [two-] piece body, ASTM D1784 PVC, lug type flange facing, disc encapsulated with EPDM, stainless steel shaft, locking lever handle.

D. Locks: Furnish padlock with keyway matching [existing keying system.] [cylinders specified in Section 08 71 00.]

2.08 PIPE HANGERS AND SUPPORTS

A. Manufacturers:

1. Carpenter & Paterson Inc.
2. Creative Systems Inc.
3. Flex-Weld, Inc.
4. Globe Pipe Hanger Products Inc.
5. Michigan Hanger Co.
6. Superior Valve Co.
7. Substitutions: Section 01 60 00 – Product Requirements.

- A. Conform to MSS SP 58.
- B. Furnish hangers for copper piping system with copper finish and sized for copper pipe.

2.09 FLEXIBLE PIPE CONNECTORS

- A. Manufacturers:
 - 1. Flex-Hose Co., Inc.
 - 2. Flexonics.
 - 3. Flex-Weld, Inc./Keflex.
 - 4. The Metraflex Company.
 - 5. Twin City Hose, Inc.
 - 6. Substitutions: Section 01 60 00 – Product Requirements.
- B. inches and Smaller: Corrugated [bronze] [stainless steel] hose with single layer of [bronze] [stainless steel] exterior braiding, [Schedule [40] [80] black steel] [copper tubing] ends; maximum working pressure [170] [190] [] psig, threaded or soldered ends. Minimum burst pressure of 1000 psi.
 - 1. Furnish cleaned for oxygen service by manufacturer and labeled, sealed and packed for shipping.

2.10 PRESSURE GAUGES

- A. Manufacturers:
 - 1. Amico Corporation.
 - 2. Dresser Instruments, Dresser, Inc.
 - 3. Dwyer Instruments, Inc.
 - 4. H.O. Trerice Co.
 - 5. Weiss Instruments, Inc.
 - 6. Substitutions: Section 01 60 00 – Product Requirements.
- B. Gauge: ASME B40.1 Grade B with bourdon tube, rotary brass or copper alloy movement, brass socket, front calibration adjustment, black scale on white background.
 - 1. Case: Stainless steel.
 - 2. Bourdon Tube: Type 316 stainless steel or copper alloy.
 - 3. Dial Size: 2-inch diameter.

4. Mid-Scale Accuracy: ± 1.5 percent of full scale at point of reading.
5. Scale Range Positive Pressure: Normal reading falls within middle 50 percent of scale.
 - a. Oxygen, Medical Air and Nitrous Oxide: 0 to 100 psig.
 - b. Instrument Air: 0 to 300 psig.
6. Scale Range Vacuum and Waste Anesthetic Gas Disposal: 0 to 29.9 inches Hg.
7. Scale: Both psi and kPa.
8. Furnish gauges with demand check fitting.
9. Furnish gauges cleaned for oxygen service by manufacturer and labeled, sealed, and packed for shipping.

2.11 UNDERGROUND PIPE MARKERS

- A. Manufacturers:
 1. Seton.
 2. Brady.
 3. Substitutions: Section 01 60 00 – Product Requirements.
- A. Plastic Ribbon Tape: Bright colored, continuously printed, minimum 6 inches wide by 4 mil thick, manufactured for direct burial service.
- B. Trace Wire: Magnetic detectable conductor, [clear] [brightly colored] plastic covering, imprinted with "[Medical Oxygen Service] [Medical Gas Service] [_____]" in large letters.

2.12 LABELING AND IDENTIFICATION

- A. Furnish labeling and identification in accordance with NFPA 99.
- B. Pipe Labels:
 1. Furnish pipe labels or stenciling identifying the medical gas or vacuum system. Furnish with name of gas or vacuum system or chemical symbol.
 2. Furnish pipe labels with colors in accordance with NFPA 99.
 3. When gas system operates at other than standard pressures, include operating pressure in addition to gas name.
- C. Valve Labels:
 1. Label source valve, main line valve, riser valve and service valve in accordance with NFPA 99.

2. Furnish valve with name of gas or vacuum system or chemical symbol. Label with room or area served. Label with caution to not open or close valve in an emergency.
 3. When gas system operates at other than standard pressures, label valve with operating pressure in addition to gas name.
- D. Cylinders: Label cylinder contents in accordance with CGA C-7.
- E. Outlets and Inlets:
1. Furnish with name of gas or vacuum system or chemical symbol.
 2. When gas system operates at other than standard pressures, include operating pressure in addition to gas name.
- F. Alarm Panels:
1. Label indicating condition monitored.
 2. Label each panel for area of surveillance.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Section 01 30 00 – Administrative Requirements: Verification of existing conditions before starting work.
- B. Verify excavations are to required grade, dry, and not over-excavated.

3.02 PREPARATION

- A. Prepare soldered joints in accordance with ASTM B828.
- B. Ream pipe and tube ends. Remove burrs.
- C. Remove scale and dirt on inside and outside before assembly.
- D. Prepare piping connections to equipment with flanges or unions.
- E. Keep open ends of pipe free from scale and dirt. Protect open ends with temporary plugs or caps. TAPE OF ANY KIND IS UNACCEPTABLE.

3.03 INSTALLATION – INSERTS

- A. Provide inserts for placement in concrete forms.
- B. Provide inserts for suspending hangers from reinforced concrete slabs and sides of reinforced concrete beams.
- C. Provide hooked rod to concrete reinforcement section for inserts carrying pipe 4 inches and larger.

- D. Where concrete slabs form finished ceiling, locate inserts flush with slab surface.
- E. Where inserts are omitted, method of attachment shall be as approved by Structural Engineer.

3.04 INSTALLATION – HANGERS AND SUPPORTS

- A. Install hangers and supports in accordance with MSS SP 69.
- B. Install hangers and supports at maximum spacing in accordance with NFPA 99.
- C. Install hangers to provide minimum 1/2-inch space between finished covering and adjacent work.
- D. Place hangers within 12 inches of each horizontal elbow.
- E. Use hangers with 1-1/2-inch minimum vertical adjustment. Design hangers for pipe movement without disengagement of supported pipe.
- F. Support vertical piping at every floor; maximum 15 feet on center. Support riser piping independently of connected horizontal piping.
- G. Provide clearance in hangers and from structure and other equipment for installation of insulation and access to valves and fittings.
- H. Install pipe hangers and supports in accordance with Section 22 05 29.

3.05 INSTALLATION – BURIED PIPING SYSTEMS

- A. Establish elevations of buried piping with not less than two ft of cover.
- B. Establish minimum separation of three from other services and piping.
- C. Excavate pipe trench in accordance with Section 31 23 17.
- D. Install pipe to elevation as indicated on Drawings.
- E. Install buried oxygen piping in protector piping.
- F. Place bedding material at trench bottom to provide uniform bedding for piping, Category bedding materials in one continuous layer not exceeding compacted depth; compact to 95 percent maximum density.
- G. Install pipe on prepared bedding.
- H. Route pipe in straight line.
- I. Install pipe to allow for expansion and contraction without stressing pipe or joints.
- J. Install plastic ribbon tape continuous over top of pipe, buried 6 inches below finish grade, above pipe line; coordinate with Section 31 23 23 and 31 23 17. Refer to Section 22 05 53.

- K. Pipe Cover and Backfilling:
 - 1. Backfill trench in accordance with Section 31 23 23.
 - 2. Maintain optimum moisture content of fill material to attain required compaction density.
 - 3. After pressure test, evenly backfill entire trench width by hand placing backfill material and hand tamping in 6 inches compacted layers to 12 inches minimum cover over top of pipe. Compact to 95 percent maximum density.
 - 4. Evenly and continuously backfill remaining trench depth in uniform layers with backfill material.
 - 5. Do not use wheeled or tracked vehicles for tamping.

3.06 INSTALLATION – ABOVE-GROUND PIPING – MEDICAL GAS SYSTEMS

- A. Install medical gas systems in accordance with NFPA 99.
- B. Install vacuum pump exhaust with termination exterior to building with elbow turned down and screen on end of elbow.
- C. During brazing of pipe connections, purge interior of pipe continuously with nitrogen.
- D. Cut pipe and tubing accurately and install without springing or forcing.
- E. Slope piping in direction of flow.
- F. Make branch connections in accordance with NFPA 99.
- G. Pressure Gauges:
 - 1. Install at locations identified in NFPA 99.
 - 2. Install capable of being read from standing position.
- H. Install pressure gauges located downstream from source valve with demand check fitting.
- I. Install pipe sleeves where pipes and tubing pass through walls, floors, roofs and partitions. Refer to Section 22 05 29.
- J. Install firestopping at fire rated construction perimeters and openings containing penetrating sleeves and piping. Refer to Section 07 84 00 and 22 05 29.
- K. Install pipe identification in accordance with this Section.
- L. Except where indicated or in flush wall-mounted cabinets, install manual shut-off valves with stem vertical and accessible for operation and maintenance.
- M. Install locks on valves.

3.07 LABELING AND IDENTIFICATION

- A. Piping:
 - 1. Install pipe labels at intervals of not more than 20 feet.
 - 2. Install minimum of one pipe label in each room.
 - 3. Install label on each side of wall when penetrated by piping.
 - 4. Risers: Install minimum of one label for each story traversed by piping.
- B. Label gas cylinders with either labels or stencils naming contents in accordance with CGA C-7.

3.08 FIELD QUALITY CONTROL

- A. Section 01 40 00 – Quality Requirements and Section 01 70 00 – Execution and Closeout Requirements: Field inspecting, testing, adjusting and balancing.
 - B. Installer Performed Tests – Category 1 and Category 2 Systems:
 - 1. Complete installer performed tests for each system in accordance with procedures specified in NFPA 99.
- System Verification Tests – Category 1 and Category 2 Systems:
- 1. Perform after completion of Installer Performed Tests.
 - 2. Conduct test by agency independent of system installer.
 - 3. Complete system verification tests for each system in accordance with procedures specified in NFPA 99.

3.09 MANUFACTURER'S FIELD SERVICES

- A. Section 01 40 00 – Quality Requirements: Requirements for manufacturer's field services.
- B. Furnish initial start-up including routine servicing and checkout.

3.10 DEMONSTRATION

- A. Section 01 70 00 – Execution and Closeout Requirements: Requirements for demonstration and training.
- B. Demonstrate each piece of equipment operation and maintenance.

3.11 SCHEDULES

A. Valve Service:

SYSTEM DESCRIPTION	SHUTOFF
Instrument Air – Category 1 and 2	BA-1
Oral Evacuation	BA-2, BA-3, BA-4

B. Pipe Hanger Spacing:

PIPE HANGER SPACING		
PIPE SIZE Inches	MAXIMUM HANGER SPACING Feet	HANGER ROD DIAMETER Inches
1/2	6	3/8
3/4	7	3/8
1	8	3/8
1-1/4	9	3/8
1-1/2 and Larger	10	3/8

END OF SECTION

SECTION 23 00 01 – BASIC HVAC REQUIREMENTS

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Basic HVAC Requirements specifically applicable to Division 23 sections, in addition to Division 1 - General Requirements.

1.02 REFERENCES

- A. All references in Division 23 to code standards or other publications shall be the latest edition/version, unless noted otherwise.

1.03 PLANS

- A. These specifications are accompanied by plans indicating typical layouts, pipe and equipment location, etc. The plans and these specifications are complimentary each to the other and what is called for by one shall be as binding as if called for by both. Should there be a conflict between Drawings and specifications regarding a material shown or work described or detailed then the material of work having the greater value shall be provided.
- B. The plans as prepared are in general diagrammatic. The contractor shall carefully lay out his work at the site to conform to the architectural, mechanical, electrical and structural conditions to provide grading of piping, to avoid all obstructions and to conform to details of installation as shown on the plans and supplied by the manufacturers of the equipment to be installed, and thereby to provide an integrated satisfactorily operating installation. **The General Contractor must coordinate the work of all trades.** All necessary offsets in piping, fittings, ductwork, etc. required to avoid interferences between piping, equipment, structural and architectural work are not shown but shall be furnished and installed by the Contractor without additional expense to the Owner.
- C. These specifications and plans accompanying same are intended to cover systems which will not interfere with the design of the building, which will fit into the available spaces, and which will insure complete and satisfactory systems. Each contractor shall, therefore, carefully examine the plans and the building and shall be responsible for the proper fitting of his material and apparatus into the building.
- D. The size of mechanical and electrical equipment indicated on the plans is based on the dimensions of a particular manufacturer. While other manufacturers may be acceptable, it is the responsibility of the Contractor to determine if the equipment he proposes to furnish will fit in the space with the manufacturer's recommended clearances allocated for same on the plans. It shall be the Contractor's responsibility to furnish data to evidence that sufficient space can be provided for the installation of proposed equipment and that adequate access will exist for servicing and maintenance of equipment. Should changes become necessary during construction, the contractor shall make such necessary changes at his (the Contractor's) own expense.
- E. Exceptions and inconsistencies in plans and specifications shall be brought to the Architect's attention no later than ten (10) days prior to the bid date, unless specified otherwise in Division 1. Otherwise, the Contractor shall be responsible for any and all changes and additions that may be necessary to accommodate his particular apparatus or equipment.

1.04 CHANGES

- A. Any changes from the plans necessary to make this work conform to the building as it is constructed, to make this work fit the work of other trades or to make this work conform to the rules of city and municipal bodies having jurisdiction shall be made by this contractor at no additional cost to the Owner. However, no changes shall be made from the work described on the plans and these specifications except on written order from the Architect/Engineer.
- B. If any changes are required other than those mentioned above and the changes involve extra work on the part of the Contractor, no charges for this extra work shall be allowed unless authorized in advance of the work by a written order from the Owner and/or Architect/Engineer stating the charges to be made for the work.
- C. Proposed use of item or equipment other than that specified or indicated may require redesign of structure, partitions, foundations, piping, wiring, or other parts of mechanical, electrical, or architectural layout. Redesign, new drawings, and detailing required shall be prepared and submitted to Architect/Engineer for approval.
- D. Where approved deviation requires different quantity, size and arrangement of wiring, conduit, equipment, etc. from that specified or indicated, provide such items and all other additional equipment required by system at no additional cost to the Owner.

1.05 DELIVERY, STORAGE AND HANDLING

- A. Protection:
 - 1. All work, equipment and materials shall be protected at all time to prevent damage or breakage either in transit, storage, installation or testing. All openings shall be closed with caps or plugs during installation.
 - 2. Equipment and material placed on the job site shall remain in the custody of the Contractor until phased acceptance, whether or not the owner has reimbursed the Contractor for the equipment and material. The Contractor is solely responsible for the protection of such equipment and material against any damage.
 - 3. Place damaged equipment in first class, new operating condition; or, replace same as determined and directed by the Architect. In particular, ductwork insulation which becomes saturated will be rejected and must be removed from the job. Such repair or replacement shall be at no additional cost to the Owner.
 - 4. Protect interiors of new equipment, ductwork, and piping systems against entry of foreign matter. Clean both inside and outside before painting or placing equipment in operation.
 - 5. Existing equipment, ductwork, and piping being worked on by the Contractor shall be under the custody and responsibility of the Contractor and shall be protected as required for new work.
- B. Cleanliness of Piping, Ductwork, and Equipment Systems:
 - 1. Exercise care in storage and handling of equipment and piping material to be incorporated in the work. Remove debris arising from cutting, threading and

welding of piping.

2. Piping systems shall be flushed, blown or pigged as necessary to deliver clean systems.
3. Clean interior of all tanks prior to delivery for beneficial use by the Owner.
4. Boilers shall be left clean following final internal inspection by the inspector.
5. Contractor shall be fully responsible for all costs, damage, and delay arising from failure to provide clean systems.

1.06 SUBSTITUTIONS

- A. The materials, products and equipment described and specified establish a standard of quality, function, dimension and appearance to be met by any proposed substitutions.
- B. Reference Section 01 60 00 – Product Requirements.
- C. Substitution requests are only required where specific manufacturers are listed or scheduled.

1.07 SUBMITTALS

- A. Submit under provisions of Section 01 33 00.
- B. The Contractor shall furnish copies of the manufacturer's literature and drawings describing all proposed equipment and materials indicated in the specifications. The proposed use of the exact equipment and materials specified shall not change this requirement of including literature describing the proposed equipment. Manufactured items proposed for use, whether specified or proposed for substitution, shall be the current, catalogued product of the manufacturer, and replacement parts shall be available.
- C. Manufacturer's regular catalog sheets will not be acceptable under this requirement unless they indicate completely all of the specification requirements. Where drawings cover several sizes or types of construction they shall clearly indicate the size or type of construction to be used on the project. In cases where several sizes of the same type of equipment are required to be furnished, the submittal shall include a schedule identifying each piece of equipment, complete with all capacity information needed to compare every submitted item with its respective specified item. **Annotate to indicate exact model, size, and type submitted.**
- D. Brochures shall contain a certification that the equipment or materials are suitable for conditions shown and specified; that the equipment or materials are believed to be in conformity with the plans and specifications, except as may be specifically described and that approval is recommended. The certification shall be signed by the Contractor. Brochures received not in conformity with these requirements will be returned for required actions. Any deviation from the requirements of the specifications shall be clearly noted and marked for the Engineer's consideration.
- E. Approval of the brochures, or any part of the contents therein, shall not eliminate responsibility for compliance with the plans and specifications, unless specific attention has been called in writing to proposed deviations at the time of transmittal of the brochures and

such deviations have been approved, nor shall it eliminate the requirements or the responsibilities, if there are errors of any sort in the data submitted.

1.08 INTERFERENCES AND COOPERATION

- A. The plans are generally diagrammatic and the Contractor shall coordinate the work of the different trades so that interferences between piping, equipment, structural and architectural work will be avoided. Not all offsets in piping, ductwork, etc., are shown. The Contractor shall cooperate with the General Contractor and all other contractors to coordinate their work to avoid interferences and delays and arrange all parts of the work to harmonize in service and appearance with all other parts.
- B. The General Contractor shall coordinate the work of all trades. The various systems to be installed shall follow the normal, common sense priority of systems installation with the highest system to lowest system installation as follows:
1. HVAC ductwork shall be installed up and against building (floor/roof) structural members.
 2. Sanitary waste and storm drainage piping system shall begin horizontal routing as high as possible between structural members, offsetting vertically only to avoid conflict with structure or to drop below HVAC ductwork where offset is unavoidable.
 3. Electrical conduit shall be installed up, and against building structure, running parallel with HVAC ductwork and offsetting up into structural bay (void) or below HVAC ductwork to obtain a change in direction or branch take-off. Electrical conduit installation shall not control or dictate the routing or installation of the HVAC ductwork.
 4. Refrigerant piping, domestic hot and cold water supply and hot water circulating return piping, and medical gas piping shall be installed beside and below the HVAC ductwork and electrical conduit. Preferred installation shall be on trapeze, wall brackets, or racked on vertical channel on the wall above the ceiling line. The completed installation shall not conflict with the installation or removal of ceiling system components of tile. All main-run and branch take-off isolation valves shall be readily identifiable and accessible from a standing position on a step ladder.
 5. Fire sprinkler piping system shall be installed below all other systems and components. The fire sprinkler piping shall not conflict with the installation or removal of ceiling system components or tile. The fire sprinkler system piping layout and installation shall be coordinated by the fire sprinkler contractor and the General Contractor with all other trades performing work in the affected area, to avoid conflict with the installation or removal of any other systems components, or to prevent ready access to valves, equipment of the other trades. Do not install sprinkler piping until ductwork mains are in place.
- C. Provide an overhead coordination submittal per Section 01 30 00. The submittal shall include all structural, plumbing, mechanical, electrical and fire protection components.

1.09 MATERIALS AND WORKMANSHIP

- A. All materials shall be new, of the quality specified and free of any defects. Manufacturer's names are listed to establish a standard of quality and construction.

- B. The Contractor will be responsible for transportation of his materials to the job and for their storage and protection until the final acceptance of the job.
- C. Contractor shall furnish all necessary scaffolding, tackle, tools and appurtenances of all kinds and all labor required for the safe and expeditious execution of his contract.

1.10 PERMITS AND INSPECTIONS

- A. The Contractor will be responsible for all permits and inspections required by law for the completion of his work. Cost of all permits and inspections shall be paid for by the Contractor. The Contractor shall obtain and pay for all certificates of approval which must be delivered to the Architect before final acceptance of the job. All materials and labor furnished by the Contractor shall be in strict accordance with the rules and requirements of the National Board of Fire Underwriters, state and municipal regulations and other authorities who may have lawful jurisdiction over the work being done.
- B. Each contractor shall be responsible for coordinating their work with the General Contractor and scheduling AHJ required inspections through the General Contractor to allow inspections to be performed without impeding the progress of construction. Generally, the Contractor shall plan for inspections to occur two (2) weeks prior to the scheduled concealment of work in the area of inspection.

1.11 ENGINEERING DESIGN TEAM OBSERVATIONS

- A. Each contractor shall be responsible for coordinating their work with the General Contractor and scheduling progress observations through the General Contractor to allow for the following observations to be performed without impeding the progress of construction. Generally, the Contractor shall plan for observations to occur two (2) weeks prior to the scheduled concealment of work in the area of observation.
- B. In general, observations for this project shall include but not be limited to:
 - 1. Rough Wall: All utilities, services and systems in-place including wall studs, cross bracing, supports, etc. (No sheetrock or insulation).
 - 2. Corrected Rough Wall: (Before Sheetrock).
 - 3. Above Ceiling: All utilities, services and systems in place, labeling on exposed piping (No insulation on piping systems. Ceiling grid/channels may be installed but no sheetrock or ceiling tile).
 - 4. Above Ceiling Final: All utilities, services and systems complete including hangers, insulation, and labeling (ceiling grid and/or channel may be in place but no sheetrock or ceiling tile shall be installed).
 - 5. Substantial Completion: All surfaces complete, fixtures installed and trim-out complete.
 - 6. Final: Cleaned and ready for occupancy.

1.12 EXAMINATION OF SITE

- A. All Contractors submitting proposals for this work shall first examine the site and all

conditions thereon and therein. All proposals shall take into consideration conditions as may affect the work under this contract. They shall satisfy themselves as to existing grades and the actual formation, and soil conditions.

- B. Contractors shall verify all service locations, elevations, sizes, etc. No information given on the plans shall relieve the Contractor of this responsibility.
- C. Before starting work, the Contractor shall verify all associated existing systems, pipe and duct sizes, locations, and dimensions so that the new systems can be properly connected as indicated on the documents.

1.13 QUALITY ASSURANCE

- A. Perform Work in accordance with codes listed on the drawing sheets, the local authority having jurisdiction (AHJ), Owner, and the Architect/Engineer. As the minimum standard for the level of quality, in all cases the greater quantity or better quality shall be the first consideration for the basis of an acceptable product or process. The local authority having jurisdiction, Owner, and the Architect and the Engineer shall have the final authority on the approval and/or use of any product or process specified or submitted for substitution. The greater quality and/or value specified herein for the system(s) and various components and installation procedures shall take precedence over the minimum requirements of the herein before mentioned codes.
- B. Equipment and Components: Bear UL and FM label or marking.
- C. Welding Materials and Procedures: Perform to ASME Code.
- D. Valves: Bear UL/FM label or marking. Provide manufacturer's name and pressure rating marked on valve body.
- E. Piping: All piping installed on this project shall bear the complete ASTM and Manufacturer's marking. Labeling and identification requirements as required by ASTM. All installed piping 5'-0" or greater in length shall be readily identifiable per ASTM labeling criteria. Piping not bearing this identification upon installation shall be removed and replaced by the correctly labeled piping. Piping shall not be re-stenciled after it is installed, to meet this requirement.

1.14 CONTROLS

- A. Where "automatic controls" are called for in the plans and specifications, all the control instruments, such as motorized valves, etc., shall be provided by the Contractor. The Drawings may show some power connections to controls equipment. However, if more power is required, then the Contractor shall provide this power.

1.15 UNIONS

- A. No unions are to be placed in any pipe in a location which will be concealed or inaccessible after completion of the building unless furnished with an access panel either as shown on the drawings or as specified herein. Unions must be installed on each side of all pieces of equipment such as heating/cooling equipment, coils, pumps, etc., so that such equipment may be readily disconnected in location that equipment can be disconnected and removed.

1.16 ARRANGEMENT AND INSTALLATION OF EQUIPMENT AND PIPING

- A. Coordinate location of piping, sleeves, inserts, hangers, ductwork and equipment. Locate piping, sleeves, inserts, hangers, ductwork and equipment clear of windows, doors, openings, light outlets, and other services and utilities. Prepare equipment layout drawings to coordinate proper location and personnel access of all facilities. Follow manufacturer's published recommendations for installation methods not otherwise specified.
- B. Operating Personnel Access and Observation Provisions: Select and arrange all equipment and systems to provide clear view and easy access, without use of portable ladders, for maintenance and operation of all devices including, but not limited to: all equipment items, valves, filters, strainers, transmitters, sensors, control devices. All gages and indicators shall be clearly visible by personnel standing on the floor or on permanent platforms. Do not reduce or change maintenance and operating space and access provisions that are shown on the drawings.
- C. Equipment and Piping Support: Coordinate structural systems necessary for pipe and equipment support with pipe and equipment locations to permit proper installation.
- D. Location of pipe sleeves, trenches and chases shall be accurately coordinated with equipment and piping locations.
- E. Interconnection of Instrumentation or Control Devices: Generally, electrical and pneumatic interconnections are not shown but must be provided.
- F. Minor Piping: Generally, small diameter pipe runs from drips and drains, water cooling, and other service are not shown but must be provided.
- G. Electrical and Pneumatic Interconnection of Controls and Instruments: This is generally not shown but must be provided. This includes interconnections of sensors, transmitters, transducers, control devices, control and instrumentation panels, instruments and computer workstations. Comply with NFPA-70.
- H. Install gages, thermometers, valves and other devices with due regard for ease in reading or operating and maintaining said devices. Locate and position thermometers and gages to be easily read by operator or staff standing on floor or walkway provided. Servicing shall not require dismantling adjacent equipment or pipe work.

1.17 INDOOR AIR QUALITY CONTROL

- A. All Adhesives, sealants, paints, coatings applied within the weatherproofed interior of the building shall comply with applicable VOC thresholds of SCAQMD 1113 and 1168.

PART 2 PRODUCTS

2.01 FACTORY-ASSEMBLED PRODUCTS

- A. Provide maximum standardization of components to reduce spare part requirements.
- B. Manufacturers of equipment assemblies that include components made by others shall assume complete responsibility for final assembled unit.
 - 1. All components of an assembled unit need not be products of same manufacturer.
 - 2. Constituent parts that are alike shall be products of a single manufacturer.

3. Components shall be compatible with each other and with the total assembly for intended service.
 4. Contractor shall guarantee performance of assemblies of components, and shall repair or replace elements of the assemblies as required to deliver specified performance of the complete assembly.
- C. Components of equipment shall bear manufacturer's name and trademark, model number, serial number and performance data on a name plate securely affixed in a conspicuous place, or cast integral with, stamped or otherwise permanently marked upon the components of the equipment.
- D. Major items of equipment, which serve the same function, must be the same make and model. Exceptions will be permitted if performance requirements cannot be met.

2.02 COMPATIBILITY OF RELATED EQUIPMENT

- A. Equipment and materials installed shall be compatible in all respects with other items being furnished and with existing items so that the result will be a complete and fully operational system that conforms to contract requirements.

2.03 ESCUTCHEONS AND PLATES

- A. Where pipes or ducts pass through ceilings or walls in finished spaces, install sectional plates or escutcheons to cover the annular opening between pipe and sleeve. Solid plates with set screws shall be used where the sectional plates will not stay in place or are not available in the required size, or where other individual specification section(s) require one piece or greater quality escutcheons or plates.
- B. Inside diameter of escutcheons shall fit around insulation and around pipe or duct when not insulated; outside diameter shall cover sleeve. Secure escutcheons or plates to pipe or duct or sleeve but not to insulation. All escutcheons shall be triple nickel-chromium plated brass, or type 316L stainless steel.

2.04 INSULATION

- A. All insulation materials used inside the building on this project, including finishes and adhesives on the exterior surfaces of ducts, pipes and equipment shall have a flame spread rating of 25 or less and a smoke developed rating of 50 or less as determined by an independent testing laboratory in accordance with NFPA 255 as required by NFPA 90A, unless noted otherwise acceptable.

2.05 SOLENOID VALVES

- A. All solenoid valves used in hydronic systems shall be the slow acting type.

2.06 ASBESTOS

- A. Materials containing asbestos are not permitted.
- B. If any asbestos-containing material is discovered or suspected, the contractor shall immediately cease any and all work in that area. Cover the exposed material in plastic containment without disturbing the exposed material and notify the Architect and the

Owner's representative.

- C. Certify in writing that neither the Contractor nor any of Contractor's subcontractors or suppliers will supply any materials that contain any asbestos in any form for this Project.

PART 3 EXECUTION

3.01 ACCESS PANELS

- A. All valves, traps, drains, cleanouts, equipment, etc., must be accessible. The Contractor shall, wherever required to service his installation, coordinate size and location of access panels with General Contractor. Refer to Section 08 31 13 – Access Doors and Frames.

3.02 FIRESTOPPING

- A. Firestopping: Unused slots, sleeves and other penetrations in floors, walls or other general construction shall be closed and sealed with an approved firestopping material.
 - 1. Reference Section 07 84 00 – Firestopping for appropriate firestopping material required for each wall rating and penetration size and type.
 - 2. Openings in walls shall be closed with 16 gauge galvanized steel sheet securely attached at the midpoint of the wall thickness and firestopped on both sides of the steel sheet with not less than 1/8-inch thick layer of non-sagging silicone elastomer to fully cover the opening.
 - 3. Single or multiple pipes passing through walls and floors shall have the annular space between pipes or between pipes and structure filled with silicone elastomer to provide a rated firestop (rated to match the assembly) for floors and walls.
- B. Pipe and Ducts: The annulus between exposed pipe and ductwork and walls or floors in finished spaces shall be refilled, sealed and painted to match adjacent surfaces.
- C. Future Slots: Cap ends of sleeve and mark as future.

3.03 CUTTING AND PATCHING

- A. All cutting and patching of floors, walls and ceilings for installation of work covered in these sections will be done by the General Contractor.
- B. Where it becomes necessary to drill into or cut through any existing or completed floors, walls or ceilings to permit the installation of any work under this contract or to repair any defects that may appear up to the expiration of the guarantee, such cutting and patching shall be done by the General Contractor under the supervision of the Architect.
- C. No joists, beams, girders or columns shall be cut without first obtaining written permission from the Architect or Structural Engineer.
- D. Methods of cutting: Openings cut through concrete and masonry shall be made with masonry saws and/or core drills and at such locations approved by the Architect/Engineer. Impact type equipment shall not be used except where specifically approved by the Architect/Engineer. Openings in precast concrete slabs for pipes, etc., shall be core drilled to exact size.

- E. Where core drilling or saw cutting of concrete floor or wall penetrations is required, work shall be performed in accordance with Division 03 Specifications. Where applicable Division 03 Specifications are not included in the Project, core drilling shall be in accordance with generally accepted standards and be performed by licensed personnel where applicable.
- F. Contractor shall use ground penetrating radar (GPR) to scan areas of concrete prior to core drilling or saw cutting for embedments. Contractor shall clearly mark locations of embedments for review by Structural Engineer or owner's construction representative before core drilling or saw cutting.
- G. Masonry: Where openings are cut through masonry walls, provide and install lintels or other structural supports to protect the remaining masonry. Adequate supports shall be provided during the cutting operation to prevent any damage to the masonry occasioned by the operation. All structural members, supports, etc., shall be of the proper size and shape, and shall be installed in a manner approved by the Architect/Engineer.
- H. Plaster: All mechanical work in areas containing plaster shall be completed prior to the application of the finish plaster coat. Cutting of finish plaster coat will not be permitted.
- I. All drilling methods for expansion bolts, hangers and other supports shall be done subject to be approval of the Architect or Structural Engineer. Labor and materials required to replace or rebuild parts or injured portions shall be furnished at the Contractor's expense, subject to the satisfaction of the Architect.
- J. Restoration: All openings shall be restored to "as new" condition under the appropriate Specification Section for the materials involved, and shall match remaining surrounding materials and/or finishes.

3.04 PAINTING

- A. Types of paint shall be as specified in the Architectural specifications. Surfaces to be painted are identified in Section 09 90 00 and the drawings.
- B. All surfaces to be painted shall be thoroughly cleaned, all rust scraped off and all oil and grease removed before any paint is applied.
- C. Finishing paint coats shall not be applied until all the work is completed. Cloths shall be spread where necessary to prevent drops of paint, oil, etc. from defacing walls, floors, etc., and the Contractor shall be held responsible for all damage by neglect of such precautions. The finished conditions of the painting shall be subject to the approval of the Architect, who may require retouching or repainting of surfaces not properly finished.

3.05 RIGGING

- A. Design is based on application of available equipment. Openings in building structures are planned to accommodate design scheme.
- B. Alternative methods of equipment delivery may be offered by Contractor and will be considered by Government under specified restrictions of phasing and maintenance of service as well as structural integrity of the building.
- C. Close all openings in the building when not required for rigging operations to maintain

proper environment in the facility for Owner operation and maintenance of service.

- D. Contractor shall provide all facilities required to deliver specified equipment and place on foundations. Attachments to structures for rigging purposes and support of equipment on structures shall be Contractor's full responsibility.
- E. Contractor shall check all clearances, weight limitations and shall offer a rigging plan designed by a Registered Professional Engineer. All modifications to structures, including reinforcement thereof, shall be at Contractor's cost, time and responsibility.
- F. Restore building to original condition upon completion of rigging work.

3.06 CLOSE OUT DOCUMENTATION AND TESTING REPORTS

- A. Contractor shall provide Project Record Documents, Operation and Maintenance data and all product warranty data as specified in Section 01 70 00.
- B. Contractor shall also provide copies of all piping and ductwork system test and certification reports for inclusion in project close out documents.

END OF SECTION

SECTION 23 05 13 – COMMON MOTOR REQUIREMENTS FOR HVAC EQUIPMENT

PART 1 GENERAL

1.01 SUMMARY

- A. Section includes single- and three-phase motors for application on equipment provided under other sections and for motors furnished loose to Project. These requirements shall apply unless otherwise noted within each equipment specification.
- B. Related Sections:
 - 1. Section 26 05 26 – Grounding and Bonding for Electrical Systems.
 - 2. Section 26 05 53 – Identification for Electrical Systems.
 - 3. Section 26 29 13 – Enclosed Controllers.

1.02 REFERENCES

- A. American Bearing Manufacturers Association:
 - 1. ABMA 9 – Load Ratings and Fatigue Life for Ball Bearings.
- B. National Electrical Manufacturers Association:
 - 1. NEMA MG 1 – Motors and Generators.
- C. International Electrical Testing Association:
 - 1. NETA ATS – Acceptance Testing Specifications for Electrical Power Distribution Equipment and Systems.

1.03 SUBMITTALS

- A. Section 01 33 00 – Submittal Procedures: Submittal procedures.
- B. Product Data: Submit catalog data for each motor furnished loose. Indicate nameplate data, standard compliance, electrical ratings and characteristics, and physical dimensions, weights, mechanical performance data, and support points.

1.04 QUALIFICATIONS

- A. Manufacturer: Company specializing in manufacturing products specified in this section with minimum ten years documented experience.
- B. Testing Agency: Company specializing in testing products specified in this section with minimum ten years documented experience.

1.05 DELIVERY, STORAGE AND HANDLING

- A. Section 01 60 00 – Product Requirements: Product storage and handling requirements.

- B. Lift only with lugs provided. Handle carefully to avoid damage to components, enclosure, and finish.
- C. Protect products from weather and moisture by covering with plastic or canvas and by maintaining heating within enclosure.
- D. For extended outdoor storage, remove motors from equipment and store separately.

PART 2 PRODUCTS

2.01 PRODUCT REQUIREMENTS FOR MOTORS

- A. Three-Phase Motors: NEMA MG 1, Design B, energy-efficient squirrel-cage induction motor, with windings to accomplish starting methods and number of speeds as indicated on Drawings.
 - 1. Voltage: As indicated on Drawings.
 - 2. Service Factor: 1.15
 - 3. Design for continuous operation in 40 degrees C environment, with temperature rise in accordance with NEMA MG 1 limits for insulation class, service factor, and motor enclosure type.
 - 4. Insulation System: NEMA Class B or better.
 - 5. Motor Frames: NEMA Standard T-Frames of steel, aluminum, or cast iron with end brackets of cast iron or aluminum with steel inserts.
 - 6. Thermistor System (Motor Frame Sizes 254T and Larger): Three PTC thermistors embedded in motor windings and epoxy encapsulated solid state control relay with wiring to terminal box.
 - 7. Bearings: Grease lubricated anti-friction ball bearings with housings equipped with plugged provision for relubrication, rated for minimum ABMA 9, L-10 life of 200,000 hours. Calculate bearing load with NEMA minimum V-belt pulley with belt center line at end of NEMA standard shaft extension. Stamp bearing sizes on nameplate.
 - 8. Sound Power Levels: Conform to NEMA MG 1.
- B. Single Phase AC Induction Motors:
 - 1. Permanent split-capacitor type where available, otherwise use split-phase start/capacitor run or capacitor start/capacitor run motor.
 - 2. Motor shall be permanently lubricated, heavy duty ball bearing type.
 - 3. Voltage: As indicated on Drawings.
- C. Brushless DC Motor/Electronically Commutated Motor (EC motor):
 - 1. Internal motor circuitry shall convert supplied AC power to DC power to operate the motor.

2. Motors are permanently lubricated, heavy duty ball bearing type to match the equipment load.
 3. Motor shall be speed controllable down to 20% of full speed. Speed shall be controlled by either a dial-mounted potentiometer at the motor or a 0-10 VDC signal. Refer to Drawings for specific requirements.
 4. Motor shall be a minimum of 85% efficient at all speeds.
 5. Voltage: As indicated on Drawings.
- D. Wiring Terminations: Furnish terminal lugs to match branch circuit conductor quantities, sizes, and materials indicated.
- E. Motor Enclosure: meet conditions of the installation unless noted otherwise on the Drawings.

2.02 SOURCE QUALITY CONTROL

- A. Test motors in accordance with NEMA MG 1, including winding resistance, no-load speed and current, locked rotor current, insulation high-potential test, and mechanical alignment tests.

PART 3 EXECUTION

3.01 INSTALLATION

- A. Install securely on firm foundation. Mount ball bearing motors with shaft in any position.
- B. Install in accordance with manufacturer's instructions.
- C. Ground and bond motors in accordance with Section 26 05 26.
- D. Verify that speed control method for brushless DC/electronically commutated motors (ECMs), is provided as scheduled in the Drawings.

3.02 FIELD QUALITY CONTROL

- A. Section 01 40 00 – Quality Requirements, 01 70 00 – Execution and Closeout Requirements: Field inspecting, testing, adjusting, and balancing.
- B. Perform inspections and tests listed in NETA ATS, Section 7.15.

END OF SECTION

SECTION 23 05 29 – HANGERS AND SUPPORTS FOR HVAC

PART 1 GENERAL

1.01 SUMMARY

- A. Perform all Work required to provide and install supports, hangers, anchors, sleeves and bases for all plumbing piping, equipment, system components and accessories, indicated by the Contract Documents with all supplementary items necessary for complete, code compliant and approved installation.
- B. Section Includes:
 - 1. Hangers and supports.
 - 2. Accessories.
 - 3. Flashing.
 - 4. Equipment curbs.
 - 5. Formed steel channel.
 - 6. Equipment bases (housekeeping pads).
 - 7. Exterior pipe supports
 - 8. Roof pipe chase housing
- C. Related Sections:
 - 1. Section 03 30 00 – Cast-In-Place Concrete: Execution requirements for placement of concrete housekeeping pads specified by this section.
 - 2. Section 07 84 00 – Firestopping: Product requirements for firestopping for placement by this section.
 - 3. Section 07 62 00 – Sheet Metal Flashing and Trim: Product and execution requirements for sheet metal flashing and trim for placement by this section.
 - 4. Section 07 90 00 – Joint Protection: Product requirements for sealant materials for placement by this section.
 - 5. Section 09 90 00 – Painting and Coating: Product and execution requirements for painting specified by this section.
 - 6. Section 23 05 48 – Vibration for HVAC Piping and Equipment: Product and execution requirements for vibration isolators.
 - 7. Section 23 31 00 – HVAC Ducts and Casings: Execution requirements for placement of hangers and supports specified by this section.

1.03 SUBMITTALS

- A. Section 01 33 00 – Submittal Procedures: Submittal procedures.
- B. Product Data: Submit manufacturer's catalog data including load capacity.
- C. Design Data: Indicate when requested, load carrying capacity of trapeze, multiple pipe, and riser support hangers. Indicate calculations used to determine load carrying capacity of trapeze, multiple pipe, and riser support hangers.
- D. Shop Drawings: Indicate system layout with location including critical dimensions, sizes, and pipe hanger and support locations and detail of trapeze hangers.
- E. Manufacturer's Installation Instructions: Submit special procedures and assembly of components.
- F. UL/FM assembly sheets or WH assembly sheets for fire rated penetrations.

1.04 QUALIFICATIONS

- A. Manufacturer: Company specializing in manufacturing Products specified in this section with minimum three years of documented experience.
- B. Installer: Company specializing in performing Work of this section with minimum 3 years of documented experience.

1.05 DELIVERY, STORAGE AND HANDLING

- A. Section 01 60 00 – Product Requirements: Requirements for transporting, handling, storing, and protecting products.
- B. Accept materials on site in original factory packaging, labeled with manufacturer's identification.
- C. Protect from weather and construction traffic, dirt, water, chemical and damage, by storing in original packaging.

1.06 ENVIRONMENTAL REQUIREMENTS

- A. Section 01 60 00 – Product Requirements: Environmental conditions affecting products on site.

1.07 FIELD MEASUREMENTS

- A. Verify field measurements prior to fabrication.
- B. Contractor shall review all drawings, including structural drawings, for details regarding pipe supports, housekeeping pads, anchors, hangers, and guides.

1.08 WARRANTY

- A. Section 01 70 00 – Execution and Closeout Requirements: Product warranties and product bonds.

PART 2 PRODUCTS

2.01 GENERAL

- A. All materials shall meet or exceed all applicable referenced standards, federal, state and local requirements, and conform to codes and ordinances of authorities having jurisdiction.
- B. Refer to individual system and equipment Specification Sections for additional support requirements. Comply with MSS SP-69 for support selections and applications that are not addressed within these Specifications.
- C. Utilize hangers and supports to support systems under all conditions of operation, allowing free expansion and contraction, and to prevent excessive stresses from being introduced into the structure, piping or connected equipment.
- D. All pipe supports shall be of the type and arrangement to prevent excessive deflection, to avoid excessive bending stresses between supports, and to eliminate transmission of vibration.

- E. Design hangers to impede disengagement by movement of supported pipe.
- F. Install building attachments within concrete slabs or attach to structural steel. Space attachments within maximum piping span length indicated in MSS SP-69. Install additional attachments at concentrated loads, including valves, flanges, guides, strainers, and expansion joints, and at changes in direction of piping.
- G. Wire or perforated strap iron will not be acceptable as hanger material.
- H. Hanger rods shall be threaded on both ends, threaded one end, or continuous threaded, complete with adjusting and lock nuts.
- I. Fasteners requiring explosive powder (shooting) or pneumatic-driven actuation will not be acceptable under any circumstances.
- J. Nail drive anchors, plastic anchors or plastic expansion shields will not be permitted under any circumstances.
- K. Each hanger shall be properly sized to fit the supported pipe or fit the outside of the insulation on lines, hangers shall not penetrate insulation. Hangers shall bear on the outside of the insulation, which shall be protected by support shields as specified. For piping larger than 2", protect insulation from crushing by means of a section of rigid insulation to be installed at hanger points. Refer to Section 23 07 00.
- L. Hangers and clamps supporting and contacting individual non-insulated copper lines shall be copper or copper plated. Support individual non-insulated copper lines 4 inches and smaller with adjustable swivel ring hangers. Where non-insulated copper lines are supported on trapeze hangers or channels, the pipes shall be isolated from these supports with approved flexible elastomeric/thermoplastic isolation cushion material to completely encircle the piping and avoid contact with the channel or clamp. Plastic tape is not acceptable.
- M. Field fabricated supports shall be constructed from ASTM A36/A36M, steel shapes selected for loads being supported. Weld steel according to AWS D-1.1.
- N. Provide adjustable spring type hangers/isolators on all pipe hangers on the first 15 feet of pipe entering the building and where piping offsets vertically from one floor level to another.
- O. Provide adjustable spring type vibration isolation hangers for piping connected to isolated equipment (i.e. pumps, etc.). Refer to Section 23 05 48.
- P. Finishes:
 - 1. All ferrous hangers, rods, inserts, clamps, stanchions, and brackets on piping within interior non-corrosive environments, shall be dipped in Zinc Chromate Primer before installation. Rods may be galvanized or cadmium plated after threading, in lieu of dipping zinc chromate.
 - 2. All hangers and supports exposed to the weather, including roofs and building crawl space areas, shall be galvanized or manufactured from materials that will not rust or corrode due to moisture. All hangers and supports located within corrosive environments shall be constructed from or coated with materials

manufactured for installation within the particular environment.

- Q. Trapezes: Where multiple lines are run horizontally at the same elevation and grade, they may be supported on manufactured channel, suspended on rods or pipes. Trapeze members including suspension rods shall be properly sized for the quantity, diameters, and loaded weight of the lines they are to support.
- R. Vertical Piping:
1. Supports for vertical riser piping in concealed areas shall utilize double bolt riser clamps, with each end having equal bearing on the building structure at each floor level.
 2. Supports for vertical riser piping at floor levels in exposed areas (such as piping in mechanical rooms) shall be attached to the underside of the penetrated structure utilizing drilled anchors, two hanger rods (sized as specified), and socket clamp with washers.
 3. Two-hole rigid pipe clamps or four-hole socket clamps with washers may be used to support pipe directly from adequate structural members where floor-to-floor distance exceeds required vertical support spacing and lines are not subject to expansion and contraction.

2.02 HANGERS AND SUPPORTS

- A. Refrigerant Piping and Condensate Drain Piping:
1. Conform to ASME B31.5, ASTM F708, MSS SP58, MSS SP69 and MSS SP89.
 2. Hangers for Pipe Sizes 1/2 to 1-1/2 inch: Carbon steel, adjustable swivel, split ring.
 3. Hangers for Pipe Sizes 2 inches and Larger: Carbon steel, adjustable, clevis.
 4. Multiple or Trapeze Hangers: Steel channels with welded spacers and hanger rods. At un-insulated piping provide clamp with a thermoplastic elastomer cushion insert similar to Unistrut's Cush-A-Clamp or equal.
 5. Wall Support: Steel channels with electro-galvanized clamps. At un-insulated piping provide clamp with a thermoplastic elastomer cushion insert similar to Unistrut's Cush-A-Clamp or equal.
 6. Vertical Support: Steel riser clamp.
 7. Floor Support: Steel channels with electro-galvanized clamps. At un-insulated piping provide clamp with a thermoplastic elastomer cushion insert similar to Unistrut's Cush-A-Clamp or equal.
 8. Copper Pipe Support: Copper-plated carbon-steel ring.
- B. Ductwork Supports:
1. All ductwork shall be supported in accordance with the "Hangers and Supports." Chapter of SMACNA "HVAC Duct Construction Standards - Metal and Flexible"

for the service involved unless indicated otherwise in on the drawings.

2. Hanger Spacing. Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Table 4-1, "Rectangular Duct Hangers Minimum Size," and Table 4-2, "Minimum Hanger Sizes for Round Duct," for maximum hanger spacing. Install hangers and supports within 24 inches of each elbow and within 48 inches of each branch intersection. Do not use wire to support ductwork.
3. Horizontal ducts supported using galvanized steel bands shall extend up both sides and onto the construction above, where they shall turn over and be secured with bolts and nuts fitted in inserts set in the concrete, bolted to angles secured to the construction above, or secured in another approved manner.
4. Horizontal Ducts Larger Than 40 Inches. Support horizontal ducts larger than 40 inches in their greatest dimension by means of hanger rods bolted to angle iron (or equivalent unistrut) trapeze hangers. Place supports on at least 8'0" centers according to the following:

Angle Length	Angle	Rod Diameter
4'-0"	1-1/2" x 1-1/2" x 1/8"	1/4"
6'-0"	1-1/2" x 1-1/2" x 1/8"	1/4"
8'-0"	2" x 2" x 1/8"	5/16"
10'-0"	3" x 3" x 1/8"	3/8"

5. Vertical Ducts. Support ducts to ensure rigid installation. Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Fig. 4-7, Fig 4-8, Fig 4-9. Support vertical ducts where they pass through the floor lines with 1-1/2 inches x 1-1/2 inches x 1/4 inch angles. Support vertical duct drops more than 6 feet in length with angle iron frames attached to ducts. Provide additional supports for any vertical duct drop more than 20 feet at maximum 15 feet on center.
6. Note that not all hangers are shown on the drawings. The Contractor shall coordinate all hangers with the structure and other trades.

C. Terminal Units:

1. Terminal units weighing up to 150 pounds shall be supported by four (4) 1 inch wide sheet metal straps with ends turned under bottom of unit at all corners.
2. Each band shall be secured by not over 3/4 inch in length, 1/4 inch diameter sheet metal screws – two (2) on bottom of unit and one (1) on each side.
3. The other strap end shall be attached to the structure by 1/4 inch diameter threaded bolt into the concrete insert or into drilled-hole threaded concrete expansion anchor.
4. Where interference occurs, overhead of the box, not allowing direct vertical support by straps, provide trapeze channels suspended by 1/4 inch diameter galvanized threaded rods providing such channels do not block access panels of units.
5. Terminal units weighing more than 150 pounds shall be supported per the terminal unit manufacturer's installation instructions using threaded rod and hanger brackets located per manufacturer's drawing.

2.03 ACCESSORIES

- A. Hanger Rods: Mild steel threaded both ends, threaded on one end, or continuous threaded with adjusting and lock nuts.
- B. Pipe Shields: Provide pipe shields at each support location of insulated piping in accordance with insulation manufacturer's published recommendations. Install MSS SP-58, Type 39 protection shields, if insulation without vapor barrier is indicated. Install MSS SP-58, Type 40 protective shields on cold piping with vapor barrier. Refer to Section 23 07 00 for addition data on insulation shields.
- C. Power-actuated fasteners (shooting) will not be acceptable under any circumstances.
- D. Note: Under no circumstances will the use of plastic anchors or plastic expansion shields be permitted for any purpose whatsoever.

2.04 FLASHING

- A. Metal Flashing: 24 gauge thick galvanized steel.
- B. Metal Counterflashing: 24 gauge thick galvanized steel.
- C. Lead Flashing:
 - 1. Waterproofing: 5 lb./sq. ft. sheet lead.
 - 2. Soundproofing: 1 lb./sq. ft. sheet lead.
- D. Flexible Flashing: 47 mil thick sheet butyl; compatible with roofing.
- E. Caps: Steel, 22 gauge minimum; 16 gauge at fire-resistant elements.

2.05 EQUIPMENT CURBS

- A. Standard curbs for roof-mounted equipment:
 - 1. Furnished with roof mounted equipment.
 - 2. Factory insulated with 1-1/2 inches, 3 lb. density rigid insulation.
 - 3. Constructed for the roof slope so that equipment is level.
 - 4. 24-inch-high, galvanized steel construction with sufficient structural capacity to accommodate the imposed load.
 - 5. Factory-installed 2" by 2" wood nailer.
 - 6. Provide rubber curb seal between unit and roof curb.
 - 7. Roof curb shall be compatible with the roof type.
 - 8. Where installed on a metal roof the curb shall match the metal roof profile.
 - 9. Where installed on a sloped roof structure the curb shall have an adjustable pitch to match the slope of the structure, so that the equipment is mounted level.
- B. Condensing units, heat pumps, and condensers, roof-mounted:

1. Curbs shall be as specified in Division 7. Where curbs are not specified in Division 7, furnish curbs equal to ThyCurb Model TEMS-3, 24 inches high. Each unit to be supported by a minimum of two equipment curbs.
 2. Secure units to curb with galvanized steel or stainless steel fasteners. Utilize galvanized steel or stainless steel ell brackets as required to allow for the fasteners to penetrate at the side of the curb and not the top.
- C. Vibration isolation curbs (VRF heat pumps):
1. Where specified, scheduled, or noted in the Drawings, a vibration isolation curb shall be furnished and installed for roof-mounted equipment.
 2. Curb shall match all requirements of "Standard curbs for roof-mounted equipment" above, where applicable.
 3. Curb assembly shall be designed for the equipment and curb to withstand 125 mph winds without the use of guy wires.
 4. Curb shall be equal to Thybar model "VibroCurb III" with 1" deflection spring isolators and weather seal. Isolators shall be designed specifically for the weight distribution of the equipment being supported/isolated.
 5. Curb shall have a solid sloped stainless steel top, EPDM flashing, and hat channels for mounting unit above surface.

2.06 FORMED STEEL CHANNEL

- A. Product Description: Galvanized 12 gauge roll formed ASTM A1011 SS Grade 33 structural steel channel, 1-5/8 inch by 1-5/8 inch minimum strut or stronger as required. with holes 1-1/2 inches on center.

2.07 EQUIPMENT BASES (HOUSEKEEPING PADS)

- A. Provide minimum 3-1/2 inch reinforced concrete pads with chamfered corners and equipment bases for all outdoor equipment on grade, floor mounted equipment in main central plant area, mechanical rooms, areas with floors below grade, penthouse equipment rooms, floor mounted air handling units, and where shown on Drawings.
- B. Refer to Section 03 30 00 for concrete requirements.
- C. Housekeeping pads shall extend minimum of 6 inches on all sides beyond the limits of the mounted equipment unless otherwise noted.
- D. Provide galvanized anchor bolts for all equipment placed on concrete pads or on concrete slabs of the size and number recommended by the equipment manufacturer.

2.08 EXTERIOR PIPE SUPPORTS

- A. The following exterior supports may be utilized as non-penetrating type roof supports or as grade mounted supports on concrete pads.
- B. Adjustable height, single pipe support for pipe sizes 3" and smaller: UV resistant, high density polypropylene, polycarbonate or fiberglass reinforced nylon base with support strut channel, threaded rod, nuts, washers and pipe clamp. All metal components to be

hot dipped galvanized or stainless steel.

1. PHP model PP10
 2. Miro Industries, Inc. model 2.5-SB-HCS
 3. Mapa model MS-12SA10
 4. Substitutions: Under provisions of Section 01 60 00.
- C. Adjustable height, single pipe support for pipe sizes 4" and larger: Two base type support system with UV resistant high density polypropylene, UV resistant polycarbonate or stainless steel bases. Provide with support hangers appropriate for the type of pipe as specified in this section. Provide with threaded rod, nuts and washers. All metal components, unless indicated otherwise, to be hot dipped galvanized or stainless steel.
1. PHP model PS-1-2
 2. Miro Industries, Inc. models 6-H, 8-H or 16-H as appropriate
 3. Mapa model MB series
 4. Substitutions: Under provisions of Section 01 60 00.
- D. Adjustable height, multiple pipe support: Two base type support system with UV resistant high density polypropylene, UV resistant polycarbonate or stainless steel bases. Provide with support hangers appropriate for the type of pipe as specified in this section. Provide with threaded rod, nuts and washers. All metal components, unless indicated otherwise, to be hot dipped galvanized or stainless steel.
1. PHP model PSE series
 2. Miro Industries, Inc. models 6-H, 8-H or 16-H as appropriate
 3. Mapa model MB series
 4. Substitutions: Under provisions of Section 01 60 00.

2.09 ROOF PIPE CHASE HOUSING

- A. Manufacturers:
1. Roof Penetration Housing, LLC: The Vault
 2. Substitutions: Under provisions of Section 01 60 00.
- B. Roof Pipe Chase Housing:
1. Constructed of heavy gage powder coated welded aluminum with stainless steel hardware consisting of three pieces, a removable vandal resistant lid, a middle housing and a wide flanged 14-inch-high curb.
 2. Size, unless noted otherwise on drawings:
 - a. Length: 20 ½ inches.
 - b. Width: 14 ½ inches.
 - c. Height: 12 inches.
 3. Exit seals to be of aluminum or stainless steel using SilX14 gasket seal. Each seal shall accommodate the specified size of the pipe, cable or conduit ranging in

size from .25 inches up to 7.09 inches OD.

- a. Where noted on the drawings, provide pipe chase housing prepped with a hole and cover plate for a GFCI outlet to be installed by the electrician.
 4. ICC-500 and FEMA 320/361 wind rated and rain tight.
 5. Furnish each unit with factory installed one-inch-thick insulation in the curb, housing and lid. Insulation to have a minimum R value of 4.3.
- C. Warranty:
1. The rooftop pipe chase housing shall carry an insured 20 year warranty accommodating multiple penetrations including piping and conduits.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Section 01 30 00 – Administrative Requirements: Verification of existing conditions before starting work.
- B. Verify openings are ready to receive sleeves.

3.02 PREPARATION

- A. Do not drill or cut structural members, unless written permission is obtained from the Structural Engineer.
- B. All auxiliary steel required for supports, anchors, guides, etc. shall be provided by the Contractor unless specifically indicated to be provided by others.
- C. All supports shall be of type and arrangement to prevent excessive deflection, to avoid excessive bending stresses between supports, and to eliminate transmission of vibration.
- D. Contractor shall be responsible for structural integrity of all supports, anchors, guides, etc. All structural hanging materials shall have a minimum safety factor of 5 built in

3.03 INSTALLATION – GENERAL

- A. Installation shall meet or exceed all applicable federal, state and local requirements, referenced standards and conform to codes and ordinances of authorities having jurisdiction.
- B. Application, sizing and installation of piping, supports, anchors and sleeves shall be in accordance with manufacturer's printed installation instructions.
- C. All supports shall be designed and installed to avoid interference with other piping, hangers, ducts, electrical conduit, supports, building structures, equipment, etc. All piping shall be installed with due regard to expansion and contraction and the type of hanger method of support, location of support, etc. shall be governed in part by this Specification.
- D. Install hanger so that rod is vertical under operating conditions.

- E. Provide for vertical adjustments after erection and during commissioning, where feasible, to ensure pipe is at design elevation and slope.
- F. Install hangers and supports to allow controlled thermal movement of piping systems, permitting freedom of movement between pipe anchors, and to facilitate action of expansion joints, expansion loops, expansion bends, and similar units.
- G. Supports hangers, anchors, and guides shall be fastened to the structure only at such points where the structure is capable of restraining the forces in the piping system
- H. The load and spacing on each hanger and/or insert shall not exceed the safe allowable load for any component of the support system, including any concrete that holds the inserts. Reinforcement at inserts shall be provided as required to develop the strength required. Contractor shall be responsible for engaging a structural engineer as required for design and review at support systems.
- I. Do not hang pipe, duct or any mechanical item directly from a metal deck or locate on the bottom chord of any truss or joist unless approved by the Structural Engineer of Record.
- J. Piping and ductwork supports shall be independent from fire protection piping supports or supports for other trade. Combining supports is not permitted
- K. All supports shall be designed and installed to avoid interference with other piping, hangers, ducts, electrical conduit, supports, building structures, equipment, etc.
- L. All piping and ductwork supports shall be designed and installed to allow the insulation to be continuous through the hangers.
- M. Adjustable clevis hangers shall be supported at rods with a nut above and below the hanger.
- N. All hanger rods shall be trimmed neatly so that 1 inch of excess hanger rod protrudes beyond the hanger nut. In the event a rod is intentionally but temporarily left excessively long (for sloped or insulated lines for example), the Contractor shall take appropriate measures to protect the pipe or other materials from damage.
- O. Install hangers to provide minimum ½ inch space between finished covering and adjacent structures, materials, etc.

3.04 INSTALLATION – PIPE HANGERS AND SUPPORTS

- A. Install in accordance with ASME B31.1, ASME B31.5, ASME 31.9, ASTM F708, MSS SP 58, MSS SP 69 and MSS SP 89.
- B. Support horizontal piping as scheduled at end of this section.
- C. Install hangers with minimum 1/2 inch space between finished covering and adjacent work.
- D. Locate hangers within 12 inches of each horizontal elbow.
- E. Use hangers with 1-1/2 inch minimum vertical adjustment.

- F. Support vertical piping at every floor and at maximum 10' on center.
- G. Where piping is installed in parallel and at same elevation, provide multiple pipe or trapeze hangers.
- H. Support riser piping independently of connected horizontal piping.
- I. Provide copper plated hangers or non-metallic coatings or inserts on attachments for electrolytic protection where attachments are in direct contact with copper piping.
- J. Design hangers for pipe movement without disengagement of supported pipe.
- K. Prime coat exposed steel hangers and supports. Refer to Section 09 90 00. Hangers and supports located in crawl spaces, pipe shafts, and suspended ceiling spaces are not considered exposed.
- L. Provide clearance in hangers and from structure and other equipment for installation of insulation.
- M. Insulated piping larger than 2" diameter shall be supported with inserts of the same thickness as the insulation, or with other approved methods. Refer to Section 22 07 00 – Piping Systems Insulation.
- N. Supports, hangers, anchors, and guides shall be fastened to the structure only at such points where the structure is capable of restraining the forces in the piping system.

3.05 INSTALLATION – ATTACHMENT TO STRUCTURE

- A. Hangers shall be attached to the structure as follows.
 - 1. Poured-In-Place Concrete: Where pipes and equipment are supported under poured in place concrete construction, each hanger rod shall be fitted with a nut at its upper end, which nut shall be set into an Underwriters Laboratories, Inc. listed universal concrete insert placed in the form work before concrete is poured. Where inserts are placed in the bottom faces of concrete joists which are too narrow to provide adequate strength of concrete to hold the insert properly or where a larger insert would require displacement of the bottom joist steel, the hanger rod shall be suspended from the center of a horizontal angle iron, channel iron, I-beam, etc. spanning across two adjacent joists. The horizontal support shall be bolted to nonadjustable concrete inserts of the "spot" type, of physical size small enough to avoid the bottom joist steel.
 - 2. Steel Bar Joists: Where pipes and loads are supported under bar joists, hanger rods may be run through the space between the bottom angles and secured with a washer and two nuts. Where larger lines are supported beneath bar joists, hanger rods shall be secured to angle irons of adequate size; each angle shall span across two or more joists as required to distribute the weight properly and shall be welded to the joists or otherwise permanently fixed thereto.
 - 3. Steel Beams: Where pipes and loads are supported under steel beams, approved type beam clamps shall be used.
- C. Where inserts are omitted, drill through concrete slab from below and provide through-bolt with recessed square steel plate and nut recessed into and grouted flush with slab.

3.06 INSTALLATION – FLASHING

- A. Provide flexible flashing and metal Counterflashing where piping and ductwork penetrate weather or waterproofed walls, floors, and roofs.
- B. Provide acoustical lead flashing around ducts and pipes penetrating equipment rooms for sound control.
- C. Provide curbs for roof installations. Flash and counter-flash with sheet metal; seal watertight. Attach Counterflashing to equipment and lap base flashing on roof curbs. Flatten and solder joints. Provide continuous shims under curbs as required to install equipment level.
- D. Adjust storm collars tight to pipe with bolts; caulk around top edge. Use storm collars above roof jacks. Screw vertical flange section to face of curb

3.07 INSTALLATION – ROOF CURBS

- A. Install curbs in accordance with manufacturer's instructions and as indicated on Drawings.
- B. Coat nailing flange in contact with pressure-treated wood with bituminous paint or isolate flange from pressure-treated wood with a layer of APP or SBS underlayment or separation sheet specified in Division 6.
- C. Coordinate installation of components of this section with installation of roofing membrane and base flashings, as specified in Division 7.

3.08 INSTALLATION – SLEEVES

- A. Exterior watertight entries: Seal with mechanical sleeve seals.
- B. Set sleeves in position in forms. Provide reinforcing around sleeves.
- C. Size sleeves large enough to allow for movement due to expansion and contraction. Provide for continuous insulation wrapping.
- D. Extend sleeves through floors 1 inch above finished floor level. Caulk sleeves.
- E. Where piping or ductwork penetrates floor, ceiling or wall, close off space between pipe or duct and adjacent work with firestopping insulation and caulk airtight. Provide close fitting metal collar or escutcheon covers at both sides of penetration.
- F. Install chrome plated steel or stainless steel escutcheons at finished surfaces.
- G. Where installed in fire rated wall, floors, etc., install in accordance with UL/FM or Warnock Hersey fire rated assembly instructions.
- H. Install sleeves for all piping passing through penetrations in floors, partitions, roofs, and walls. All penetrations shall pass through sleeves.
- I. For sleeves that will have sleeve-seal system installed, select sleeves of size large enough to provide 1-inch annular clear space between piping and concrete slabs and

walls. Sleeves are not required for core-drilled holes.

- J. Install sleeves in concrete floors, concrete roof slabs, and concrete walls as new slabs and walls are constructed.
 - 1. Permanent sleeves are not required for holes in slabs formed by molded-PE or -PP sleeves.
 - 2. Cut sleeves to length for mounting flush with both surfaces. Exception: Extend sleeves installed in floors of mechanical equipment areas or other wet areas 2 inches above finished floor level.
 - 3. Using grout, seal the space outside of sleeves in slabs and walls without sleeve-seal system.
- K. Install sleeves for pipes passing through interior partitions.
 - 1. Cut sleeves to length for mounting flush with both surfaces.
 - 2. Install sleeves that are large enough to provide 1/4-inch annular clear space between sleeve and pipe or pipe insulation.
 - 3. Seal annular space between sleeve and piping or piping insulation; use joint sealants appropriate for size, depth, and location of joint. Comply with requirements for sealants specified in Division 07 Section "Joint Sealants."

3.09 INSTALLATION – EQUIPMENT BASES AND SUPPORTS

- A. Provide concrete housekeeping pads, per requirements in Part 2 of this section.
- B. Install anchor bolts, and accessories for mounting and anchoring equipment. Foundation bolts shall be placed in the forms when the concrete is poured, the bolts being correctly located by means of templates. Each bolt shall be set in a sleeve of sufficient size to provide ½ inch clearance around bolt.
- C. Construct supports of steel members or formed steel channel. Brace and fasten with flanges bolted to structure.
- D. Provide rigid anchors for pipes after vibration isolation components are installed.

3.10 INSTALLATION – EXTERIOR PIPE SUPPORTS

- A. Install exterior pipe and duct supports and exterior walkways and access platforms per manufacturer's recommendations.
- B. Locate bases and support framing as specified herein. Provide complete and adequate support of all piping and ducts, whether or not all required devices are shown.
- C. The use of wood for supporting piping is not permitted.
- D. Install piping supports at spacing indicated in schedule at end of this section
- E. Spacing of duct supports shall be in accordance with SMACNA and where indicated on the drawings.
- F. Accurately locate and align bases.

1. Consult manufacturer of existing or new roofing system as to the type of isolation pads required between the roof and base.
 2. Set isolation pads in adhesive if required by manufacturer's instructions.
 3. Place bases on isolation pads.
 4. Adhere or mechanically attach if required by code.
 5. Where applicable, replace gravel around bases
- G. Use galvanized fasteners for galvanized framing and stainless-steel fasteners for stainless steel framing.

3.11 INSTALLATION – ROOF PIPE CHASE HOUSINGS

- A. Install in accordance with manufacturer's recommendations.
- B. Coordinate size of the exit seals with HVAC, plumbing, electrical and telecommunications contractor.
- C. All penetrations shall use the appropriate exit seal furnished by the manufacturer. All penetrations shall only pass through the housing portion of the assembly. Support each penetration within 12 inches of exiting the unit

3.12 FIELD QUALITY CONTROL

- A. Section 01 40 00 – Quality Requirements and 01 70 00 – Execution and Closeout Requirements: Field inspecting, testing, adjusting, and balancing.
- B. Inspect installed firestopping for compliance with specifications and submitted schedule.

3.13 CLEANING

- A. Section 01 70 00 – Execution and Closeout Requirements: Requirements for cleaning.
- B. Clean adjacent surfaces of firestopping materials.

3.14 PROTECTION OF FINISHED WORK

- A. Section 01 70 00 – Execution and Closeout Requirements: Requirements for protecting finished Work.
- B. Protect adjacent surfaces from damage by material installation.

3.15 SCHEDULES

- A. Copper and Steel Pipe Hanger Spacing:

PIPE HANGER SPACING		
PIPE MATERIAL	MAXIMUM HANGER SPACING (Feet)	MIN. HANGER ROD DIAMETER (Inches)

Copper Tube, 1-1/4 inches and smaller	6	3/8
Copper Tube, 1-1/2 thru 2-1/2 inches	8	1/2
Copper Tube, 3 inches and larger	10	5/8
Steel Pipe, 1-1/2 inches and smaller	8	3/8
Steel Pipe, 2 thru 3 inches	10	1/2
Steel Pipe, 4 inches and larger	12	5/8

Support all vertical piping at each floor level and at maximum 10 feet spacing.

END OF SECTION

SECTION 23 05 48 – VIBRATION CONTROLS FOR HVAC PIPING AND EQUIPMENT

PART 1 GENERAL

1.01 SUMMARY

A. Section Includes:

1. Vibration isolators.

B. Related Sections:

1. Section 07 90 00 - Joint Protection: Product requirements for joint sealers specified for placement by this section.
2. Section 23 05 29 - Hangers and Supports for HVAC Piping and Equipment: Product requirements for pipe hangers and supports.
3. Section 23 05 93 - Testing, Adjusting, and Balancing for HVAC: Requirements for sound and vibration measurements performed independent of this section.

1.02 REFERENCES

A. American Society of Heating, Refrigerating and Air Conditioning:

1. ASHRAE 2019 HVAC Applications Handbook, Chapter 49.

B. Sheet Metal and Air Conditioning Contractors' National Association:

1. SMACNA - HVAC Duct Construction Standard - Metal and Flexible.

1.03 SUBMITTALS

A. Section 01 33 00 - Submittal Procedures: Submittal procedures.

B. Shop Drawings: Indicate inertia bases and locate vibration isolators, with static and dynamic load on each. Indicate assembly, materials, thickness, dimensional data, pressure losses, acoustical performance, layout, and connection details for sound attenuation products fabricated for this project.

C. Product Data: Submit schedule of vibration isolator type with location and load on each. Submit catalog information indicating, materials, dimensional data, pressure losses, and acoustical performance for standard sound attenuation products.

D. Design Data: Submit calculations indicating maximum room sound levels are not exceeded.

E. Manufacturer's Installation Instructions: Submit special procedures and setting dimensions. Indicate installation requirements maintaining integrity of sound isolation.

F. Manufacturer's Field Reports: Indicate sound isolation installation is complete and in accordance with instructions.

1.04 CLOSEOUT SUBMITTALS

- A. Section 01 70 00 - Execution and Closeout Requirements: Closeout procedures.
- B. Project Record Documents: Record actual locations of hangers including attachment points.

1.05 QUALITY ASSURANCE

- A. Provide for vibration isolation supports for all equipment, piping and ductwork indicated herein. The transmission of perceptible vibration to occupied areas by equipment installed under this Contract will not be permitted. Install vibration isolators as specified herein or shown on the Drawings or otherwise required to prevent the transmission of vibration which would create objectionable noise levels in occupied areas.
- B. The vibration isolation supplier must be a firm capable of dealing effectively with vibration and noise characteristics effects and criteria; and one that can provide facilities and capabilities for measuring and evaluating the aforementioned disturbances.
- C. Provide vibration isolation devices, from a single manufacturer or supplier who will be responsible for complete coordination of all phases of this work.

1.06 QUALIFICATIONS

- A. Manufacturer: Company specializing in manufacturing products specified in this section with minimum three years experience.
- B. Installer: Company specializing in performing Work of this section with minimum three years experience.

1.07 FIELD MEASUREMENTS

- A. Verify field measurements prior to fabrication.

1.08 WARRANTY

- A. Section 01 70 00 - Execution and Closeout Requirements: Product warranties and product bonds.

PART 2 PRODUCTS

2.01 VIBRATION ISOLATORS

- A. Open Spring Isolators - Type A:
 - 1. Spring Isolators:
 - a. For Exterior and Humid Areas: Furnish hot dipped galvanized housings and neoprene coated springs.
 - b. Code: Color code springs for load carrying capacity.
 - 2. Springs: Minimum horizontal stiffness equal to 75 percent vertical stiffness, with working deflection between 0.3 and 0.6 of maximum deflection.

3. Spring Mounts: Furnish with leveling devices, minimum 0.25-inch-thick neoprene sound pads, and zinc chromate plated hardware.
 4. Sound Pads: Size for minimum deflection of 0.05 inch; meet requirements for neoprene pad isolators.
- B. Restrained Spring Isolators - Type B:
1. Spring Isolators:
 - a. For Exterior and Humid Areas: Furnish hot dipped galvanized housings and neoprene coated springs.
 - b. Code: Color code springs for load carrying capacity.
 2. Springs: Minimum horizontal stiffness equal to 75 percent vertical stiffness, with working deflection between 0.3 and 0.6 of maximum deflection.
 3. Spring Mounts: Furnish with leveling devices, minimum 0.25-inch-thick neoprene sound pads, and zinc chromate plated hardware.
 4. Sound Pads: Size for minimum deflection of 0.05 inch; meet requirements for neoprene pad isolators.
 5. Restraint: Furnish mounting frame and limit stops.
- C. Closed Spring Isolators - Type C:
1. Spring Isolators:
 - a. For Exterior and Humid Areas: Furnish hot dipped galvanized housings and neoprene coated springs.
 - b. Code: Color code springs for load carrying capacity.
 2. Type: Closed spring mount with top and bottom housing separated with neoprene rubber stabilizers.
 3. Springs: Minimum horizontal stiffness equal to 75 percent vertical stiffness, with working deflection between 0.3 and 0.6 of maximum deflection.
 4. Housings: Incorporate neoprene isolation pad meeting requirements for neoprene pad isolators, and neoprene side stabilizers with minimum 0.25-inch clearance.
- D. Restrained Closed Spring Isolators - Type D:
1. Spring Isolators:
